Department of State Lands, Property Manager (to be completed by DSL)

If the project is located on state-owned submerged and submersible lands, DSL staff will obtain a signature from the Land Management Division of DSL. A signature by DSL for activities proposed on state-owned submerged/submersible lands only grants the applicant consent to apply for a removal-fill permit. A signature for activities on state-owned submerged and submersible lands grants no other authority, express or implied and a separate proprietary authorization may be required.

Print Name	Title
Signature	Date

* Not required by the Corps.

(14) ATTACHMENTS

- ☐ Drawings
  - ☐ Location map with roads identified
  - ☐ U.S.G.S topographic map
  - ☐ Tax lot map
  - ☐ Site plan(s)
  - ☐ Plan view and cross section drawing(s)
  - ☐ Recent aerial photo
  - ☐ Project photos
  - ☐ Erosion and Pollution Control Plan(s), if applicable
  - ☐ DSL / Corps Wetland Concurrence letter and map, if approved and applicable
- ☐ Pre-printed labels for adjacent property owners (Required if more than 30)
- ☐ Incumbency Certificate if applicant is a partnership or corporation
- ☐ Restoration plan or rehabilitation plan for temporary impacts
- ☐ Mitigation plan
- ☐ Wetland functional assessments, if applicable
  - ☐ Cover Page
  - ☐ Score Sheets
  - ☐ ORWAP OR, F, T, & S forms
  - ☐ ORWAP Reports
  - ☐ Assessment Maps
  - ☐ ORWAP Reports: Soils, Topo, Assessment area, Contributing area
- ☐ Stream Functional Assessments, if applicable
  - ☐ Cover Page
  - ☐ Score Sheets
  - ☐ SFAM PA, PAA, & EAA forms
  - ☐ SFAM Report
  - ☐ Assessment Maps
    - ☐ Aerial Photo Site Map and Topo Site Map (Both maps should document the PA, PAA, & EAA)
- ☐ Compensatory Mitigation (CM) Eligibility & Accounting Worksheet
  - ☐ Matching Quickguide sheet(s)
  - ☐ CM Eligibility & Accounting sheet
- ☐ Alternatives analysis
- ☐ Biological assessment (if requested by the Corps project manager during pre-application coordination)
- ☐ Stormwater management plan (may be required by the Corps or DEQ)
- ☐ Other
  - ☐ Please describe:

For U.S. Army Corps of Engineers send application to:

USACE Portland District
ATTN: CENWP-ODG-P
PO Box 2946
Portland, OR 97208-2946
Phone: 503-808-4373
portlandpermits@usace.army.mil

Counties:
Baker, Benton, Clackamas, Clatsop, Columbia, Gilliam, Grant, Hood River, Jefferson, Lincoln, Linn, Malheur, Marion, Morrow, Multnomah, Polk, Sherman, Tillamook, Umatilla, Union, Wallowa, Wasco, Washington, Wheeler, Yamhill

U.S. Army Corps of Engineers
ATTN: CENWP-ODG-E
211 E. 7th AVE, Suite 105
Eugene, OR 97401-2722
Phone: 541-465-6868
portlandpermits@usace.army.mil

Counties:
Coos, Crook, Curry, Deschutes, Douglas, Jackson, Josephine, Harney, Klamath, Lake, Lane

For Department of State Lands send application to:

West of the Cascades:
Department of State Lands
775 Summer Street NE, Ste 100
Salem, OR 97301-1279
Phone: 503-986-5200
https://www.oregon.gov/dsl/WW/Documents/uploadinstructions_removalfill.pdf

East of the Cascades:
Department of State Lands
951 SW Simpson Ave, Ste 104
Bend, OR 97702
Phone: 541-388-6112
https://www.oregon.gov/dsl/WW/Documents/uploadinstructions_removalfill.pdf

For Department of Environmental Quality:

Submit all application materials electronically through *Your DEQ Online*.

For questions related to *Your DEQ Online*, please visit the *Your DEQ Online* help page, email YourDEQOnline@deq.state.or.us, or call 503-229-6184

INSTRUCTIONS FOR PREPARING THE JOINT APPLICATION

This is a joint application and must be sent to all agencies (Corps, DSL, and DEQ), who administer separate permit or certification processes. For questions regarding these instructions or the form, contact the Corps, DSL and/or DEQ or refer to the following online resources:

- DSL's Removal-Fill Guide; or,
- The Corps Regulatory website: http://www.nwp.usace.army.mil/Missions/Regulatory.aspx
- DEQ's 401 Water Quality Certification website: https://www.oregon.gov/deq/wq/wqpermits/Pages/Section-401-Certification.aspx

General Instructions and Tips

- Provide the information in the appropriate blocks of the application form. If you need more space, provide a summary in the space provided and attach additional detail as an appendix to the application. Each appendix or attachment must reference which application block number it pertains to.
- Not all items on the application form will apply to all projects.
- Electronic submittal of applications and supporting material is preferred by the Corps. Both electronic and hard copies must be in 8 ½ x 11-inch sized format and reproducible in black and white. Currently DSL does not accept electronic submittals. DSL will accept color figures and 11 X 17. Use either all double sided or all single sided paper. Do not use staples or dividers. NOTE: If the electronic submittal of application and associated documents is 10 megabytes or more, check with each agency for how best to submit the document to that agency.
- **FEES:** Fees for water quality certification apply. Nationwide projects approved by DEQ will incur a fee of $985. Others will be evaluated on a case-by-case basis: https://www.oregon.gov/deq/wq/wqpermits/Pages/Section-401-Fees.aspx.

For complex projects or for those that may have more than minimal impacts, additional information may be necessary to complete the evaluation and make a permit decision. Alternative forms of permit applications may be acceptable; contact the Corps and DSL for more information.

Section 1. Type of Permit(s) if Known

If known, indicate the type of permit/authorization applying for.

Section 2. Applicant and Landowner Contact Information

Applicant: The applicant is the responsible party. If the applicant is an agency, business entity or other organization, indicate the name of the organization and a person that has the authority to sign the application. If applicant is a partnership or corporation, the applicant name must match the Incumbency Certificate, and the business name as listed on OR Secretary of State business registry. Applicant must not be "doing business as" or has an "assumed business name." In such cases the applicant must be an individual.

Applicant Contact Name: If the applicant is a business, provide the contact name for an individual representing the business.

Authorized Agent: An authorized agent is someone who has permission from the applicant to represent their interests and supply information to the agencies. An agent can be a consultant, an attorney, builder, contractor, or any other person or organization. An authorized agent is optional.

Landowner: Provide landowner information if different from the applicant. DSL requires the landowner's signature, unless the project qualifies as a linear project, e.g. road, pipeline, utility.

Section 3. Project Information

A. Provide location information. Latitude and longitude must be reported in decimal format and can be found by zooming in to your respective project location and reading off the coordinates displayed on the bottom many maps, such as Google Earth.

B. Provide information on wetlands and waterbodies within the project area. Indicate the category of activities that make up your project. For projects with multiple locations, provide latitude and longitude for each location. For linear projects, provide the latitude and longitude for the start and end points.

Section 4. Project Description

A. Overall Description: Provide a description of the overall project, including:

- All associated work with the project both outside and within waters or wetlands.
- Total ground disturbance for all associated work (i.e., area and volume of ground disturbance).
- Total area of impervious surfaces created or modified by the project, if applicable.

B. Work within Waters and Wetlands: Provide a description of the proposed work within waters and wetlands, including:

- Each removal or fill activity proposed in waters or wetlands, as well as any construction or maintenance of in-water or over-water structures.
- The number and dimensions of in-water or over-water structures (i.e., pilings, floating docks) proposed within waters or wetlands.

C. Construction Methods: Describe how the removal and/or fill activities will be accomplished, including the following:

- Construction methods, equipment to be used, access and staging areas, etc.
- Measures you will use during construction to minimize impacts to the waterbody or wetland. Examples may include isolating work areas, controlling construction access, site specific erosion and sediment control methods, site specific best management practices, and using specialized equipment or materials. Attach work area isolation and/or erosion and pollution control plans, if applicable.

D. Fill Material and Disposal: Provide a description of fill material and procedure for disposal of removed material, including:

- The source(s) of fill materials (if known).
- Locations for disposal area(s) for dredged material, if applicable. If dredged material is to be discharged on an upland site, identify the site and the steps to be taken (if necessary) to prevent runoff from the dredged material back into jurisdictional waters. If using an upland disposal area that is not a Department of Environmental Quality (DEQ)-regulated landfill, a Solid Waste Letter of Authorization or a Beneficial Use Determination from DEQ may be required.

E. Construction Timing: Provide the proposed start and completion dates for the project. Describe project work that is already complete, if applicable.

F. – I. Summary of Removal and Fill Activities: Summarize the dimensions, volume and type/composition of material being placed or removed in each waterbody or wetland. Describe each impact on a separate row. For instance, if two culverts are being removed from Clear Creek, use two rows. Add extra rows if needed or include an attachment.

The DSL and the Corps use different elevations for determining whether an activity in tidal waters is regulated by the State's Removal-Fill law, the Clean Water Act, and/or the Rivers and Harbors Act. DSL regulates activities below the highest measured tide. The Clean Water Act applies below the high tide line. The Rivers and Harbors Act applies below the mean high water.

If jurisdictional limits are not the same for each agency, prepare a table for each agency stating impacts within that agency's jurisdiction.

Section 5. Project Purpose and Need
Explain the purpose and need for the project. Also include a brief description of any related activities needed to accomplish the project objectives.

The following items are required by DSL, as applicable:
- If the removal-fill would satisfy a public need and the applicant is a public body, include any pertinent findings regarding public need and benefit.
- If the project involves fill in the estuary for a non-water dependent use, explain how the project is for public use and/or satisfies a public need.
- If the project is located within a marine reserve or marine protected area, explain how the project is needed to study, monitor, evaluate, enforce or protect the designated area.

Section 6. Description of Resources in Project Area
Territorial Sea: For activities in the Territorial Sea (mean lower low water seaward 3 nautical miles), provide a separate evaluation of the resources and effects determination.

For each wetland, include:
- Whether the wetland is freshwater or tidal, and the Cowardin class and Hydrogeomorphic (HGM) class.
- Source of hydrology and direction of flow (if any).
- Dominant plant species by layer (herb, shrub, tree).
- Assessment of the hydrologic, water quality, fish habitat, aquatic habitat, and ecosystem support functions and values of the wetland(s) to be permanently impacted. The assessment should be attached as a separate Excel document.
    - DSL requires the use of ORWAP for wetland impacts over 0.2 acre and any wetland that is an Aquatic Resource of Special Concern (ARSC), unless the impacts are to Agate Desert Vernal Pools (VPs). See Appendix B of the Removal Fill Guide for a list of ARSCs. The Vernal Pool Assessment Method is required for all VPs. For impacts to wetlands less than 0.2 acre that are not ARSCs or VPs Best Professional Judgment (BPJ) may be used.
- Identify any Aquatic Resources of Special Concern (ARSC) in or near the project area. ARSCs include alkali wetlands, bogs, cold water habitat, fens, hot springs, interdunal wetlands, kelp beds, mature forested wetlands, native eelgrass beds, off-channel habitats (alcoves and side channels), ultramafic soil wetlands, vernal pools (including Willamette Valley, Medford area, Modoc basalt, and Columbia Plateau vernal pools), wet prairies, or wooded tidal wetlands. See Appendix B of the Removal Fill Guide for a list of ARSCs.
- Include relevant summary information from the wetland delineation report if available. Provide a copy of the wetland delineation report to **the Corps,** if not previously provided to the Corps. If a delineation report has not been previously submitted to DSL, then submit to DSL under a separate cover.
- Describe existing uses, including fish and wildlife use (type, abundance, period of use, and significance of site).
- Next major downstream waterbody name.

For rivers, streams, other waterbodies, lakes and ponds, include a description of, as applicable:
- Streamflow regime (e.g., perennial year-round flow, intermittent seasonal flow, ephemeral event-driven flow). If flow is ephemeral, provide streamflow assessment data sheet or other information that supports your determination.
- Field indicators used to identify the Ordinary High Water Mark (OHWM).
- Channel and bank conditions.

- Type and condition of riparian (streamside) vegetation.
- Channel morphology (structure and shape).
- Stream substrate.
- Assessment of the hydrologic, geomorphic, biologic and water quality functions and values of waters to be permanently impacted.
    - DSL requires use of the Stream Function Assessment Methodology (SFAM) for wadable non-tidal streams. SFAM should be attached as a separate Excel document. For impacts to non-wadable or tidal streams, BPJ can be used. Sections 2.2 through 2.3 of the SFAM User Manual give guidance for the functions and values to be addressed for all streams, even if SFAM does not apply.
- Identify any Aquatic Resources of Special Concern (ARSC) in or near the project area. ARSCs include alkali wetlands, bogs, cold water habitat, fens, hot springs, interdunal wetlands, kelp beds, mature forested wetlands, native eelgrass beds, off-channel habitats (alcoves and side channels), ultramafic soil wetlands, vernal pools (including Willamette Valley, Medford area, Modoc basalt, and Columbia Plateau vernal pools), wet prairies, or wooded tidal wetlands.
- Fish and wildlife use (type, abundance, period of use, and significance of site).
- Water quality impairments, including waterways adjacent to impacted wetlands and waterway to be impacted and next major downstream waterbody

Section 7. Project Specific Criteria and Alternatives Analysis
Provide an explanation describing how impacts to waters and wetlands are being avoided and minimized on the project site. For DSL, the alternatives analysis must include:
- Project-specific criteria that are needed to accomplish the stated project purpose.
- A range of alternative sites and designs that were considered with less impact.
- An evaluation of each alternative site and design against the project criteria and a reason for why the alternative was not chosen.
- If the project involves fill in an estuary for a non-water dependent use, a description of alternative non-estuarine sites must be included.

The level of rigor required in this analysis should be commensurate with the level of impact proposed. Please note that additional information regarding alternatives may be necessary for Corps Individual Permits to comply with the Clean Water Act Section 404(b)(1) Guidelines. Please check with your local Corps contact early in the planning process to determine what level of analysis is required. An alternative analysis is not required for a complete application by the Corps; however, it may be required before a permit decision can be rendered.

Section 8. Additional Information
Any additional information you provide helps the reviewer(s) understand your project and the other approvals or reviews that may be required.

Section 9. Impacts, Restoration/Rehabilitation, and Compensatory Mitigation
A. Description of Impacts: Clearly identify the permanent, temporary, direct and indirect impacts. Provide a written analysis of potential changes the project may make to the hydrologic characteristics of the affected wetlands or waterbodies, and an explanation of measures taken to avoid or minimize any adverse effects of those changes, such as: impeding, restricting or increasing flows; relocating or redirecting flow; and potential flooding or erosion downstream of the project. Provide a table summarizing permanent and temporary impacts by HGM and Cowardin Classifications.

B. Site Restoration/Rehabilitation: For temporary disturbance of soils and/or vegetation in waterbodies, wetlands or riparian (streamside) areas, discuss how you will restore the site after construction. This may include the following:

- ☐ Grading plans to restore pre-existing elevations.
- ☐ Planting plans and species list (native species only) to replace vegetation in riparian or wetland areas.
- ☐ Maintenance and monitoring plans to document restoration to wetland condition and/or vegetation establishment.
- ☐ Associated erosion control for site stabilization.

C.-D. Compensatory Mitigation. Describe your proposed compensatory mitigation approach or explain why you believe compensatory mitigation is not required. If proposing permittee-responsible mitigation for permanent impacts to jurisdictional waters, see OAR 141-085-0705 and 33 CFR 332.4(c) for plan requirements. The Oregon Explorer Aquatic Mitigation topic page and map viewers may be a helpful resource.

For activities involving discharges of dredged or fill material into waters of the United States, the Corps requires the application to include a statement describing how impacts to waters of the United States are to be avoided and minimized. The application must also include either a statement describing how impacts to waters of the United States are to be compensated for or a statement explaining why compensatory mitigation should not be required for the proposed impacts.

Section 10. Adjacent Property Owners for Project and Mitigation Site(s)
Names and addresses for properties that are adjacent to the project site and permittee responsible mitigation site (if applicable), are required. "Adjacent" means those properties that share or touch upon a common property line or are across the street or stream. If more than 30, attach pre-printed labels. A list of property owners may be obtained by contacting the county tax assessor's office.

Section 11. City/County Planning Department Land Use Affidavit
This section is required to demonstrate land use compatibility for removal fill permits and water quality certifications. Provide this form to your local planning official for them to complete and sign.

Section 12. Coastal Zone Certification
Your signature for this statement is **required** for projects within the coastal zone (generally, west of the summit of the Coast Range).

Section 13. Signatures
The application **must** be signed by the responsible party as identified in section 1. DSL also requires the landowner's signature. Linear Facilities (e.g. road, pipeline, utility) do not require landowner signature for the impact sites; signatures are required for mitigation sites.

Section 14: Attachments
Project Drawings. A complete application must include a location map, site plan, and plan view and cross-section drawings. DSL also requires a recent aerial photo. All drawings should be clear, legible, and to scale. For the Corps, drawings must be on 8.5 x 11-inch paper and must be in black and white or clearly reproducible in black and white. DSL will accept color and 11 x 17, but all figures must be clear when reproduced in black and white. While illustrations need not be professionally prepared, they should be clear, accurate, and contain all necessary information, as follows:

Location maps (with project boundaries, including staging and construction access, scale bar and north arrow on all):
- ☐ Location map with roads identified
- ☐ U.S.G.S. Topographic map
- ☐ Tax lot map

Site plan(s), including:
- ☐ Entire project site and activity areas, which includes staging and construction access areas
- ☐ Existing and proposed contours
- ☐ Stormwater outfalls and other related features
- ☐ Location of Ordinary High Water Mark, wetland boundaries, and other jurisdictional boundaries. Clearly identify temporary, permanent, direct and indirect impact areas within waterbodies and wetlands
- ☐ Scale bar, legend, and north arrow
- ☐ Location of staging areas and construction access
- ☐ Location of cross section(s), as applicable
- ☐ Location of mitigation area, if applicable

Cross section drawing(s), including:
- ☐ Existing and proposed elevations
- ☐ Clearly identify temporary, permanent, direct and indirect impact areas within waterbodies and wetlands
- ☐ Ordinary High Water Mark, wetland boundaries, and other jurisdictional boundaries
- ☐ Scale bar (horizontal and vertical scale)

Recent Aerial Photo
- ☐ 1:200 resolution, or, if not available for your site, highest resolution possible

DSL Wetland Concurrence (map and letter only for DSL; the Corps requires the full wetland/waters delineation report if not already submitted)

Mitigation documents including:
- ☐ Functional assessment results for each impacted resource and mitigation area
  - Results should include: Cover sheet, Score Sheet, assessment area maps
- ☐ Eligibility and Accounting Worksheet
  - Matching "Quickguide" sheet(s)
  - Compensatory Mitigation (CM) Eligibility & Accounting sheet

Do NOT submit the following items to DSL (unless specifically requested by DSL for your project):
- ☐ Wetland delineation report
- ☐ Biological assessment
- ☐ Cultural/archeological reports
- ☐ Stormwater calculations
- ☐ Geotechnical reports
- ☐ Marketing reports
- ☐ Contract agreements
- ☐ Applications for other agencies such as local land use applications
- ☐ Contractor/construction specifications
- ☐ Other extraneous drawings and information

Columbia River Navigation Channel O&M_Project Location Information (Upland and Shoreline Placement Sites)

Dredging BMPs

Measure	Justification	Duration	Ongoing Management
Hopper and Pipeline Dredging			
Drag or cutterheads will be buried in the substrate and will not exceed an elevation of 3 feet off the bottom for when cleaning the hopper or reverse purging dragheads or clearing pipeline. If water is pumped through dragheads to clean the hopper or cutterhead to clear the pipeline, dragheads or cutterhead will be 20 ft below the surface while dredging between RM 3 and RM 106.5 and 9 ft below the surface between RM 106.5 and RM 145 and in shallow-draft side channels.	To minimize potential entrainment of juvenile salmonids	Continuous throughout dredging operations	Maintain unless new information warrants change(s)
All Dredging			
Contractor(s) shall not release any trash, garbage, oil, grease, chemicals, or other contaminants into waterways	Protection of aquatic resources	Life of contract or action	Any unintentional in-water release will be immediately reported to the National Spill Response Center, U.S. Coast Guard, and other federal and state agencies for appropriate response. If material is released, it shall be immediately cleaned up/removed and the affected area shall be restored to a condition approximating adjacent undisturbed areas. Contaminated soils shall be excavated and removed.
Contractor(s), where possible, will use or propose for use materials considered environmentally friendly in that waste from such materials is not regulated as hazardous or is not considered harmful to the environment. If hazardous wastes are generated, disposal shall be done in accordance with 40 CFR parts 260-272 and 49 CFR parts 100-177.	Minimize and ensure safe disposal of hazardous waste	Life of contract or action	Any unintentional in-water release will be immediately reported to the National Spill Response Center, U.S. Coast Guard, and other federal and state agencies for appropriate response. If material is released, it shall be immediately cleaned up/removed and the affected area shall be restored to a condition approximating adjacent undisturbed areas. Contaminated soils shall be excavated and removed.

Dredged Material Placement BMPs

Measure	Justification	Duration	Ongoing Management
In-Water Placement			
Spread out dredged material to prevent mounding	Reduces depth of material to minimize effects to fish and invertebrates	Life of contract or action	Maintain unless new information warrants change(s)
Maintain discharge pipe of pipeline dredge at or below 20 ft depth during placement	Reduce impact of placement, suspended sediment, and turbidity to migrating juvenile salmonids	Continuous throughout placement operations	Maintain unless new information warrants change(s)
Shoreline Placement			
Grade placement site to slope of 10-15%, with no swales, to reduce the possibility of stranding juvenile salmonids	Ungraded slopes can create small pools or flat slopes that can strand juvenile salmon washed ashore by waves	Continuous throughout placement operations	Maintain unless new information warrants change(s)
Upland Placement			
Construct dredge material containment berms with weir systems to maximize the settlement of fine materials in runoff water	Maintain habitat functions/values of aquatic resources	Continuous throughout operations	Maintain unless new information warrants change(s)
Construction access routes and barge ramps will be limited to the smallest footprint practicable to minimize potential discharge into areas waterward of OHW or MHHW.	Minimize potential deleterious effects to water quality and aquatic resources	Life of contract or action	Maintain unless new information warrants change(s)
All Placement			
Contractor(s), where possible, will use or propose for use materials considered environmentally friendly in that waste from such materials is not regulated as hazardous or is not considered harmful to the environment. If hazardous wastes are generated, disposal shall be done in accordance with 40 CFR parts 260-272 and 49 CFR parts 100-177.	Minimize and ensure safe disposal of hazardous waste	Life of contract or action	Any unintentional in-water release will be immediately reported to the National Spill Response Center, U.S. Coast Guard, and other federal and state agencies for appropriate response. If material is released, it shall be immediately cleaned up/removed and the affected area shall be restored to a condition approximating adjacent undisturbed areas. Contaminated soils shall be excavated and removed.

EPA-Region 10 5 July 2017
Office of Environmental Review & Assessment (Sediment Management Unit)

Memorandum for: U.S. Army Corps of Engineers – Portland District, Operations Division, Channels and Harbors, Waterways Maintenance Section (CENWP-OD-NW, Stokke)

Subject: Portland Sediment Evaluation Team (PSET) Level 2 dredged material suitability determination for the U.S. Army Corps of Engineers - Portland District's (Corps) operations and maintenance (O&M) dredging of the Lower Columbia River (LCR) deep-draft Federal Navigation Channel (FNC) in the Columbia River from River Mile (RM) 3 to 106.5 in Oregon and Washington.

Introduction: Per the *Sediment Evaluation Framework for the Pacific Northwest* (SEF)[1], this suitability memorandum (SDM) documents the consensus of the PSET agencies regarding the suitability of the dredged material for unconfined, aquatic placement. The PSET reviewed the Corps' 21 April 2017 "Sediment Quality Evaluation Report: Lower Columbia River Federal Navigation Channel (River Miles 3 to 106.5)" (SQER), prepared by Corps' Sediment Quality Team (SQT)[2]. Sediment physical testing results are summarized in the SQER; the analytical results were compared to the physical screening levels published in the 2016 SEF.

Suitability Summary:

Surface Sediments:	☑ Suitable	☐ Unsuitable
Post-Dredge Surface (PDS):	☑ Suitable	☐ Unsuitable

Reviewers: The PSET agencies include the Corps, U.S. Environmental Protection Agency – Region 10 (EPA), National Marine Fisheries Service (NMFS), U.S. Fish and Wildlife (USFWS), Washington Department of Ecology (Ecology), and Oregon Department of Environmental Quality (ODEQ). Table 1 lists the PSET's review timeline for this project. Reviewers included:

☑ James Holm (Corps, Lead)	☑ Bridgette Lohrman (EPA, Co-Lead)	
☑ James McMillan (Corps)	☑ Pete Anderson (ODEQ)	☑ Laura Inouye (Ecology)
☑ Tom Hausmann (NMFS)	☐ Jeremy Buck (USFWS)	

Table 1. PSET Review Timeline

Sampling and analysis plan (SAP) received	9 March 2016
SAP consistency determination	9 March 2016[3]
Sampling date(s)	22-31 March 2016
SQER received by PSET	24 April 2017
Suitability determination memorandum issued	5 July 2017
Management area ranking	Very Low (deep-draft federal navigation channel)
Recency of data*	10 years from sampling date (expires March 2026)

* If site conditions or the proposed project change, or if new information related contaminants of concerns are discovered, additional project coordination with PSET may be required to determine the validity of this SDM.

Project Description: Table 2 summarizes the O&M dredging program details for the LCR FNC project. Dredging is needed to provide reliable commercial and recreational navigation.

Table 2. Project Details

Waterbody / river miles (RMs)	Columbia River / +3.0 to +106.5
Dredged volume	~6.7 million cubic yards annually
Deep-draft channel dimensions	600 ft. wide + 100 ft. over-dredge width, 103 miles long
Max. proposed dredging depth	-48 ft. (43 ft. + 5 ft. advanced maintenance depth, MLLW/CRD)
Dredging method	Pipeline, Hopper Dredge
Dredged material transport	Pipeline, Hopper Dredge
Placement locations	Ocean, in-river, shoreline, upland
Dredging dates	Typically April through October

Sampling and Analysis Description: The Corps' sampling and analytical program for the LCR FNC is summarized in Table 3. Dredge prism surface grab (power grab sampler) samples were collected from 22 through 31 March 2016. Sample station locations are shown in Figures 2 through 6 of the SQER.

Table 3. LCR FNC Sampling and Analysis Description

Sampling Description		
Sample collection methods		Power grab sampler
Dredged material management unit (DMMU)		N/A
Averaged DMMU volume (cy)		On average, each sample represents ~114,000 cy
Subsamples (SS)/DMMU		
DP	Depth range (ft. MLLW/CRD)	-22.6 to -74.5
	Composite (Y/N)	N
	SS archive (Y/N) Composite archive (Y/N)	N N
PDS	Not Proposed	--
Sediment Physical and Chemical Analysis (no. analyses/decision unit)		
Decision unit (DMMU ID)		59 discrete stations
Station ID(s)		CR-2 to CR-299
ASTM Dredge Analyses		--
Grain size		1
Bulk Density		1
Total volatile solids		--
Total organic carbon		1
Sulfides		--

Metals		--

Semi volatile organic compounds (polynuclear aromatic hydrocarbons, chlorinated hydrocarbons, phthalates, phenols, misc. extractables)	--
Pesticides	--
Polychlorinated biphenyls (Aroclors)	--
Butyltins	--
Total petroleum hydrocarbons	--
Dioxins/furans	--
Biological Testing Description	
Bioassays planned (Y/N)	N

Deviations from the SAP: Five (5) deviations from the PSET-approved SAP occurred.

1. The Corps simplified the sample ID by removing the date of collection from the sample ID and relied on the station ID because each station was discretely analyzed.
2. No fine-grained sediments were visually observed in the FNC grab samples. Therefore, no chemical analyses were necessary.
3. The Corps sampled 59 stations within the LCR FNC, 4 more than proposed in the PSET-approved SAP.
4. To achieve cost efficiencies, the Corps proposed the LCR FNC survey in conjunction with a larger regional sediment management survey. This combined survey effort and unpredictable shoaling resulted in only 44% (26) of samples representing dredge prism material and 56% (33) of the stations were below the advanced maintenance depth of – 48 feet. For 6.7 MCY of dredging, a minimum of 22 stations are needed in very low ranked project (300,000 CY per DMMU) per the 2016 SEF. The 26 samples the Corps collected within the dredge prism meets the sampling density for a very low ranked project.
5. Even though approximately half of the stations were below maintenance depth (-48', AMD included), the majority of dredged material in the FNC consists of coarse-grained bedload material instead of fine-grained suspended sediment load. Bedload material typically form the sand waves that shoal (each typically less than 50,000 CY) within the FNC and trigger localized dredging. Sand waves move downstream as bedload sediment erodes from the upstream face, deposits in the downstream trough and is then buried by additional material eroded from the upstream face. This movement occurs in a layer only a few sand grains thick. Through this mechanism, all the individual grains in a sand wave are exposed to flow, eroded, transported, deposited, buried, and then eventually exposed again as the sand wave migrates downstream. The height of sand waves is dependent on higher river flows (spring freshets) that shapes the bedload material into taller sand waves. The suspended sediment load stays suspended by high flows and does not interact with the bedload materials that form sand waves. Therefore, even the bedload sediments sampled below -48' have the potential to form sandwave shoals that require dredging and are represented of dredged materials in LCR FNC.

Results and Discussion: Analytical results for the Corps' sampling event are summarized in Table 4. The analytical results from the SQER were compared to the 2016 SEF SLs.

Table 4. LCR FNC Sediment Analytical Summary

Sediment Physical Results	
DMMU ID and Sample ID(s):	59 discrete sampling stations
Sample type (dredge prism, adv. main. depth)	dredge prism + advanced maintenance depth*
Grain size, minimum % gravel and sand / maximum % silt and clay	>97 / 2.6
Bulk density, range (g/cm^3)	1.27 to 2.15
Total organic carbon, range (%)	0.1 to 0.29
* 33 of the 59 stations (56%) were sampled below the maximum depth of -48' due the location of the regional sediment management transects every ~two river miles. This broader survey effort dictated where LCR FNC stations were placed.	

There have been no substantive changes in the complex hydrologic (riverine, tidal) regimes of the lower Columbia River, hydropower operations within the Columbia River Basin, or the LCR federal navigation channel since the completion of the Columbia River Channel Improvement Project that deepened the LCR FNC to -43+5 feet in 2010. The grain size, bulk density, and total organic carbon results from the March 2016 sampling event are representative of the bedload sediments within the LCR FNC regardless of the sampling surface elevation relative to the project depth. The 2016 physical results confirm the LCR FNC sediments are very similar to previous testing results (2008).

Dredge Prism: The LCR deep-draft FNC is assigned a "very low" rank because the project is dominated by coarse sands, low total organic carbon content (<0.5%), and strong river and tidal currents. Per the Section 3.5.3 of the 2016 SEF, chemical testing is not required. Therefore, the LCR deep-draft FNC dredge prism material is suitable for unconfined, aquatic placement per the SEF guidance through March 2026.

Post-Dredge Surface: The dredge prism materials were determined to be suitable and the LCR deep-draft FNC is assigned a "very low" rank. As such, the PSET assumes that the LCR deep-draft FNC post-dredge surface is suitable for unconfined, aquatic exposure per the SEF guidance through March 2026.

Subject: [Non-DoD Source] PSET - LCR FNC Transfer Sites - suitability
Attachments: 20220707 LCR DM Transfer Sites Lvl 1_Plates.pdf

Hello Jessica,

This email correspondence constitutes the Portland Sediment Evaluation Team's (PSET's) determination regarding the June 2022 No Test request for the U.S. Army Corps of Engineers – Portland District (Corps) transfer sites for the Lower Columbia River (LCR) deep-draft federal navigation channel (FNC). The LCR FNC is located in the Columbia River from river mile (RM 3 to 106.5) along the boundary between the states of Oregon and Washington. This determination was made in accordance with the May 2018 Sediment Evaluation Framework for the Pacific Northwest (SEF) and after reviewing the Corps 28 June 2022 "MEMORANDUM FOR THE RECORD – Re: SEF Level 1 No-Test Request for the Lower Columbia River Federal Navigation Project – In-Water Dredged Material Transfer Sites" (Level 1 memo), prepared by the Corps' Sediment Quality Team. The scope of the PSET's sediment evaluation includes placement of previously determined suitable LCR FNC dredged material in the aquatic transfer sites and the subsequent dredging for shoreline or upland placement, including minimal over-dredging of the transfer sites when removing LCR FNC sediments. This email documents the PSET's decision to not require sediment testing per Subpart G of the Clean Water Act section 404(b)(1) guidelines (see 40 CFR 230.60-230.61).

PROJECT DESCRIPTION: The Corps dredges 6 to 8 million cubic yards of sand from the LCR FNC each year. The eight LCR FNC transfer sites are in-water holding areas for temporary storage of suitable dredged materials. The Corps proposes to modify one existing site and add seven new sites. Transfer sites are necessary when shoaling forms beyond the reach of the pipeline DREDGE Oregon that is used to place sediments along shorelines or in upland sites. Dredged materials would typically be placed by a hopper dredge. Transfer sites are located in water deeper than 20 feet and in locations which have been previously used by the Corps for placement of dredged material. The Corps anticipates placing and removing the material into/from these eight sites annually.

SOURCES OF CONTAMINATION: In 2017, the PSET evaluated potential sources of contamination for the LCR FNC sediments and issued a suitability determination memo (SDM) stating the dredged materials are suitable for unconfined aquatic placement without chemical testing. The PSET confirmed a "very low" management area ranking for these sediments.

Once the material is within the transfer sites, the potential for contamination is very low given the 8 sites are subject to high river flows which transport large bed loads of material. Based on the Corps' LCR FNC sediment sampling in 2017, an analysis of stations in close proximity to the transfer sites indicates that any material that may be transported into the transfer sites by the riverine processes is predominately sand and gravel (>95%) with less than 5% fines. Thus, the potential for the sediments to be carriers of contamination is very low. Also, the 8 transfer sites are not in close proximity to known land-based sources of contamination that could cause contamination while the sediments are "stored" at the transfer sites.

MANAGEMENT AREA RANK: The PSET assigns a "very low" management area ranking to these 8 transfer sites due to the previous review of the LCR FNC, and no reason to believe that the project sediments have chemicals of concerns at concentrations above SEF SLs.

REGULATORY REQUIREMENTS FOR SEDIMENT EVALUATION: In accordance with the CWA section 404(b)(1) guidelines (40 CFR 230.60), when provided information indicates the material is sufficiently removed from sources of contamination, with reasonable assurances that the dredged material is not a carrier of contaminants, then testing is unnecessary. Project sediments are most likely not a carrier of contaminants because they are composed primarily of sand, gravel, or other naturally occurring inert material and if dredged materials are found in areas of high current or wave energy. Less than 5% of the material is fine-grained sediment.

NO TEST DETERMINATION: Based on the information provided, the PSET has determined that the transfer sites project areas do not require additional sediment physical or chemical evaluation per the CWA section 404(b)(1) guidelines. If the project changes or if additional information is available, then this "no test" determination must be re-evaluated, and sediment testing may be required. The PSET has assigned a "very low" site management area ranking to this project with this analysis being valid until March 2026, which aligns with the recency of the data collected by the Corps for the LCR FNC in 2016. If there are project changes or new information regarding sources of contamination are available, PSET would re-evaluate the suitability determination.

REVIEWING PSET AGENCIES: U.S. Army Corps of Engineers, U.S. Environmental Protection Agency, Oregon Department of Environmental Quality, Washington Department of Ecology, U.S. Fish and Wildlife Service, National Marine Fisheries Service.

CONTACT: If you have questions regarding this PSET determination, please email or call me.

Take care,
-Bridgette

EPA-Region 10 Water Division, Wetlands and Oceans Section 08 May 2023

Memorandum for: U.S. Army Corps of Engineers – Portland District, Operations Division, Channels and Harbors, Waterways Maintenance Section (CENWP-ODN-W, Stokke), Oregon Slough Downstream Deep Draft Federal Navigation Channel (entrance to mile 1.5) in Portland, Multnomah County, Oregon.

Subject: Portland Sediment Evaluation Team (PSET) Level 2A dredged material suitability determination for the U.S. Army Corps of Engineers - Portland District's (USACE) operations and maintenance (O&M) dredging for the Oregon Slough Downstream (OSD) Deep Draft Federal Navigation Channel (FNC) in the Columbia River at river mile (RM) 102 to 104 (project mile entrance to 1.5).

Introduction: Per the May 2018 *Sediment Evaluation Framework for the Pacific Northwest* (SEF)[1], this suitability memorandum (SDM) documents the consensus of the PSET agencies regarding the suitability of the OSD deep draft FNC dredged material for unconfined, aquatic disposal and suitability of the post-dredge surface for unconfined, aquatic exposure. The PSET reviewed the April 2023 "*Sediment Characterization: Oregon Slough Downstream Deep-Draft Draft Channel, Columbia River Mile 102.5, Multnomah County, Oregon*" (SQER)[2] prepared by ANAMAR for the USACE's Sediment Quality Team (SQT). Sediment chemical testing results are summarized in the SQER; chemical analytical results were compared to the freshwater benthic toxicity screening levels (SEF SLs) published in the 2018 SEF. The PSET also used Oregon DEQ's sediment screening level value (SLV) for freshwater fish to evaluate PCBs[3].

Suitability Summary:

Dredge Prism (DP) Sediments:	☒Suitable	☐Unsuitable
Post-Dredge Surface (PDS):	☒Suitable	☐Unsuitable

Project Description: Table 2 provides a summary of the dredging project details for the OSD deep draft FNC. Maintenance dredging is needed to provide navigation access.

Table 2. Project Details

Waterbody/river mile (RM)	Columbia River, 102 to 104
Total proposed dredging volume (cy)	~100,000 to 250,000
Max. proposed dredging depth (includes overdepth allowance)	-48 feet CRD (43+5 ft overdredge)
Dredging area (acres, approx.)	~125
Dredge dimensions	Triangular turning basin: ~1,000 ft. wide by 3,000 ft long; Deep draft channel: 400 ft wide by 1.5 miles
Dredging method	Pipeline, clamshell or hopper dredge
Dredged material transport	Barge, hopper
Proposed disposal location(s)	Columbia River flowlane
Proposed dredging date(s)	August 1 through December 15
Dredged material mgmt. units (DMMUs)	3

Sampling and Analysis Description: The USACE sampling and analytical program for the OSD deep draft FNC is summarized in Table 3. Actual grab sample station locations are shown in SQER Table 1 and Map 1 (SDM Figure 1).

Deviations from the SAP: One lab deviation from the PSET-approved SAP was identified in SQER Section 4.3.5, regarding the SVOCs.

In all three composite samples, bis(2-ethylhexyl) phthalate was L-qualified (QC recovery was off scale high and the concentration exceeded the linear range) and V-qualified (detected in the sample and blank). Benzoic acid was HP-qualified (the time between prep and analysis was outside the method specified hold time) and V-qualified. Di-n-butyl phthalate and phenol were V-qualified. Therefore, the USACE had frozen archive samples analyzed at ARI for bis(2-ethylhexyl) phthalate and benzoic acid. The ARI results were below SEF SLs for both analytes.

Table 3. Sampling and Analysis Description

Sample collection method		Standard Ponar

Sediment Physical and Chemical Analysis (No. DP samples / No. PDS samples analyzed)				
Grain size		1/-	1/-	1/-
Total organic carbon		1/-	1/-	1/-
Total solids		1/-	1/-	1/-
Ammonia		1/-	1/-	1/-
Total sulfides		1/-	1/-	1/-
Metals, freshwater		1/-	1/-	1/-
PAHs		1/-	1/-	1/-
SVOCs (phthalates, phenols, misc. extractables)		1/-	1/-	1/-
Pesticides		1/-	1/-	1/-
PCBs (Total Aroclors)		1/-	1/-	1/-
Butyltins		1/-	1/-	1/-
TPH (diesel [dx], residual [rx] range)		1/-	1/-	1/-
Dioxin/Furans		-/-	-/-	-/-
Biological Analysis (No. DP samples / No. PDS samples analyzed)				
Freshwater Bioassays		-/-	-/-	-/-

Results and Discussion: Analytical results for the USACE sampling event are summarized in Table 4. The chemical analytical results were compared to the 2018 SEF freshwater SLs and to ODEQ's fish based freshwater SLV (22 ug/kg) to evaluate PCBs (total Aroclors). There were no exceedances of ODEQ's fish-based, freshwater bioaccumulative SLV (22 ug/kg) for total PCB Aroclors because all samples were between 5.75 and 8.81 ug/kg.

All analytes were detected below SEF freshwater SLs or were non-detections (U) with method reporting limits (MRLs) below SLs. The composite samples consisted of 73 to 82% sand and 18 to 27% fines with trace gravel (<0.4%). The total organic carbon (TOC) ranged from 0.62 to 1.27%. Total solids ranged from 60.7 to 63.8%.

Site Ranking: Based on the results, the PSET confirms a "low" rank to the Oregon Slough Downstream deep draft sediments.

PSET Suitability Determination:
Dredge Prism – Chemical concentrations in OSD dredge prisms are below the SEF freshwater SLs and ODEQ SLV as discussed above. As such, the **OSD deep draft FNC dredged prism material** is **suitable for unconfined, aquatic disposal** per the 2018 SEF guidance without additional testing.

Post-Dredge Surface – Based on a "Low" rank and multiple rounds of suitable sediments, the post-dredge surfaces are expected to be of similar quality to the dredge prisms. As such, the **OSD deep draft FNC post-dredge surfaces** are **suitable for unconfined, aquatic exposure** per the 2018 SEF guidance without additional testing.

Contact: This memorandum was prepared by Bridgette Lohrman (PSET co-lead) and James Holm (PSET Lead, USACE) and reviewed by the participating PSET agencies, identified above. Questions regarding this memorandum should be directed to Bridgette Lohrman at (503) 326-4006 or e-mail to: lohrman.bridgette@epa.gov.

Table 4. Project Sediment Analytical Summary – Dredge Prism (sampled November 2022)

Sediment Physical and Chemical Results				
Composite Sample ID: Parameter	1122-OSDS-1-COMP	1122-OSDS-2-COMP	1122-OSDS-3-COMP	SEF SL1, freshwater (SLV†)

EPA-Region 10 Water Division, Wetlands and Oceans Section 17 April 2019

Memorandum for: U.S. Army Corps of Engineers – Portland District, Operations Division, Channels and Harbors, Waterways Maintenance Section (CENWP-ODN-W, Stokke), Vancouver to The Dalles Federal Navigation Channel

Subject: Portland Sediment Evaluation Team (PSET) Level 2A dredged material suitability determination for the U.S. Army Corps of Engineers - Portland District's (Corps) operations and maintenance (O&M) dredging for the Vancouver to The Dalles Federal Navigation Channel (VTD FNC) in the Columbia River from river mile (RM) 106 to 192.5.

Introduction: Per the *Sediment Evaluation Framework for the Pacific Northwest* (SEF)[1], this suitability memorandum (SDM) documents the consensus of the PSET agencies regarding the suitability of the dredged material for unconfined, aquatic disposal. The PSET reviewed the Corps' 20 March 2019 "Sediment Quality Evaluation Report: Vancouver to The Dalles Federal Navigation Channel" (SQER)[2], prepared by Corps' Sediment Quality Team (SQT). Sediment testing consisted of physical analysis of sediments to confirm very low rank. If the sediment testing did not confirm a "very low rank", additional testing would be pursued.

Suitability Summary:

Surface Sediments:	☒Suitable	☐Unsuitable
Post-Dredge Surface (PDS):	☒Suitable	☐Unsuitable

Reviewers: The PSET agencies include the Corps, U.S. Environmental Protection Agency – Region 10 (EPA), National Marine Fisheries Service (NMFS), U.S. Fish and Wildlife (USFWS), Washington Department of Ecology (Ecology), and Oregon Department of Environmental Quality (ODEQ). Table 1 lists the PSET's review timeline for this project. Reviewers included:

Project Description: Table 2 summarizes the O&M dredging program details for the VTD FNC project. Dredging is needed to provide reliable commercial and recreational navigation.

Table 2. Project Details

Waterbody / river miles (RMs)	Columbia River (106-192.5)
Dredged volume (cy)	~406,960 (2019 volume for RM 106-136; dredged annually)
Channel dimensions	300 ft wide by 84.5 miles long
Dredge area	~1,090 acres
Max. proposed dredging depth + advanced maintenance depth	-27 ft Columbia River Datum (CRD) (authorized); Maintained to -19 ft CRD (-17+2)
Dredging method	Hopper dredge
Dredged material transport	Hopper dredge
Disposal locations	In-water placement in off-channel areas
Dredging dates	Typically June through December
Dredged material management units (DMMUs): No. of stations	DMMU 1: 4 grabs, 1 composite sample DMMU 2: 5 grabs, 1 composite sample DMMU 3: 2 grabs, 1 composite sample

Sampling and Analysis Description: The Corps' sampling and analytical program for the VTD FNC is summarized in Table 3. Actual sample station locations are shown in SQER Table 3 and Figures 2, 3, and 4.

Table 3. Project Sampling and Analysis Description

Sampling Description				
Sample collection methods		Double van Veen grab sampler		
DMMU ID		VTD-01	VTD-02	VTD-03
Proposed DMMU volume (cy)		~122,467	~258,049	~26,444
Subsamples per DMMU		4	5	2
Dredge Prism	Depth range (ft. CRD)	-5.8 to -21.7	-13.4 to -20.5	-13.8 to -18.7
	Composite (Y/N)	Y	Y	Y
	SS archive (Y/N)	N	N	N
	Composite archive (Y/N)	N	N	N
PDS		Not proposed		
Sediment Analytical Parameters (No. Analyses by DMMU)				
Grain Size		1 (triplicate analysis)	1	1
Total Solids		1	1	1
Total Organic Carbon		1	1	1

Deviations from the SAP: There were two minor deviations from the sampling and analysis plan. These minor deviations do not affect the sediment suitability.

- Samples were collected using a double van Veen grab sampler provided by the contractor instead of the Grey-O'hara box corer.
- Five of the 11 stations were deeper than the proposed dredge prism (-19 ft. CRD) as listed in SQER Table 3; however, at least two samples in each DMMU are representative of the dredge prism. Surficial sediments within the VTD FNC are consistently dominated by coarse-grain particles.

Results and Discussion: Analytical results for the Corps' sampling event are summarized in Table 4. Sediment testing consisted of physical analysis of sediments to confirm a very low rank (minimum 80% sand, less than 0.5% total organic carbon (TOC)). As expected, the sampling results confirmed a "very low rank", therefore, analytical chemistry testing was not triggered.

Table 4. Sediment Analytical Summary

Sediment Physical and Conventional Results – Dredge Prism			
Sample ID:	011019VTD-COMP01	011019VTD-COMP02	011019VTD-COMP03

Total Organic Carbon (%)	0.04	0.16	0.03
Total Solids (%)	85.3 85.4 76.7	73.2	74.2
Gravel (%)	17.7 17.4 20.8	0.1	0.2
Sand (%)	81.2 81.2 76.7	98.0	99.6
Fines (%), silt + clays	1.1 1.4 2.5	1.9	0.1

PSET Suitability Determination:

Dredge Prism

The VTD FNC maintains a “very low” management area rank because the project sediments are still dominated by coarse sands and gravels (>98%) with low total organic carbon content (<0.2%) in strong river and tidal currents. The **VTD FNC dredge prism material** is **suitable** for **unconfined, aquatic disposal** without further testing per the 2018 SEF guidance.

Post-Dredge Surface

Based on a “very low” management area rank and confirmed coarse grain size with low total organic carbon for the dredge prism, chemical testing of the post-dredge surface sediments is not required. The **VTD FNC post-dredge surface** is **suitable** for **unconfined, aquatic exposure** without further testing per the 2018 SEF guidance.

Contact: This memorandum was prepared by Bridgette Lohrman (EPA, PSET Co-Lead), James Holm (USACE, PSET Lead) and reviewed by the participating PSET agencies, identified above. Questions regarding this memorandum should be directed to Bridgette Lohrman at (503) 326-4006 or e-mail to: lohrman.bridgette@epa.gov.

EPA-Region 10 Water Division, Wetlands and Oceans Section 17 March 2021

Memorandum for: U.S. Army Corps of Engineers – Portland District, Operations Division, Channels and Harbors, Waterways Maintenance Section (CENWP-ODN-W, Groth), Skipanon River Federal Navigation Channel (Mile 0.0 to 2.0), near Warrenton, Clatsop County, Oregon.

Subject: Portland Sediment Evaluation Team (PSET) Level 2A dredged material suitability determination for the U.S. Army Corps of Engineers - Portland District's (Corps) operations and maintenance (O&M) dredging for the Skipanon River (SKIP) Federal Navigation Channel (FNC) at river mile (RM) 10.7 of the Columbia River.

Introduction: Per the May 2018 *Sediment Evaluation Framework for the Pacific Northwest* (SEF)[1], this suitability memorandum (SDM) documents the consensus of the PSET agencies regarding the suitability of the SKIP FNC dredged material for unconfined, aquatic disposal and suitability of the post-dredge surface for unconfined, aquatic exposure. The PSET reviewed the February 2021 "*Sediment Characterization: Skipanon Channel Federal Navigation Project, Skipanon River Miles 0.0 to 2.0, Clatsop County, Oregon*" (SQER)[2], prepared by ANAMAR for the Corps' Sediment Quality Team (SQT). Sediment chemical testing results are summarized in the SQER; chemical analytical results were compared to the marine benthic toxicity screening levels (SEF SLs) published in the 2018 SEF. The PSET also used Oregon DEQ's sediment screening level value (SLV) for marine fish to evaluate PCBs[3].

Suitability Summary:
Dredge Prism (DP) Sediments:
☒Suitable ☐Unsuitable
Post-Dredge Surface (PDS):
☒Suitable ☒Unsuitable (DMMU SKIP-04-Z, -17 to -19 ft MLLW)

Reviewers: The PSET agencies include the Corps, U.S. Environmental Protection Agency – Region 10 (EPA), National Marine Fisheries Service (NMFS), U.S. Fish and Wildlife (USFWS), Washington Department of Ecology (Ecology), and Oregon Department of Environmental Quality (ODEQ). Table 1 lists the PSET's review timeline for this project. Reviewers included:

☒ James Holm (Corps, Lead) ☒ Bridgette Lohrman (EPA, Co-Lead)
☒ Pete Anderson (ODEQ) ☒ Laura Inouye (Ecology) ☒ Dominic Yballe (Corps)
☒ Tom Hausmann (NMFS) ☒ Jeremy Buck (USFWS)

Published May 2018, by the U.S. Army Corps of Engineers, Northwestern Division, 183 pp with Appendices.
[2] U.S. Army Corps of Engineers – Portland District. 2021. *Sediment Characterization: Skipanon Channel Federal Navigation Project, Skipanon River Miles 0.0 to 2.0, Clatsop County, Oregon*. Prepared by ANAMAR, February 2021. 23 pp with Maps, Tables, and Appendices.
[3] Oregon Department of Environmental Quality. 2007. *Guidance for Assessing Bioaccumulative Chemicals of Concern in Sediment*. Updated April 3, 2007 by ODEQ Environmental Cleanup Program, 18 pp with Appendices.

PSET/SEF Conditions:

☒ Data Recency Expiration:

- Based on a "**Moderate**" rank, the data recency for **DMMUs 2, 3, 4, and 5** in the **Skipanon FNC** expires in **September 2025**.
- Based on a "**Low**" rank, the data recency for **DMMUs 1 and 6789** in the **Skipanon FNC** expires in **September 2027**.

☒ **Biological testing** per the 2018 SEF is required for the **post-dredge surface in DMMU 4** to assess the suitability of these sediments for unconfined, aquatic exposure. If biological testing is not performed or if biological tests fail, then the following is required:

- **Upland disposal** of post-dredge surface sediments (-17 to -19 feet MLLW) from **DMMU 4** with full characterization of underlying sediments and/or placement of 12 inches of sand; or
- **Post-dredge surface management** in **DMMU 4** in coordination with PSET. Post-dredge surface management may include one or more of the following:
  - Under dredging to -15 feet MLLW or shallower;
  - Post-dredge sampling for pesticides;
  - Placement of 12 inches of sand; and/or
  - Monitored natural recovery.

Project Description: Table 2 provides a summary of the dredging project details for the SKIP FNC. Maintenance dredging is needed to provide reliable navigation access.

Table 2. Project Details

Waterbody/river mile (RM)	Skipanon River / 0.0 to 2.0 (Enters the Columbia River at RM 10.7)
Total proposed dredging volume (cy)	~160,000 (range: 65,000 to 355,000)
Max. proposed dredging depth (includes overdepth allowance)	-17 feet MLLW (-16 + 1 ft)
Dredge dimensions	Channel: 2.0 miles long by 200 feet wide with a turning basin from RM 1.5 to 1.8 that is 220 to 480 feet wide
Dredging method	Pipeline, clamshell, or hopper
Dredged material transport	Barge, hopper, or pipeline
Proposed disposal location(s)	Columbia River flowlane
Proposed dredging date(s)	Typically August through December
Dredged material mgmt. units (DMMUs) / stations	6 / 2 per DMMU

Sampling and Analysis Description: The Corps' sampling and analytical program for the SKIP FNC is summarized in Table 3. Actual sample station locations are shown in the SQER Table 1 and Map 1 (SDM Figure 1) with full delineation of all DMMUs in Figures 3 and 4 of SAP.

Deviations from the SAP: Deviations from the PSET-approved SAP are listed in SQER section 3.1 and noted in SQER Tables 1 (core summary). Deviations included the following:

1. Core station VC-04 for DMMU SKIP-02 was relocated to avoid rocks (potentially rip rap) that caused shallow refusal. The Corps was only able to penetrate to -18 feet MLLW, one foot short of the full Z-layer interval (-17 to -19 ft MLLW).
2. Seven cores (VC-06 to VC-12) were over-penetrated by 1 to 4 feet to improve retention of the soft silty surface layer and minimize sample loss from the bottom of the core sampler. Consolidated sediments at depth prevented sample loss. The over-penetrated section of the core was discarded after completing the linear core compaction correction. See SQER section 2.2.2 (Vibracore Sampling Methods) and SQER Exhibit 2-3.
3. Low percent core recovery (<75%) occurred on multiple core attempts at core stations VC-02, VC-04, VC-05, VC-06, VC-07, VC-08, VC-09, VC-11, and VC-12 as shown in SQER Table 1. The field team processed the core with highest recovery.

Results and Discussion: Dredge prism analytical results for the Corps' sampling event are summarized in Table 4. Post-dredge surface analytical results for the Corps' sampling event are summarized in Table 5. The chemical analytical results from the SQER were compared to the 2018 SEF marine SLs and to ODEQ's SLV for marine fish (47 ug/kg) to evaluate PCBs.

The dredge prism sediments are predominantly silt (77-86%) with some clay (12-20%) and minor amounts of sand and gravels (<3%). Total organic carbon (TOC) in the dredge prism sediments ranged from 2.14 to 2.79%. Total solids in the dredge prism sediments ranged from 35 to 42%.

In all dredge prism composite samples, no parameters had detections, estimated concentrations (J) or non-detections (U) with elevated detections or reporting limits above SEF marine SLs or the ODEQ SLV for PCB Aroclors.

The post-dredge surface sediments are predominantly silt (56-79%) with clay (15-42%) and lesser amounts of sand and gravels (2 to 29%). Total organic carbon (TOC) in the post-dredge surface sediments ranged from 1.66 to 3.13%. Total solids in the dredge prism sediments ranged from 44 to 52%.

In the post-dredge surface composite sample for DMMU 4 (SKIP-04-COMP-Z), 4,4'-DDD was detected at a concentration of 48.2 ug/kg which exceeds the SEF marine SL of 16 ug/kg. In the 2014 dredged material evaluation, 4,4'-DDD was also detected at a concentration of 19 ug/kg in the post-dredge surface layer of DMMU 4. Based on the continued presence of elevated DDD concentrations, the post-dredge surface is not suitable for unconfined aquatic exposure without further testing. If testing is not conducted or fails, management of the post-dredge surface in DMMU 4 is required. The Corps may choose upland disposal of the post-dredge surface sediments and conduct post-dredge sampling for pesticides to inform placement of a 12-inch sand layer. The Corps shall prepare a dredging and disposal quality control plan for the project and coordinate with PSET for implementation prior to dredging DMMU 4.

N-nitrosodiphenylamine was detected in 3 PDS samples (1Z, 3Z, and 4Z). However, the concentration only minimally exceeded the SEF marine SL (28 ug/kg) in the 1Z (29 ug/kg) and 4Z (30 ug/kg) samples. The sample 3Z concentration of 17 ug/kg is below the SEF SL. To confirm the concentration in the post-dredge surface of DMMU 1, the Corps re-analyzed the initial composite sample twice and an archived jar of the composite sample. All three re-analyses were non-detections for n-nitrosodiphenylamine with a sufficiently low MRL (5.0 ug/kg) below the SEF SL. There is "no reason to believe" that n-nitrosodiphenylamine is present in the post-dredge surface sediments in DMMU 1 at concentrations exceeding the SEF SL.

No other parameters had detections, estimated concentrations (J) or non-detections (U) with elevated detections limits above SEF marine SLs or ODEQ SLV for PCB Aroclors.

PSET Suitability Determination:
Dredge Prism – Chemical concentrations in all dredge prism samples were below the SEF marine SLs and ODEQ SLV as discussed above. As such, the **Skipanon FNC dredged prism**

material is **suitable for unconfined, aquatic disposal** per the 2018 SEF guidance without additional testing.

Post-Dredge Surface – Chemical concentrations in five of the six post-dredge surface samples were below the SEF marine SLs and ODEQ SLV as discussed above. As such, the **Skipanon FNC post-dredge surfaces**, **excluding DMMU 4**, are **suitable for unconfined, aquatic exposure** per the 2018 SEF guidance without additional testing.

The post-dredge surface (-17 to -19 ft MLLW) in DMMU 4 has elevated n-nitrosodiphenylamine and 4,4'-DDD above SEF marine SLs. Therefore, the **DMMU 4 post-dredge surface** is **not suitable** for **unconfined, aquatic exposure** without biological testing per the 2018 SEF. If additional testing is not completed or fails, management of the post-dredge surface is required in coordination with the PSET.

Contact: This memorandum was prepared by Bridgette Lohrman (PSET co-lead) and James Holm (PSET Lead, Corps) and reviewed by the participating PSET agencies, identified above. Questions regarding this memorandum should be directed to Bridgette Lohrman at (503) 326-4006 or e-mail to: lohrman.bridgette@epa.gov.

EPA-Region 10 Water Division, Wetlands and Oceans Section 11 January 2021

Memorandum for: U.S. Army Corps of Engineers – Portland District, Operations Division, Channels and Harbors, Waterways Maintenance Section (CENWP-ODN-W, Stokke), Cathlamet Bay (Tongue Point) Federal Navigation Channel (Station 0+00 to 1+24), near Astoria, Clatsop County, Oregon.

Subject: Portland Sediment Evaluation Team (PSET) Level 2B dredged material suitability determination for the U.S. Army Corps of Engineers - Portland District's (Corps) operations and maintenance (O&M) dredging for the Cathlamet Bay (CBY) Federal Navigation Channel (FNC) in the Columbia River at river mile (RM) 18.5.

Introduction: Per the May 2018 *Sediment Evaluation Framework for the Pacific Northwest* (SEF)[1], this Level 2B suitability determination memorandum (SDM) documents the consensus of the PSET agencies regarding the suitability of the CBY FNC dredged material from DMMUs CBY-54-B and CBY-67-A for unconfined, aquatic disposal. The PSET reviewed the December 2020 "*Sediment Characterization and Bioassays of Cathlamet Bay Federal Side Channel (Tongue Point), Lower Columbia River, Clatsop County, Oregon*" (2B SQER)[2], prepared by ANAMAR for the Corps' Sediment Quality Team (SQT). Sediment chemical and bioassay testing results are summarized in the 2B SQER; chemical analytical results were compared to the marine benthic toxicity screening levels (SLs) published in the 2018 SEF; bioassay results were compared to the SEF interpretive criteria for dispersive sites (SEF Table 7-1). The PSET also used Oregon DEQ's sediment screening level value (SLV) for marine fish to evaluate PCBs[3].

Suitability Summary:

Dredge Prism (DP) Sediments:

☒ Suitable (DMMUs CBY 54-B and 67-A)

☐ Unsuitable

Post-Dredge Surface (PDS):

Previously determined suitable.

Reviewers: The PSET agencies include the Corps, U.S. Environmental Protection Agency – Region 10 (EPA), National Marine Fisheries Service (NMFS), U.S. Fish and Wildlife (USFWS), Washington Department of Ecology (Ecology), and Oregon Department of Environmental Quality (ODEQ). Table 1 lists the PSET's review timeline for this project. Reviewers included:

Project Description: Table 2 provides a summary of the Corps' dredging project details for the CBY FNC. Maintenance dredging is needed to provide navigation access. The CBY turning basin (Station 1+24 to 1+40) will not be dredged, was not characterized in the Level 2A or 2B SQER and is not evaluated in this 2B SDM.

Table 2. Project Details – CBY FNC

Waterbody/river mile (RM)	Columbia River, 18.5
Total proposed dredging volume (cy)	~585,000 (Shoal A = ~80,000, Shoal B = ~465,000, Shoal B side slopes = ~40,000)
Max. proposed dredging depth (includes overdepth allowance)	-36 feet MLLW (34 + 2 ft overdredge)
Dredging area (acres, approx.)	~120
Dredge dimensions	~2,200 ft. wide narrowing to 350 ft. wide for ~3,000 ft., then 350 ft. wide for 1 mi. (turning basin excluded)
Dredging method	Pipeline, clamshell or hopper dredge
Dredged material transport	Barge, hopper, or pipeline
Proposed disposal location(s)	Columbia River flowlane
Proposed dredging date(s)	Typically August through December
Dredged material mgmt. units (DMMUs)	Level 2A: 94 + 16 side slope stations Level 2B: 2 (CBY-54-B, CBY-67-A)

Sampling and Analysis Description: The Corps' Level 2B sampling and analytical program for DMMUs CBY-54-B and CBY-67-A and the reference site sediments are summarized in Table 3. Actual sample station locations are shown in the 2B SQER Table 1 and Map 1 (Level 2B SDM Figure 1).

Deviations from the SSAP: One deviation from the PSET-approved SSAP was necessary. The reference site was relocated from outside the Chinook Channel breakwater to within the breakwater to collect reference sediments with grain size similar to the Cathlamet Bay FNC test sediments.

Bioassays, marine		3/--	3/--	3/--

Results and Discussion: Analytical results for the Corps' Level 2B sampling event are summarized in Table 4. The chemical analytical results were compared to the 2018 SEF marine SLs and to ODEQ's SLV for marine fish to evaluate PCBs (47 ug/kg). The marine bioassay results were compared to the 2018 SEF performance standards and interpretive criteria for dispersive disposal sites as shown in Tables 5, 6, 7, and 8.

The initial November 2019 concentrations of diethyl phthalate detected in DMMUs CBY-54-B (254 ug/kg) and CBY-67-A (223 ug/kg) were not replicated in the Level 2B test sediments (19 ug/kg J, 15 ug/kg J). No other parameters had detections, estimated concentrations (J) or non-detections (U) with elevated detections limits above SEF marine SLs or ODEQ SLV for PCBs.

Table 4. DMMUs CBY-54-B and CBY-67-A and Reference Site Analytical Summary

Sediment Physical and Chemical Results

PSET Suitability Determination:
Based on both 1-hit and 2-hit rules for dispersive disposal site criteria, both DMMU CBY-54-B and DMMU CBY-67-A pass all marine bioassay tests. Therefore, **dredged materials** from **DMMUs CBY-54-B** and **CBY-67-A** are **suitable for unconfined, aquatic disposal** per the 2018 SEF.

Contact: This memorandum was prepared by Bridgette Lohrman (PSET co-lead) and James Holm (PSET Lead, Corps) and reviewed by the participating PSET agencies, identified above. Questions regarding this memorandum should be directed to Bridgette Lohrman at (503) 326-4006 or e-mail to: lohrman.bridgette@epa.gov.

CENWP-EC-HR March 5, 2014

Memorandum for: Portland District, Waterways Maintenance, (CENWP-OD-NW, Stokke)

Subject: Portland Sediment Evaluation Team (PSET) Level 2 dredged material suitability determination for maintenance dredging at the Wahkiakum Ferry and Westport Slough side channel projects.

Reviewers: The PSET includes the U.S. Army Corps of Engineers (Corps), Environmental Protection Agency (EPA), National Marine Fisheries Service (NMFS), U.S. Fish and Wildlife (USFWS), Washington Department of Ecology (Ecology), and Oregon Department of Environmental Quality (ODEQ). The reviewers for this project included James McMillan and James Holm (Corps), Laura Inouye (Ecology), Jeff Lockwood (NMFS), Jeremy Buck (USFWS), Pete Anderson (ODEQ), and Jonathan Freedman and Bridgette Lohrman (EPA).

The PSET reviewed the Portland District (District) Sediment Quality Team's February 3, 2014 "Wahkiakum Ferry Channel Realignment – Westport Slough Dredging Project, Sediment Quality Evaluation Report" (SQER). This technical memorandum documents the consensus of the reviewing agencies regarding the suitability of sediments at the Wahkiakum Ferry and Westport Slough side channels for unconfined, aquatic placement. Sediment quality data collected from these side channel projects was evaluated using guidance found in the 2009 *Sediment Evaluation Framework for the Pacific Northwest* (SEF).

Applicable Authorities Governing the Project: Congressional authorization under the Rivers and Harbors Act of 1937; sections 401 and 404 of the Clean Water Act; section 7 of the Endangered Species Act; section 305 of the Magnuson-Stevens Act; et al.

Project Description: The Lower Columbia River (LCR) deep draft navigation channel bisects the Wahkiakum Ferry channel into two side channel projects: the Westport Slough side channel (Oregon) and Wahkiakum Ferry side channel (Washington). These side channel projects are located at Columbia River mile (RM) 43.5. Side channel project figures appear in the SQER.

Wahkiakum Ferry Side Channel. The existing Wahkiakum Ferry side channel project is currently maintained for ferry traffic only, and provides for a channel 9 ft. deep, 200 ft. wide, and 1,900 ft. long, with a 100-ft. over-width on each side of the channel. The Corps performs advanced maintenance dredging on the project to -11 ft. Columbia River Datum (CRD); the project was last dredged in 2010 and the sediment was placed in the Columbia River flow lane. The Corps proposes to widen and realign the Puget Island segment of the ferry channel; the channel centerline would be shifted upstream and the channel will be widened from 200 to 300 ft. and shifted upstream. The downstream channel boundary would shift upstream approximately 70 ft. while the upstream channel boundary would shift upstream approximately 170 ft. The 100-ft. over-width will shift upstream as well. The Wahkiakum Ferry side channel depth would remain the same (-11 ft. CRD). The new area to be dredged is approximately 300 ft. by 400 ft., and the

total volume of sediment to be dredged is estimated between 22,000 and 33,000 cubic yards (CY).

Westport Slough Side Channel. The Westport Slough side channel project was authorized by Congress for a channel 28 ft. deep, 200 ft. wide, and 1,600 ft. long, with a 100-ft. over-width on each side of the channel. A single user may ultimately need the channel maintained to -22 ft. CRD, but funding has not been available for the Corps to maintain the channel to that depth. However, the Corps currently maintains the Westport Slough side channel to -11 ft. CRD for the ferry. The project was last maintained to -11 ft. CRD in 2010 and the sediment was placed in the Columbia River flow lane. The area to be dredged (to -11 ft. CRD) is approximately 200 ft. by 500 ft., and the total volume to be dredged is estimated between 30,000 and 40,000 CY. The estimated volume of sediment to be dredged for the -22 ft. CRD project would be 75,000 to 100,000 CY.

Dredging Methods: Both side channel projects will be dredged with a clamshell dredge.

Dredged Material Transport and Placement: A tug and bottom dumping scow are typically used to transport the dredged material. Dredged material will be placed near the Wahkiakum Ferry channel in the Columbia River flow lane.

Site History and Management Area Ranking: Based on prior sediment characterization, sediment grades from coarse-grained material in the LCR federal navigation channel to fine-grained material in the Westport Slough side channel. The Wahkiakum Ferry side channel is composed of coarse-grained material. There are no known sources of contamination in the project area or immediately upstream of the ferry. Georgia Pacific (formerly James River paper mill) is located at Wauna, Clatsop County, Oregon, approximately 2 miles downstream. Sediments in both side channel projects have been characterized multiple times. Sediment concentrations of metals, semi-volatile organic compounds (SVOCs), pesticides, and polychlorinated biphenyls (PCBs) have never exceeded the SEF freshwater benthic toxicity screening levels (SLs). Based on the previous testing, SVOC analysis was not included in the CoC list for this round of testing.

Management Area Ranking: The PSET has assigned a “very low” management area ranking to the Wahkiakum Ferry side channel. The Wahkiakum Ferry side channel sediments must be re-characterized 10 years from the sampling date, by September 2023. A “low” management area ranking is assigned to the Westport Slough side channel project. The Westport Slough side channel sediments must be re-characterized 7 years from the sampling date, by September 2020.

Sampling and Analysis Description: The Wahkiakum Ferry federal project was sampled on September 26, 2013; samples were collected with a petite ponar grab sampler. Sample stations appear in Figures 3 and 4 of the SQER; the grab sample log form appears in Attachment A of the SQER. The laboratory chain of custody form appears in Attachment B of the SQER.

Wahkiakum Ferry Side Channel. Three dredge prism subsamples were collected at the Wahkiakum Ferry dredged material management unit (DMMU) to form one composite sample (092613CRWF-COMP-1). Although metals were not originally proposed for analysis, the District instructed the contract laboratory to analyze the Wahkiakum Ferry composite sample for total solids, total organic carbon, grain size, and metals.

Westport Slough Side Channel. The Westport Slough side channel was split into two DMMUs that were defined by depth. Sample 092613CRWS-COMP-1 was composited from four grabs to characterize material above -11 ft. CRD (the typical maintenance depth). Sample 092613CRWS-COMP-2 was composited from four grabs to characterize material from -11 ft. to -22 ft. CRD (the depth that would be required for ocean-going barges that could potentially use the channel in the future). The District instructed the contract laboratory to analyze the Westport Slough composite samples for total solids, total organic carbon (TOC), grain size, metals, pesticides, PCBs, and total petroleum hydrocarbons.

Results: Sediment chemical results appear in Table 2 of the SQER. The District compared bulk sediment concentrations to the 2006 SEF freshwater SLs.

Wahkiakum Ferry Side Channel. The Wahkiakum Ferry shoal is composed of 96.2% sand and 3.5% fines (silt + clay); the TOC content of the shoal material is 0.768%. Antimony, mercury, and silver were not detected in sample 092613CRWF-COMP-1. Concentrations of detected metals were below the respective SLs.

Westport Slough Side Channel. The Westport Slough material is composed of an average of 83.1% sand and 15.2% fines; the TOC content is 0.698%. Antimony, mercury, and silver were not detected in either of the composite samples (092613CRWS-COMP-1, 092613CRWS-COMP-2). Concentrations of detected metals were below the respective SLs in both samples. Pesticides and PCBs were not detected in either sample. Diesel-range organics ranged from 7.8 to 35 mg/kg. Lube oil was only detected in the deep composite sample (092613CRWS-COMP-2; -11 to -22 ft. CRD) at 130 mg/kg; it was not detected in 092613CRWS-COMP-1.

Suitability Determination: The PSET's suitability determination is based on comparison of the District's sediment quality data to the 2006 SEF freshwater SLs.

Wahkiakum Ferry Side Channel. Material in the current and realigned Wahkiakum Ferry side channel configurations is suitable for unconfined, aquatic placement. The PSET assumes that the quality of sediments exposed after dredging will be similar to the dredge prism material.

Westport Slough Side Channel. Material in the Westport Slough side channel project is suitable for unconfined, aquatic placement. Materials from the mudline to -11 ft. CRD and from -11 ft. to -22 ft. CRD may be placed in the Columbia River flow lane. The PSET assumes that the quality of sediments exposed after dredging will be similar to the dredge prism material.

Contact: This memorandum was prepared by James McMillan, and reviewed by the participating PSET agencies, identified above. Questions regarding this memorandum should be directed to James McMillan (Lead – Portland Sediment Evaluation Team) at (503) 808-4376 or e-mail to: james.m.mcmillan@usace.army.mil.

EPA-Region 10 Water Division, Wetlands and Oceans Section 08 September 2021

Memorandum for: U.S. Army Corps of Engineers – Portland District, Operations Division, Channels and Harbors, Waterways Maintenance Section (CENWP-ODN-W, Stokke), Oregon Slough Downstream Shallow Draft Federal Navigation Channel (miles 1.5 to 3.8) in Portland, Multnomah County, Oregon.

Subject: Portland Sediment Evaluation Team (PSET) Level 2A dredged material suitability determination for the U.S. Army Corps of Engineers - Portland District's (USACE) operations and maintenance (O&M) dredging for the Oregon Slough Downstream (OSD) Shallow Draft Federal Navigation Channel (FNC) in the Columbia River at river mile (RM) 101.4 to 104.6 (project mile 1.5 to 3.8).

Introduction: Per the May 2018 *Sediment Evaluation Framework for the Pacific Northwest* (SEF)[1], this suitability memorandum (SDM) documents the consensus of the PSET agencies regarding the suitability of the OSD shallow draft FNC dredged material for unconfined, aquatic disposal and suitability of the post-dredge surface for unconfined, aquatic exposure. The PSET reviewed the December 2020 "*Sediment Characterization: Oregon Slough Downstream Shallow Draft Channel (Miles 1.5 to 3.8), Multnomah County, Oregon*" (2020 SQER)[2] and the August 2021 "*Supplemental Sediment Characterization: Oregon Slough Downstream Shallow Draft Channel (Miles 1.5 to 3.8), Multnomah County, Oregon*" (2021 SQER)[3], prepared by ANAMAR for the USACE's Sediment Quality Team (SQT). Sediment chemical testing results are summarized in the SQER; chemical analytical results were compared to the freshwater benthic toxicity screening levels (SEF SLs) published in the 2018 SEF. The PSET also used Oregon DEQ's sediment screening level value (SLV) for freshwater fish to evaluate PCBs and dioxins and furans[4].

Suitability Summary:

Dredge Prism (DP) Sediments:	☒Suitable	☐Unsuitable
Post-Dredge Surface (PDS):	☒Suitable	☐Unsuitable

Reviewers: The PSET agencies include the USACE, U.S. Environmental Protection Agency – Region 10 (EPA), National Marine Fisheries Service (NMFS), U.S. Fish and Wildlife (USFWS), Washington Department of Ecology (Ecology), and Oregon Department of Environmental Quality (ODEQ). Table 1 lists the PSET's review timeline for this project. Reviewers included:

Table 2. Project Details

Waterbody/river mile (RM)	Columbia River, 101.4 to 104.6
Total proposed dredging volume (cy)	~425,000
Max. proposed dredging depth (includes overdepth allowance)	-22 feet CRD (20+2 ft overdredge)
Dredging area (acres, approx.)	~55
Dredge dimensions	~200 ft. wide for 2.3 miles
Dredging method	Pipeline, clamshell or hopper dredge
Dredged material transport	Barge, hopper
Proposed disposal location(s)	Columbia River flowlane
Proposed dredging date(s)	August 1 through December 15
Dredged material mgmt. units (DMMUs)	11

Sampling and Analysis Description: The USACE sampling and analytical program for the OSD FNC is summarized in Table 3. Actual grab sample station locations are shown in the 2020 SQER Table 1A and Map 1 (SDM Figure 1). Based on the inability to collect deeper-dredge prism material, a SSAP was prepared, approved by PSET, and implemented by the USACE. The USACE' significantly modified their sampling approach by using a sonic core sample to penetrate deeper through the dredge prism and into the post-dredge surface. The PSET agreed to the USACE' approach of considering the grab samples to represent the top 4-feet of dredge prism material because of the likelihood of those materials being more recently deposited coarse Columbia River sand. Actual sonic core sample station locations are shown in the 2021 SQER Table 1C and Map 1 (SDM Figure 2). The conceptual DMMU layout is shown in Figure 2 of the PSET-approved SSAP (SDM Figure 3).

Deviations from the SAP: Deviations from the PSET-approved SAP are identified in the 2020 SQER sections 2.1.1, 2.2.2, and 2.2.3 and are noted in SQER Tables 1A (grab sample summary) and 1B (core sample summary).

1. Core sampling with a standard vibracore sample and core catcher was not possible due to the presence of unconsolidated, coarse sand and gravel in the upper 6 to 9 feet of the dredge prism. Coarse sediments resulted in core refusals above project depth (-24 ft CRD) or core recoveries of 0 to 16%. After many coring attempts across the project and coordinating with Ecology staff from the field, the USACE switched to a standard Ponar grab sampler to characterize the surface layer DMMUs (OSD-01, OSD-02, OSD-03, OSD-06, OSD-09 and OSD-11) of the project.
2. Due to the coarse character of the surface sediments, the reference site for the contingency bioassays was relocated from Elk Rock Island in the Willamette River (~RM 16) to sandy sediments along Sauvie Island in the Columbia River (~RM 100).

Deviations from the SSAP: Deviations from the PSET-approved SSAP are listed in the 2021 SQER Table 1C for stations OSD-06D, OSD-06E, OSD-09D, and OSD-09E. The deviations included the inability to collect surface material from DMMUs 6 and 9 because the mudline elevation encountered in the field during sampling was deeper than what was encountered in 2020. This deviation did not result in a lack of data collection because the 2020 sampling collected sediment from the shallower depths.

Pesticides		1/1	1/1	3/1	3/1	2/1	1/1
PCBs (Total Aroclors)		1/1	1/1	3/1	3/1	2/1	1/1
Butyltins		1/1	1/1	3/1	3/1	2/1	1/1
TPH (diesel [dx] and residual [rx] range)		1/1	1/1	3/1	3/1	2/1	1/1
Dioxin/Furans		1/1	1/1	3/1	3/1	2/1	1/1
Contingency Biological Analysis – dredge prism only, three DMMUs maximum							
Freshwater Bioassays		1*	1*	3*	3*	2*	1*

† = Ponar grab samples; ‡ = sonic drill core samples; ^ = sulfides analysis removed by USACE since no biological test are needed on the PDS; * = contingency bioassays not required based on sediment chemistry.

Total sulfides were removed from analysis by the USACE on the six Z-layer composite samples because biological tests are not necessary on the post-dredge surface and the overlying DMMUs were analyzed for sulfides. Only one of the 11 overlying DMMUs detected elevated sulfides (39.1 mg/kg, DMMU OSD-5r) above the SEF freshwater SL (39 mg/kg).

Results and Discussion: Analytical results for the USACE sampling event are summarized in Tables 5a (dredge prism) and 5b (post-dredge surface). The chemical analytical results from both SQERs were compared to the 2018 SEF freshwater SLs and to ODEQ's freshwater fish-based SLV (22 ug/kg) to evaluate PCBs (total aroclors) and SLV (5.6 ng/kg) for dioxins and furans.

Total sulfides in DMMU OSD-05r (39.1 mg/kg) was the only DMMU or post-dredge surface sample with an analyte detected above an SEF SL (39 mg/kg). All other analytes were detected below SEF freshwater SLs or were non-detections (U) with method reporting limits (MRLs) below SLs. Sulfides are generally used to inform bioassay testing for potential non-treatment effects. When total sulfides are the sole parameter detected above an SEF SL, the PSET may determine sediments are suitable for unconfined, aquatic disposal and exposure.

Except for DMMU OSD-05r, all dredge prism samples (Table 5a) consisted of at least 91% sand with a total organic carbon (TOC) of 0.1% or less. DMMU OSD-05r was 67% sand, 26% silt, and 6% clay with a TOC of 0.3%.

Except for samples OSD-03Z and OSD-09Z, all post-dredge surface samples (Table 5b) consisted of at least 80% sand with a TOC of less than 0.19%. OSD-03Z consisted of 38% sand, 51% silt, and 11% clay with a TOC of 0.89%. OSD-09Z consisted of 3% gravel, 72% sand, 22% silt, and 3% clay with a TOC of 0.9%. DMMU OSD-05r is directly on top of OSD-3Z layer.

There were no exceedances of ODEQ's bioaccumulative SLV for PCBs because all samples were non-detections (U) with an MRL (4.0 ug/kg) below the SLV (22 ug/kg). There were no exceedances of ODEQ's bioaccumulative SLV for dioxins and furans because all samples had 2,3,7,8 TCDD TEQ results below the SLV (5.6 ng/kg).

No other parameters had detections, estimated concentrations (J) or non-detections (U) with elevated MRLs above an SEF freshwater SLs or an ODEQ SLVs.

Site Ranking: The sampling design was based upon a "moderate" rank due to the lack of dredging and agency concerns about CoCs at depth. Based on the dredge prism and post-dredge surface results and similar physical characteristics to surrounding projects, the PSET has assigned a "low" rank to the OSD shallow-draft sediments.

PSET Suitability Determination:
Dredge Prism – Chemical concentrations in OSD dredge prisms are below the SEF freshwater SLs and ODEQ SLVs as discussed above. As such, the **OSD shallow draft FNC dredged prism material** is **suitable for unconfined, aquatic disposal** per the 2018 SEF guidance without additional testing.

Post-Dredge Surface – Chemical concentrations in OSD post-dredge surface samples are below the SEF freshwater SLs and ODEQ SLVs as discussed above. As such, the **OSD shallow draft FNC post-dredge surfaces** are **suitable for unconfined, aquatic exposure** per the 2018 SEF guidance without additional testing.

Contact: This memorandum was prepared by Bridgette Lohrman (PSET co-lead) and James Holm (PSET Lead, USACE) and reviewed by the participating PSET agencies, identified above. Questions regarding this memorandum should be directed to Bridgette Lohrman at (503) 326-4006 or e-mail to: lohrman.bridgette@epa.gov.

EPA-Region 10 Water Division, Wetlands and Oceans Section 1 August 2019

Memorandum for: U.S. Army Corps of Engineers – Portland District, Operations Division, Channels and Harbors, Waterways Maintenance Section (CENWP-ODN-W, Stokke), Oregon Slough Federal Navigation Side Channel, Upstream Entrance.

Subject: Portland Sediment Evaluation Team (PSET) Level 2A dredged material suitability determination for the U.S. Army Corps of Engineers - Portland District's (Corps) operations and maintenance (O&M) dredging for the Oregon Slough Federal Navigation Side Channel, Upstream Entrance (OSU FNC) in the Columbia River at river mile (RM) 108.

Introduction: Per the May 2018 *Sediment Evaluation Framework for the Pacific Northwest* (SEF)[1], this suitability memorandum (SDM) documents the consensus of the PSET agencies regarding the suitability of the dredged material for unconfined, aquatic disposal. The PSET reviewed the Corps' 18 July 2019 "*Oregon Slough Upstream Federal Navigation Side Channel, Sediment Quality Evaluation Report*" (SQER)[2], prepared by Corps' Sediment Quality Team (SQT). Sediment chemical testing results are summarized in the SQER; chemical analytical results were compared to the freshwater benthic toxicity screening levels (SEF SLs) published in the 2018 SEF. The PSET also used Oregon DEQ's sediment screening level value (SLV) for freshwater fish to evaluate PCBs[3].

Suitability Summary:

Surface Sediments:	☒ Suitable	☐ Unsuitable
Post-Dredge Surface (PDS):	☒ Suitable	☐ Unsuitable

Reviewers: The PSET agencies include the Corps, U.S. Environmental Protection Agency – Region 10 (EPA), National Marine Fisheries Service (NMFS), U.S. Fish and Wildlife (USFWS), Washington Department of Ecology (Ecology), and Oregon Department of Environmental Quality (ODEQ). Table 1 lists the PSET's review timeline for this project. Reviewers included:

☒ James Holm (Corps, Lead)	☒ Bridgette Lohrman (EPA, Co-Lead)	
☒ Pete Anderson (ODEQ)	☒ Laura Inouye (Ecology)	☒ Dominic Yballe (Corps)
☒ Tom Hausmann (NMFS)	☒ Jeremy Buck (USFWS)	

PSET/SEF Conditions:

☒ Data Recency Expiration – The data recency of this SDM for the OSU FNC expires in April 2026.

Project Description: Table 2 provides a summary of the dredging project details for the OSU FNC. Maintenance dredging is needed to provide navigation access.

Table 2. Project Details

Waterbody/river mile (RM)	Columbia River, 108
Total proposed dredging volume (cy)	~133,000
Max. proposed dredging depth (includes overdepth allowance)	-12 ft. CRD
Dredging area (acres, approx.)	~40
Dredge dimensions	300 ft. wide by 5,800 ft. long
Dredging method	Pipeline, clamshell or hopper dredge
Dredged material transport	Barge, hopper, or pipeline
Proposed disposal location(s)	Columbia River flowlane
Proposed dredging date(s)	Typically August through December
Dredged material mgmt. units (DMMU)	2 (3-station composite samples)

[4] US Army Corps of Engineers. 2019. *Oregon Slough Federal Navigation Channel – Upstream Entrance (Columbia River, River Miles 108-109); Multnomah County, Oregon; Sediment Sampling and Analysis Plan*. Prepared by Corps SQT 11 March 2019. 14 pp with Attachments.

Total volatile solids		1/-	1/-	-/-
Metals, freshwater		1/-	1/-	-/-
Total PAHs		1/-	1/-	-/-
SVOCs (phthalates, phenols, misc. extractables)		1/-	1/-	-/-
Pesticides		1/-	1/-	-/-
PCBs (Total Aroclors)		1/-	1/-	-/-
Butyltins		-/-	-/-	1/-
Total petroleum hydrocarbons (dx, rx)		1/-	1/-	-/-

Deviations from the SAP: There were no deviations from the PSET-approved SAP.

Results and Discussion: Analytical results for the Corps' sampling event are summarized in Table 4. The chemical analytical results from the SQER were compared to the 2018 SEF freshwater SLs and ODEQ's SLV for freshwater fish to evaluate PCBs. There were no detections or non-detection exceedances (U) of freshwater SEF SLs or applicable ODEQ SLV.

Table 4. Project Sediment Analytical summary

Decision unit (Sample ID): Parameters	040519-OSU-01-COMP	040519-OSU-02-COMP	040519-OSU-COMP-TIN	SEF freshwater SL1
Grain size (%)

Total Petroleum Hydrocarbons (mg/kg)				
Diesel range	6.1 U	27.7	--	340
Residual range	12.2 U	55.7	--	3,600

U = Non-detection at the method reporting limit (MRL) or method detection limit (MDL), MRL reported;
J = Estimated value between MDL and MRL; † = ODEQ (2007) freshwater fish-based SLV

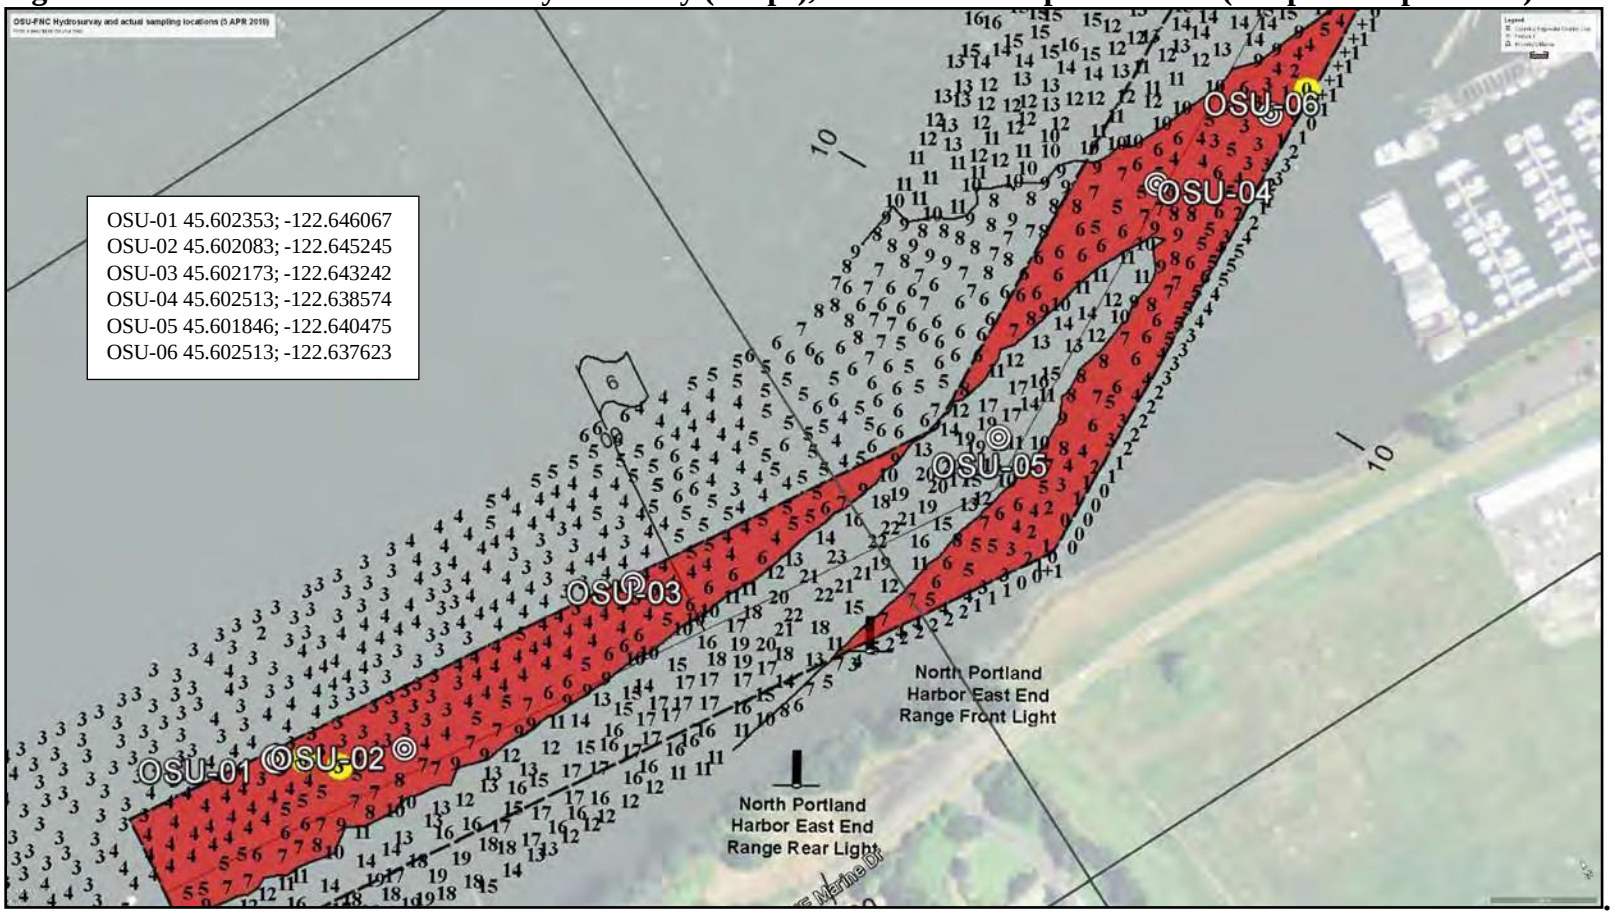
PSET Suitability Determination:

Dredge Prism – Chemical concentrations in both dredge prism composite samples were below the SEF freshwater SLs as discussed above. As such, the **OSU FNC dredged prism material** is **suitable for unconfined, aquatic disposal** per the 2018 SEF guidance.

Post-Dredge Surface – The dredge prism materials were determined to be suitable and the Oregon Slough Upstream Entrance has a "low" management area rank. As such, the PSET assumes that the **OSU FNC post-dredge surface** is **suitable for unconfined, aquatic exposure** per the 2018 SEF guidance.

Contact: This memorandum was prepared by Bridgette Lohrman (PSET co-lead) and James Holm (PSET Lead, Corps) and reviewed by the participating PSET agencies, identified above. Questions regarding this memorandum should be directed to Bridgette Lohrman at (503) 326-4006 or e-mail to: lohrman.bridgette@epa.gov.

Figure 1. OSU FNC – December 2018 hydrosurvey (Corps), 2019 actual sample locations (sampled 5 April 2019)



Water Quality Sampling and Monitoring Plan

For Federally authorized Columbia River Navigation Channel (RM 3 to 145),
Columbia River Side Channels and Portland-Vancouver Anchorages

This plan is prepared in accordance with the following environmental clearances:

A) 401 Water Quality Certificates:

Columbia River (RM 3 to 145) & Side Channels
State of Oregon Department of Environmental Quality, application for certificate renewal
State of Washington Department of Ecology, certificate dated September 10, 2020, as amended

B) Biological Opinions:

Mouth of the Columbia River, Columbia River & Side Channels (except as listed separately)
National Marine Fisheries Service, consultation number 2011/02095 dated July 11, 2012

Tongue Point, Elochoman Slough, Lake River and Oregon Slough Side Channels
National Marine Fisheries Service, consultation number WCRO-2020-02918 dated June 16, 2021

The work procedures described herein have been coordinated with the States of Oregon and Washington and the National Marine Fisheries Service to ensure compliance with all applicable Water Quality Certificates and Biological Opinions. All requirements of the state Water Quality Certificates and Biological Opinions apply.

If there is a discrepancy between this Sampling Plan and the Water Quality Certificates or Biological Opinions, the more restrictive requirement applies.

Sampling Procedures

1. **Instrument Sampling and Visual Observations**. It is expected that instrument samples for turbidity and dissolved oxygen will be taken from a water quality monitoring boat. All sample measurements by instrument will be taken at a water depth of 15 feet (± 2 feet) or the midpoint of the water column (± 2 feet) if the water depth is less than 20 feet. It is expected that visual turbidity observations for dredging activities will be observed from the dredge and turbidity observations for in-water placement will be observed from the hopper dredge or tugboat or end scow, as applicable. Visual observations shall include notation of whether the water is clear (no visible turbidity) or cloudy (yes visible turbidity) at the observation point.

2. **Background Sampling**. Background samples/observations must be taken immediately prior to conducting each compliance test. Background samples/observations will be taken up current of dredging and placement operations, within the authorized navigation channel if possible, and well outside the influence of the dredging operation. Obtaining a sample/observation outside the influence of the dredging or placement operation is critical to ensuring valid compliance tests, and is the primary consideration when selecting a location. Background sampling does not apply to dissolved oxygen compliance.

3. **Dredging Compliance Sampling**. Compliance samples/observations must be taken during daylight hours, during active dredging, and in the turbidity plume if visible. Sampling/observation frequencies, locations, and types are listed below by Federal channel.

Turbidity

Dredge Area	Frequency of Testing	Compliance Test Location	Type of Sample
Columbia River Navigation Channel RM 3 to 145	twice/day (ebb & flood)	900 feet downcurrent from point of discharge and no more than 150 feet lateral	Visual
State of Washington Side Channels: Baker Bay, Chinook, Skamokawa Creek, Elochoman Slough, Wahkiakum Ferry Channel, Old Mouth Cowlitz, Lake River	twice/day (ebb & flood)	900 feet downcurrent from point of discharge and no more than 150 feet lateral	Visual
State of Oregon Side Channels: Hammond Boat Basin, Skipanon, Tongue Point, Westport Slough, Oregon Slough RM 1.5-3.8, Upstream Entrance to Oregon Slough	twice/day (ebb & flood)	900 feet downcurrent from point of discharge and no more than 150 feet lateral	Instrument (Turbidimeter)
State of Oregon: Portland-Vancouver Anchorages	twice/day (ebb & flood)	900 feet downcurrent from point of discharge and no more than 150 feet lateral	Instrument (Turbidimeter)

Dissolved Oxygen

Dredge Area	Frequency of Testing	Compliance Test Location	Type of Sample
Columbia River Navigation Channel RM 3 to 145	Not required		
All Side Channels and Portland-Vancouver Anchorages	Prior to start of project, then twice/day (ebb & flood)	300 feet downcurrent from point of discharge and no more than 150 feet lateral	Instrument (Dissolved Oxygen meter)

4. **Placement Compliance Sampling**. Compliance samples must be taken during daylight hours, during active placement and/or placement site dewatering, and in the turbidity plume if possible. Sampling frequencies, locations, and types are organized below by operation.

Turbidity

Operation	Frequency of Testing	Compliance Test Location	Type of Sample
In-Water Placement	twice/day (ebb & flood)	900 feet downcurrent from point of discharge and no more than 150 feet lateral	Visual
Shoreline Placement	twice/day (ebb & flood)	900 feet downcurrent from point of discharge and no more than 150 feet lateral	Visual
Upland Placement return water outfall	every 4 hours	300 feet downcurrent from point of discharge	Visual

Notes:

1. Upcurrent & downcurrent locations for selecting sampling points are determined by surface currents, not by tidal state.

2. Tidal state will be reported as the tide at the sample location as determined by the automatic tide gauge on the dredge, or by a published tide program specific to the area being tested.

3. Daylight hours are determined by the published times for sunrise and sunset. These will be noted on the water quality monitoring report.

4. Monitoring will generally be conducted mid-way through the dredging cycle or placement event, or after a sufficient amount of time has elapsed to ensure that the turbidity plume has had sufficient time to reach the compliance sampling location. This would generally be several minutes after a cycle or event commences.

5. Water quality monitoring will not be done under any unsafe conditions as determined by the boat operator, captain or other individual. A monitoring interval may be omitted during unsafe conditions for the monitoring boat. As long as monitoring can be done during the tide cycle, third party verification will not be made. However, if conditions do not improve by the end of the tide cycle and monitoring cannot be done on the tide cycle as required, a third party verification will be required. Should the boat operator or dredge captain determine that conditions are unsafe for the monitoring boat; this must be verified via an independent third party such as the Coast Guard Watch Stander, National Weather Service, Columbia River Pilots, Columbia River Bar Pilots, or other credible third party. This verification must be done in writing by preparing a written record of the telephone conversation (worksheet attached). This third party verification must be obtained prior to the end of the tide cycle.

6. A positive means of determining relative position of the monitoring boat to the dredge, such as an electronic distance measurer (range finder) will be kept on the monitoring boat and used to periodically check positioning.

7. The testing depth will be automatically logged by the YSI instrument and reported on the Water Quality Monitoring Report.

8. Coordinates will be automatically logged by the YSI instrument for all test locations by a differential GPS unit (using the Coast Guard beacon or a WASS-enabled GPS unit). This coordinate data will be reported in NAD 83 (State Plane Oregon North) on the Water Quality Monitoring Report.

9. The instrument will be lowered to the testing depth (background and compliance); the reading will be taken shortly after reaching the testing depth. The only exception is if the readings are rapidly going up, which indicates that the instrument display has not had time to increment up to the correct reading. The reading will not be recorded until the display number has stabilized.

Equipment (for non-visual monitoring)

1. Instrumentation. The YSI Meter will be used, with the following features (or equivalent):

    a. Turbidity Probe, Model 6136
    b. Dissolved Oxygen Probe, Model 6562 or 6150
    c. Logger 650 MDS
    d. Sonde: Multiparameter 6600 EDS-M or 6820
    e. Temperature and Depth Probe 6560

2. Calibrations:

    a. The turbidity probe will be calibrated once a week, or more if data is suspect. A two-point calibration method will be used and calibrations will be in accordance with the manufacturer's instructions.
    b. The YSI data logger clock will be checked against the dredge clock (or tug if a scow is used for disposal) daily.
    c. The Dissolved Oxygen probe and all other instrument features will be calibrated in accordance with the manufacturer's recommendations.
    d. The results of the calibrations (including measurement value against a standard) will be recorded in the Daily Water Quality Monitoring Report.

3. Instrument Parameters. The YSI instrument will be set to take discrete readings every 0.5 seconds.

4. Downrigger System. The YSI instrument will be mounted on an automatically operated downrigger with a 15-pound minimum weight. Downrigger stops will be installed at the testing depth so it can be rapidly reached quickly while the boat is in position for testing. A manual downrigger will be stored on each monitoring boat in a readily accessible location. This manual downrigger will be used in the event that the automatic downrigger malfunctions. All necessary mounting hardware for the manual downrigger will be installed on the boat so that the manual downrigger can be quickly put in place.

5. The Operations Manual Supplied by YSI. A copy of this manual will be kept with all instruments.

6. Instrument Accuracy. For the YSI meter specified, the manufacturer's stated accuracies are as follows:

    a. Turbidity: $\pm$ 2 NTU or 5% of the reading, whichever is greater.
    b. Dissolved Oxygen: $\pm$ 0.2 mg/l or 2% of the reading (in the range of 0 to 20 mg/l), whichever is greater.

    All measurements should be considered to be a range of values based on the stated accuracy. For example, a measurement of 8 NTU would be considered to be a range of 6 NTU to 10 NTU.

    Turbidity will be reported to the nearest 1 NTU. Conventional rounding will be used. For example 0.5 or greater, should be rounded to 1 when reporting whole numbers.

    Dissolved oxygen will be reported to the nearest 0.1 mg/l. Conventional rounding will be used.

Compliance

1. Turbidity

Turbidity must be measured/observed and recorded as described above. All samples/observations must be recorded. Results must be compared to the background sample/observation taken during that monitoring event.

For visual observations: the observation of the turbidity plume at the compliance location is considered an exceedance.

For instrument sampling: Determination of compliance must take into account the accuracy of the instrument (compliance range calculation examples attached). Turbidity is considered to be in exceedance when the lower range value of the compliance measurement (considering instrument accuracy) is greater than the upper range value of the sum of the background measurement and acceptable compliance range (defined in table below).

Turbidity is considered to have returned to background when the lower range value of the compliance measurement is at or below the upper range value of the background measurement.

If an exceedance is measured, a re-test will be taken immediately. If the value of the re-test is also an exceedance, the exceedance is confirmed for that monitoring interval and action must be taken according to the table below. If the re-test value is within acceptable levels, the initial exceedance is not confirmed so there is no exceedance for that monitoring interval.

If a confirmed exceedance occurs at two consecutive monitoring intervals, the activity must stop until the turbidity levels return to background (as confirmed by another sample or observation). At that time, activity may resume with the minimum frequency of monitoring while maintaining compliance.

Turbidity Level		Action Required at 1st Monitoring Interval	Action Required at 2nd Monitoring Interval
Background <50 NTU	Background ≥ 50 NTU		
0 to 5 NTU above background	10% or less over background	Continue to monitor at next interval	Continue to monitor at next interval
Greater than 5 NTU above background	Greater than 10% over background	Modify activity and continue to monitor at next interval	Stop activity until levels return to background and then continue to monitor at next interval

During re-sampling/observations to determine when levels return to background, a new background sample/observation for turbidity will be obtained if it appears that conditions have changed such that the background sample/observation may be invalid, or if up to two hours have passed. If a new background sample/observation is obtained, the reason therefore must be clearly annotated on the water quality monitoring report.

2. Dissolved Oxygen

Dissolved oxygen must be measured and recorded as described above. All samples must be recorded. If the concentration measured is below 8 mg/l, a re-test will be taken immediately. If the value of the re-test is also measured below 8 mg/l, the reduced level is confirmed and action must be taken according to the table below.

If a confirmed level (test and re-test) below 6.5 mg/l is measured (or if distressed or dead fish are observed in or beside the dredge), the activity must stop until the dissolved oxygen level returns above 6.5 mg/l (as measured by another sample). At that time, activity may resume with monitoring at the appropriate frequency interval based on the level of dissolved oxygen measured. Dredging may not begin if dissolved oxygen concentration at the dredge site is less than 6.5mg/l.

Dissolved Oxygen Level	Action Required
8 mg/l or greater	Continue to monitor at next interval
6.5 mg/l up to 8 mg/l	Increase monitoring frequency to every 4 hours during daylight hours and active dredging
Less than 6.5 mg/l	Stop activity until levels return to above 6.5 mg/l and then continue to monitor at appropriate interval based on level of dissolved oxygen measured

Activity Modifications and Stopping Activity

Dredging

1. Hopper Dredging Activity:
    a. Modification of the hopper dredging activity means that the dredge cannot pass back over the point where the exceedance occurred while completing the dredging load. Dredging may continue while moving away from the area, but no dredging can occur in the area where the exceedance was observed (or measured and confirmed) until the water quality parameter(s) have returned to acceptable levels. The mate's screen will be marked with the position of the dredge when the exceedance was measured to ensure that the dredge does not pass back over this point while filling the hopper. This may necessitate frequent moves or additional transit time, especially during clean-up operations.
    b. Stopping the hopper dredging activity could be any of the following actions:
        i. Stop dredging and transit to the disposal site.
        ii. Stop dredging and move to a different dredging location well away from the area where an exceedance was measured.
        iii. Stop dredging and stand by.

    Dredging may not resume at the same dredging location where the exceedance occurred until an additional observation (or sampling) indicates that the water quality parameter(s) have returned to acceptable levels.

2. Pipeline Dredging Activity: The Corps is not aware of any acceptable "modifications" for pipeline dredging activities. Once an exceedance has been observed or measured and confirmed, all further dredging operations must be stopped until additional sampling indicates that the water quality parameter(s) have returned to acceptable levels.

3. Clamshell Dredging Activity: Currently the Corps is not aware of any acceptable "modifications" for clamshell dredging activities. Because of the stationary nature of a clamshell operation, once an exceedance has been observed or measured and confirmed, all further dredging operations must be stopped until additional observations or sampling indicate that the water quality parameter(s) have returned to acceptable levels.

In-Water Placement

1. Hopper Dredge and Dump Scow Placement: In-water placement by a hopper dredge or dump scow is anticipated to be a short term discrete event. Because of the short term nature of the placement event, the dredge or scow will not be expected to stop placing the current load if an exceedance is observed during placement. However, once an exceedance has been observed, all further placement operations at that placement site must be stopped until an additional observation indicates turbidity has returned to acceptable levels. It is anticipated that turbidity levels will return to background before the next scheduled placement event.

2. Pipeline Dredge Placement: In-water placement by a pipeline dredge is anticipated to be a continuous event. The Corps is not aware of any acceptable "modifications" for pipeline dredge in-water placement operations. Once an exceedance has been observed, placement operations at that site must be stopped until an additional observation indicates that turbidity has returned to acceptable levels.

Shoreline Placement

1. Activity modifications include: adjusting site berms to slow water discharge and any other action intended to further minimize turbidity.

2. If exceedances occur at two consecutive monitoring intervals, placement operations at that site must be stopped until an additional observation indicates turbidity has returned to acceptable levels.

Upland Placement

1. Return water from upland placement site: Activity modifications include: adjusting weirs (boards and outfall discharge ends), adjusting internal site berms to slow water discharge, and any other action intended to further minimize turbidity.

2. If exceedances occur at two consecutive monitoring intervals, all water discharge to the river must be stopped until an additional observation indicates turbidity has returned to acceptable levels. The drainage system for return water to the river must contain a means to shut off the discharge.

Reporting

Daily Water Quality Monitoring Report. There must be a water quality monitoring report completed for each day that there is scheduled activity. If no activity actually occurs during a monitoring interval (for example, the dredge is down for repairs), a report is submitted with an explanation in the Remarks column. Example reporting forms for visual turbidity observations turbidity/dissolved oxygen sampling with an instrument are attached. Electronic copies are provided to the dredge. The following data will be included:

1. Date
2. Published times for sunrise and sunset
3. Test (Background, compliance, confirmation of exceedance (if applicable), return to background)
4. Location (Channel Dredge Area or Placement site name)
5. Contract Name (if applicable)
6. Contract Number (if applicable)
7. Placement Site
8. For instrument sampling: Position in NAD 83 (State Plane Oregon North)
9. For instrument sampling: Depth as logged by the YSI instrument
10. Tidal State (ebb/flood/slack), at the testing location
11. Load Number
12. Time
13. Remarks column will contain any statements necessary to explain the data including the following:
    a. Delays in the testing cycle and the reason therefore (for example if the dredge was down for repairs, or if the dredging cycle was longer than the required testing frequency)
    b. Delays in monitoring due to restricted visibility
    c. Locations where water quality criteria were exceeded, along with actions taken (i.e. was the operation modified or stopped)
    d. Additional samples performed to confirm exceedance or return to background, this must be noted
    e. If operation is modified or stopped as a result of the exceedance, what time the modification or stoppage began, how long it lasted, and what time operations resumed
    f. Best Management Practices used to bring the levels back into compliance
    g. Observation of a visible plume (yes/no) if present when measurement exceeds water quality criteria
14. Results of calibrations

LCR FNC Upland, Shoreline, Transfer, and Ocean Dredged Material Placement Sites. In-water placement of material dredged from federal navigation projects in Oregon and Washington occurs in depths greater than 20 feet within or outside the navigation channel throughout the mainstem Columbia River from RM 3 to RM 145.

INTRODUCTION

The U.S. Army Corps of Engineers, Portland District (Corps) prepared this Biological Assessment (BA) for the purpose of re-initiating consultation under Section 7 of the Endangered Species Act (ESA) of 1973, as amended. This document evaluates the effects on federally listed species and their designated critical habitats for the Columbia River Federal Navigation Channel (CR FNC), Operations and Maintenance (O&M) Program through 2018. This BA specifically describes the biological effects to streaked horned larks (SHLA) (*Eremophila alpestris strigata*) that may occur from the placement of material dredged from the Columbia River. Dredging the Columbia River maintains the CR FNC from the River Mouth to Bonneville Dam (River Mile (RM) -3.0 to 145), including the Mouth of the Columbia River (MCR) project, nine side channel projects (Baker Bay, Chinook Channel, Hammond Boat Basin, Skipanon Channel, Skamokawa Creek, Wahkiakum Ferry Channel, Westport Slough, Old Mouth Cowlitz River, and Upstream Entrance to Oregon Slough), and the Portland-Vancouver Anchorages.

Section 7 of the ESA states that Federal agencies shall ensure that any action they authorize, fund, or carry out is not likely to jeopardize the continued existence of a listed species or result in destruction or adverse modification to designated critical habitat (CH). Therefore, Federal agencies consult with the U.S. Fish and Wildlife Service (USFWS) and/or the National Oceanic and Atmospheric Administration's National Marine Fisheries Service (NMFS), depending on the species that may be affected. Section 7 (a)(1) further directs federal agencies to use their existing authorities to further the purposes of the Act, aid in recovering listed species, and to address existing and potential conservation issues with regards to preserving, enhancing, and restoring important habitat types (USFWS 1998).

The proposed action, as described in this BA, entails upgrading the existing placement network and operations to meet current and projected dredged material placement needs for the next five years (2014 through the 2018 dredging season). This BA describes the potential adverse and beneficial effects to SHLA and its critical habitat in the lower Columbia River. The SHLA was listed as threatened and had critical habitat designated under the ESA on 3 October 2013.

BACKGROUND AND HISTORY

In support of the regional and national economy, the Corps operates and maintains the CR FNC to provide reliable navigation throughout the lower river between the Mouth of the Columbia River and Bonneville Dam (RM -3 to 145). The CR FNC includes nine side channels and the Portland/Vancouver anchorages (referred to as auxiliary channels). The Columbia River is the gateway for global imports and exports from the Columbia-Snake River navigation system, where the CR FNC is used by commercial, industrial, agricultural, and recreational interests. The CR FNC is the number one gateway on the West Coast for the export of wheat, wood products, and bulk minerals, totaling 42 million tons in 2010 and $20 billion worth of U.S. products bound for world markets. Approximately 55 million tons of incoming cargo pass through the Columbia River annually, supporting more than 40,000 regional jobs directly linked to the seaport and import/export activities on the river (PNWA 2010).

The deep draft channel from the ocean to Vancouver, WA was originally authorized for full construction in 1878 with a 20-foot minimum depth. Over the years, the depth has increased in order to accommodate larger ocean-going vessels transporting goods into and out of the region. Most recently completed in 2010, the channel from RM 3 to 106.5 was deepened from 40 to 43 feet. The Supplemental Environmental Impact Statement (EIS) for this action identified dredge

placement sites suitable for a period of 20 years (USACE 2003). However, since the channel deepening was completed, some placement sites have reached or are nearing maximum capacity.

The Corps annually dredges shoals from the CR FNC from RM -3 to 3 and RM 3 to 106.5 to maintain the congressionally-authorized depths of 48/55 feet and 43 feet, respectively, to accommodate deep-draft vessels. The Corps also dredges shoals annually from the CR FNC from RM 106.5 to 145 to maintain a depth of 17 feet for current users. The auxiliary channels are dredged annually or less often to their various full authorized depths or as adjusted for current user traffic. Inherent to the dredging is placement of the dredged materials immediately following or simultaneous to active dredging. To maintain the navigation channels in the complex river system, the Corps uses a balance of dredged material placement at in-water, shoreline, and upland (including island) sites, which is referred to as the Columbia River Dredged Material Placement Network (Network). The Network is a complex combination of sites distributed throughout the lower river, and includes federal, state and locally managed lands, and some private lands and shorelines.

As part of the NMFS' 2012 Biological Opinion (BiOp), *Reinitiation of Endangered Species Act Section 7 Formal Consultation and Magnuson-Stevens Fishery Conservation and Management Act Essential Fish Habitat Consultation for the Columbia River Navigation Channel Operations and Maintenance, Mouth of the Columbia River to Bonneville Dam, Oregon and Washington (HUCs 1708000605, 1708000307, 1708000108),* the Corps was directed to implement Terms and Conditions (T&Cs) to minimize take of ESA-listed species (namely salmonids) (NMFS 2012). In the NMFS BiOp, the T&Cs include specific mandates for the timing of dredging and placement activities, water quality sampling and monitoring, operational constraints, dissuasion practices for avian species that consume juvenile salmonids, and construction requirements for in-water, upland, and shoreline dredged material placement sites.

PROJECT AUTHORITY

Since 1824, the Corps has been the governmental agency responsible for maintaining navigable waters. The Commerce Clause in the U.S. Constitution and subsequent Supreme Court decisions have established the Federal right and obligation to regulate navigation and commercial activity, and also to make any necessary improvements to the river for this purpose. Congress has strengthened this authority through several Rivers and Harbor Acts, the earliest one enacted in 1872. The Rivers and Harbors Acts gave way to the Water Resources Development Acts in 1973. Subsequently, the Courts have determined the Corps has paramount rights to work in all navigable waters of the U.S. below the ordinary high water mark (mean higher high water in the estuary). Appendix A provides a complete history of Congressional authorizations for the Columbia River dredging program.

Maintenance dredging and in-water placement of dredged sediments to maintain these authorized navigation channels is conducted under the provisions of Sections 102 and 103 of the Marine Protection Reserve and Sanctuaries Act (MPRSA) of 1972, Sections 401 and 404 of the Clean Water Act (CWA) of 1977, and in accordance with Regulations 33 Code of Federal Regulations (CFR) parts 335 through 338 ("Operation and Maintenance of Army Corps of Engineers Civil Works Projects Involving Discharge of Dredged or Fill Material into Waters of the U.S. or Ocean Waters" and affiliated procedures, etc).

The Corps does not own or have exclusive use of the dredged material placement sites, and therefore cannot manage or regulate use of the sites prior to or following dredged material placement. Some sites may be leased by the landowner (states of Washington or Oregon, private entities, or Ports) to outside parties for the purpose of extracting the placed dredged materials for

off-site uses. Other sites have public and private users for recreation, agriculture, grazing, storage, or training.

CONSULTATION HISTORY

The Corps has previously consulted with the USFWS on the CR O&M navigation program addressing effects to several ESA-listed species. Table 1 lists current ESA-listed species in the action area that are within the USFWS' jurisdiction.

Table 1: USFWS ESA-listed species in the proposed action area.

Species		Federal Status	Critical Habitat	Protective Regulations
Marbled murrelet	*Brachyramphus marmoratus*	Threatened	Designated	75 FR 3424 76 FR 61599
Northern spotted owl	*Strix occidentalis caurina*	Threatened	Designated	77 FR 71875
Short-tailed albatross	*Phoebastria albatrus*	Endangered	(none)	65 FR 46643
Western snowy (coastal) plover	*Charadrius nivosus*	Threatened	Designated	53 FR 45788 77 FR 36727
Streaked horned lark	*Eremophila alpestris strigata*	Threatened	Designated	78 FR 61452 78 FR 61506
Yellow-billed cuckoo	*Coccyzus americanus*	Proposed Threatened	(none)	78 FR 61621 78 FR 78322
Bull trout	*Salvelinus confluentus*	Threatened	Designated	63 FR 31647 75 FR 63897
Oregon silverspot butterfly	*Speyeria zerene hippolyta*	Threatened	Designated	45 FR 44935
Columbian white-tailed deer	*Odocoileus virginianus leucurus*	Endangered	(none)	35 FR 16047 68 FR 43647
Water howellia	*Howellia aquatilis*	Threatened	(none)	59 FR 35860

Several species have been delisted and no longer require ESA consultation, which include the bald eagle (*Haliaeetus leucocephalus*), peregrine falcon (*Falco peregrinus*), brown pelican (*Pelecanus occidentalis*), and the Aleutian Canada goose (*Branta canadensis leucopareia*). These consultations are incorporated herein, and include:

- On June 14, 1991, the USFWS issued a Biological Opinion which stated the placement of dredged material on Rice Island is *"not likely to jeopardize"* the continued existence of bald eagles (USFWS reference #1-7-91-F-280).
- On July 9, 1991, the Corps determined that the interim disposal site at RM 5.5-6.5 would have *"no effect"* on bald eagle, peregrine falcon, Columbian white-tailed deer, marbled murrelet, and western snowy plover (USFWS reference # 1-7-91-I-398).
- On November 19, 1992, the Corps determined that ocean dredged material disposal sites would have *"no effect"* on marbled murrelet (USFWS reference # 1-7-93-I-57).

- On June 28, 1994, the USFWS concurred the Baker Bay West Channel Maintenance Dredging project *"may affect, not likely to adversely affect"* bald eagle, peregrine falcon, brown pelican, and marbled murrelet (USFWS reference # 1-7-94-I-328).
- On February 19, 1998, the Corps determined the O&M of the Columbia River federal navigation channel from RM 3 to 106.5 would have *"no effect"* on peregrine falcon, Aleutian Canada goose, Oregon silverspot butterfly, water howellia, golden paintbrush, Nelson's checker-mallow, Bradshaw's lomatium, brown pelican, marbled murrelet, and western snowy plover (USFWS reference # 1-7-97-I-127).
- On February 24, 1998, the USFWS concurred that O&M of the Columbia River federal navigation channel from RM 3 to 106.5, *"may affect, not likely adversely affect"* Columbian white-tailed deer and bald eagle (USFWS reference # 1-7-97-I-127).
- On August 14, 1998, the Corps determined that the MCR North Jetty Dredged Material Placement would have *"no effect"* on Aleutian Canada goose, bull trout, bald eagle, peregrine falcon, marbled murrelet, and brown pelican (USFWS reference # 1-3-98-I-0385).
- On December 6, 1999, the USFWS issued a Biological Opinion (1-7-99-F-280, 1-7-99-TA-374, 1-7-98-I-342, 1-7-98-I-138) on the Columbia River Channel Deepening project. The Corps determined that the channel deepening project would have *"no effect"* on Aleutian Canada goose, brown pelican, marbled murrelet, western snowy plover, Oregon silverspot butterfly, Bradshaw's lomatium, golden paintbrush, Nelson's checker-mallow, and water howellia. The USFWS concurred that the action *"may affect, not likely adversely affect"* peregrine falcon. The USFWS determined the channel deepening project *"may affect, likely to adversely affect"* bald eagle and Columbian white-tailed deer. On April 24, 2002, the USFWS concurred the MCR dredging and disposal project *"may affect, not likely adversely affect"* bald eagle, brown pelican, and marbled murrelet (USFWS reference # 02-4212).
- On May 20, 2002, the USFWS issued a Biological and Conference Opinion on the Columbia River Channel Improvement Project (CRCIP), from RM 3-106.5. The Opinion stated the project *"may effect, likely to adversely affect"* proposed Southwestern Washington/Columbia River distinct population segment (DPS) of coastal cutthroat trout, bald eagle, Columbia River DPS of bull trout, and Columbian white-tailed deer. The USFWS provided an updated incidental take statement for Columbian white-tailed deer and bald eagle to the December 6, 1999 Opinion, (USFWS reference #02-4212).
- On September 13, 2004, the USFWS concurred that the MCR jetty rehabilitation project *"may affect, not likely adversely affect"* bald eagle, marbled murrelet, and brown pelican (USFWS reference # 04-3736).
- On December 14, 2004, the Corps determined that continued O&M of the CR navigation channel, from RM -3.0 to 145, would have *"no effect"* on western snowy plover, northern spotted owl, short-tailed albatross, Oregon silverspot butterfly, and water howellia. The USFWS concurred that the O&M of the project *"may affect, not likely adversely affect"* bull trout, bald eagle, brown pelican, marbled murrelet, and Columbian white-tailed deer (USFWS reference # 1-7-04-I-0090).
- On December 27, 2004, the USFWS concurred that de-designation and designation of the dredged material disposal sites offshore of the MCR, in Oregon and Washington, *"may affect, not likely adversely affect"* short-tailed albatross, marbled murrelet, and brown pelican (USFWS reference # 1-7-04-I-489).
- On May 23, 2008, the USFWS concurred that the Benson Beach sand berm restoration project *"may affect, not likely adversely affect"* brown pelican and western snowy plover (USFWS reference # 13420-2008-I-0063).

- On September 29, 2010, the Corps determined that O&M of the Columbia River federal navigation channel, from RM -3.0 to 145, will have *"no effect"* to western snowy plover, northern spotted owl, short-tailed albatross, Oregon silverspot butterfly, and water howellia. The USFWS concurred that O&M of the project *"may affect, not likely adversely affect"* bull trout, marbled murrelet, and Columbian white-tailed deer (USFWS reference # 13420-2010-I-0165).
- On February 23, 2011, the USFWS concurred that the major rehabilitation of the MCR Jetty System *"may affect, not likely adversely affect"* bull trout, marbled murrelet, and western snowy plover (USFWS reference # 13420-2011-I-0082).
- On January 24, 2012, the USFWS concurred that the minor 2012 updates to the North Jetty dredged material placement site has the same effects as the 2010 consultation (USFWS reference # 13420-2010-I-0165) on the O&M of the Columbia River federal navigation channel. The USFWS concurred that the action *"may affect, not likely adversely affect"* bull trout, marbled murrelet, and Columbian white-tailed deer (USFWS reference # 13420-2010-I-0165).

The Corps' 2010 BA for the Columbia River dredging and dredged material placement program, for which the dredging and placement action and range of effects is very similar to the proposed action described herein, received USFWS concurrence on September 29, 2010, as listed above. Therefore, the potential effects for bull trout, marbled murrelet, and Columbian white-tailed deer ***are consistent with previous determinations*** and the species are not further evaluated in this BA. In addition, the Corps determined the proposed action will have ***"no effect"*** to western snowy plover, northern spotted owl, short-tailed albatross, Oregon silverspot butterfly, and water howellia. Therefore, these species are also not further evaluated in this BA.

Beginning in April 2013, the Corps sought active participation from USFWS on ways to avoid and minimize potential adverse effects to SHLA and its habitats. Placement activities can facilitate the creation and/or maintenance of suitable SHLA habitat and the Corps has worked with USFWS and its partners to minimize potentially adverse effects and maximize the beneficial effects of dredged material placement actions throughout the lower Columbia River for SHLA. Specific meetings and phone conversations include the following:

- The Corps met with staff from USFWS and the Center for National Lands Management on 26 April 2013 to discuss the dredging program and processes involved in coordinating dredging and placement at uplands sites.
- In addition, the Corps met with the USFWS on 25 June 2013 to discuss the dredged material placement sites and define the project area to include all placement sites within the Network.
- In August 2013, the Corps participated in a workshop with USFWS personnel from both the Washington and Oregon offices and the ports to discuss ESA coverage, Section 7 consultation, the Corps' proposed action and consequential management needs – specifically the development of Habitat Conservation Plans.
- Staff from the USFWS participated in a site visit to Rice and Miller Sands Islands on 16 September 2013 to observe active dredged material placement by the Dredge OREGON.
- Following this site visit, the Corps and USFWS (both ESA consultation specialists and migratory bird specialists) met on 25 September 2013 to discuss the Corps' actions in the lower Columbia River and potential impacts to Caspian terns and double-crested cormorants in the lower estuary.

- On 19 December 2013, the Corps met with USFWS staff to discuss the proposed action, specifically dissuasion of terns and cormorants and monitoring of streaked horned larks, as well as how to address western yellow-billed cuckoos (discussed below).
- The Corps presented the USFWS with an initial draft of the proposed action on 10 January 2014 and further discussed the proposed action in a follow-up meeting on 21 January 2014.
- The Corps organized a meeting on 3 February 2014 to discuss the proposed monitoring strategy for streaked horned larks, including USFWS staff and regional experts from the Washington Department of Fish and Wildlife, the Center for Natural Lands Management.
- On 26 February 2014, the Corps discussed dissuasion of terns and cormorants, and possible areas of overlap with staff from the USFWS.
- Finally, on 3 March 2014, the Corps initiated formal consultation with USFWS and delivered this biological assessment to the Service for review.

WESTERN YELLOW-BILLED CUCKOO

The USFWS announced the proposed listing of the western distinct population of yellow-billed cuckoos (*Coccyzus americanus occidentalis*) as *threatened* under the ESA on October 3, 2013 (FR 78 61622). This proposal applies to the western yellow-billed cuckoo throughout its entire breeding range. The cuckoo became a candidate for ESA-listing in 2001 and since this time, the USFWS has annually evaluated the species' status and identified threats to its continued existence. The available information concludes that the western yellow-billed cuckoo has declined by several orders of magnitude over the past 100 years, and that the decline is continuing, isolating birds into smaller populations at core breeding areas. The decline of the western yellow-billed cuckoo is primarily the result of habitat loss and degradation. While much of this habitat loss occurred historically, many of the impacts have subsequent ramifications that are on-going and affect the size, extent, connectivity, and quality of riparian vegetation within the range of the cuckoo. The USFWS found that no critical habitat was present in Oregon or Washington and as a result, no critical habitat was proposed for designation in this region.

The western yellow-billed cuckoo is a riparian obligate species, historically found in parts of 12 states west of the Continental Divide, including: Oregon, Washington, Idaho, Montana, Wyoming, Colorado, Nevada, Utah, California, Arizona, New Mexico, and Texas. Approximately 350-500 pairs are estimated to breed north of the Mexican border where habitat requirements include extensive riparian forests dominated by mature, structurally diverse trees and a vegetative understory consisting of shrubs and smaller trees. The last confirmed breeding records in Oregon are from the 1940s and observations of individual birds in 2009, 2010, and 2012 near the Sandy River Delta and its confluence with the Columbia River were the first confirmed sightings west of the Cascade Mountains since 1977. Historically, the western yellow-billed cuckoo was considered rare in the Pacific Northwest and the available data suggests that if yellow-billed cuckoos still breed in Oregon and Washington, the numbers are extremely low with pairs numbering in the single digits.

The USFWS concluded that the curtailment and decline in riparian habitat is primarily the result of long-lasting effects from manmade features that alter watercourse hydrology such that the natural processes that sustain riparian habitats are diminished or non-functional. In addition, the encroachment and establishment of non-native species has further degraded the quality of remaining riparian areas. Climate change was also recognized as a critical issue with potentially wide-ranging effects on the species and its habitat; it was suggested that the effects of climate change will exacerbate habitat loss and degradation, invasive species, and wildlife/drought resulting in smaller patch sizes and more isolated breeding areas. Nesting yellow-billed cuckoos are sensitive to patch size and seldom use riparian areas smaller than 100m x 300m. For this reason, the USFWS concluded that smaller patch sizes and isolated breeding areas may compound juvenile

dispersal and re-occupation of breeding adults. Furthermore, where riparian areas are located in proximity to urban and agricultural areas, the potential for pesticide and herbicide to affect habitat, prey availability, and cuckoos themselves is increasingly high.

Based on the information provided above, it is assumed that very few western yellow-billed cuckoos are present in the region, and if any birds are present they would likely occupy intact and extensive riparian forests found outside of the Network. The placement sites (described in more detail below) are largely composed of open, sandy areas and if riparian vegetation is present, it does not consist of large, extensive riparian forests preferred by the cuckoo (greater than 100 x 300m). For this reason, the proposed placement activities are highly unlikely to affect individual cuckoos or their preferred habitats because these conditions are not present in the action area. As a result, the Corps has determined the proposed action will have **"*no effect*"** to the western yellow-billed cuckoo and therefore the species is not further discussed in this assessment.

CHANGES FROM PREVIOUS ACTION

The Corps is proposing to practice shoreline placement at Pillar Rock Island (RM 27.2), which is currently an upland placement site within the existing Network and is owned by Oregon Department of State Lands. Shoreline placement will facilitate use of the upland placement site, which is currently too narrow for placement to occur. Once the site reaches upland placement capacity, shoreline placement would be conducted periodically to protect the integrity of the upland site.

The Corps is also modifying the Wahkiakum Ferry Channel side channel project (RM 43) that connects the ferry landing on Puget Island to an area of deep water in the Columbia River for the purpose of supporting improvements to the ferry dock and a new, larger ferry. The modification increases channel width from 200 to 300 feet and shifts the channel centerline approximately 120 feet upstream. There is no change to dredging or placement methods or best management practices, and construction and future maintenance volumes associated with the channel widening are within the previously considered range of effects. Figure 1 shows the revised channel alignment and shoaling to be dredged within the existing and new footprints.

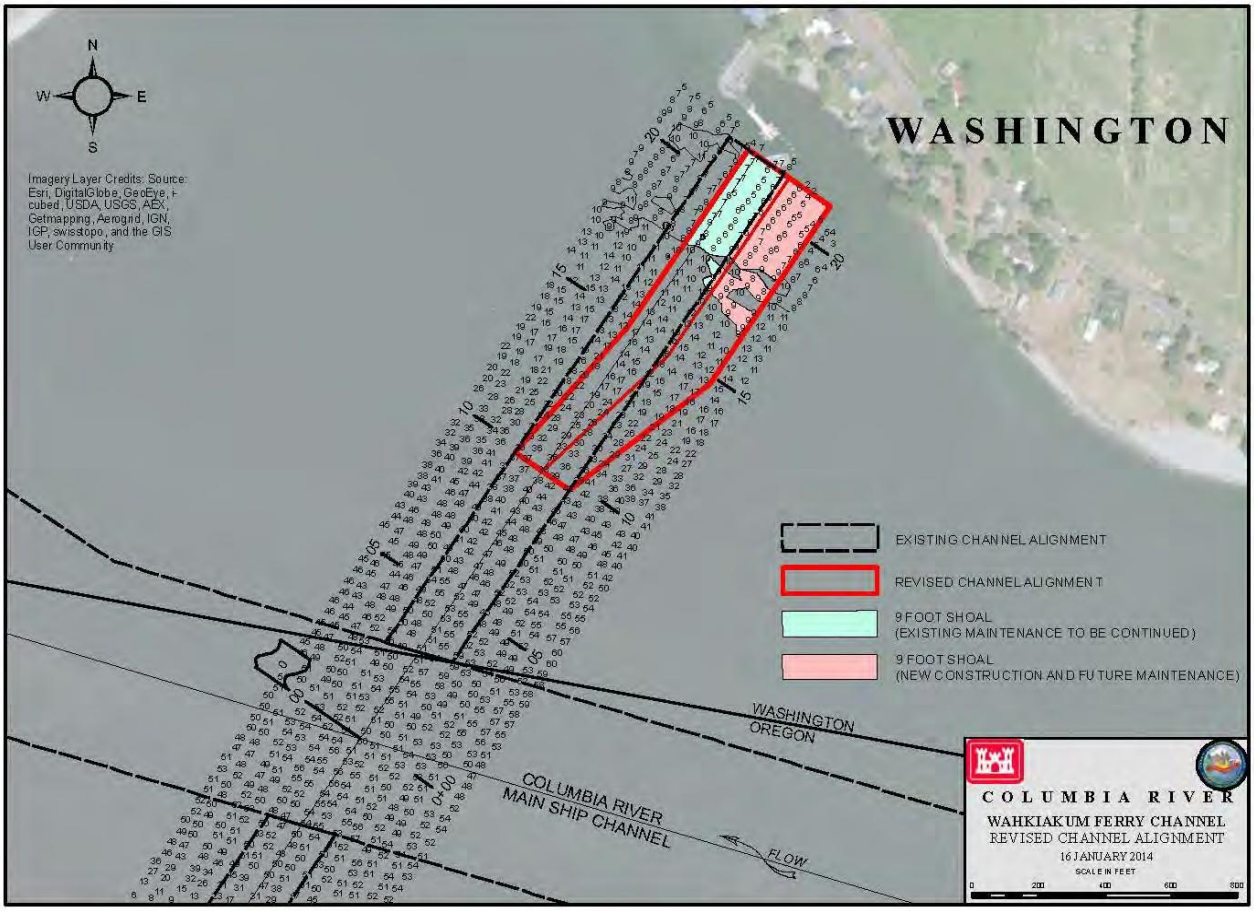

Figure 1: Modification to the Wahkiakum Ferry Channel

As detailed above, the Corps has previously consulted on the range of effects from shoreline placement in the lower Columbia River and dredging the Wahkiakum Ferry Channel and associated in-water placement on bull trout, marbled murrelet, Columbian white-tailed deer, and determined there would be ***"no effect"*** to western snowy plover, northern spotted owl, short-tailed albatross, Oregon silverspot butterfly, and water howellia. As a result of these evaluations, the addition of shoreline placement at Pillar Rock Island and modifications to the Wahkiakum Ferry Channel ***will not result in new or additional effects*** that were not previously considered. For this reason, the effects to these species from shoreline placement at Pillar Rock Island and modifications to the Wahkiakum Ferry Channel will not be evaluated further.

ACTION AREA

The Action Area includes all areas to be affected directly or indirectly by the Federal action and not merely the immediate are involved in the action (50 CFR § 402.02). The Columbia River is the largest river in the Pacific Northwest, starting high in the Rocky Mountains of British Columbia. The river flows northwest before turning south into Washington State and then west toward the Pacific Ocean, forming the border between Oregon and Washington. The river is approximately 1,240 miles in length and, by volume, is the fourth largest river in the United States.

For the purposes of this BA, the Action Area is defined as the Columbia River Federal Navigation Channel from the mouth (RM -3), upstream to Bonneville Dam (RM 145), including the Portland-

Vancouver Anchorages and the nine federally authorized side channel projects in this reach. The side channels include Baker Bay, Chinook Channel, Hammond Boat Basin, Skipanon Channel, Skamokawa Creek, Wahkiakum Ferry Channel, Westport Slough, Old Mouth Cowlitz River, and Upstream Entrance to Oregon Slough. The lateral extension of the Action Area extends 300 feet shoreward of the mean higher high water (MHHW) or ordinary high water (OHW) line to include direct and indirect effects from dredging and in-water placement of dredged materials in the lower Columbia River. The Action Area also extends 200 feet landward from the boundaries of the upland and shoreline dredged material placement sites.

The upland and shoreline dredged material placement network, as shown in Table 2 and Figure 2 below, includes 25 sites in the Columbia River between RM 3 to 105 and the Benson Beach intertidal site on the Pacific Ocean. Detailed information, figures, and current environmental baseline conditions on the upland and shoreline placement sites is provided in Appendix B. The Action Area includes the ocean disposal sites, which are described in Appendix B.

Table 2: Upland and Shoreline Dredged Material Placement Network

Site	State – River Mile	Site Type
Benson Beach	W-Pacific Ocean	Shoreline (intertidal)
West Sand Island	O-3.1	Upland
Rice Island	O/W-21.0	Upland, Sump
Miller Sands	O-23.5	Shoreline
Pillar Rock Island	O-27.2	Upland, Shoreline
Skamokawa - Vista Park	W-33.4	Upland, Shoreline
Welch Island	O-34.0	Upland
Tenasillahe Island	O-38.3	Upland
James River	O-42.9	Upland
Puget Island	W-44.0	Upland, Sump
Brown Island	W-46.3	Upland
Crims Island	O-57.0	Upland
Hump Island	W-59.7	Upland
Lord Island (Upstream)	O-63.5	Upland
Dibblee Point	O-64.8	Upland
Howard Island	W-68.7	Upland
Cottonwood Island	W-70.1	Upland
Northport	W-71.9	Upland
Sandy Island	O-75.8	Upland
Lower Deer Island	O-77.0	Upland
Martin Bar	W-82.0	Upland
Sand Island	O-86.2	Shoreline
Austin Point	W-86.5	Upland
Fazio Sand & Gravel	W-97.1	Upland, In-water
Gateway	W-101.0	Upland
West Hayden Island	O-105.0	Upland

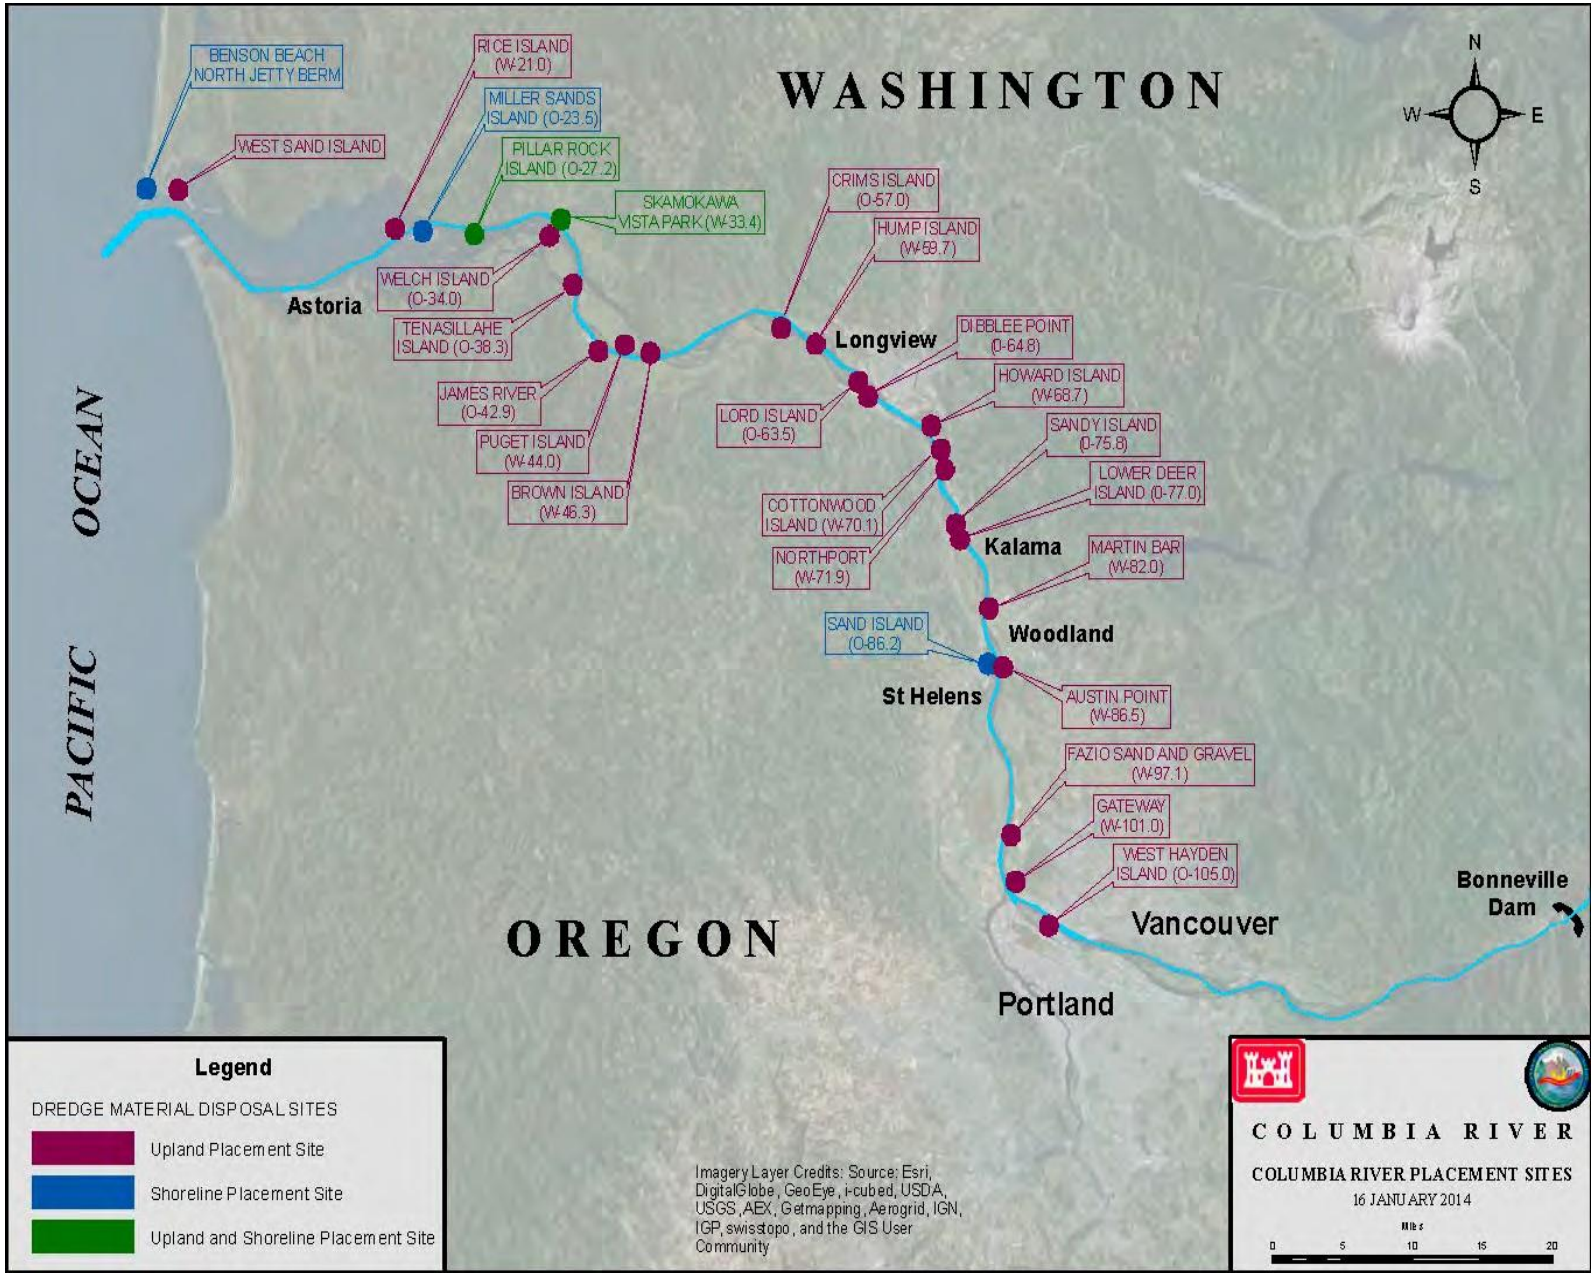

Figure 2: Upland and shoreline Dredged Material Placement Network in the Columbia River

Streaked horned larks are not distributed evenly throughout the Columbia River or across all placement sites, where some sites host a large proportion of the local population (Rice and Brown Islands) and other sites have very few, if any, birds. For the purpose of this document, placement sites were grouped together to describe changes to habitat within specific sections of the river. Six groups were identified as biologically relevant and within operational flexibility for the O&M program, and include the following placement sites:

- Group 1: Benson Beach intertidal site and West Sand Island
- Group 2: Rice, Miller Sands, and Pillar Rock Islands
- Group 3: Skamokawa – Vista Park, Welch and Tenasillahe Islands, James River, Puget and Brown Islands
- Group 4: Crims and Hump Islands, Lord Island (upstream), Dibblee Point, Howard and Cottonwood Islands, and Northport
- Group 5: Sandy and Lower Deer Islands, Martin Bar, Sand Island, and Austin Point
- Group 6: Fazio Sand & Gravel, Gateway, and West Hayden Island

DESCRIPTION OF THE PROPOSED ACTION

The proposed action entails the continued operation and maintenance of the CR FNC and upgrading the existing placement network and operations to meet current and projected dredged material placement needs for the next five years. As part of the proposed management of material placement, the maintenance of the placement network includes pre-placement conservation measures to minimize potential impacts of placement, post-placement redistribution of sediment, and routine dissuasion of colonial nesting birds to preclude nesting on active placement sites in order to minimize adverse effects. Additionally, the placement of dredged materials on previously unsuitable habitat will be beneficial by creating denuded areas, which will transition into suitable breeding habitat for SHLA.

Appendix B provides a general description by which the Portland District Corps conducts dredging and placement activities in the Columbia River. The appendix briefly describes the different types of dredges (hopper, pipeline, clamshell, and backhoe), placement sites (in-water, ocean, upland, and shoreline), and best management practices performed during dredging, as well as site descriptions for the upland and shoreline dredged material placement network.

There are seven individual features of the proposed action discussed at length below, including:

- Pre-placement site preparations and modifications
- Dissuasion of avian species
- Dredging and in-water placement
- Upland and shoreline placement: 5-year placement plan
- Post-placement site modifications
- SHLA monitoring
- Communication and Coordination

All actions will necessarily be specific to each dredged material placement location, but would generally include site preparations prior to placement, avian dissuasion actions (if necessary), followed by active dredged material placement and post-dredged material placement modifications, monitoring, and regular stakeholder meetings.

SITE PREPARATIONS

Prior to placement of dredged sediments, upland and shoreline sites may need preparation and/or modification to facilitate placement and minimize adverse impacts to sensitive species and habitat. There are two phases to site preparations: those that occur prior to the breeding season and those that occur immediately prior to placement of dredged material. In all cases, site preparations begin with delineation of the dredged material placement footprint by a Corps technical channel maintenance representative, dredge manager, and a Corps biologist.

The dredging season typically begins in June after the spring freshet has subsided. This coincides with the breeding season for nesting and migratory songbirds, whereupon nesting begins at upland locations in the early spring in March and April. If vegetation (trees, shrubs, forbs) is present in the dredged material placement footprint and is used for nesting, nestlings and juvenile songbirds could be directly impacted from dredged material placement later in the summer (June through September). To minimize adverse impacts to songbirds in the dredged material placement footprint, vegetation would be mechanically removed via a bulldozer or similar equipment, piled on the site, and if possible, buried in the dikes or berms in the late winter/early spring prior to the onset of the breeding season. Only vegetation within that year's dredged material placement footprint, and any staging/stockpile areas, or access routes would be removed during site preparations.

Depending on the dredged material placement schedule (presented and discussed later), each site will need to be evaluated prior to placement to assess the suitability of the area for SHLA and document the presence/absence of any birds. A protocol will be based on established survey methods or the most recent site information. If upland or shoreline sites have high site use by SHLA, early site preparations would occur in the winter/spring prior to the lark nesting season and may include site grading by earth-moving equipment, and trenching or mounding of sands for dissuasive purposes. As a ground dwelling bird, SHLA prefer open space with a clear view of their surroundings. Mounding or trenching of dredged materials throughout a placement site substantially reduces the line-of-sight available to birds from the ground, resulting in an area that may be less appealing for nesting and foraging than nearby areas which provide better visibility. If a dredged material placement site is scheduled for use in any particular year, making a site unsuitable by trenching or mounding sands could minimize adverse affects associated with dredged material placement during the breeding season.

For example, if Tenasillahe Island is used for dredged material placement in June, site preparations would clear and remove vegetation in February or March before songbirds have an opportunity to initiate nesting in the dredged material placement footprint. Similarly, off-loading, staging, stockpile areas and all access roads used during material placement will be evaluated prior to placement. If these secondary use areas are not contained within the dredged material placement footprint, these areas will be evaluated and prepared in the same manner as the dredged material placement area to minimize adverse effects to SHLA and nesting songbirds.

As a preventative measure to preclude site use by terns and cormorants, sands were mounded and trenched following placement activities in 2011, 2012, and 2013 at Miller Sands Island and Rice Island (see Figure 3). While neither site was regularly monitored following mounding/trenching, it is hypothesized that the reduced visibility decreased site nesting by larks and other birds, including Caspian terns, double-crested cormorants, and American white pelicans. Where mounding or trenching occurs during the five-year implementation plan, a monitoring plan (presented and discussed later) will evaluate the efficacy of these actions in precluding site use and minimizing direct adverse effects to avian species during the nesting season.

Figure 3: Trenches on Rice Island (left) and mounding on Miller Sands Island (right)

It should be noted that it is not the intent of the dredging program to make all dredged material placement sites unsuitable in every year. Rather, only those portions of sites that are suitable in any given year ***and*** are proposed for use during the breeding season will be modified to preclude active SHLA use during the breeding season. Ideally, a shifting mosaic of suitable nesting habitat on a particular site and across the Network would be available for SHLA use while only a portion of some sites are actively prepared for dredged material placement (and therefore unsuitable) in any given year. At sites with high human activity (sand mining/borrow sites, public recreation, agriculture, heavy machines, storage, etc.) where there are no avian species concerns, early site preparations may not be necessary to preclude effects to larks during placement activities because nesting birds are highly unlikely to be present in these areas.

Where site preparations are deemed necessary, earth-moving equipment (bulldozers, tractors, etc.) is used to construct berms and dikes around the perimeter of upland dredged material placement areas to contain the slurry mixture as it is discharged from the incoming dredged material pipe (see Figure 4). In addition, the site is graded to maximize the capacity of the dredged material placement footprint (see) and provide space for the settling ponds.

Figure 4: Site preparations and dike building for placement of dredged materials (at Northport).

If there is not sufficient water depth for the equipment barge to land at an existing shoreline, a landing ramp and access road would be constructed from material on the placement site to gain access to the island (see Figure 5). Some shoreline grading at the landing location may also be

necessary to facilitate equipment access to other portions of the island. Typical site preparations at upland sites include grading a slope for the incoming dredged material pipe (see Figure 6).

Figure 5: Typical build-out of a barge landing (Rice Island)

Figure 6: Grading slope for incoming dredged material pipe

Site preparations may take anywhere from several days to several weeks to complete, depending on the existing condition of the site. If a site has little-to-no vegetation, was used recently where some berms or dikes remain in place, the necessary site preparations would be minimal and could be completed within 1-3 days. Conversely, if a site has substantial vegetation and/or has not been used recently, preparations could take several weeks to clear vegetation, construct dikes and re-grade the area for dredged material placement.

Prior to placement of sediments in the summer/fall, additional site preparations at all sites would include the staging, stockpiling and placement of pipes and valves for sediment discharge. When pipes and other material are not stockpiled on the landing barge, they are stockpiled in the staging area within or near the placement footprint. Unless there are permanent weirs (i.e. Gateway and West Hayden Island) and outfall pipes on site, temporary weirs and outfall pipes are re-used as the dredge moves from site to site (see Figure 7 and Figure 8). At upland sites requiring the installation of temporary weirs and outfall pipes, these actions will occur immediately prior to placement and disassembly would occur immediately after placement.

Figure 7: Weir and berm structure, in operation on Rice Island

The combination of riverine processes, river flows, waves, and tidal effects naturally erodes material from shorelines. As described in Appendix B, beach nourishment is a method of replenishing material that has eroded away from shorelines and is conducted as needed. Beach nourishment or shoreline placement occurs at the sand/water interface, not in open water. Shoreline placement operations differ from beach nourishment operations in that the premise of placement is also used to directly protect a Corps asset. For example, shoreline placement is conducted when the integrity of an upland placement site is compromised by rapidly eroding shorelines. However, for the purposes of this document, shoreline placement and beach nourishment are used interchangeably with regards to placement methodology.

Shoreline sites (listed in Table 2: Upland and Shoreline Dredged Material Placement Network) typically experience substantial erosion between dredged material placement events. Each shoreline site experiences varying rates of erosion and replenishment needs range from annual for areas with high erosion to periodic (every 3 to 5 years) for sites with less erosion. Because shoreline sites are used at higher frequencies for placement and are exposed to erosion, little vegetation typically becomes established between dredged material placement events. However, because SHLA and other ground-dwelling songbirds prefer habitats with minimal vegetation, these areas could provide suitable breeding and foraging habitat in the interim.

Figure 8: Outfall pipes returning water back to river after dredged material has settled out, Rice Island

Furthermore, equipment, vehicles and pipes are staged above the scarp of the existing dredged material placement footprint at shoreline placement sites prior to actual sediment placement (see Figure 9). These staging areas are typically 50 feet by 90 feet (~0.10 acre) and are located as close to the shoreline as safely feasible. During placement inspections, the exact location of the 0.10-acre staging area can be located to avoid or minimize impacts to SHLA. Similar to site preparations at upland sites, early preparations may be necessary in the upland areas at shoreline sites to accommodate the staging area. The remaining activities occur during active placement (discussed later).

Figure 9: Staging equipment on top of the bank at Sand Island Shoreline Placement Site

DISSUASION

It is anticipated that in some instances dissuasion will be necessary to preclude use of the site by larks, Caspian terns (*Hydroprogne caspia*, formerly *Sterna caspia*), and/or double-crested cormorants (*Phalacrocorax auritus*) during the breeding season when it overlaps with dredged material placement (larks) or when required by NMFS 2012 BiOp T&C (Caspian terns and double-crested cormorants). Management activities can be categorized into three actions: hazing; physical barriers or obstructions; and habitat modification to discourage nesting, roosting, and/or foraging behavior. All management actions will comply with local, state, and federal regulations. As necessary, multiple management measures will be used in conjunction to increase the effectiveness of dissuasion in order to minimize adverse effects to birds during placement activities.

CORMORANTS AND TERNS

The Pacific Flyway Council has outlined a management strategy for double-crested cormorants to be implemented at the local, regional, and flyway scale (Pacific Flyway Plan 2012). The localized strategies are relevant and appropriate for implementation with the dredging program in the Columbia River estuary for cormorants, as well as Caspian terns and other piscivorous species. The peak nesting season for these species begins in mid-April and culminates in June, though nestlings may be present through August and September. Hazing will be conducted, where necessary, to prevent terns and cormorants from establishing nest colonies on islands in the Network (as described below). Hazing activities, including the use of frightening devices, decoys, scarecrows, visual and/or auditory deterrents, human disturbance, dogs, lights, and/or water cannons are best used in combination with other methods to ensure lasting effects.

Caspian terns formerly had a nest colony on the west (downstream) portion of Rice Island which was later moved downstream to East Sand Island in 1999 and 2000. Following the move to East Sand Island, dissuasion activities on upland placement sites in the Network are implemented regularly to prevent nesting by terns and cormorants as required by the NMFS 2012 BiOp, specifically T&C 1(k) that states, "monitor upland disposal sites during the nesting season. Discourage any avian predators that are found nesting at an upland disposal site, consistent with the Migratory Bird Act." Dissuasion activities occurred (as necessary) at the placement sites on Rice, Miller Sands, and Pillar Rock Islands, as these are the locations where terns have exhibited nesting behavior in recent years.

Between 2001 and 2003, terns were occasionally observed roosting, loafing, and displaying courtship/breeding behaviors on upland portions of Rice, Miller Sands and Pillar Rock Islands. Dissuasion materials (fencing, flagging, eagle silhouettes) were installed at Miller Sands and Pillar Rock Islands in 2004, 2005, and 2006, effectively discouraging terns from roosting or nesting in these areas. No birds were observed at Rice, Miller Sands, or Pillar Rock Islands in 2007 or 2008, but terns did initiate nesting at Rice Island in 2009, and the eggs were collect using a depredation permit from the USFWS; no further nesting attempts were made in 2009 following egg collection.

In all previous years, dissuasion materials were installed at the former colony site at the west end of Rice Island prior to the beginning of the nesting season to discourage terns from nesting. In 2010, this area became completely vegetated and consequently unsuitable for nesting terns. However, terns were observed in an upland area east of the former colony site in 2010, whereupon stakes and flagging were installed which effectively deterred nesting at Rice Island; no terns were observed at Miller Sands or Pillar Rock Islands in 2010. There was no suitable habitat for tern nesting at Miller Sands or Pillar Rock Island in 2011, 2012, or 2013, and terns were only observed in upland areas at Rice Island, from which they were subsequently hazed.

With regards to the proposed 5-year placement plan, if dissuasion is needed in the dredge placement network, physical barriers could be employed to preclude site use when regular human presence is not feasible. Following successful dissuasion, these materials (nets, ropes, silt fencing, etc.) may be dismantled and reused in other areas as needed. Only non-lethal dissuasion practices will be implemented for adult terns and cormorants. These dissuasion activities could occur and overlap spatially and temporally with SHLA nesting. Currently, Rice Island has habitat conditions which are suitable for tern nesting, but these areas do not overlap spatially with suitable habitat areas for SHLA. Pillar Rock Island has some habitat areas that are marginally suitable for tern nesting, and these areas overlap with the suitable habitat that is available for SHLA.

Where tern nests are discovered before egg-laying has been initiated, nests would be manually brushed over to eliminate the nest. Where tern egg laying has occurred, the Corps has a contract to collect tern eggs under a USFWS Migratory Bird Permit (permit # MB209988-0) from Rice, Miller Sands, and Pillar Rock Islands. Studies have shown that birds disperse to other nearby nesting areas when nests and eggs are repeatedly destroyed and birds are continually harassed early in the breeding season (Pacific Flyway Council 2012).

If birds are present and exhibit nesting or breeding behavior, the person monitoring would haze the birds from the area, destroying nest scrapes, collecting eggs (as permitted), and would follow these actions by immediately installing dissuasive materials. Wooden stakes at least three feet would be installed with flagging secured to the stakes to scare birds from the area. Flagging would be a minimum of two feet in length, and stakes shall be placed 10 feet apart. Polyester roping may be used in conjunction with the flagging to further preclude the habitat available to birds. All survey and monitoring efforts will be standardized to the extent possible to ensure consistency of information and detections. A proposed monitoring plan is presented and described later in this document, and includes monitoring the effectiveness of dissuasion actions on deterring terns and cormorants, as well as precluding site use by SHLA where it is deemed necessary.

LARKS

Recent observations have shown that some areas become suitable for SHLA less than 12 months following dredged material placement if sufficient organic materials are present in the dredged sediments to support vegetation growth (Anderson 2013). Similarly, it is anticipated that areas where dense vegetation currently makes an area unsuitable for larks could become suitable within the breeding season immediately following vegetation removal during site preparations in the spring. These same areas may also be or could become suitable for nesting or roosting by Caspian terns and double-crested cormorants.

To prevent larks from using areas that are prepared in the spring (prior to mid-April) for dredged material placement during the active breeding season (mid-April – mid-August), habitat modifications and/or physical barriers may be used to dissuade larks. Habitat modifications could be implemented to reduce the availability of nesting habitat, as well alter a site's suitability. It is proposed that trenching or mounding, as described above, effectively alters the suitability of a site for birds preferring habitats with minimal vegetation and expansive open habitat. Tree and vegetation removal, altering the density of vegetation, and modifying the topography of a site are all methods that could passively dissuade use of a placement site between dredged material placement events. Both vegetation removal and modifications to site topography would involve mechanical methods (bulldozers). Ropes and flagging may be installed at a site immediately following vegetation removal. Physical barriers and visual deterrents (nets, fencing, ropes, flagging, screens, etc.) can minimize the area available for nesting and roosting, effectively dissuading nesting behavior through passive means.

DREDGING AND IN-WATER PLACEMENT

The CR FNC projects are maintained by regular O&M dredging to provide reliable deep-draft navigation. Each year, the Corps dredges 3-5 million cubic yards (CY) of sediment at the Mouth of the Columbia River to maintain the inlet's 6-mile long deep-draft navigation entrance channel and approximately 6 to 9 million cubic yards of material from the lower Columbia River with placement at in-water, ocean, upland, and shoreline dredged material placement sites. The annual dredging plan is based on up-to-date survey data collected regularly and frequently throughout the year.

Unusually high and sustained spring flows occurred in 2011 and 2012 and it is unknown where "typical" shoaling will occur with the deepened channel from RM 3 to 106.5. In addition, it is also unknown what potential volumes of sediment will need to be removed from the deeper channel and placed in upland or shoreline areas. The proposed action forecasts dredging and placement need based on the best available information.

A general description of dredging and placement activities is described in detail in Appendix B.

DREDGED MATERIAL SEDIMENT QUALITY

Sediments from the federal navigation channels are evaluated to determine if they are acceptable for in-water unconfined placement according to the requirements of the Clean Water Act and the Marine Protection, Research, and Sanctuaries Act. The Corps has characterized sediments to be dredged in accordance with the regional and national dredge material testing manual protocols, Ocean Testing Manual, Inland Testing Manual, 2009 Northwest Regional Sediment Evaluation Framework (SEF), and previously under the 1998 Dredge Material Evaluation Framework (DMEF).

Project sediment testing is typically performed on the mainstem Columbia River on a 10-year rotational cycle unless an event occurs that would warrant more frequent sampling. The 10-year rotation allows for the continued, even management of both budget and labor while providing sediment quality information to allow dredging to proceed unobstructed. Projects dredged less frequently, such as the auxiliary side channel projects, are evaluated, sampled, and tested as required by the SEF. A brief description of recent sediment quality sampling results is provided below for the Action Area.

- Mouth of the Columbia River (MCR) FNC (RM -3 to RM 3) – The sediments tested in 2008 at the MCR averaged 98.5% sands and 1.5% fines.
- Columbia River FNC, deep draft channel and associated turning basins (RM 3 to RM 106.5) – The 2008 analyses indicated a mean grain-size of 92% sand. Total organic carbon averaged 0.25%. The Oregon Slough reach of the deep-draft channel was tested in 2005. Mean grain size for all the samples is 0.40 mm, with .037% gravel, 48.15% sand, 41.925% silt, and 9.875% clay.
- Columbia River FNC, Vancouver, Washington to Bonneville Dam (RM 106.5 to RM 145) – The 2009 analyses indicated a mean grain-size of 99.9% sand and gravel.
- Portland/Vancouver Anchorage Project – There is currently no shoaling in the anchorages to test. If shoaling develops, the site will be evaluated under the SEF prior to dredging.
- Columbia River FNC, side channels:
  - Baker Bay (tested in 2009) – Materials are primarily fine-grained that have settled out of the Columbia River.
  - Chinook Channel (tested in 2008) – The material is less than 25% sand, with the outer channel averaging 19.3% sand and 81.0% fine-grained material. The inner channel averaged 1.5% sand and 98.1% fine-grained material.

- Hammond Boat Basin (tested in 1994) – The samples were sandy, clayey, silts. They averaged 10% sand, 18% clay and 72% silt. The median grain size for the samples varied from medium to coarse silt.
- Skipanon (tested in 2003 and 2013) – The post dredge sampling materials from 2013 are predominately fine-grained, with approximately 83.6% fines. The 2003 physical analyses indicated mean values of 23.9% sand and 76.1% silt/clay.
- Skamokawa Creek (tested in 1992) – Sediments are primarily sandy silt with concentrations of silt and clay, up to 22%.
- Wahkiakum Ferry (tested in 2006 and 2013) – This channel is part of the main Columbia River channel and in 2006 it was predominately sand, with 1.2 % fines. Sampling results from 2013 for the channel re-alignment are in preparation and review under the SEF.
- Westport Slough (tested in 2006 and 2013) – The 2006 analysis indicates the material is 66.4% sand and 33.8% silt and clay. Sampling results from 2013 are in preparation and review under the SEF.
- Old Mouth Cowlitz (tested in 2006) – The material is mostly silty sand of 96% fines.
- Upstream Entrance to Oregon Slough (tested in 2005) – Analysis indicate the material ranges from poorly graded sand to silty sand with an average of 94.28 % sand and 5.67 % fines.

The detailed results of the characterizations highlighted above are available upon request. Based on these results, the dredged materials have been determined suitable for unconfined aquatic placement without further testing.

UPLAND AND SHORELINE DREDGED MATERIAL PLACEMENT

OVERVIEW

The Columbia River has not yet stabilized following the completion of channel improvements in 2010, and by necessity, the Network needs to be fully utilized to accommodate the increased volumes of dredged material removed from shoals in the Columbia River. To meet this need, the Corps is proposing to continue placing dredged materials on the existing dredged material placement network, including the addition of shoreline placement at Pillar Rock as described previously. This allows for strategic management of dredged material for conservation and operational purposes. The careful management of the Network will allow for greater flexibility for the CR O&M program, as well as create suitable habitat for larks.

SHORELINE PLACEMENT

Shoreline placement involves pumping dredged material through a floating discharge pipe from the pipeline or hopper dredge (see Figure 10). The material is pumped to an existing shoreline where placement occurs at the sand/water interface (not in open-water). As described in the site preparations, the dredge first pumps a landing area on the shoreline to establish a point from which further material placement occurs. Dredged material is then pumped out in sand and water slurry (about 20% sand) and as it exits the shore pipe, sand settles out along the shoreline while water returns to the river (see Figure 11). A temporary sand berm is constructed to retain sand on the beach during pump-out, otherwise, much of the sand would immediately be lost to the river. Settling rates of Columbia River sands are very quick and turbidity from the operation is minimal.

Figure 10: Active shoreline placement at Sand Island (looking upstream)

Figure 11: Active shoreline placement at Sand Island (looking downstream)

The temporary berms are typically 5 feet high and 12 feet wide at the base. The berms are built gradually by earth-moving equipment as pump-out continues and are created from existing beach sand, pumped sand, or both. After sufficient sand has settled out and begins to increase in height, the settled sand is moved by bulldozers to match the elevation and profile of the existing shoreline at approximately the high water line. This process continues by adding to the shore pipe and proceeding longitudinally along the shoreline.

A typical beach/shoreline placement operation lasts from 5 to 15 days and the typical width of the created shoreline is approximately 100 to 150 ft, but may vary slightly depending on site and river

conditions. The length of shoreline replaced is dependent on the quantity of material to be dredged from the shoal in the channel and the available capacity within the placement footprint. After shoreline placement has completed, the slope of the shoreline is groomed by mechanical equipment (bulldozers) to a steepness of 10% to 15% to prevent the possibility of creating areas where juvenile fish could be stranded from vessel wakes on the new shoreline.

UPLAND PLACEMENT

Upland placement of dredged material is conducted via clamshell, hopper, and pipeline dredges, and earth-moving equipment (bulldozers, backhoes, etc.) to manage sediment placement. Regardless of type of dredge used, the earth-moving equipment may be barged in or driven in, depending on site accessibility. When equipment is barged in, the barge(s) is maneuvered to the shoreline where it is anchored for the duration of the operation. As discussed in site preparation, a wide sand berm is constructed from the barge to the placement site for movement and transfer of equipment.

While the method of discharge is similar to shoreline placement, upland placement requires extension of a pipeline from the dredge to a location in the placement site that is higher in elevation (see Figure 12). To maintain the stability and integrity of the pipeline, it is placed to rest against the berms that were constructed during site preparations. The sand-water slurry flows downhill from the discharge point toward the settling pond and weirs, which are lower in elevation than the discharge pipe (see Figure 13). There may be several discharge points (controlled by a valve) to better manage the incoming dredged material and use multiple settling pond configurations to ensure sufficient time for sediments to settle out before the water returns to the river.

Figure 12: Active dredged material placement at Martin Bar Upland Site

Figure 13: Active discharge of sand and water dredged material slurry at Rice Island Upland Site

If a clamshell dredge places material on a barge for upland placement, the material is off-loaded at a transfer point for placement at an upland site. Hopper and pipeline dredges pump dredged material in sand-and-water slurry directly into the diked, upland site. Discharge of water from upland sites back into the river is controlled by the use of weirs. The landward end of the pipe is moved by a bulldozer at regular intervals to minimize unintentional mounding on the site. In addition, sediment is maneuvered regularly during placement to facilitate flow and drainage of the slurry mixture across the site, maximizing settling and sediment accretion.

FIVE-YEAR DREDGED MATERIAL PLACEMENT PLAN

Recent surveys of the placement sites indicate site capacity varies by site and placement activities may fill a site to capacity. The pipeline dredge will likely be capable of pumping material farther and higher on upland placement sites due to a planned engine overhaul, increasing the Corps' ability to place dredged material on sites that were not previously viable or feasible. Table 3 below provides the estimated placement volumes in thousands of cubic yards (kCY) and estimated acres of each placement in the next five years, from 2014 through 2018.

The estimated volumes and acreages take into consideration the maximum feasible amount of placement based on equipment limitations, anticipated shoaling, site-use logistics based on past and future placements, and anticipated funding. Actual placement volumes and areas may be less due to limited annual funding and shoal development. In total, approximately 17,270,000 CY of dredged material will be placed at 20 of 26 sites over the next five years. Of that total volume, approximately 3,750,000 CY will be placed across four shoreline sites (Miller Sands, Pillar Rock Island, Skamokawa – Vista Park, Sand Island) over the next five years. The six sites not planned for use by the Corps for placement in the next five years (Benson Beach, Dibblee Point, Northport, Sandy Island, Austin Point, and Fazio Sand & Gravel) will remain in the Corps' planning for long-term placement.

Appendix B provides information on site history, existing site conditions, recent placements of dredged materials, and known SHLA use for each site within the Corps' Network. Figures for each site's placement plan over the next five years relative to suitable SHLA nesting conditions are

located in Appendix C. Placements of dredged material and availability of suitable SHLA nesting habitat on each designated critical habitat subunit in the Network are displayed on figures located in Appendix D.

The following narrative summarizes the proposed dredged material placement activities across the Network by year.

Eight (8) sites will be used in 2014, totaling approximately 3,150,000 CY over 281 acres. Approximately 700,000 CY will be shoreline placement at the Miller Sands and Pillar Rock Island sites, combined. Table 4 provides the Corps' estimated sequence and timing of placement during the 2014 dredging season. The placement sequence assumes 25,000 CY will be placed daily, working five to seven days a week, and requiring three days to move between work areas. The sequence for each subsequent dredging year will be estimated during each year's annual coordination meeting with the USFWS.

Table 4: Estimated 2014 Dredged Material Placement Sequence

Site	Volume (CY)	Area (acres)	Timing	Notes
Tenasillahe Island	400,000	14	During SHLA nesting	Need early season site prep to remove vegetation and install SHLA dissuasion
Pillar Rock Island	500,000 (Shoreline)	26	During SHLA nesting	Shoreline placement with 0.10-acre staging site
Hump Island	300,000	65	During SHLA nesting	Need early season site prep to remove vegetation and install SHLA dissuasion
Martin Bar	250,000	23	During SHLA nesting	South parcel only, no SHLA or migratory bird nesting at borrow site
Miller Sands	200,000 (Shoreline)	6	During SHLA nesting	Shoreline placement with 0.10-acre staging site
Rice Island	650,000	53	After SHLA nesting	Site prep on west end to remove vegetation with tern dissuasion
Brown Island	500,000	68	After SHLA nesting	Site prep to remove vegetation, no dissuasion
Cottonwood Island	350,000	26	After SHLA nesting	Site prep to remove vegetation, no dissuasion
2014 TOTAL	3,150,00	281		

In 2015, nine (9) sites will be used, totaling approximately 3,450,000 CY over 400 acres. Approximately 1,100,000 CY will be shoreline placement at the Miller Sands, Pillar Rock Island, and Sand Island sites, combined.

In 2016, nine (9) sites will also be used, totaling approximately 3,350,000 CY over 324 acres. Approximately 950,000 CY will be shoreline placement at the Miller Sands and Pillar Rock Island sites, combined.

In 2017, nine (9) sites will be used, totaling approximately 3,200,000 CY over 372 acres. Approximately 800,000 CY will be shoreline placement at the Miller Sands, Skamokawa-Vista Park, and Sand Island sites, combined.

In 2018, nine (9) sites will be used, totaling approximately 4,120,000 CY over 365 acres. Approximately 200,000 CY will be shoreline placement at the Miller Sands site.

The availability of SHLA breeding habitat during the next five years is affected by specific site characteristics and landscape context, recent site modifications, vegetation succession, other human site uses, and planned site preparation and placement actions. Each placement site is

evaluated annually to assess the amount of habitat available for nesting, the amount of habitat that is unsuitable, and the amount of habitat yet-to-be suitable for nesting in any given year[1]. Finally, SHLA are not likely to completely use a site because they require a buffer of open space between the habitat edge and actual nest sites. This buffer to the river's edge, taller vegetation, or a riparian edge is approximately 25 meters (Anderson 2013).

As described above, site preparations and placement of dredged materials removes or buries all vegetation in the placement footprint. Habitat in the placement footprint is then considered yet-to-be suitable because the area is devoid of all vegetation (>90% bare sand). If left undisturbed, these areas are assumed to transition into suitable SHLA nesting habitat conditions after sufficient time has elapsed for vegetation to become established following placement. Once areas have developed into suitable habitat, it is further assumed they will remain suitable for a given number of years, based on the amount of time it takes for vegetation to grow and exceed 50% cover. It should also be noted that without placement of dredged materials, many areas would transition into unsuitable SHLA nesting habitat and these areas would remain unavailable to SHLAs until habitat conditions change through other disturbance mechanisms. The Corps' placement of dredged materials is therefore a crucial disturbance event for maintaining suitable breeding habitat for SHLA on upland placement sites.

Upland placement events at Rice Island, Skamokawa-Vista Park, James River, Puget Island, Howard Island, and Sand Island typically occur late in the summer, after the SHLA nesting season ends in mid-August/early-September. Therefore, placement events at these sites are not expected to interfere with active SHLA nesting during the breeding season. All other sites are assumed to have placement occur during the breeding season, which may affect SHLAs if they move into the placement footprint and initiate nesting after the Corps has conducted site preparations and dissuasion activities.

It should also be reiterated that habitat conditions on Rice, Miller Sands, and Pillar Rock Islands transition slower than on the other islands farther upstream. It is assumed that vegetation succession takes three growing seasons following placement to transition into suitable nesting habitat, such that the placement area is suitable at the beginning of the fourth year after placement. Since vegetation establishment and growth is reduced in the lower river due to high winds and harsh growing conditions, suitable nesting habitat is assumed to remain viable for a duration of 12 years at Rice, Miller Sands, and Pillar Rock Islands.

For all other sites (Skamokawa – Vista Park upstream to West Hayden Island), it is assumed that vegetation only takes one full growing season to develop into suitable nesting habitat. Placement areas would then be available as suitable nesting habitat at the beginning of the breeding season in second year following placement if no additional disturbance occurs. This suitable habitat is assumed to remain viable for a duration of 6 years (Anderson 2013).

To maintain consistency with recent information and observations about SHLA in the Columbia River, the Corps used Normalized Difference Vegetation Index (NDVI) data that was collected and classified as part of an analysis to identify suitable nesting habitat throughout the lower river for the USFWS (Anderson 2013). The Corps has taken into account additional Corps' placement actions in 2011, 2012, and 2013 to establish the 2014 suitable SHLA nesting habitat baseline across the network. Since this consultation covers five years and baseline conditions for suitable habitat are

[1] Unsuitable areas are assumed to be those areas not affected by the placement of dredged materials, but which are also not suitable for nesting SHLA. This includes areas with dense vegetation (trees, shrubs, grasses, forbs), rocks, wetlands, beach and shorelines that are tidally-influenced daily, etc.

based on NDVI data collected in 2011, some areas may transition beyond suitability if placement activities do not occur to restart vegetation succession that benefits SHLA.

The following narrative and Table 5 details the acreages of currently available suitable SHLA nesting habitat, placements of dredged material, regrading events, and the shifting mosaic of yet-to-be suitable to suitable to unsuitable SHLA nesting habitats on each of the Network sites from 2014 through 2018. Sites without planned placements are included because a few sites provide suitable SHLA nesting habitat during the next five years. Figures for each site's placement plan over the next five years relative to suitable SHLA nesting conditions are located in Appendix C.

* Denotes placement areas/islands designated as critical habitat.

[1] Baseline suitable in 2014 equal the extent of habitat which is suitable for SHLA at the beginning of the breeding season based on the best scientific information available (Anderson 2013). In addition, the area is calculated by subtracting a 25m buffer from the edge of shorelines, unsuitable vegetation (trees, shrubs). While larks are known to forage in these areas, they are not known to nest and breed in these areas.

[2] Suitable habitat loss is defined as those areas where placement or pre-season site-preparation activities affect suitable habitat, thereby making these areas unsuitable during the given breeding season.

[3] Baseline suitable for 2015, 2016, 2017, and 2018 are estimates of suitable habitat at the beginning of the breeding season. These values are assumed to equal the quantity of suitable habitat remaining from the preceding year plus any areas that become suitable from previous placement events. Where placement occurs after the breeding season, any loss of suitable habitat acres are not realized until the beginning of the following breeding season, and thus reflected in the baseline suitable conditions.

[4] 2016 placement on Brown Island will occur during the nesting season, thereby reducing available suitable nesting habitat during the 2016 nesting season

NETWORK SCALE

Figure 14 below summarizes how SHLA nesting habitat changes throughout the Network due to the 5-year placement plan as detailed in Table 5. The entire Network totals 1,826 acres that are categorized as suitable habitat, yet-to-be suitable habitat, or unsuitable habitat based on the assumptions discussed above. The 2011 NDVI habitat data, Corps placement events in 2011, 2012, 2013, and placement events during the 2014 nesting season are included in the baseline information for the analysis. Of the 1,826 acres in the Network, only 315 acres (17% of total upland placement area) are considered suitable SHLA nesting habitat at the time of its listing under the ESA in October 2013.

Following the placements in 2014, the suitable habitat acreage of the Network will initially experience a reduction (-0.3%) of suitable habitat during the 2014 breeding season, for a total of 314 acres available in 2014. Dredged material placement and/or habitat succession results in an initial decrease of 73 acres (-23%) o suitable habitat during the 2015 breeding season as compared to 2014, for a total of 241 acres available in 2015.

Following placement activities in 2015, the acreage of suitable habitat available increases in 2016, 2017, and 2018 across the Network. Dredged material placement and/or habitat succession results in an increase of 24 acres (+10%) of suitable nesting habitat during the 2016 breeding season as compared to 2015, for a total of 265 acres available in 2016. Dredged material placement and/or habitat succession results in an increase of 209 acres (+79%) of suitable habitat during the 2017 breeding season, as compared to 2016, for a total of 474 acres in 2017. Dredged material placement and/or habitat succession results in an increase of 169 acres (+36%) of suitable habitat during the 2018 breeding season, for a total of 643 acres of suitable habitat available across the Network in 2018.

Overall, suitable SHLA nesting habitat will increase by 328 acres (+104%) from 315 acres in 2014 to 643 acres in 2018. Additionally, the acreage of yet-to-be suitable nesting habitat increases by 250 acres, from 21 acres in 2014 to 271 acres in 2018 (+1,190%) across the Network. Unsuitable habitat will decrease by 579 acres from 1,491 to 912 acres, a reduction of -39%. Therefore, at the Network scale, the upland placement of dredged materials is essential for suitable SHLA nesting habitat in the lower Columbia River, which will aid in the recovery of the species.

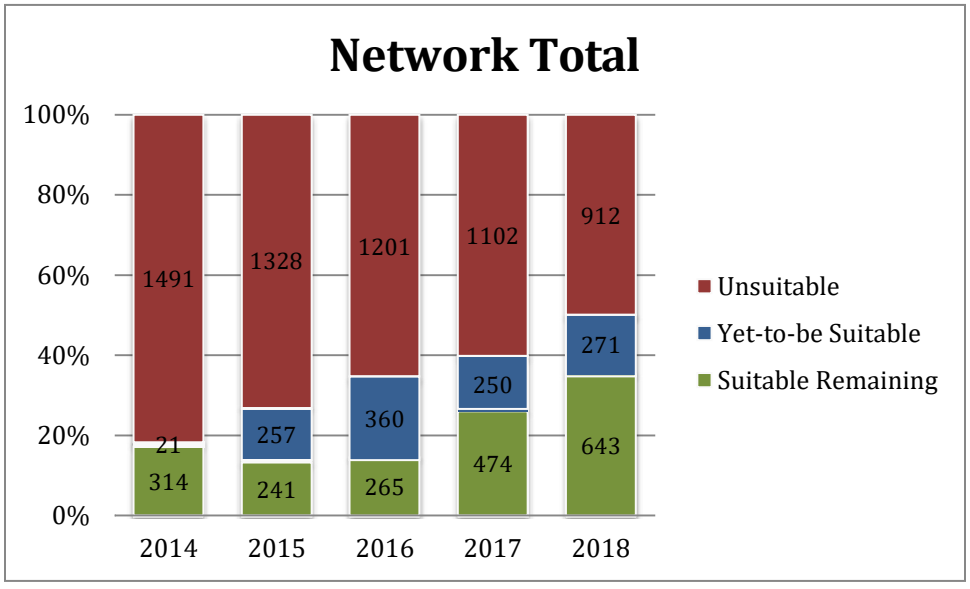

Figure 14: Transition of Suitable SHLA Nesting Habitat throughout Network, 2014-2018

INDIVIDUAL PLACEMENT SITE SCALE

BENSON BEACH (PACIFIC OCEAN)

No placement is planned on the 27-acre Benson Beach intertidal site on the Pacific Ocean during the 5-year placement plan. No suitable SHLA nesting habitat is known or expected to develop over the course of this consultation, as shown in Figure 15 below.

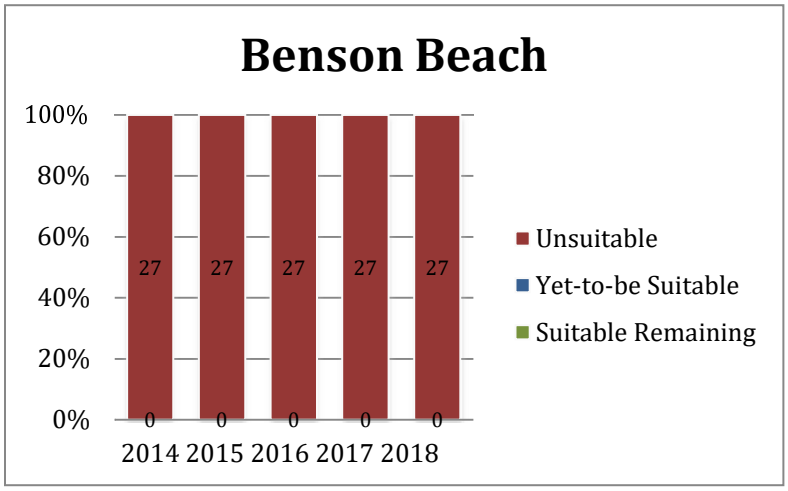

Figure 15: Availability of SHLA Nesting Habitat on Benson Beach, 2014-2018

WEST SAND ISLAND (RM 3.1)

This site is 83 acres and has no suitable SHLA breeding habitat currently available due to extensive site vegetation. Placement would occur during the summer in-water work window. In 2018, or earlier if needed, dredged material will be placed on the entire 83-acre site using a pipeline dredge. This will require early spring removal of existing vegetation and installation of SHLA dissuasion measures. If practicable, following placement the site will be replanted with native vegetation that will not affect the native dune-grass community south of the placement site. No suitable SHLA nesting habitat is available or is expected to develop over the course of this consultation at West Sand Island, as shown in Figure 16.

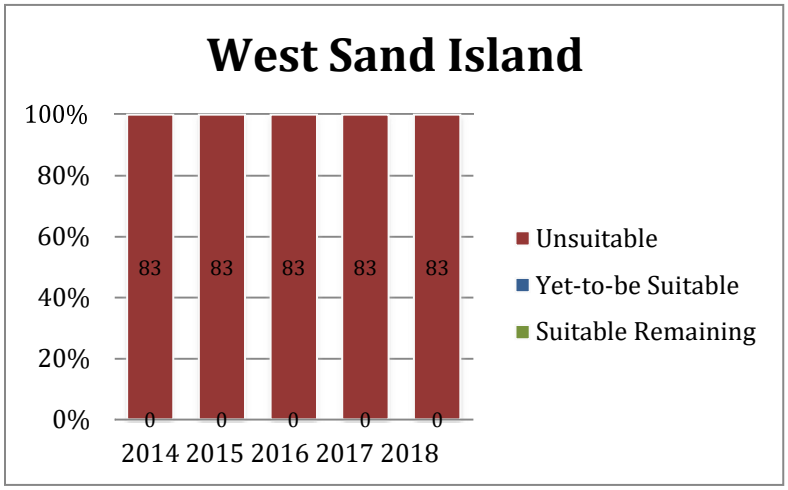

Figure 16: Availability of SHLA Nesting Habitat on West Sand Island, 2014-2018

GROUP I

Group I consists of two placement sites located at the mouth of the Columbia River: the Benson Beach intertidal site on the Pacific Ocean and the West Sand Island upland placement area. No suitable SHLA nesting is currently available within the 110 acres of Group I. The 83-acre placement on West Sand Island in 2018 will not result in a loss of suitable habitat or create suitable habitat because the site is revegetated with native plants. Group I will be unsuitable over the 5-year placement plan. No suitable SHLA nesting habitat is available or is expected to develop over the course of this consultation in Group I, as shown in Figure 17.

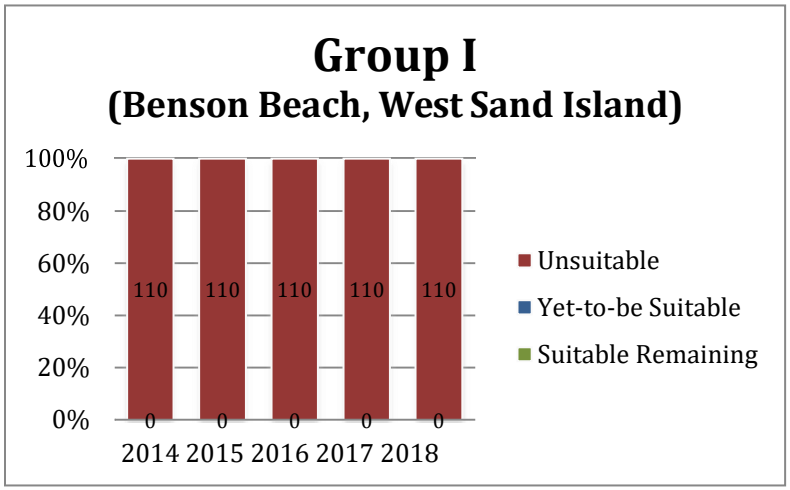

Figure 17: Availability of SHLA Nesting Habitat on Group I Sites, 2014-2018

RICE ISLAND (RM 21.0)

Placement events on the 264-acre Rice Island occur late in the summer, after the SHLA nesting season ends in mid-August/early-September. Therefore, placement actions on Rice Island are not expected to interfere with active SHLA nesting during the year of dredged material placement. Habitat conditions on Rice Island transition slower than on other islands farther upstream and it is assumed that vegetation succession takes three growing seasons following placement to transition into suitable breeding habitat in the fourth year after placement. In addition, because vegetation establishment and subsequent growth on dredged materials is reduced in the estuary, suitable SHLA nesting habitat conditions are assumed to remain viable for 12 years at Rice Island. The total succession cycle from placement to unsuitable is 15 years.

In 2014, the baseline of suitable breeding habitat is 150 acres with the remaining 114 acres of the site as unsuitable. The 2014 placement events will occur after the breeding season has ended and will cover a total of 53 acres of habitat currently classified as a mixture of suitable and unsuitable conditions, where 28 acres of suitable habitat will be covered. The placement events will occur in two locations on the island: (1) on the downstream end of the island which is currently covered by short vegetation, and (2) along a strip of low-ground in the interior portion of the island. In addition to the placement of dredged materials, 23 acres on the upstream end of the island, which was trenched following placement activities in September 2013, will be smoothed out after the 2014 breeding season. This regraded area will develop into suitable breeding habitat in 2018.

Approximately 122 acres will remain in suitable nesting conditions for the beginning of the SHLA breeding season in 2015. The 53-acre area covered by the 2014 placements and the 23-acre trenched/regraded area are expected to be mostly bare sand for the duration of 2015, and this yet-

to-be suitable acreage (76 acres) is assumed to be unavailable for nesting SHLA. All remaining areas (66 acres) are considered unsuitable as breeding habitat in 2015. A small placement event will occur in 2015 in an area that is not currently suitable for SHLA, covering approximately three acres at the upper-most end of the island after the nesting season.

No placement will occur in 2016 at Rice Island, and therefore no suitable breeding habitat will be lost. The areas covered by the 2014 and 2015 placement events (79 acres total) will be yet-to-be suitable habitat, and it is assumed to be unavailable for nesting. It is assumed all areas suitable at the beginning of the 2016 breeding season will remain in suitable condition throughout the breeding season, such that 122 acres are available SHLA nesting habitat and the remaining 63 acres are unsuitable for nesting.

Approximately 122 acres will be available as suitable nesting habitat in the 2017 breeding season. The 76 acres from the 2014 re-grading and placement activities will be in the third year of vegetation succession, but still considered yet-to-be suitable habitat, along with the three acres from the 2015 placement event, resulting in a total of 79 acres of yet-to-be suitable habitat in 2017 nesting season. The placement event in 2017 will cover approximately 104 acres in the center of the island after the breeding season, whereupon 64 acres of suitable habitat would be lost to nesting SHLA in the following breeding season. The 2017 placement event will cover areas where the most SHLA activity has been recorded in the recent years (Anderson 2013). The remaining 63 acres of the site are still expected to be unsuitable nesting habitat.

Approximately 134 acres will be available as suitable nesting habitat in the 2018 breeding season due to the loss of 64 acres of suitable habitat by the placement event in 2017 and the addition of 76 acres from the 2014 placement and regrading areas that were yet-to-be suitable becoming suitable in 2018. The 104-acre placement event in 2017, combined with the 3-acre placement event in 2015 at the upstream tip, will total 107 acres of yet-to-be suitable habitat for the 2018 breeding season. The remaining 23 acres are expected to remain unsuitable. A 2018 placement event will cover approximately 23 acres at the upstream end of the site after the breeding season, resulting in a loss of 23 acres of suitable breeding habitat in subsequent years. These 23 acres had recently transitioned into viable nesting habitat from the 2014 re-grading event. The 23-acre placement event will increase the acreage of yet-to-be suitable habitat following in subsequent years.

Figure 18 displays the percentage and acreage of suitable, yet-to-be suitable, and unsuitable SHLA nesting habitat over the next five years on Rice Island.

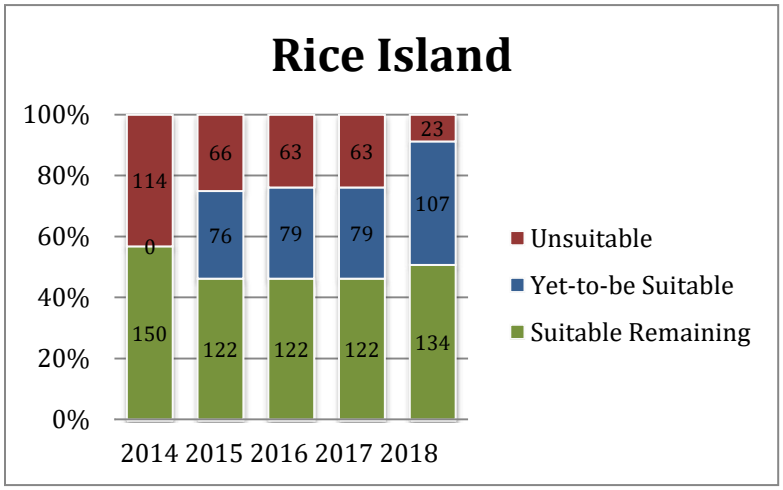

Figure 18: Availability of SHLA Nesting Habitat on Rice Island, 2014-2018

MILLER SANDS (RM 23.5)

Placement events on the 117-acre Miller Sands site occur during the SHLA nesting season. However, this site is only used for shoreline placements and the 0.10-acre upland staging area can be placed to avoid any nesting larks, if any are identified. Therefore, shoreline placement actions on Miller Sands are not expected to interfere with active SHLA nesting. Shoreline placements on Miller Sands are also not expected to typically develop into suitable SHLA nesting habitat because the dredged material is expected to erode away in subsequent years. Habitat conditions on Miller Sands transition slower than on other islands farther upstream and it is assumed that vegetation succession takes three growing seasons following placement to transition into suitable breeding habitat in the four year after upland placement. In addition, because vegetation establishment and subsequent growth on dredged materials are reduced in the estuary, suitable SHLA nesting habitat conditions are assumed to remain viable for 12 years at Miller Sands. The total succession cycle from placement to unsuitable is 15 years.

In 2014, the baseline of suitable breeding habitat is zero (0) acres due to the succession of vegetation on Miller Sands and the entire 117 acres are considered unsuitable for SHLA nesting. In 2014, a six-acre shoreline placement will occur on the upstream tip of the site during the breeding season. In addition to the shoreline placement, 34 acres in the middle of the island will be smoothed during the 2014 breeding season to offset future impacts to suitable habitat in Group II following an extensive placement event at Rice Island in 2017. Regrading in 2014 allows this area to transition into suitable habitat at the beginning of 2018 for the purpose of avoiding substantial impacts to SHLA at the population scale in 2018. This area was previously mounded to dissuade tern and cormorant use.

No suitable SHLA nesting conditions will be present on Miller Sands in 2015. The 34-acre re-graded mound area is expected to be yet-to-be suitable habitat. All remaining areas (83 acres), including the prior shoreline placement, are considered unsuitable as breeding habitat in 2015. A 14-acre shoreline placement will occur on the mid-downstream portion of the site, during the 2015 breeding season.

No suitable SHLA nesting conditions will be present on Miller Sands in 2016. The 34-acre re-graded mound area is expected to be in its second year of yet-to-be suitable habitat. All remaining areas (83 acres), including the prior shoreline placements, are considered unsuitable as breeding habitat in 2016. An 11-acre shoreline placement will occur on two downstream portions of the site, during the 2016 breeding season.

No suitable SHLA nesting conditions will be present on Miller Sands in 2017. The 34-acre re-graded mound area is expected to be in its third year of yet-to-be suitable habitat. All remaining areas (83 acres), including the prior shoreline placements, are considered unsuitable as breeding habitat in 2017. A nine-acre shoreline placement will occur where necessary to repair site erosion, during the 2017 breeding season.

The 34 acres of mounded area that was regarded in 2014 will be available as suitable SHLA nesting habitat in the 2018 breeding season. All remaining areas (83 acres), including the prior shoreline placements, are considered unsuitable as breeding habitat in 2018. A nine-acre shoreline placement will occur where necessary to repair site erosion, during the 2018 breeding season.

Figure 19 displays the percentage and acreage of suitable, yet-to-be suitable, and unsuitable SHLA nesting habitat over the next five years on Miller Sands.

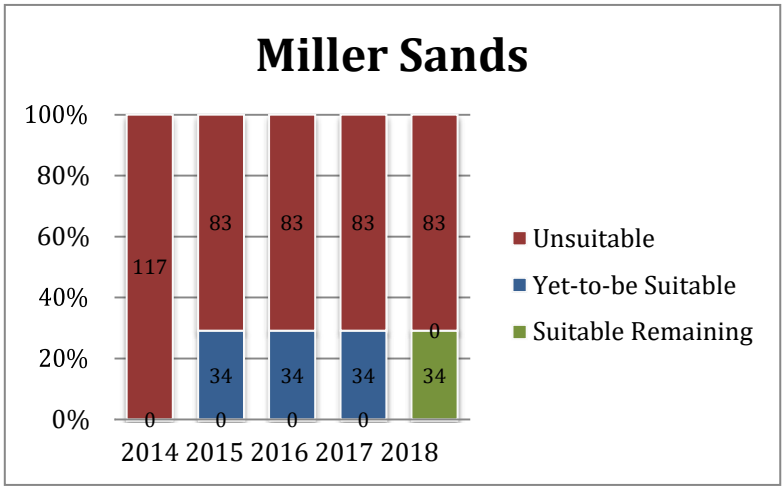

Figure 19: Availability of SHLA Nesting Habitat on Miller Sands, 2014-2018

PILLAR ROCK ISLAND (RM 27.2)

Both shoreline and upland placement events on the 52-acre Pillar Rock Island site occur during the SHLA nesting season. Shoreline placements require a 0.10-acre upland staging area which can be placed to avoid any nesting larks, if any are identified. Therefore, shoreline placement actions on Pillar Rock Island are not expected to interfere with active SHLA nesting. Shoreline placements on Pillar Rock Island are not expected to typically develop into suitable SHLA nesting habitat because the placements are expected to erode away in subsequent years. Early season site preparation activities for upland placement will include vegetation removal and dissuasion techniques to preclude SHLA nesting in proposed upland placement locations. Habitat conditions on Pillar Rock Island transition slower than on other islands farther upstream to and it is assumed that vegetation succession takes three growing seasons following upland placement to transition into suitable breeding habitat in the four year after placement. In addition, because vegetation establishment and subsequent growth on dredged materials are reduced in the estuary, suitable SHLA nesting habitat conditions are assumed to remain viable for 12 years at Pillar Rock Island. The total succession cycle from placement to unsuitable is 15 years.

In 2014, the baseline of suitable SHLA breeding habitat is four acres due to the succession of vegetation and active erosion of Pillar Rock Island. The remaining 48 acres of the site are considered unsuitable for SHLA nesting. In 2014, a 26-acre shoreline placement will occur on the northern portion to rebuild the site. The 2014 shoreline placement event will occur during the breeding season on the shoreline.

In 2015, the baseline of suitable SHLA breeding habitat is four acres. The remaining 48 acres of the site are considered unsuitable for SHLA nesting. In 2015, a 26-acre shoreline placement will occur on the northern portion to rebuild the site. The 2015 shoreline placement event will occur during the breeding season on the shoreline.

In 2016, the baseline of suitable SHLA breeding habitat is four acres. The remaining 48 acres of the site are considered unsuitable for SHLA nesting. In 2016, a 26-acre shoreline placement will occur on the northern portion to rebuild the site. The 2016 shoreline placement event will occur during the breeding season on the shoreline.

No suitable SHLA nesting conditions will be present on Pillar Rock Island in 2017 due to the succession of vegetation since placement last occurred in 2001, 15 years prior. A 26-acre placement will occur during the breeding season in 2017 on Pillar Rock Island. Approximately half

of the acreage will be shoreline placement to maintain the site and the other 13 acres will be placed in uplands that had vegetation removed and SHLA dissuasion techniques installed in the early spring. The entire 52-acre site is considered unsuitable for SHLA nesting in 2017.

No suitable SHLA nesting conditions will be present on Pillar Rock Island in 2018. Approximately 13 acres of yet-to-be suitable habitat is expected from the 2017 upland placement. The remaining 43 acres of the site are considered unsuitable for SHLA nesting in 2018. A 26-acre placement will occur during the breeding season in 2018 on Pillar Rock Island. Approximately half of the acreage will be shoreline placement to maintain the site and the other 13 acres will be placed in uplands that had vegetation removed and SHLA dissuasion techniques installed in the early spring. The 13-acre upland placement in 2018 will not overlap with the 2017 upland placement.

Figure 20 displays the percentage and acreage of suitable, yet-to-be suitable, and unsuitable SHLA nesting habitat over the next five years on Pillar Rock Island.

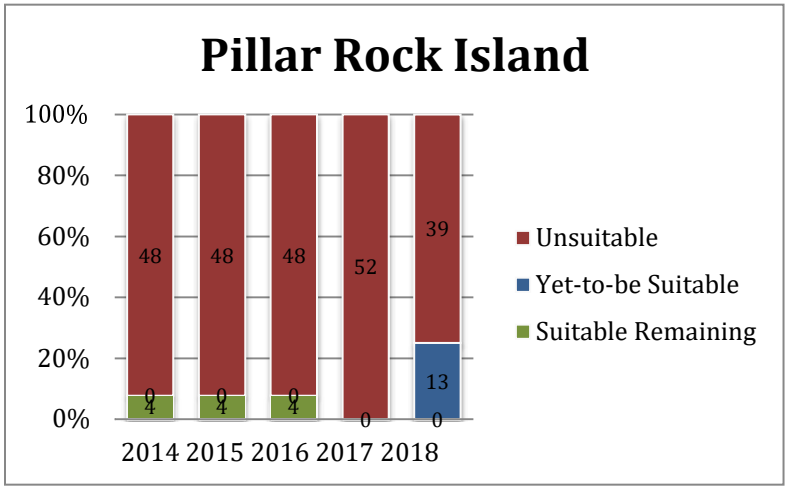

Figure 20: Availability of SHLA Nesting Habitat on Pillar Rock Island, 2014-2018

GROUP II

Group II consists of three placement sites located in the lower Columbia River estuary: Rice Island, Miller Sands, and Pillar Rock Island. Of the 433 acres in Group II, only 154 acres (36% of total upland placement area) are baseline suitable SHLA nesting habitat at the time of its listing under the ESA in October 2013 and all 154 acres are available during the 2014 breeding season. Dredged material placement and/or habitat succession results in a decrease of 28 acres (-18%) of suitable habitat during the 2015 breeding season as compared to 2014, for a total of 126 acres available in 2015. There is no change in the acreage of suitable habitat between 2015 and 2016 breeding seasons. Increased vegetation at Pillar Rock Island results in a decrease of 4 acres (-3%) of suitable nesting habitat during the 2017 breeding season as compared to 2016, for a total of 122 acres available in 2017. Dredged material placement and/or habitat succession results in an increase of 46 acres (+38%) of suitable nesting habitat available during the 2018 breeding season as compared to 2017, for a total of 168 acres available in 2018. Overall, suitable nesting habitat is expected to increase by 14 acres from 154 acres available as baseline habitat during the 2014 breeding season to 168 acres available during the 2018 breeding season (+9%). Additionally, yet-to-be suitable nesting habitat is expected to increase from zero acres in 2014 to 120 acres in 2018. Figure 21 shows the percentage and acreage of suitable, yet-to-be suitable, and unsuitable SHLA nesting habitat over the next five years in Group II.

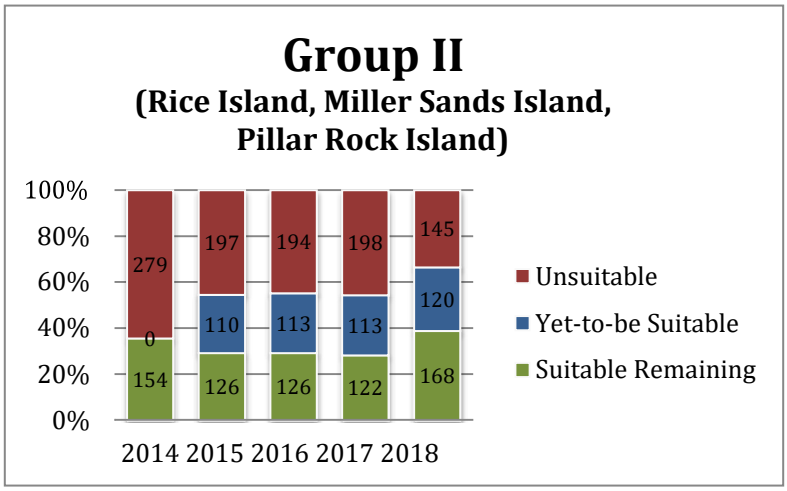

Figure 21: Availability of SHLA Nesting Habitat on Group II Sites, 2014-2018

SKAMOKAWA – VISTA PARK (RM 33.4)

The CNLM estimated that approximately five acres of suitable lark breeding habitat existed on the site in 2011 using NDVI habitat analysis. A placement event in 2012 covered the entire 15 acre upland site, eliminating all habitat identified as suitable in the 2011 analysis. The site was surveyed for larks in 2013 by CNLM, but no individuals were observed. Despite the NDVI analysis results, high levels of human use and regular disturbance from recreation and commercial sand extraction likely preclude SHLA use of the site. Therefore, the Corps assumes that no suitable nesting habitat is currently available for SHLA, and no suitable SHLA nesting habitat is expected to develop over the course of this consultation, as shown in Figure 22.

In 2017, the entire site 15-acre site is planned for placement after the breeding season across the uplands and shoreline. The Corps does not anticipate this area would transition into yet-to-be suitable nesting habitat in 2018 due to high levels of human use at the site and the site is unsuitable in all years. No placements are planned to occur in 2014, 2015, 2016, or 2018.

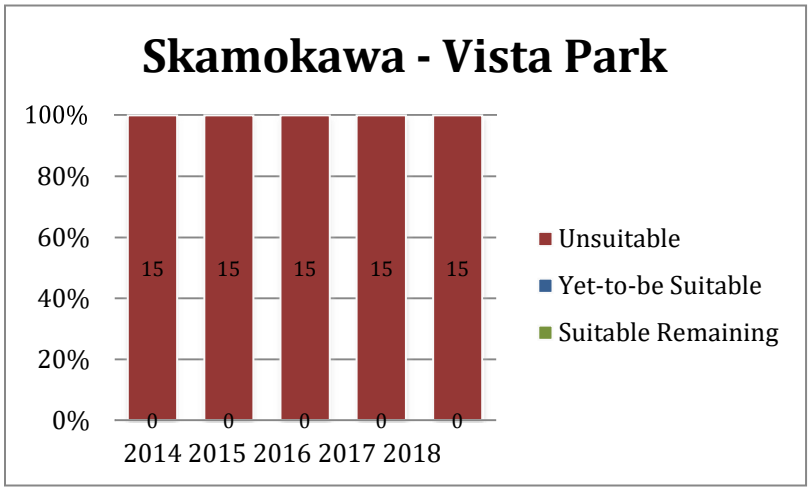

Figure 22: Availability of Nesting Habitat at Skamokawa-Vista Park, 2014-2018

WELCH ISLAND (RM 34.0)

Placement events on the 41-acre Welch Island occur in the summer, during the SHLA nesting season. Early season site preparation activities for upland placement will include vegetation removal and dissuasion techniques to preclude SHLA nesting in proposed upland placement locations. Habitat conditions on Welch Island assume vegetation succession takes one growing season following placement to transition into suitable breeding habitat in the second year after placement. Suitable SHLA nesting habitat conditions are assumed to remain viable for six years on Welch Island (Anderson 2013). The total succession cycle from placement to unsuitable is seven years.

In 2014, the baseline of suitable SHLA breeding habitat is 10 acres with the remaining 31 acres of the site as unsuitable habitat. No placements are planned in 2014.

In 2015, the baseline of suitable SHLA breeding habitat is 10 acres. However, the entire 41-acre site will used for upland placement during the breeding season. Therefore, the entire 41-acre site would be unsuitable for SHLA nesting in 2015.

In 2016, no suitable SHLA breeding habitat will be available on the site. The entire 41-acre site is classified as yet-to-be suitable due the 2015 placement event. No placement is planned in 2016.

In 2017, the 41 acres of yet-to-be suitable habitat is expected to transition into suitable SHLA nesting habitat. However, a 23-acre placement is planned during the breeding season on the upstream portion of the site making it unsuitable for nesting. Therefore, the baseline of suitable SHLA nesting habitat is 18 acres in 2017.

In 2018, the baseline of suitable SHLA nesting habitat is 18 acres with the remaining 23 acres as yet-to-be suitable due to the 2017 upland placement. No placement is planned in 2018.

Figure 23 displays the percentage and acreage of suitable, yet-to-be suitable, and unsuitable SHLA nesting habitat over the next five years on Welch Island.

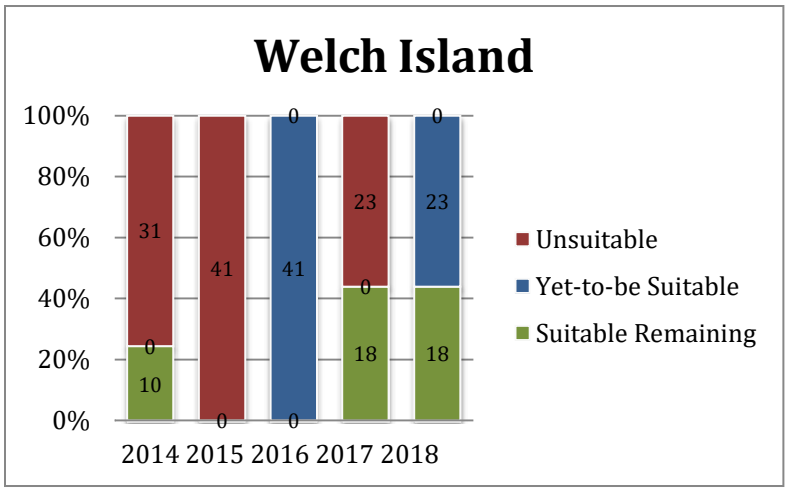

Figure 23: Availability of SHLA Nesting Habitat on Welch Island, 2014-2018

TENASILLAHE ISLAND (RM 38.3)

Placement events on the 41-acre Tenasillahe Island occur in the summer, during the SHLA nesting season. Early season site preparation activities for upland placement will include vegetation removal and dissuasion techniques to preclude SHLA nesting in proposed upland placement

locations. Habitat conditions on Tenasillahe Island assume vegetation succession takes one growing season following placement to transition into suitable breeding habitat in the second year after placement. Suitable SHLA nesting habitat conditions are assumed to remain viable for six years on Tenasillahe Island (Anderson 2013). The total succession cycle from placement to unsuitable is seven years.

The baseline of suitable SHLA breeding habitat is two acres at the time of its listing under the ESA in October 2013. In 2014, a 14-acre placement is planned during the breeding season on the downstream third of the site, resulting in a loss of one acre of suitable SHLA nesting habitat. Therefore, the baseline of suitable SHLA breeding habitat in 2014 is two acres. Approximately 21 acres of yet-to-be suitable habitat are anticipated due to placements in 2012 and 2013. Approximately 18 acres on the site is unsuitable for SHLA nesting habitat.

In 2015, the baseline of suitable SHLA breeding habitat is 23 acres because the 21 acres of placement in 2013 have become suitable habitat. The 14-acre placement in 2014 is classified as yet-to-be suitable in 2015 with the remaining four acres as unsuitable. No placement is planned in 2015.

In 2016, a 27-acre placement is planned during the breeding season on the downstream two thirds of the site, resulting in a loss of approximately 12 acres of suitable nesting habitat and 14 acres of yet-to-be suitable habitat. Therefore, there are an estimated 10 acres of suitable SHLA nesting habitat in 2016. The remaining 31 acres are unsuitable.

In 2017, the baseline of suitable SHLA breeding habitat is 10 acres. The 27-acre placement area from 2016 is yet-to-be suitable habitat and the remaining four acres of the site is unsuitable. No placement is planned in 2017.

In 2018, a 14-acre placement is planned during the breeding season on the downstream third of the site, resulting is a loss of 14 acres of suitable SHLA nesting habitat. However, the 27-acre placement event from 2016 will transition into suitability, thereby creating a net gain of 13 acres of suitable habitat. As a result, 23 acres are estimated to be suitable for SHLA nesting in 2018 and the remaining 18 acres are considered unsuitable for nesting.

Figure 24 displays the percentage and acreage of suitable, yet-to-be suitable, and unsuitable SHLA nesting habitat over the next five years on Tenasillahe Island.

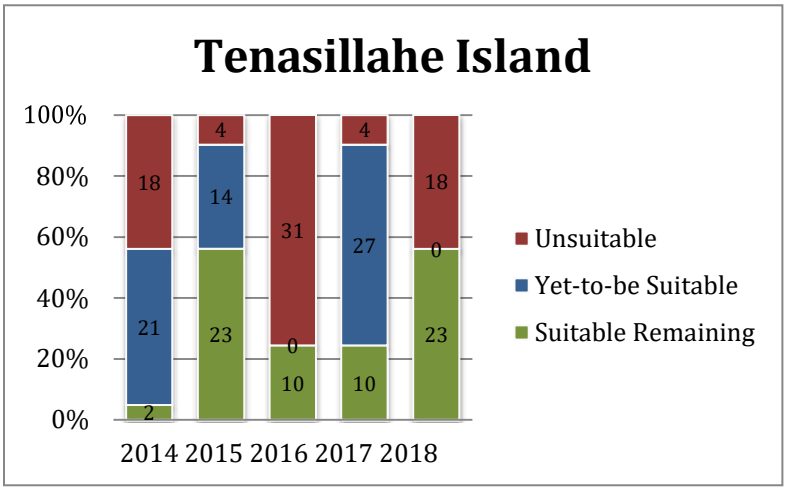

Figure 24: Availability of SHLA Nesting Habitat on Tenasillahe Island, 2014-2018

JAMES RIVER (RM 42.9)

The CNLM estimated that approximately 14 acres of suitable lark breeding habitat existed on the James River site in 2011 using NDVI analysis. James River has not been surveyed due to expected low habitat value. Despite the NDVI analysis, high levels of human use and regular disturbance from recreation and commercial sand extraction likely preclude SHLA use of the site. Therefore, the Corps assumes that no suitable nesting habitat is currently available for SHLA and no suitable SHLA nesting habitat is expected to develop at James River over the course of this consultation.

No placements are planned in 2014 or 2015. The entire 53-acre site is planned for placement after the 2016 and 2017 SHLA breeding seasons, but the Corps assumes this site would not develop into suitable SHLA nesting habitat between 2014 and 2018 due to regular site disturbance, as shown in Figure 25, and the entire site would be unsuitable in all years.

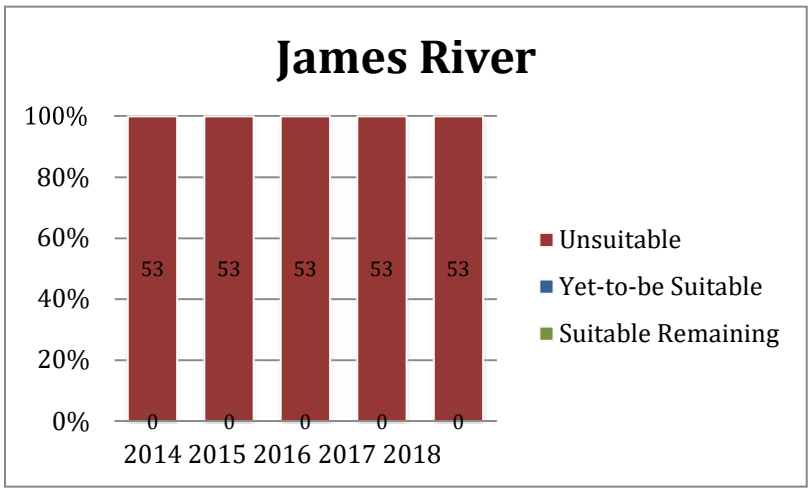

Figure 25: Availability of SHLA Nesting Habitat on James River Site, 2014-2018

PUGET ISLAND (RM 44.0)

Placements on the 96-acre Puget Island site occur late in the summer, after the SHLA nesting season ends in mid-August/early-September. As part of required site maintenance after each placement event, the Corps will establish a healthy vegetative cover by grass seeding, fertilization, and/or irrigation to prevent wind erosion of placed sand onto adjacent agricultural lands. Additionally, trees may be planted along the perimeter of the site for the same purpose. Maintenance mowing and invasive vegetation control measures may be taken. Therefore, no suitable SHLA nesting is expected to develop on Puget Island between 2014 and 2018, as shown in Figure 26, and the site will be unsuitable in all years.

In 2014, no suitable SHLA nesting habitat is available on the site and the 96-acre site is unsuitable habitat. No placement is planned in 2014.

In 2015, no suitable SHLA nesting habitat is available on the site and the 96-acre site is unsuitable habitat. A full 96-acre site placement is planned after the SHLA nesting season in 2015.

In 2016, no suitable SHLA nesting habitat is available on the site due to reseeding the site with grass and the 96-acre site is unsuitable habitat. No placement is planned in 2016.

In 2017, no suitable SHLA nesting habitat is available on the site and the 96-acre site is unsuitable habitat. No placement is planned in 2017.

In 2018, no suitable SHLA nesting habitat is available on the site due to reseeding the site with grass and the 96-acre site is unsuitable habitat. A full 96-acre site placement is planned after the SHLA nesting season in 2018.

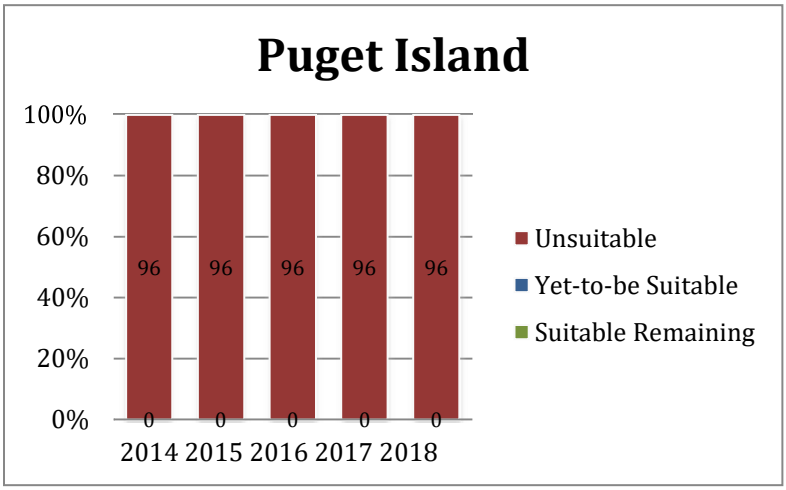

Figure 26: Availability of SHLA Nesting Habitat on Puget Island Site, 2014-2018

BROWN ISLAND (RM 46.3)

Placement events on the 102-acre Brown Island typically occur in the summer, during the SHLA nesting season. Early season site preparation activities for upland placement will include vegetation removal and dissuasion techniques to preclude SHLA nesting in proposed upland placement locations. Placement actions after the breeding season are not expected to interfere with active SHLA nesting during the year of dredged material placement. Habitat conditions on Brown Island assume vegetation succession takes one growing season following placement to transition into suitable breeding habitat in the second year after placement. Suitable SHLA nesting habitat conditions are assumed to remain viable for six years on Brown Island. The total succession cycle from placement to unsuitable is seven years.

In 2014, the baseline of suitable breeding habitat is 72 acres due to placement activities in 2011. The remaining 30 acres of the site are unsuitable during the nesting season. A 68-acre placement is planned after the nesting season, resulting is a loss of 51 acres of suitable nesting habitat in the following year. The placement will occur adjacent the shoreline and downstream end of the site.

In 2015, the baseline of suitable breeding habitat is 21 acres with approximately 68 acres of yet-to-be suitable habitat and 13 acres of unsuitable habitat. No placement is planned in 2015 on Brown Island.

In 2016, a 50-acre placement on the north side and downstream end of the site will occur during the breeding season, resulting is a loss of 50 acres of suitable nesting habitat. The 68-acre placement event in 2014 will become suitable nesting habitat. Therefore, 49 acres of suitable SHLA nesting habitat will be available during 2016 breeding season. The remaining 53 acres will be unsuitable habitat.

In 2017, the baseline of suitable breeding habitat on Brown Island will be 49 acres. The 50-acre placement event in 2016 will be yet-to-be suitable habitat with three acres of unsuitable habitat. No placement is planned in 2017 on Brown Island.

In 2018, the 50-acre placement event from 2016 will become suitable. Therefore, the baseline of suitable SHLA nesting habitat in 2018 on Brown Island is approximately 99 acres. The remaining three acres will be unsuitable. No placement is planned in 2018 on Brown Island.

Figure 27 displays the percentage and acreage of suitable, yet-to-be suitable, and unsuitable SHLA nesting habitat over the next five years s on Brown Island.

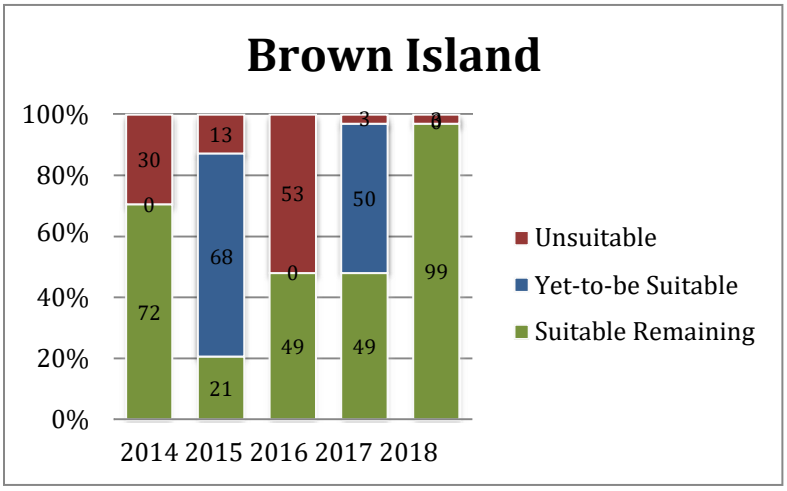

Figure 27: Availability of SHLA Nesting Habitat on Brown Island, 2014-2018

GROUP III

Group III consists of six placement sites located in the lower Columbia River: Skamokawa-Vista Park, Welch Island, Tenasillahe Island, James River, Puget Island, and Brown Island. Of the 348 acres in Group III, only 85 acres (24% of total upland placement area) are baseline suitable SHLA nesting habitat at the time of its listing under the ESA in October 2013. Dredged material placement results in a decrease of one acre (-1%) of suitable habitat during the 2014 breeding season, for a total of 84 acres available in 2014. Dredged material placement and/or habitat succession results in a decrease of 40 acres (-48%) of suitable habitat during the 2015 breeding season as compared to 2014, for a total of 44 acres available in 2015. Dredged material placement and/or habitat succession results in an increase of 15 acres (+34%) of suitable nesting habitat during the 2016 breeding season as compared to 2015, for a total of 59 acres available in 2016. Dredged material placement and/or habitat succession results in an increase of 18 acres (+31%) of suitable nesting habitat during the 2017 breeding season as compared to 2016, for a total of 77 acres available in 2017. Dredged material placement and/or habitat succession results in an increase of 63 acres (+82%) of suitable nesting habitat available during the 2018 breeding season as compared to 2017, for a total of 140 acres available in 2018. Overall, suitable nesting habitat is expected to increase by 55 acres from 85 acres available as baseline habitat during the 2014 breeding season to 140 acres available during the 2018 breeding season (+65%). Additionally, yet-to-be suitable nesting habitat is expected to increase by 2 acres from 21 acres in 2014 to 23 acres in 2018 (+10%). Figure 28 shows the percentage and acreage of suitable, yet-to-be suitable, and unsuitable SHLA nesting habitat over the next five years Group III.

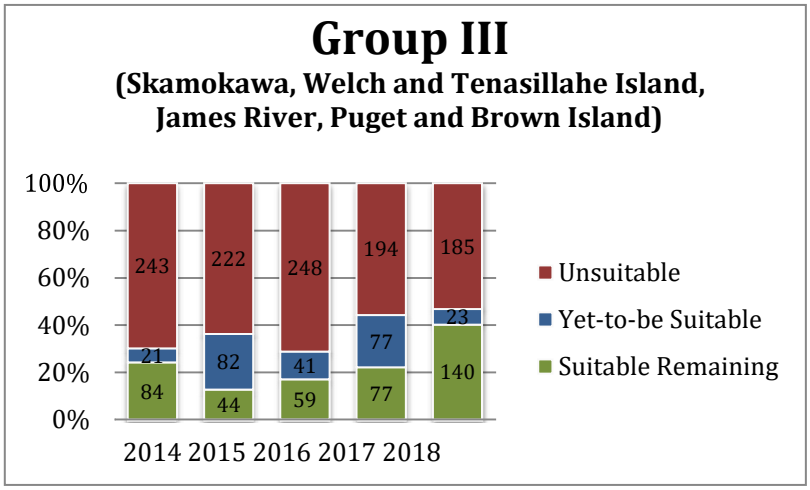

Figure 28: Availability of SHLA Nesting Habitat on Group III Sites, 2014-2018

CRIMS ISLAND (RM 57.0)

Placement events on the 59-acre Crims Island occur in the summer, during the SHLA nesting season. Early season site preparation activities for upland placement will include vegetation removal and dissuasion techniques to preclude SHLA nesting in proposed upland placement locations. Habitat conditions on Crims Island assume vegetation succession takes one growing season following placement to transition into suitable breeding habitat in the second year after placement. Suitable SHLA nesting habitat conditions are assumed to remain viable for six years on Crims Island. The total succession cycle from placement to unsuitable is seven years.

In 2014, the baseline of suitable SHLA breeding habitat is 25 acres with the remaining 34 acres of the site as unsuitable habitat. No placements are planned in 2014.

In 2015, a 22-acre placement on the downstream end of the site during the breeding season will result in a loss of five acres of suitable SHLA nesting habitat. Therefore, there will be an estimated 20 acres of suitable SHLA nesting habitat in 2015. The remaining 39 acres will be unsuitable habitat.

In 2016, the baseline of suitable SHLA nesting habitat is 20 acres. The 22-acre placement event in 2015 will be yet-to-be suitable habitat. The remaining 17 acres will be unsuitable habitat. No placement is planned in 2016 on Crims Island.

In 2017, the 22-acre placement event in 2015 will transition to suitable habitat. Therefore, the baseline of suitable SHLA nesting habitat in 2017 will be 42 acres. The remaining 17 acres will be unsuitable habitat. No placement is planned in 2017 on Crims Island.

In 2018, the baseline of suitable SHLA nesting habitat is 42 acres. The remaining 17 acres will be unsuitable habitat. No placement is planned in 2018 on Crims Island.

Figure 29 displays the percentage and acreage of suitable, yet-to-be suitable, and unsuitable SHLA nesting habitat over the next five years on Crims Island.

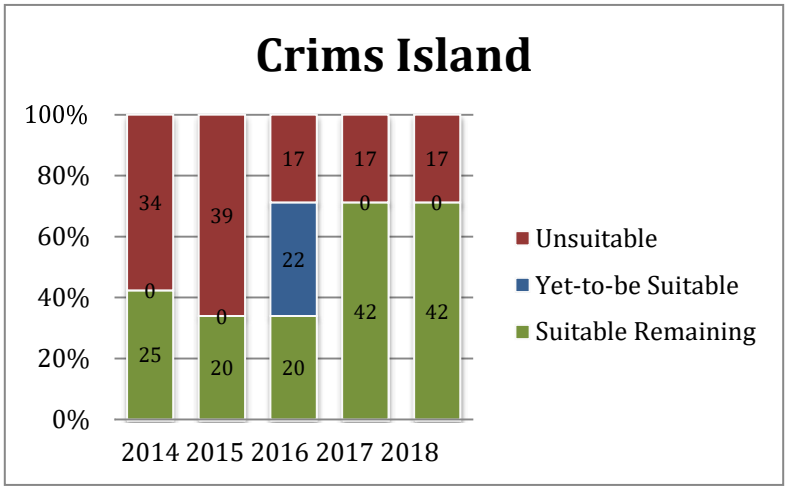

Figure 29: Availability of SHLA Nesting Habitat on Crims Island, 2014-2018

HUMP ISLAND (RM 59.7)

Placement events on the 65-acre Hump Island occur in the summer, during the SHLA nesting season. Early season site preparation activities for upland placement will include vegetation removal and dissuasion techniques to preclude SHLA nesting in proposed upland placement locations. Habitat conditions on Hump Island assume vegetation succession takes one growing season following placement to transition into suitable breeding habitat in the second year after placement. Suitable SHLA nesting habitat conditions are assumed to remain viable for six years on Hump Island. The total succession cycle from placement to unsuitable is seven years.

In 2014, no suitable SHLA nesting habitat is available on the site due to extensive vegetation since the last placement prior to 2000. A full-site placement is planned during the nesting season on Hump Island. The 65-acre Hump Island site is unsuitable habitat.

In 2015, no suitable SHLA nesting habitat is available on the site due to the previous year's placement event. The entire 65-acre site is yet-to-be suitable habitat. No placement is planned in 2015 on Hump Island.

In 2016, the 65-acre site would transition into suitable habitat. However, a 48-acre placement in the upper three quarters of the site during the breeding season will prevent 48 acres from becoming suitable. Therefore, there will be an estimated 17 acres of suitable SHLA nesting habitat in 2016. The remaining 48 acres will be unsuitable habitat.

In 2017, the baseline of suitable SHLA nesting habitat is 17 acres. The remaining 48 acres will be yet-to-be suitable habitat from the placement event in 2016. No placement is planned in 2017 on Hump Island.

In 2018, the baseline of suitable SHLA nesting habitat will be 65 acres due to the 48-acre placement in 2016 transitioning to suitable habitat. No placement is planned in 2018 on Hump Island.

Figure 30 displays the percentage and acreage of suitable, yet-to-be suitable, and unsuitable SHLA nesting habitat over the next five years on Hump Island.

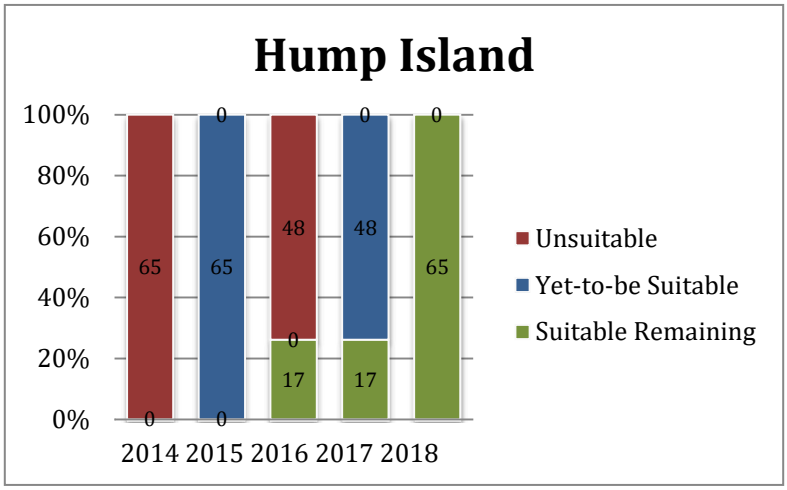

Figure 30: Availability of SHLA Nesting Habitat on Hump Island, 2014-2018

LORD ISLAND – UPSTREAM (RM 63.5)

Placement events on the 24-acre Lord Island Upstream site occur in the summer, during the SHLA nesting season. Early season site preparation activities for upland placement will include vegetation removal and dissuasion techniques to preclude SHLA nesting in proposed upland placement locations. Habitat conditions on Lord Island assume vegetation succession takes one growing season following placement to transition into suitable breeding habitat in the second year after placement. Suitable SHLA nesting habitat conditions are assumed to remain viable for six years on Lord Island. The total succession cycle from placement to unsuitable is seven years.

In 2014, the baseline of suitable SHLA breeding habitat is 10 acres with the remaining 14 acres of the site as unsuitable habitat. No placements are planned in 2014.

In 2015, the baseline of suitable SHLA breeding habitat is 10 acres with the remaining 14 acres of the site as unsuitable habitat. No placements are planned in 2015.

In 2016, the baseline of suitable SHLA breeding habitat is 10 acres with the remaining 14 acres of the site as unsuitable habitat. No placements are planned in 2016.

In 2017, no suitable SHLA nesting habitat is available on the site because it will have been seven years since the site was last used in 2009. A 20-acre placement over the majority of the site will occur during the breeding season. The entire 24-acre site will be unsuitable habitat in 2017.

In 2018, no suitable SHLA nesting habitat is available on the site. However, the 20-acre placement from 2017 will be yet-to-be suitable habitat. The remaining four acres of the site will be unsuitable. No placements are planned in 2018.

Figure 31 displays the percentage and acreage of suitable, yet-to-be suitable, and unsuitable SHLA nesting habitat over the next five years on the Lord Island (upstream) site.

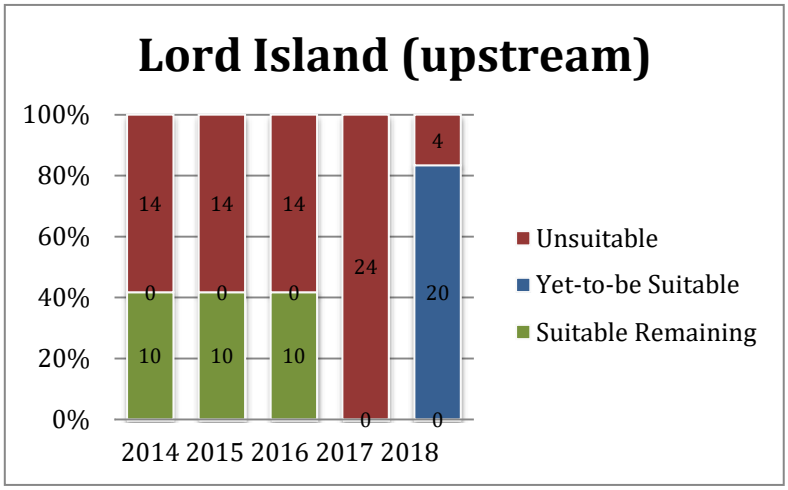

Figure 31: Availability of SHLA Nesting Habitat on Lord Island (upstream), 2014-2018

DIBBLEE POINT (RM 64.8)

No placements are planned on the 52-acre Dibblee Point upland placement site between 2014 and 2018. One acre of suitable habitat was identified as suitable habitat based on NDVI analysis in 2011. In 2013, Dibblee Point was surveyed for larks by CNLM and none were detected. It is assumed that commercial sand removal activities likely exclude SHLA from nesting or occupying the habitat. Therefore, the Corps has determined that even though the NDVI analysis indicates suitable habitat conditions exist, no suitable habitat is available or is expected to develop over the course of this consultation, as shown in Figure 32, and the site is unsuitable in all years.

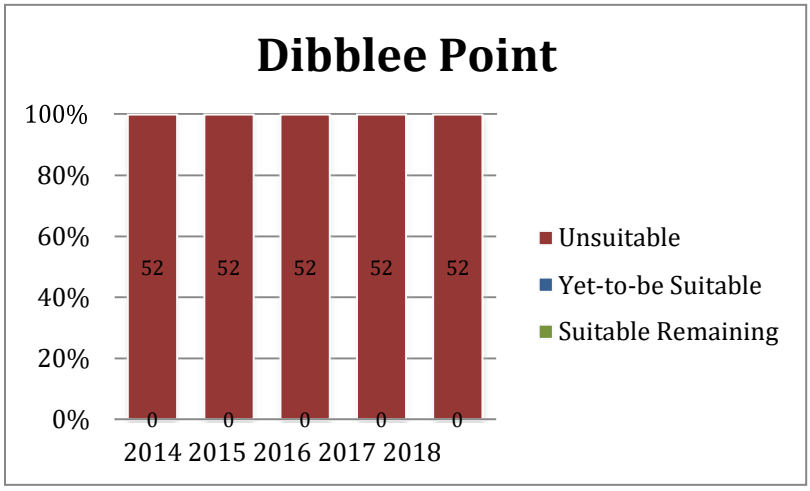

Figure 32: Availability of SHLA Nesting Habitat on Dibblee Point, 2014-2018

HOWARD ISLAND (RM 68.7)

Placements on the 315-acre Howard Island site occur late in the summer, after the SHLA nesting season ends in mid-August/early-September. Therefore, placement actions on Howard Island are not expected to interfere with active SHLA nesting during the year of dredged material placement. Habitat conditions on site assume vegetation succession takes one growing season following placement to transition into suitable breeding habitat in the second year after placement. Suitable

SHLA nesting habitat conditions are assumed to remain viable for six years at Howard Island. The total succession cycle from placement to unsuitable is seven years.

In 2014, the baseline of suitable SHLA breeding habitat is five acres with the remaining 310 acres of the site as unsuitable habitat. No placements are planned in 2014.

In 2015, the baseline of suitable SHLA breeding habitat is five acres with the remaining 310 acres of the site as unsuitable habitat. A 173-acre placement on the upstream half of the site will occur after the SHLA nesting season, resulting is a loss of five acres of suitable SHLA nesting habitat in the following year.

In 2016, no suitable SHLA nesting habitat is available on the site. The 173-acre placement event in 2015 will be yet-to-be suitable habitat in 2016. The remaining 142 acres of the site are unsuitable habitat. No placements are planned in 2016.

In 2017, the baseline of suitable SHLA breeding habitat will be 173 acres due to the 2015 placement event being suitable habitat. The remaining 142 acres of the site are unsuitable habitat. A 108-acre placement on a downstream portion of the site will occur after the SHLA nesting season. No suitable SHLA nesting habitat will be lost to the 108-acre placement.

In 2018, the baseline of suitable SHLA breeding habitat is 173 acres on Howard Island. The 108-acre placement area in 2017 will transition into yet-to-be suitable habitat. The remaining 34 acres of the site will be unsuitable habitat during the nesting season. A 34-acre placement is planned on the downstream tip of the after the SHLA nesting season. No suitable SHLA nesting habitat will be lost to the 34-acre placement.

Figure 33 displays the percentage and acreage of suitable, yet-to-be suitable, and unsuitable SHLA nesting habitat over the next five years on Howard Island.

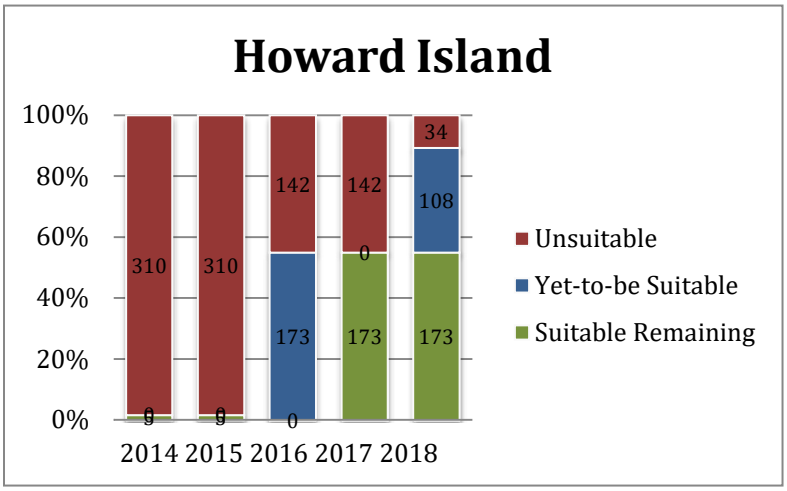

Figure 33: Availability of SHLA Nesting Habitat on Howard Island, 2014-2018

COTTONWOOD ISLAND (RM 70.1)

Placements on the 62-acre Cottonwood Island site occur in the summer, during the SHLA nesting season. Suitable SHLA nesting habitat is not expected to be available on Cottonwood Island because the site is bordered by trees that preclude lark nesting. Cottonwood Island is managed for Columbian white-tailed deer and the removal of trees and shrubs adjacent to the site is unlikely. No suitable SHLA nesting habitat is available or is expected to develop over the course of this consultation at Cottonwood Island, as shown in Figure 34, and the site is unsuitable in all years.

A 26-acre placement is planned on the downstream portion of the site during the 2014 nesting season. A 13-acre placement is planned on the downstream portion of the site during the 2016 nesting season. No placement is planned in 2015, 2017, or 2018. Despite these placements, the entire site is assumed to be unsuitable for nesting all years because the site lacks an open landscape preferred by SHLA.

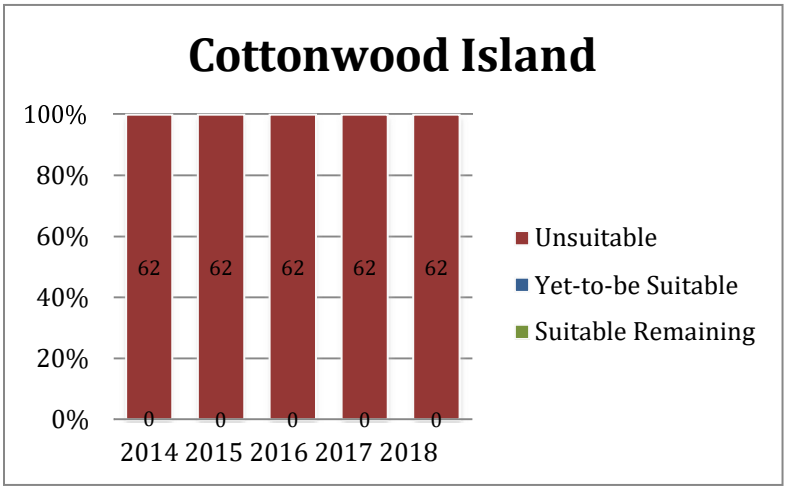

Figure 34: Availability of SHLA Nesting Habitat on Cottonwood Island, 2014-2018

NORTHPORT (RM 71.9)

No placements are planned on the 31-acre Northport upland placement site. Three acres of suitable habitat were identified in the 2011 NDVI habitat analysis. Currently, no borrow activities occur at Northport because three pair of SHLA were detected in 2013 during annual surveys by CNLM (Anderson 2013). However, since dredged materials were last placed in 2008, the site is expected to become unsuitable after the 2015 nesting season due to vegetation succession, as shown in Figure 35.

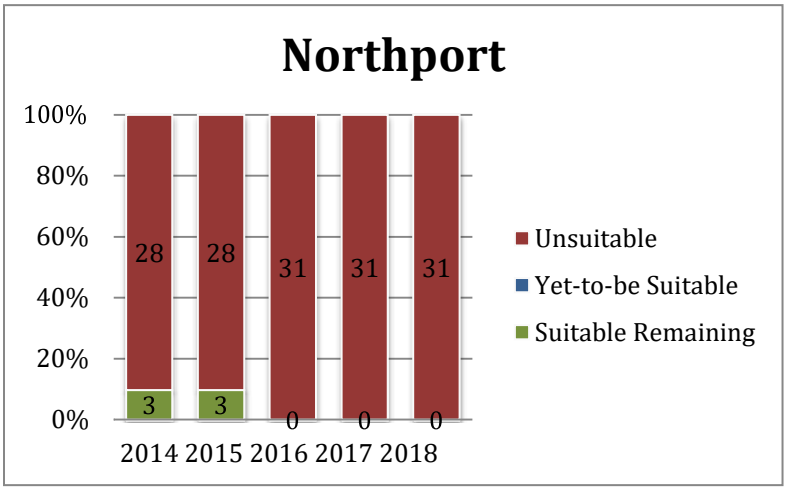

Figure 35: Availability of SHLA Nesting Habitat at Northport, 2014-2018

GROUP IV

Group IV consists of seven placement sites located in the lower Columbia River: Crims Island, Hump Island, Lord Island Upstream, Dibblee Point, Howard Island, Cottonwood Island, and Northport. Of the 608 acres in Group IV, only 43 acres (7% of total upland placement area) are baseline suitable SHLA nesting habitat at the time of its listing under the ESA in October 2013 and all 43 acres are available during the 2014 breeding season. Dredged material placement and/or habitat succession results in a decrease of five acres (-12%) of suitable habitat during the 2015 breeding season as compared to 2014, for a total of 38 acres available in 2015. Dredged material placement and/or habitat succession results in an increase of nine acres (+24%) of suitable nesting habitat during the 2016 breeding season as compared to 2015, for a total of 47 acres available in 2016. Dredged material placement and/or habitat succession results in an increase of 185 acres (+394%) of suitable nesting habitat during the 2017 breeding season as compared to 2016, for a total of 232 acres available in 2017. Dredged material placement and/or habitat succession results in an increase of 48 acres (+21%) of suitable nesting habitat available during the 2018 breeding season as compared to 2017, for a total of 280 acres available in 2018. Overall, suitable nesting habitat is expected to increase by 237 acres from 43 acres available as baseline habitat during the 2014 breeding season to 280 acres available during the 2018 breeding season (+551%). Additionally, yet-to-be suitable nesting habitat is expected to increase from no acres in 2014 to 128 acres in 2018. Figure 36 shows the percentage and acreage of suitable, yet-to-be suitable, and unsuitable SHLA nesting habitat over the next five years in Group IV.

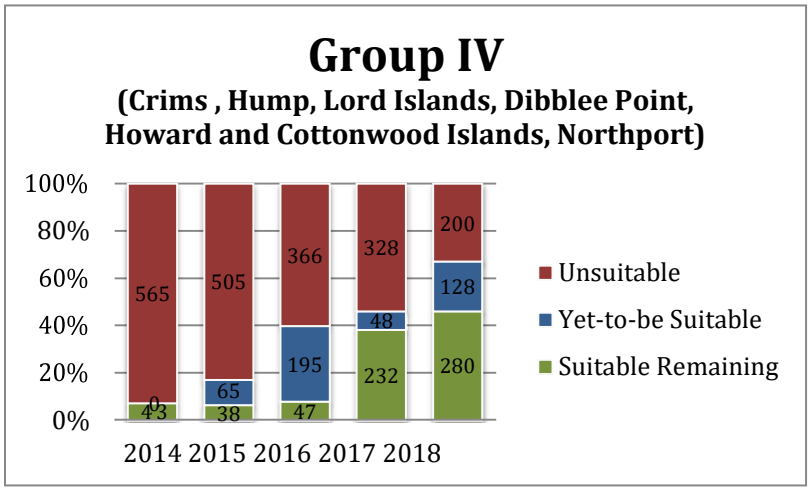

Figure 36: Availability of SHLA Nesting Habitat on Group IV sites, 2014-2018

SANDY ISLAND (RM 75.8)

No placement is planned on the 32-acre Sandy Island upland placement site. Thirty-two (32) acres of suitable SHLA nesting habitat are estimated on site due to a full-site placement in 2011. The site is expected to remain suitable for nesting from 2014 through 2018, as shown in Figure 37. Habitat is expected to become unsuitable after the 2018 nesting season.

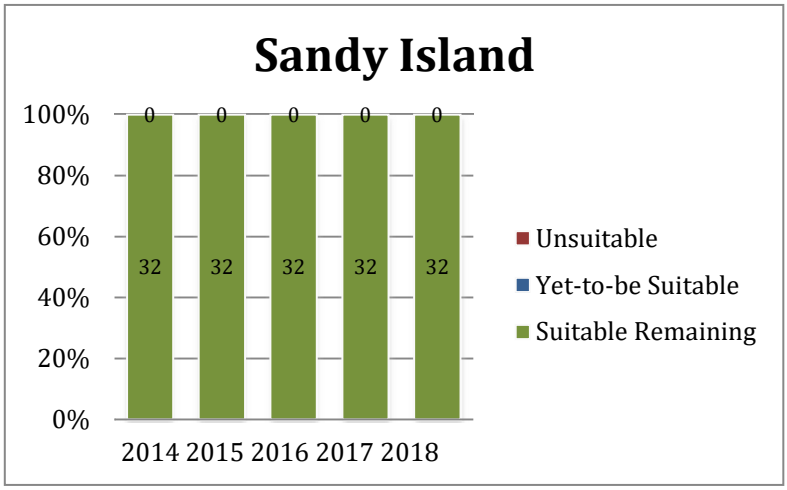

Figure 37: Availability of SHLA Nesting Habitat on Sandy Island, 2014-2018

LOWER DEER ISLAND (RM 77.0)

Placement events on the 24-acre Lower Deer Island site occur in the summer, during the SHLA nesting season. Early season site preparation activities for upland placement will include vegetation removal and dissuasion techniques to preclude SHLA nesting in proposed upland placement locations. Habitat conditions on Lower Deer Island assume vegetation succession takes one growing season following placement to transition into suitable breeding habitat in the second year after placement. Suitable SHLA nesting habitat conditions are assumed to remain viable for six years on Lower Deer Island. The total succession cycle from placement to unsuitable is seven years.

In 2014, no suitable SHLA nesting habitat is available on the site because the site has not been used since 1995 and it has established vegetation. The entire 24-acre site will be unsuitable habitat. No placement is planned in 2014.

In 2015, no suitable SHLA nesting habitat is available. An 11-acre placement is planned on the downstream portion of the site during the nesting season. The entire 24-acre site will be unsuitable habitat.

In 2016, no suitable SHLA nesting habitat is available. The 11-acre placement on the downstream end from 2015 will be yet-to-be suitable habitat. A 12-acre placement is planned on the upstream portion of the site during the nesting season. The remaining one acre of site will be unsuitable habitat. This one-acre portion is underlain by a natural gas line and fiber optics cable. No additional dredged material placement can occur over these utility lines. A total of 13 acres of unsuitable habitat will be present on Lower Deer Island in 2016.

In 2017, the baseline of suitable SHLA nesting habitat is 11 acres due to the 2015 placement area transitioning into suitable habitat on the downstream portion of the site. The 12-acre upstream placement in 2016 will be yet-to-be suitable habitat. The remaining one acre of the site over the utility lines will be unsuitable.

In 2018, the baseline of suitable SHLA nesting habitat is 23 acres due to the 2016 placement area transitioning into suitable habitat on the upstream portion of the site. The remaining one acre of the site over the utility lines will be unsuitable.

Figure 38 displays the percentage and acreage of suitable, yet-to-be suitable, and unsuitable SHLA nesting habitat over the next five years on Lower Deer Island.

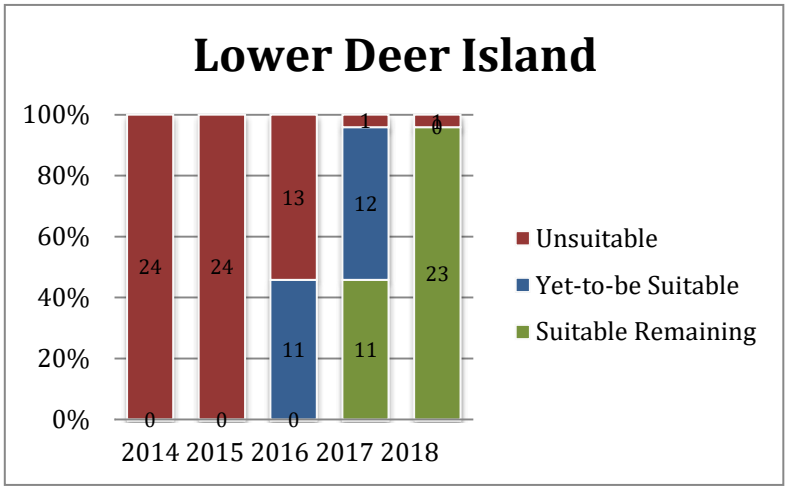

Figure 38: Availability of SHLA Nesting Habitat on Lower Deer Island, 2014-2018

MARTIN BAR (RM 82.0)

Placement events on the 40-acre Martin Bar site occur in the summer, during the SHLA nesting season. The site is composed of a 17-acre North parcel and 23-acre South parcel. The North parcel is leased for agriculture and no suitable SHLA nesting habitat is available. The South parcel is used as a borrow site. The South parcel has exterior berms that preclude SHLA nesting. The CNLM estimated that approximately five acres of suitable lark breeding habitat existed on the site in 2011, and SHLA are not known to use the site, however, Martin Bar has not been recently surveyed for the presence of SHLA. The Corps assumes that suitable SHLA nesting habitat would not be available on the site between 2014 and 2018 because of the high level of human use. As shown in Figure 39, the entire site is assumed to be unsuitable in all years.

A placement is planned in 2014 on the 23-acre South parcel during the SHLA nesting season. However, SHLA are not likely to use the South parcel for nesting due to the existing exterior berms that limit visibility from the 23-acre parcel. The material placed in 2014 on the South parcel is planned for removal in 2014 through 2016 and the exterior berms will remain in place. The entire 40-acre site will be unsuitable habitat. No placement is planned in 2015, 2016, or 2017. The entire 40-acre site is planned for placement during the SHLA nesting season in 2018 and the entire 40-acre site will be unsuitable habitat.

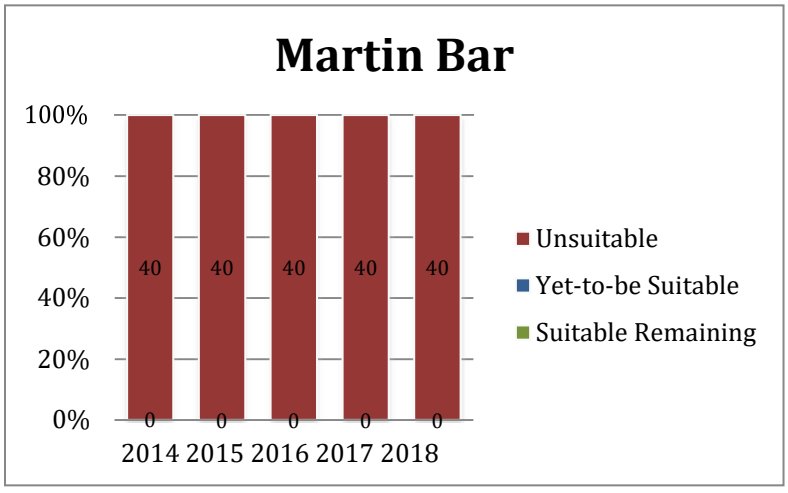

Figure 39: Availability of SHLA Nesting Habitat at Martin Bar, 2014-2018

SAND ISLAND (RM 86.2)

Shoreline placement events on the 28-acre Sand Island occur late in the summer, after the SHLA nesting season ends in mid-August/early-September. Shoreline placements require a 0.10-acre upland staging area can be placed to avoid any nesting larks, if any are identified late in the summer. Therefore, shoreline placement actions on Sand Island are not expected to interfere with active SHLA nesting during the year of dredged material placement. Shoreline placements on Sand Island are not expected to typically develop into suitable SHLA nesting habitat because the placements are expected to erode away in subsequent years. Habitat conditions on Sand Island assume vegetation succession takes one growing season following placement to transition into suitable breeding habitat in the second year after placement. Suitable SHLA nesting habitat conditions are assumed to remain viable for six years on Sand Island. The total succession cycle from placement to unsuitable is seven years. The Sand Island is extensively used for public recreation during the spring, summer, and early fall.

In 2014, the baseline of suitable SHLA nesting habitat is one acre. The remaining 27 acres on the site are unsuitable habitat. No placements are planned in 2014 on the Sand Island site.

In 2015, the baseline of suitable SHLA nesting habitat is one acre. The remaining 27 acres on the site are unsuitable habitat. A 14-acre shoreline placement is planned after the nesting season on the eastern and upstream portion of the site in 2015. No suitable SHLA nesting habitat will be lost to this placement.

In 2016, the baseline of suitable SHLA nesting habitat is one acre. The remaining 27 acres on the site are unsuitable habitat. No placements are planned in 2016 on the Sand Island site.

In 2017, no suitable SHLA nesting habitat is available due to vegetation succession on the upland portions of the site. The entire 28-acre site will be unsuitable habitat. A 14-acre shoreline placement is planned after the nesting season on the eastern and upstream portion of the site in 2017. No suitable SHLA nesting habitat will be lost to this placement.

In 2018, no suitable SHLA nesting habitat is available on the site. The entire 28-acre site will be unsuitable habitat in 2018. No placements are planned in 2018 on the Sand Island site.

Figure 40 displays the percentage and acreage of suitable, yet-to-be suitable, and unsuitable SHLA nesting habitat over the next five years on Sand Island.

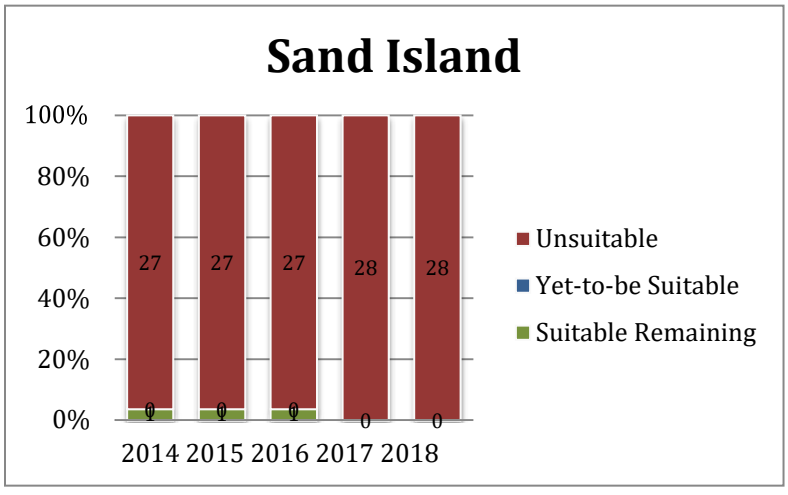

Figure 40: Availability of SHLA Nesting Habitat on Sand Island, 2014-2018

AUSTIN POINT (RM 86.5)

No placements are planned on the 30-acre Austin Point upland placement site. Although larks are not known to historically occupy the site and no formal lark surveys have been conducted recently, several juvenile larks were observed by the Corps in September 2013 prior to placing dredged material across the site. The CNLM estimated that approximately 14 acres of suitable lark breeding habitat existed on the site in 2011. The Corps currently estimates that no suitable SHLA nesting habitat occurs at Austin Point due to ongoing heavy equipment school site grading activities and therefore assumes no suitable habitat would be available between 2014 and 2018 due to regular site disturbance. As shown in Figure 41, and the entire site is assumed to be unsuitable in all years.

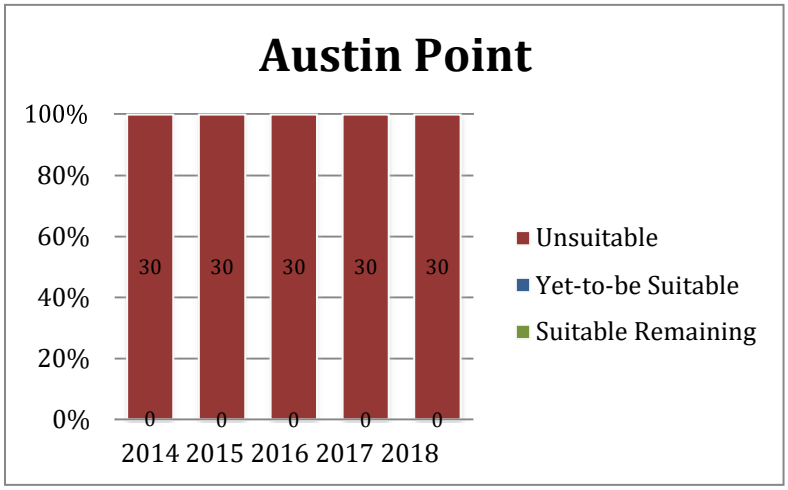

Figure 41: Availability of SHLA Nesting Habitat at Austin Point, 2014-2018

GROUP V

Group V consists of five placement sites located in the lower Columbia River: Sandy Island, Lower Deer Island, Martin Bar, Sand Island, and Austin Point. Of the 154 acres in Group V, only 33 acres (21% of total upland placement area) are baseline suitable SHLA nesting habitat at the time of its listing in October 2013. All 33 acres are suitable nesting habitat during the 2014, 2015, and 2016 breeding seasons. Dredged material placement and/or habitat succession results in an increase of 10 acres (+30%) of suitable nesting habitat during the 2017 breeding season as compared to 2016, for a total of 43 acres available in 2017. Dredged material placement and/or habitat succession results in an increase of 12 acres (+28%) of suitable nesting habitat during the 2018 breeding season as compared to 2017, for a total of 55 acres available in 2018. Overall, suitable nesting habitat is expected to increase by 22 acres from 33 acres of baseline suitable habitat in 2014 to 55 acres available during the 2018 breeding season (+67%). Figure 42 shows the percentage and acreage of suitable, yet-to-be suitable, and unsuitable SHLA nesting habitat over the next five years in Group V.

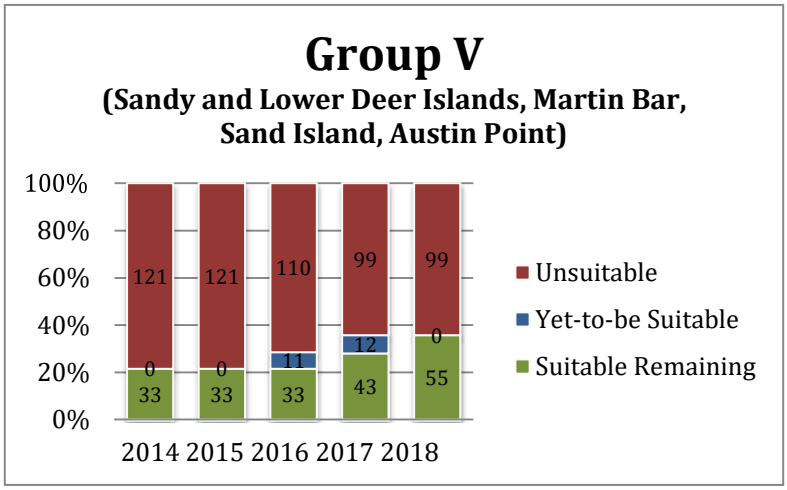

Figure 42: Availability of SHLA Nesting Habitat on Group V Sites, 2014-2018

FAZIO SAND & GRAVEL (RM 97.1)

No placements are planned on the 17-acre Fazio Sand & Gravel upland site. No suitable habitat is known or available in 2014 through 2018 due to ongoing sand and gravel mining and processing activities, as shown in Figure 43, and the entire site is assumed to be unsuitable in all years.

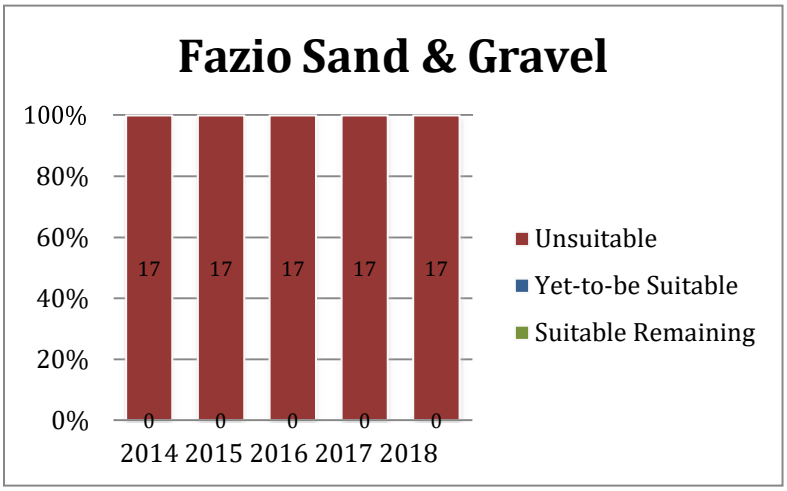

Figure 43: Availability of SHLA Nesting Habitat at the Fazio Sand & Gravel Site, 2014-2018

GATEWAY (RM 101.0)

Placement events on the 40-acre Gateway site occur in the summer, during the SHLA nesting season. The site is actively used for borrow activities and maintained by the Port of Vancouver. It has a 20-foot tall exterior berm along its perimeter and it is separated from the Columbia River by trees. Therefore, suitable SHLA nesting habitat is not expected to occur or develop on the Gateway site as shown in Figure 44.

In 2014 through 2018, no suitable SHLA nesting habitat is available on the site. No placements are planned on the site in 2014, 2015, 2016, or 2017. In 2018, the entire 40-acre site is planned for placement during the nesting season. However, no suitable SHLA nesting habitat is available on the site in 2018. The entire 40-acre site will be unsuitable habitat for nesting in all years.

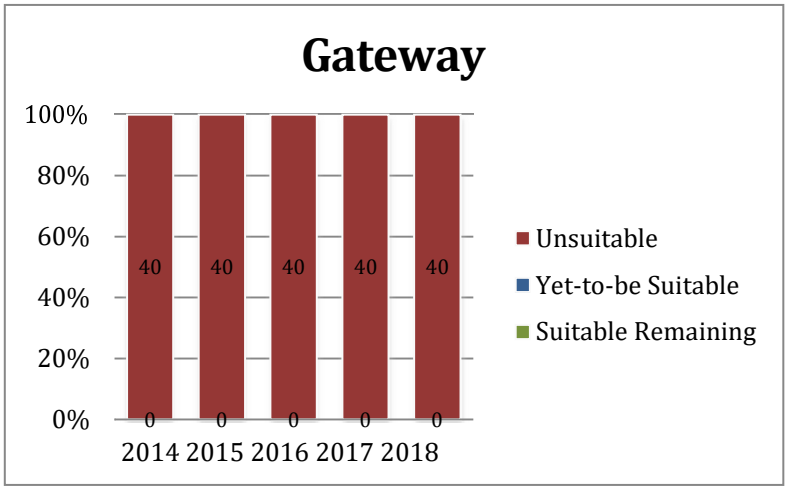

Figure 44: Availability of SHLA Nesting Habitat at Gateway, 2014-2018

WEST HAYDEN ISLAND (RM 105.0)

Placement events on the 116-acre West Hayden Island site occur in the summer, during the SHLA nesting season. The site is actively used by the Port of Portland for placing their dredged materials, storing dredging equipment, and other storage. The site has containment berms, roads, and a mix of trees, shrubs, forbs, grasses, and open ground. The site is separated from the Columbia River by trees. Therefore, suitable SHLA nesting habitat is not expected to occur or develop at West Hayden Island, as shown in Figure 45, and the site is assumed to be unsuitable in all years.

In 2014 through 2018, no suitable SHLA nesting habitat is available on the site. No placements are planned in 2014, 2015, 2017, or 2018. In 2016, an 84-acre placement is planned during the nesting season on the southern portion of the site. However, no suitable SHLA nesting habitat is available on the site in 2016. The entire 116-acre site will be unsuitable habitat for SHLA nesting from 2014 through 2018.

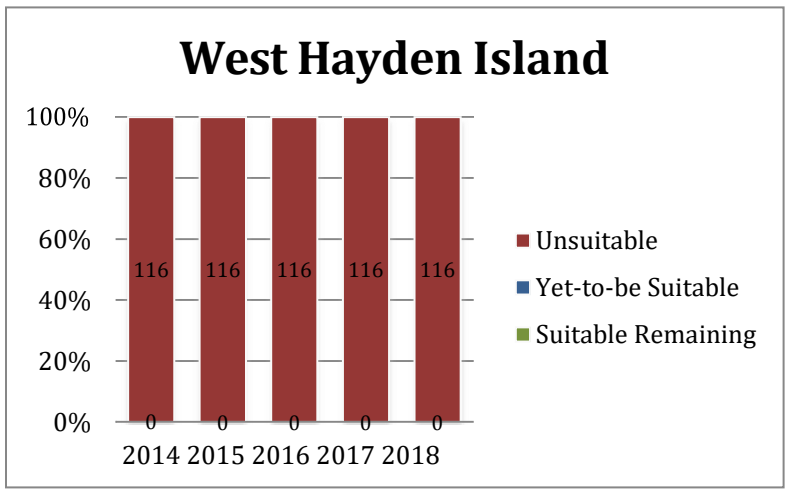

Figure 45: Availability of SHLA Nesting Habitat on the West Hayden Island Site, 2014-2018

GROUP VI

Group VI consists of three placement sites located in the lower Columbia River: Fazio Sand & Gravel, Gateway, and West Hayden Island. No suitable SHLA nesting is currently available within

the 173 acres of Group VI. The placement of dredged materials from 2014 through 2018 within Group VI will not result in a loss of suitable nesting habitat or create suitable nesting habitat because the sites are active borrow sites, have external visual barriers, and are actively disturbed by the landowners. Group VI will be unsuitable for nesting over the 5-year placement plan,as shown in Figure 46.

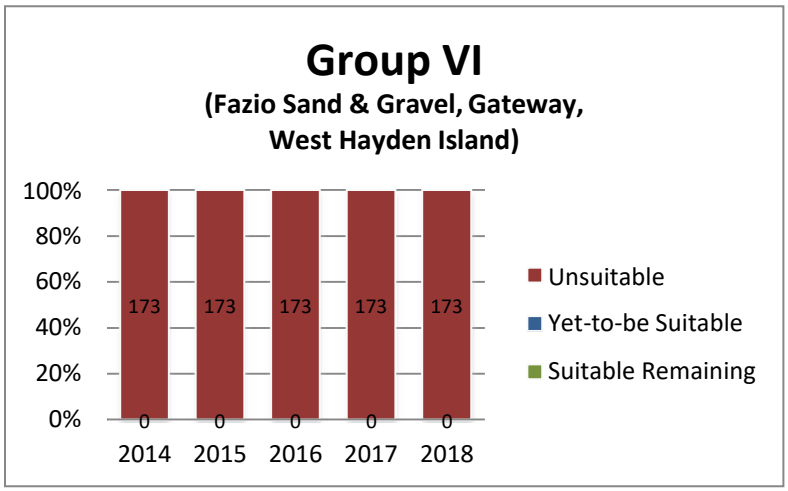

Figure 46: Availability of SHLA Nesting Habitat on the Group VI Sites, 2014-2018

POST-PLACEMENT MODIFICATIONS

Following dredged material placement, all temporary equipment (weirs, outfall pipes, valves, etc.) is removed from a placement site and transferred to the next scheduled location. The site is then graded to a condition to allow development into suitable SHLA habitat if left undisturbed or to dissuade avian species, according to what will most minimize effects. Depending on the remaining capacity within the dredged material placement footprint following placement, the berms may or may not be dismantled. Typically, when a site is not planned for placement the following year, or where sites have limited anthropogenic activity (not active borrow pits and/or public parks) the berms will be disassembled and the sand material distributed across the dredged material placement footprint evenly. The settling pond will be left undisturbed so sparse vegetation is allowed to grow quickly in the organic layer. Sites used annually (in whole or partially), or with regular anthropogenic activity, may be disassembled. However, dissuasion activities may be implemented to prevent active use of the site by larks, terns and/or cormorants (as discussed in Site Preparations).

The Corps does not own the placement sites, and therefore does not manage or regulate use of the sites prior to or following dredged material placement. Some sites may be leased by the landowner (states of Washington or Oregon, private entities, or Ports) to outside parties for the purpose of extracting the dredged material for off-site use. Other sites have public uses. Locations designated as SHLA critical habitat are denoted by # in the lists below.

The following sites are part of the dredged material placement network but are not planned for placement as part of the Columbia River FNC O&M program in the next five years:

- Dibblee Point

- Northport
- Sandy Island #
- Austin Point
- Fazio sand/gravel

The following sites have a high level of human activity and the Corps may not need to implement post-placement dissuasion:

- Skamokawa – Vista Park (county park and port-owned borrow site),
- James River (privately-owned borrow site),
- Dibblee Point (state-owned borrow site) – No planned placement,
- Northport (port-owned borrow site) – No planned placement,
- Martin Bar (port-owned borrow site),
- Sand Island (city park),
- Austin point (port-owned site leased as equipment training school) – No planned placement,
- Fazio Sand and Gravel (privately-owned sand and gravel operation) – No planned placement,
- Gateway (port-owned borrow site), and
- West Hayden Island (actively managed port-owned site with placement by others)

While some sites are currently borrow sites, any site has the potential to become a borrow site if the landowner grants permission to an interested party.

At sites that are not currently borrow sites, but where the Corps plans to return the following year for dredged material placement (on at least a portion of the placement site), the Corps intends to leave the site in a condition that does not attract SHLA. In these instances, dissuasive materials and mounding or trenching may be used to preclude site use by larks, terns and cormorants.

- Pillar Rock #

At West Sand Island, RM 3.1, the Corps will revegetate to the placement area to preclude the establishment of vegetation that could become detrimental to the native dune-grass community south of the placement area.

At sites where the Corps does not plan to repeat placement of dredged material, or repeatedly place dredged material in the same portion of a site, during the five-year dredged material placement plan, the Corps proposes to the leave the site or portions of the site in a condition that could develop into suitable SHLA habitat. These sites include:

- Rice Island #
- Miller Sands #
- Welch Island #
- Tenasillahe Island #
- Brown Island #
- Crims Island #
- Hump Island
- Lord Island (upstream portion)
- Howard Island
- Cottonwood Island
- Lower Deer Island

MONITORING

Part of the proposed action for the five-year dredged material placement plan includes monitoring the actions described above (site preparations, dissuasion, dredging, dredged material placement, and post-dredged material placement site management) across the Network. Monitoring will provide a greater comprehensive understanding of SHLA population distribution and relative abundance within the Network in response to the Corps' proposed action. Data will be collected on the presence/absence of larks throughout the Network, and incidental to this information, observational data will be collected about use of the placement site (breeding, foraging,sheltering). This information will help the Corps verify the effects from management of dredged material placement sites and evaluate the assumptions regarding habitat conditions and use by SHLA. Results will be summarized in an annual report and submitted to the USFWS. The Corps will also be able to use the results of the monitoring to plan long-term use of the Network to provide a shifting mosaic of suitable SHLA nesting habitat.

The Corps is proposing two monitoring efforts: piscivorous birds (terns/cormorants) and SHLA.

TERNS/CORMORANTS

A monitoring protocol has been developed for terns and cormorants on East Sand Island and it has been adapted for use with the dredged material placement network. This protocol has been used at Rice, Miller Sands, and Pillar Rock Islands to detect tern use in dredged material placement areas, subsequently triggering the need for active hazing from the islands during the breeding season (monitoring has not detected tern use to date). As part of the five-year dredged material placement plan, monitoring for terns and cormorants will occur at those islands where hazing should be implemented to preclude tern and cormorant use.

SHLA/SHLA HABITAT

Monitoring efforts for SHLA and SHLA habitat will focus on the sites within the Network. Monitoring for SHLA will document presence/absence, SHLA foraging and nesting, the efficacy of dissuasion efforts, and changes to SHLA habitats. For SHLA habitat, monitoring will document the placement footprint, the amount of suitable habitat modified during placement, the amount of suitable habitat available during the breeding season, and the amount of suitable habitat or yet-to-be suitable habitat remaining after placement. The acreage determinations will be done on a per site (and critical habitat sub-unit) basis, Network wide, and for the critical habitat unit (see Status of Critical Habitat section below).

A specific monitoring plan and methodologies will be developed in coordination with the USFWS and the Corps will begin implementation in 2014. In order to adequately collect data to validate how SHLA are distributed throughout the Network and how they respond to the proposed action, the Corps intends to build upon the existing SHLA data and adopt the Washington Department of Fish and Wildlife (WDFW) survey methodology to evaluate occupancy, abundance, and populations trends of SHLA in the Network.

The WDFW protocol recommends conducting three line-transect surveys during the breeding season between May and early July to confirm presence/absence of SHLA and document abundance and breeding behavior in occupied habitats. There is evidence, however, that this method may over-estimate the number of birds at a site, and some birds may not be detected in some areas where occupation is later confirmed. For example, Anderson did not detect birds at Tenasillahe Island in 2012 or 2013, but nests were discovered by Corps personnel prior to placement in both

years (2013). To increase the detection probability for sites where no surveys have been conducted, or where larks are not known to occur but where suitable habitat exists, the Corps proposes to conduct a fourth survey to confirm absence in areas where suitable habitat occurs.

COORDINATION & CONSULTATION

As part of the proposed action, the Corps requests an annual coordination meeting with the resource agencies (USFWS) and project sponsors to synthesize and discuss results from the prior dredged material placement activities. Regular meetings would guarantee on-going coordination during the five-year implementation schedule, where information about SHLA site use could be evaluated as it relates to the planned dredged material placement activities discussed above. In addition, these meetings would serve as a venue to discuss priorities for the upcoming dredging season and identify any issues needing resolution before dredged material placement commences the following year.

The Corps will initiate scheduling stakeholder meetings with the landowners and resource agencies annually in the winter (January) before site preparations are conducted for the upcoming dredging season, wherein the previous dredging season and monitoring results will be discussed and reviewed. Additional meetings would be scheduled as necessary when unanticipated shoaling necessitates unscheduled critical dredging actions and where these actions may affect SHLA.

STATUS OF THE SPECIES AND CRITICAL HABITAT

STREAKED HORNED LARKS AND LIMITING FACTORS

Horned larks are small ground-dwelling passerines endemic to open grassland habitats. There are 21 subspecies of horned larks found in 15 western states, and specific to the Pacific Northwest, streaked horned larks (SHLA) are considered a genetically distinct evolutionary unit found only in Oregon and Washington (Drovetski et al. 2005). The subspecies was originally proposed for listing by the USFWS on 30 October, 2001, and was formally listed as threatened on 3 October 2013 (FR 78 61452). In addition, to the proposed ESA-listing, SHLA are listed as *Endangered* by the State of Washington, considered *Sensitive* by the Oregon Department of Fish and Wildlife (ODFW), and are Red-listed (extirpated) in British Columbia, Canada (USFWS 2010).

The SHLA subspecies is found in prairie-oak habitats and coastal dune communities west of the Cascade Mountains in Washington and Oregon, where the birds prefer sparsely vegetated areas including sandy islands, wet prairies, oak savannahs and grasslands found at airports, and coastal spits. Prairie-oak habitat is distributed in a linear, north-south gradient in the Pacific Northwest, with the Cascade Mountains serving as a major ecological barrier to the east and the Pacific Ocean to the west. Historically, SHLA were common breeders from southern British Columbia south through the Puget Trough in Washington and into the Willamette and Rogue River Valleys in Oregon (see Figure 47) (Altman 2011, Anderson 2011).

The temporal dynamics of vegetation succession adds an additional layer of complexity to habitat development and maintenance for SHLA. Specific to the Action Area, invasive beach grasses have reduced the overall suitability of available habitat in the Columbia River and along the Washington Coast by altering the erosion/accretion processes that naturally maintain areas of sparse vegetation preferred by SHLA. Conversely, island sites currently used for placement activities may mimic sandy areas that were historically cleared of vegetation during the spring freshet and annual high flow events in the Columbia River basin (Stinson 2005).

The breeding range for SHLA has contracted in response to the loss in quantity and connectivity of native grassland habitats and increased isolation within a narrow band of suitable habitat, as is typical of edge populations (Altman 2011). Streaked horned larks experienced simultaneous north-south contraction between the 1960s and 1990s. The last SHLA in British Columbia, the northern extent of the historical range, was observed at the Vancouver International Airport in 1987; southern extent, the birds were last seen in the Rogue Valley in 1976 (Altman 2011). Currently, populations of SHLA breed in four eco-regions of Oregon and Washington: the Puget Lowlands, sandy areas along the Washington coast, islands in the lower Columbia River, and fallow agricultural fields in the Willamette Valley[2].

The breeding season is initiated with adults arriving on the breeding site in late February/early March. Most nests are constructed in late April or early May, with the first clutch fledging in May/June[3]. Females select the nest location (typically at the base of a bunch grass or forb) and will construct and incubate the nest with little involvement from the male (Stinson 2005). A typical clutch includes three eggs (one egg laid per day), which are incubated for 11 or 12 days. A successful nest will fledge nestlings after 8-10 days, and the altricial young are dependent on the parent birds until they become independent at 21-27 days. Adults and juveniles vacate breeding sites in late August, bound for over-wintering sites farther south.

[2] There is some overlap in habitat along coastal Washington, near Willapa National Wildlife Refuge.

[3] The earliest recorded clutch was observed on 15 March (Stinson 2005).

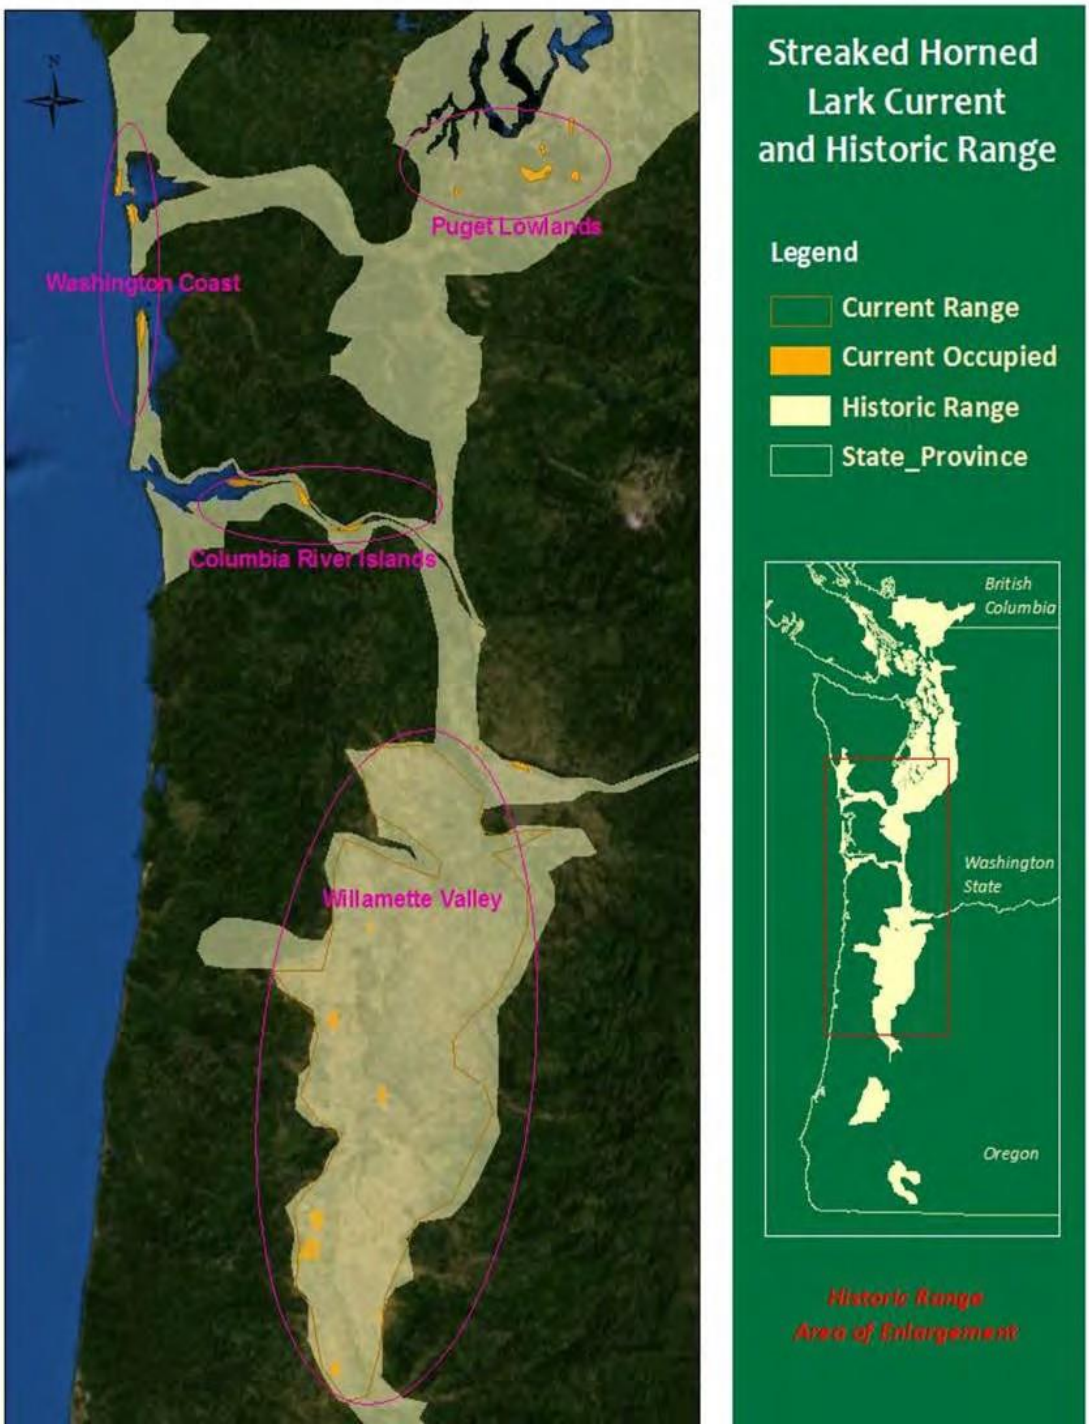

Figure 47: Estimate of Current and Historic Ranges of SHLA Image courtesy of Anderson 2011.

Breeding territories are established after adults form pair bonds in the spring. Average territories range in size between 1.5 to 2.5 acres, with an average of approximately 1.9 acres per breeding pair (Altman 1999, USFWS 2014). Nests are most often (89%) constructed on the north side of

perennial forbs in shallow depressions 2 to 3 inches deep (Beason and Franks 1974, Pearson and Hopey 2005, Stinson 2005). If the first nest fails or is abandoned, adults will likely re-initiate a second clutch within 2 days after failure in May or June. If timing allows after the re-nesting attempt, or if the first nestlings fledge successfully, a second (or third) clutch is initiated approximately 1 week following juvenile independence, with the second nest fledging in late July or August (Beason and Franks 1974, Stinson 2005, USFWS 2010 and 2013). Research by Pearson and Hopey showed three peaks in clutch initiation dates in the Action Area, where nesting is started earlier in the Columbia River and last longer into the summer than at sites in the Puget Lowlands in Washington (2005).

Recent population surveys estimate the overall population of SHLA to total approximately 1,170 – 1,600 individuals (Altman 2011, Anderson 2011). Point-count data in 1996 and 2008 indicate populations in the Willamette Valley are largely stable, but the regional population is estimated to be declining by 40% per year in the Puget Lowlands, the Washington coast, and the lower Columbia River (Pearson et al. 2008, Altman 2011, Camfield et al. 2011). The range-wide population is estimated to be declining by 40% per year as a result of low fecundity and low adult survival (Pearson et al. 2008). Model results from Pearson et al., Schapaugh, and Camfield et al. showed adult survival explains a high proportion of the variation in range-wide population growth rates, followed by juvenile survival and fecundity, suggesting adult survival has a significant impact on population growth (2008, 2009, and 2011, respectively). These findings suggest SHLA populations are demographically limited, rather than limited by the availability of suitable habitat conditions.

Direct threats to individuals include predation, natural and anthropogenic factors including low reproductive success, low genetic variation (which leads to inbreeding depression), reduced disease resistance and adaptability to stochastic events, and human disturbance (Stinson 2005, USFWS 2010)[4]. Human disturbance can cause abandonment, which may indirectly increase the predation of eggs or chicks while the nest is left exposed and vulnerable after adults are flushed. As populations continue to decline and become increasingly fragmented, genetic diversity and variability is reduced ultimately leading to reduced adaptability and a high risk of local extirpation and additional range contraction.

The available data estimates there are approximately 120-140 adults (upwards of 60-70 breeding pairs) throughout the Action Area (Altman 2011, Anderson 2013). Of the dredged material placement sites described in Appendix B and surveyed for presence/absence, nine have known breeding pairs of SHLA: Rice, Miller Sands, Pillar Rock, Welch, Tenasillahe, Brown, Wallace, Crims and Sandy Islands. Rice and Brown Island both support a substantial proportion of SHLA, where each island is estimated to sustain over 20 pairs of breeding adults (Anderson 2013). Table 6 shows the number of breeding pairs estimated between 2011 and 2013 (Anderson 2013)[5]. It should be noted that because not all potentially available sites were surveyed by a systematic method, the number of pairs estimated between 2011 and 2013 does not reflect total SHLA abundance throughout the lower Columbia River, but rather the abundance at those sites surveyed during the course of the investigation.

[4] While brown-headed cowbirds (*Molothrus ater*) have been observed at all known breeding sites, no parasitism has been observed to date (Stinson 2005).

[5] Breeding pairs were estimated by doubling the number of singing males detected during any one visit; there is some indication that survey methods used to detect SHLA may over-estimate the number of birds occupying each site and some birds may go undetected between site visits. For a complete description of survey methods and results, please refer to Anderson 2013.

Table 6: Estimated Number of SHLA Breeding Pairs in the Lower Columbia River

Site	2011	2012	2013
Rice Island	13	14	22
Miller Sands Island	4	2	5
Pillar Rock Island	4	3	2
Welch Island	0	1	0
Tenasillahe Island	2	2	0
Brown Island	14	18	23
Wallace Island (not in Corps Network)	0	1	0
Crims Island	7	4	2
Northport	-	-	3
Sandy Island	2	1	4
Total	***46***	***46***	***61***

Nesting success within the Action Area is estimated to be approximately 33%, where predation and abandonment are the most frequent causes of nest failure, each contributing equally to failure (40%, each) (Pearson and Hopey 2005, Stinson 2005). While predation is a substantial source of failure, Pearson et al. (2012) showed that nest exclosures commonly used with precocial young (shorebirds and ducks) have no effect on nest success of altricial SHLA. The lower rate of predation associated with nest exclosures was offset by an increased rate of abandonment and predation of adults by raptors.

Streaked horned larks exhibit high site fidelity to (successful) breeding areas, as documented by mark-recapture/re-sight studies where birds return to the same areas year after year to nest semi-colonially. There is no published data documenting intra- or inter-annual movement between nesting sites during the breeding season in the lower Columbia River. Observations have shown a high density of nests in one location with large expanses of nearby unoccupied nesting habitat (Pearson and Altman 2005, Stinson 2005). Over-wintering site fidelity is low and the birds disperse throughout the region to locate suitable foraging habitats, the distribution and availability of which may change from year to year. As a result, while wintering sites are extremely important to the conservation of the species, they are functionally difficult to manage and protect.

While threats to SHLA are not known to be increasing, the existing threats continue to exert unnaturally high pressures on small populations which have low genetic diversity, low growth rates, and congregate in a few over-wintering populations. Few of the existing breeding and wintering habitats are protected, and none are managed exclusively for SHLA (Pearson and Altman 2005). The islands in the lower Columbia River may serve as a geographic link between occupied regions to the north in the Puget Lowlands, to the west along the Washington coast, and to the south in the Willamette Valley. Streaked horned larks are semi-migratory and over-winter in the lower Columbia River and throughout the Willamette Valley. It is estimated that 60% to 70% of the regional population over-winters in the Willamette Valley and the remaining 30% to 40% are distributed largely between islands in the lower river and along the Washington coast (Pearson and Altman 2005, Stinson 2005).

Dynamic ecosystem processes and the management of accretion and erosion are critical to maintaining breeding and wintering habitats along the Columbia River. As described above, many of the islands in the lower Columbia River are state-owned and leased for the placement of dredged

material, and the placement of dredged material directly impacts the inter-annual availability of SHLA nesting habitat. Dredged material placement has the potential to maintain existing habitat and create or expand new sites for nesting and foraging. However, these activities ought to be spatially and temporally coordinated to minimize the adverse impacts to SHLA and their breeding habitats. In 2005, Pearson and Altman observed placement activities burying a nest, causing nest failure. However, placement events in recent years (2012 and 2013) were conducted in a manner that avoided burying active nests by isolating the nests from the placement footprint.

Various studies have evaluated habitat characteristics to identify suitable sites for foraging and nesting SHLA. These studies have demonstrated that suitability is predominantly a function of ground substrate, the composition of vegetation and the adjacency or visibility to open water areas (Pearson and Hopey 2005, Anderson 2013). Recent information suggests the percent of bare sand at a particular site can be used as a proxy for identifying suitable habitat conditions for breeding SHLA. In a recent analysis of habitat conditions in the lower river, Anderson showed that areas comprised of 50% to 90% bare sand were indicative of those habitats used most frequently by SHLA for nesting (2013). In this analysis, larks did not nest in areas with no vegetation (>90%) and did not frequent areas with covered by more than 50% vegetation. Furthermore, SHLA preferentially select nest sites at the base of perennial forbs and bunch grasses (as opposed to annual grass and forbs) and sites with low horizontal density and a high percentage of bare ground are preferred foraging areas (Stinson 2005).

Larks are known to use areas outside of what is widely considered “suitable” and while some birds utilize areas where placement of dredged material recently occurred, this BA assumes nesting would be restricted to those areas where the percent cover of vegetation and bare sand meet the suitable conditions (50% to 90% bare sand). In addition, for the purpose of this BA, habitat conditions on the placement sites are divided into three categories based on the best available science: (1) suitable, where habitat consists of 50% to 90% bare sand with some vegetation; (2) yet-to-be suitable, where vegetation has not yet established across the site and there is >90% bare sand; and (3) unsuitable, where vegetation exceeds 50% cover and the area is too dense for SHLAs. In addition, because larks are known to use areas with clear visibility of the surrounding landscape, suitable habitat is also assumed to be 25 meters from a forested edge or the shoreline. This buffer excludes areas where vegetation likely becomes too dense for SHLAs and areas affected by tides and therefore unsuitable for nesting.

The amount of time needed for vegetation succession varies throughout the lower Columbia River. Current research shows that to take longer for vegetation to establish on Rice, Miller Sands, and Pillar Rock Islands, presumably as a result of high winds and harsher climatic conditions (Anderson 2013). For this reason, it is assumed that vegetation takes three growing seasons to become established on these islands, and habitat is suitable for SHLA nesting at the beginning of the fourth breeding season following placement. For all other islands (between Skamokawa–Vista Park at RM 33.4 and West Hayden Island at RM 105), it is assumed that vegetation transitions more quickly and vegetation becomes established after one full growing season. In these areas, it is assumed that placement sites transition into suitable habitat at the beginning of the breeding season in the second year following placement.

In some instance, vegetation has been observed growing in placement areas within one year of placement, likely as a result of organic materials in the dredged sediments supporting establishment of quick-growing plants (Anderson 2013). While vegetation establishment and succession occurs at different rates throughout the Network, a habitat analysis by Anderson showed that once areas become suitable, they remain suitable for approximately 6-7 years (2013), provided the areas do not experience other disturbances during this time. Where vegetation is transforming suitable nesting habitats into densely vegetation areas, controlled burns and

mechanical or chemical treatments (tilling, mowing, and herbicide application) can be used to restore and maintain suitable foraging habitat (Pearson and Altman 2005, Anderson 2011). It has been proposed that the strategic placement of dredged materials, in combination with herbicide application, can effectively control invasive species to maintain preferred habitats for SHLA and create additional habitats where naturally erosive processes have eliminated other island habitats (Anderson 2011).

CRITICAL HABITAT

The USFWS designated a total of 4,629 acres range wide in Oregon and Washington as critical habitat for streaked horned larks (78 FR 61506). All areas designated as critical habitat constitute areas currently occupied at the time of listing and contain the primary constituent elements (PCEs) to support the life-history needs of the species. The designated areas contain the physical and biological features essential to the conservation of the species, having a minimum of 16% bare ground with sparse, low-stature vegetation comprised primarily of grasses and forbs less than 13 inches in height. In addition, these features are found in flat areas (zero to five percent slope). These areas are 300 acres in size or within a landscape context that provides visual access to open areas, such as open water or fields. These areas provide suitable foraging and nesting habitats.

The USFWS identified a number of activities that may affect the physical and biological features essential to the conservation of SHLA across its range such that special management considerations or protections may be required. Threats include (1) the loss of habitat; (2) control of non-native, invasive species; (3) development; (4) construction and maintenance of roads and utility corridors; and (5) habitat modifications brought on by successive vegetation growth from lack of regular disturbance, both small and large scale. The effects of specific activities on the quality and quantity of essential features vary between areas within the critical habitat designation, particularly where sites are large (greater than 300 acres).

The USFWS identified two units of critical habitat for SHLA, which can be further divided into 16 sub-units, one unit (Unit 3) encompassing 13 subunits along the Washington coast and lower Columbia River and another unit (Unit 4) encompassing 3 subunits in the Willamette Valley. Units 1 and 2 were not designated for SHLA. The relevant subunits for this analysis include those in Unit 3 along the Washington Coast and Columbia River, totaling 2,899 acres, where 2,209 acres are State-owned lands, 564 acres are under Federal ownership, and the remaining 126 acres are privately owned.

The four Washington coastal subunits total 2,235 acres and include:

- Damon Point (subunit 3-A), 480 acres (not part of the Corps' Network)
- Midway Beach (subunit 3-B), 611 acres (not part of the Corps' Network)
- Shoalwater Spit (subunit 3-C), 479 acres (not part of the Corps' Network)
- Leadbetter Point (subunit 3-D), 665 acres (not part of the Corps' Network)

The nine subunits in the lower Columbia River are state-owned, small islands adjacent to open water and landscapes preferred by SHLA. It should be noted that only a portion of each Corps placement site overlaps with designated critical habitat on the island. Within any Corps placement site, only a portion of the site is likely to be suitable and used by SHLA in any year. The designated subunits of critical habitat do not shift over time because they are fixed geographic units. However, the availability of suitable nesting habitat within each placement site and each subunit shifts over time as new materials are deposited, vegetation is established, and older placement sites become too heavily vegetated for nesting by SHLA. The total acreage of designated critical habitat for SHLA throughout the lower Columbia River is 665 acres, including:

- Rice Island (subunit 3-E), 224 acres
- Miller Sands (subunit 3-F), 123 acres
- Pillar Rock/Jim Crow (subunit 3-G), 44 acres
- Welch Island (subunit 3-H), 43 acres
- Tenasillahe Island (subunit 3-I), 23 acres
- Whites/Brown Island (subunit 3-J), 98 acres
- Wallace Island (subunit 3-K), 13 acres (not part of the Corps' Network)
- Crims Island (subunit 3-L), 60 acres
- Sandy Island (subunit 3-M), 37 acres

Of these, all but Wallace Island overlap dredged material placement sites within the Corps' dredged material placement Network. Figure 48 shows the designated critical habitat subunits within Unit 3 for the lower Columbia River.

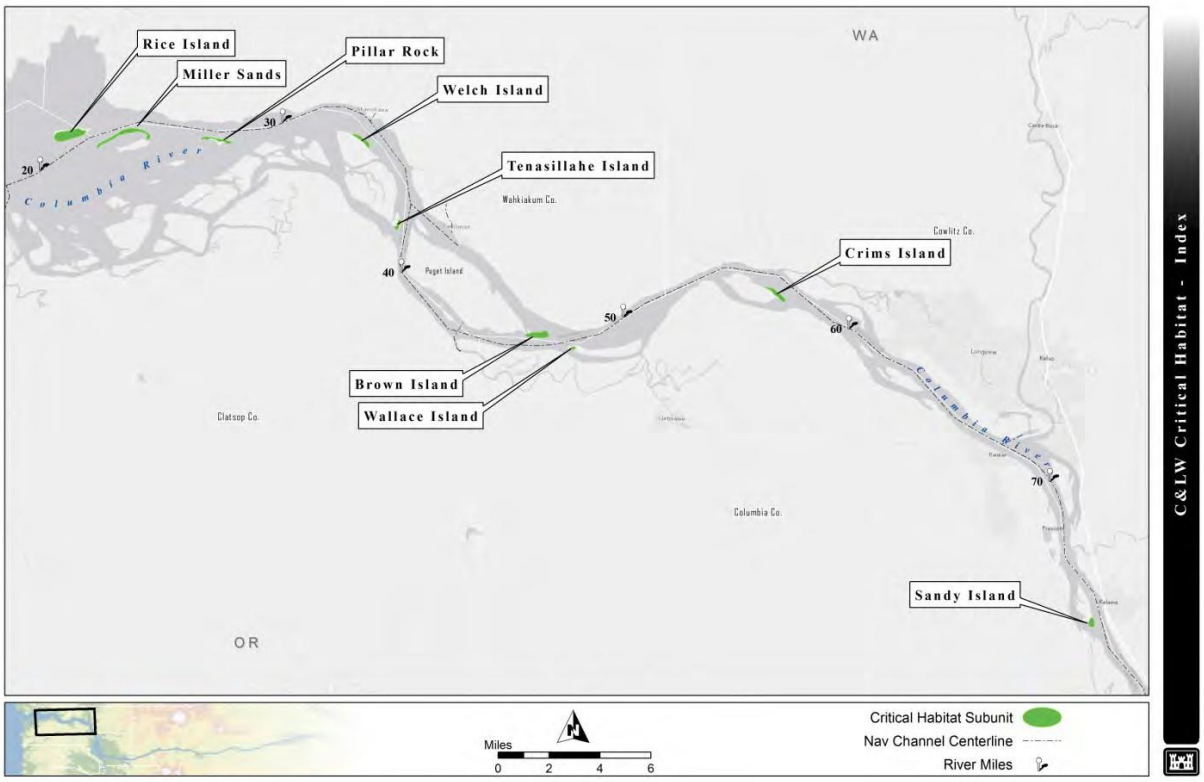

Figure 48: Designated Critical Habitat Subunits of Unit 3 in the Lower Columbia River

The main threats to SHLA critical habitat in the Columbia River subunits are natural vegetation succession, invasive vegetation, direct impacts associated with dredged material placement during the breeding season, and foraging habitat for over-wintering birds (USFWS, 2013).

Table 7 details the acreages of designated SHLA critical habitat, overlap with each placement site, and how much of that critical habitat subunit is currently suitable SHLA nesting habitat. Suitable nesting habitat for SHLA typically contains all the PCEs of SHLA designated critical habitat. However, designated SHLA critical habitat is not always suitable for nesting because of natural

vegetative succession both within and adjacent to specific subunits. Wallace Island (*) is not in the Corps' placement network.

Table 7: Designated Critical Habitat within Lower Columbia River and Corps' Network

Subunit	Subunit (acres)	Placement Site (acres)	Designated Critical Habitat (CH) Within Site (acres)	Currently Suitable SHLA Nesting Habitat Within CH (acres)
Rice Island (RM 21.0)	224	264	219	150
Miller Sands Island (23.5)	123	117	88	0
Pillar Rock Island (27.2)	44	52	41	4
Welch Island (RM 34.0)	43	41	37	10
Tenasillahe Island (RM 38.3)	23	41	23	2
Brown Island (RM 46.1)	98	102	97	72
Wallace Island (RM 47)*	13	n/a	n/a	3
Crims Island (RM 57.0)	60	59	53	25
Sandy Island (RM 75.8)	37	32	32	32
TOTAL (acres)	**665**	**708**	**590**	**298 (45% of 665)**

EFFECTS ANALYSIS

The effects of the proposed action are described with respect to the proximity, duration and frequency of the action, and resulting disturbance to species, modifications to habitat, and habitat creation. Some islands have known occupation by SHLA while others have no reported (historical) use by larks. Because habitat suitability is directly linked to vegetation succession, some areas with dense vegetation are not used by larks and have not been used by larks for several years. Placement will vary throughout the Action Area, as some sites will be used annually whereas others will be used once or intermittently during the 5-year plan. The effects to the species and critical habitat will be both localized to entire placement sites, or portions of the placement sites, as well as distributed throughout the placement network. There are eight islands designated as critical habitat in the Network, but only seven islands are in the 5-year Plan: Rice, Miller Sands, Pillar Rock, Welch, Tenasillahe, Brown, and Crims islands. No placement is planned on Sandy Island in the next five years.

Included in the discussion below is the effect of the action on specific stages of the SHLA lifecycle (adults, juveniles, nestlings, eggs) and whether the effects may affect the overall population size and distribution of larks in the Columbia River estuary. Because the Columbia River islands may serve as an increasingly important geographic link between occupied regions to the north (Puget Lowlands), the west (coastal areas), and areas to the south (Willamette Valley), it has been recommended to avoid disturbing nesting areas in the Columbia River between April 15 and August 15 (Anderson 2011). To minimize impacts to breeding birds and nesting areas, certain actions are timed to coincide outside of the breeding. However, some placement activities will occur within this timeframe, and the effects of these actions are described below.

The duration and frequency of dredged material placement has also been evaluated for its effect on SHLA and its habitat. There are immediate, short-term adverse effects to individuals and SHLA

habitat from the proposed actions. However, long-term, beneficial effects to SHLA habitat are anticipated from the strategic management of placement within the Network. To the extent practicable, the timing of certain components of the proposed action will minimize disturbance to the birds. Maintenance of the navigation channel requires annual dredging and some effects will be sustained for the life of individuals, which might have lasting effects to population growth rate and recovery of the Columbia River population. However, the long-term beneficial effects to suitable SHLA nesting habitat are expected to outweigh short-term adverse effects to individuals and habitat.

CLIMATE CHANGE

It is likely that climate change will play an increasingly important role in future years in determining the abundance of ESA-listed species and the conservation value of designated critical habitats by exacerbating long-term problems related to temperature, stream flow, habitat access, predation, and marine productivity (CIG 2004, ISAB 2007). According to the U.S. Global Change Research Program (USGRP), the average regional air temperatures have increased by an average of 1.5°F over the last century (up to 4°F in some areas), with warming trends expected to continue into the next century (2009).

Precipitation trends during the next century are less certain than those for temperature, but increased precipitation is likely to occur during October through March and less during summer, with more winter precipitation falling as rain rather than snow (ISAB 2007, USGCRP 2009). Where snow occurs, a warmer climate will cause earlier runoff resulting in lower stream flows and warmer water temperatures in late spring, summer, and fall (ISAB 2007, USGCRP 2009). These changes will not be spatially homogeneous across the entire Columbia River basin. Areas with elevations high enough to maintain temperatures well below freezing for most of the winter and early spring would be less affected. Low-lying areas that historically have received scant precipitation during the winter and contribute little to total stream flow and are likely to be more affected. The ISAB recommends planning now for future climate conditions by implementing protective tributary, mainstem, and estuarine habitat measures; as well as protective hydropower mitigation measures (2007).

Climate change may result in an expansion of prairie-oak habitats northward; however, SHLA population dynamics are declining for a multitude of reasons and not just habitat loss. Until these factors are addressed and regional populations can serve as a source population as opposed to a population sink, habitat expansion as a result from climate change is not likely to provide relief to the current declines in SHLA abundance (Altman 2011).

The effects of climate change in the Action Area could lead to a change in the timing of precipitation, the extent of snowpack, and rain-on-snow events. These changes in weather patterns could influence seasonal river flows, subsequently influencing the presence of size of shoaling in the lower Columbia River, thereby influencing the timing of dredging and placement of materials. However, the proposed placement plan described above is a short-term project, lasting five years in duration. It is assumed that any effects climate change might have across the action area during this timeframe would be negligible and effects to SHLAs or their habitats would be immeasurable.

EFFECTS OF THE ACTION

While a number of measures will be taken to minimize and avoid impacts to birds and their habitats, some direct, indirect, and cumulative effects are expected to occur. Additionally, the upland placement of dredged material will create and sustain suitable SHLA nesting habitat over

time. The sections below evaluate the effects of the components of the proposed action, as described above, on the species and its critical habitat, as well as the interrelated and interdependent activities.

SITE PREPARATIONS

The timing of site preparations will occur in the winter and early spring months outside of the breeding season to minimize future direct impacts to nesting birds. During this time period, over-wintering adults may be present on placement sites and these individuals are expected to move out of the area of active site preparation. Site preparation, including the construction of landing ramps, shoreline grading, physical demarcation of the footprint (flagging, berm building, etc.), vegetation removal that is necessary to facilitate dredged material placement could disturb birds and disrupt foraging. These actions could directly injure or harm individuals, however this is likely discountable because birds will likely flush and avoid the activity.

Repeated flushing events during the winter and before the breeding season could lead to a decrease in overall fitness of individuals, where energy is expended or foraging is interrupted to flee from people and equipment. Over-winter foraging success is directly linked to building or maintaining body fat in preparation of migration and the upcoming breeding season. Research has suggested that birds which winter in higher quality wintering habitat are more likely to survive annual migration and have higher reproductive success during the breeding season (Sillett and Holmes 2002). Flushing during site preparations could stress birds and force individuals to expend increased levels of energy to seek safety and shelter.

The physical movement or displacement of sand, vegetation, and other habitat features would fundamentally alter site characteristics and habitat suitability (either making it more or less suitable, depending on the preparations specific to the placement plan). Vegetation removed during site preparations will be buried or made unavailable to nesting birds. If the habitat was suitable for nesting, it is likely that this habitat would no longer be suitable following site preparations. During the winter and early spring, vegetation likely provides a buffer against severe weather and predators. The removal of this vegetation is expected to result in wide open expanses of exposed sand, forcing individuals to seek shelter on unused portions of the placement sites with suitable habitat conditions.

The process of removing vegetation using vehicles and earth-moving equipment will disturb the soil surface, mixing layers of the soil and exposing seeds and insects that were previously buried and inaccessible to foraging songbirds. There may be a short-term benefit to larks immediately following vegetation removal. Seeds would likely be knocked off branches and insects would be exposed when leaf litter is moved during vegetation clearing. This additional foraging material would be valuable during the winter season when forage and prey items are scarce. While there may be a short-term benefit, increased exposure resulting from vegetation removal could also lead to increased predation. However, most recorded predation events occur to juveniles during the nesting season. Streaked horned larks present on the placement sites in the winter/spring are expected to be fully mobile and able to escape most predators. While the lack of vegetation cleared during site preparations would expose SHLA to increased predation, predators would also be likewise exposed and it is expected that healthy adult larks (not injured or sick) would be able to escape predators.

Overall, the number of individuals directly affected by site preparations is expected to be low and should not result in any direct mortality.

DISSUASION

Similar to the effects from site preparations, repeated dissuasion and hazing could also impact SHLA. Dissuasion actions that coincide with site preparations are intended to minimize site use by larks, and other migratory birds where active dredged material placement will occur during the breeding season. The Corps implements early-season (February-March) dissuasion to reduce the potential for more severe impacts to SHLA later in the nesting season. All dissuasion practices are intended to discourage nesting, roosting, and/or foraging behaviors, with the ultimate intent to avoid, minimize, and reduce impacts to adults, juveniles, and/or nestlings during the breeding season. No active dissuasion of SHLA will occur during the breeding season (15 April through 15 August). While some uncertainty remains regarding the effectiveness of early season dissuasion, the Corps is confident that dissuasion efforts would be effective at precluding site use by SHLA based on discussion with species experts in the region. Further, despite dissuasion efforts, some birds may be undeterred from nesting; therefore these individuals may be adversely affected directly through the placement of sediment in their nesting territories, eliminating those areas for nesting in the short term and possibly resulting in mortality to eggs and/or chicks.

As a requirement of the NMFS 2012 BiOp, T&C 1(k), if avian predators (piscivorous birds) are identified in the action area, hazing actions would be implemented to intentionally flush birds and discourage nesting on upland placement sites. If nesting activity is observed on placement sites, the Corps will actively discourage these behaviors, including egg collection. Alternatives to intentional hazing and dissuasion actions include the use of physical barriers (nets and fencing, flagging, etc.) and habitat modifications (vegetation removal, trenching, mounding, etc.) to minimize the extent and suitability of habitat available for foraging and nesting. These activities will include human presence and may involve the use of vehicles. As a result, these activities may result in a range of effects to SHLAs, depending on the timing, location and intensity of hazing and dissuasion. This includes flushing adults and/or young, increased exposure of individuals to weather and predation, nest abandonment and/or destruction, and possible mortality of eggs or young. If these actions occur with substantial frequency and/or duration, dissuasion of avian predators could result in direct effects to SHLA survival.

Currently, dissuasion of piscivorous birds only occurs at Rice, Miller Sands and Pillar Rock islands, which are potential habitat for Caspian terns. In these areas, habitat is modified , silt fences are constructed and terns are hazed from the island to prevent occupation and nesting (Stinson 2005). These actions accelerate the development of dense vegetation, reducing the availability of bare ground and precluding the use of these areas as nesting and foraging habitat for terns or SHLA. Similarly, hazing actions directed at terns can have adverse effects to larks, when active dissuasion occurs in suitable SHLA nesting habitat. Currently, only Pillar Rock Island contains potential tern habitat that overlaps with suitable nesting habitat for SHLA. Terns have not attempted to nest in these areas to date and dissuasion of terns has not occurred. If tern dissuasion is necessary in suitable SHLA nesting habitat in the future, there could be direct and indirect effects to SHLA and its nesting habitat.

Dissuasion to avian predators and SHLA is not expected to result in direct mortality of adults, rather, dissuasion and hazing activities are expected to directly affect or alter adult behavior. Direct effects include flushing of adults, flushing adults from nests, increased exposure of eggs/young to environmental conditions, increased risk of nest predation, accident injury to eggs/young, nest abandonment, and nest failure from activity in nesting habitats. Indirect effects include the loss of suitable nesting habitat that could result in decreased nest success. Indirect effects resulting from dissuasion include modifications to habitat that preclude the use ofsuitable nesting habitat, thereby

indirectly affecting individuals. However, habitat availability is not assumed to be a limiting factor in the action area (Pearson et al. 2008, Schapaugh 2009, and Camfield et al. 2011).

DREDGING AND OCEAN AND IN-WATER PLACEMENT

All dredging and in-water work is expected to have no effects to SHLA or their critical habitat. In-water dredged material placement has no effect to terrestrial species and therefore, it will not be evaluated in this analysis. Furthermore, it has been determined that all dredged material is suitable for unconfined, in-water placement without further characterization.

DREDGED MATERIAL PLACEMENT AT UPLAND AND SHORELINE SITES

Efforts have been made in recent years to identify active nests in the placement Network and avoid these areas. As previously stated, site preparations and dissuasion activities should minimize direct effects to adult SHLAs, as these actions occur outside of the breeding season and any reductions to the suitability of placement sites for nesting will occur before the onset of the breeding season. Dredged material placement activities generally include access, equipment staging and set-up, site grading, placement of weirs and outfall pipes using earth-moving equipment, berm construction and discharge of the sand-water slurry into the placement footprint. Based on the results of sediment quality testing described above, no effects to SHLA or their habitat are expected as a result of the quality of the dredged sediments placed on upland or shoreline sites. Following placement of dredged materials, all equipment is removed from the site.

Due to a lack of data supporting the effectiveness of site preparations and dissuasion to preclude site use, SHLA may nest in the placement footprint despite these efforts. Placement sites used during the breeding season will be evaluated for any active nesting by a biologist prior to placement occurring. Adult SHLAs may experience direct effects from the placement of dredged materials if they occupy the site for foraging or nesting. While adult SHLA may be disturbed during placement, they would likely flush from the area , which could result in nest abandonment, increased predation, decreased foraging opportunities, and increased energetic expenditures. Past placement activities have resulted in placement of dredged materials on active SHLA nests. In the event that nests are in the placement footprint, sediment placement will result in the direct mortality and burial of eggs, and nestlings; adults are expected to flush from the area and avoid burial and direct mortality.

Individuals in areas adjacent to the placement footprint (but outside of the placement boundary) are expected to experience similar effects to actions in the placement footprint, including flushing adults and/or young, increased exposure of individuals to weather and predation, nest abandonment and/or destruction. In addition, juveniles and young-of-the-year birds that move into the dredged material placement footprint are expected to have sufficient flight capabilities to flush from the area upon initiation of active material placement or other disturbances.

Indirect effects to SHLA are expected to result from modifications to habitat and an associated loss of nesting and foraging areas following the placement of dredged materials, wherein the net effects are realized later in time. Based on the expected changes to the availability of suitable nesting habitat throughout the Network over the 5-year placement plan, SHLA will experience increases and decreases in the availability of suitable habitat in some years, which may impact territory size for breeding pairs and dispersal of juveniles.

ESTIMATED BREEDING PAIRS IN SUITABLE SHLA NESTING HABITAT

As described in the above sections, the breeding population of SHLA in the Columbia River is estimated to contain approximately 120-140 adults, or 60-70 breeding pairs. Additionally, territories are assumed to range between 1.5 and 2.5 acres per breeding pair (USFWS 2014). For this analysis, all areas identified as suitable are assumed to be available for nesting and the potential number of breeding pairs an area is able to support is based on the estimated number of suitable habitat acres and the given range of breeding territories, where:

$$Number\ of\ breeding\ pairs = \frac{Available\ suitable\ nesting\ habitat\ (X\ acres)}{Territory\ size\ (2.5\ acres)}$$

and

$$Number\ of\ breeding\ pairs = \frac{Available\ suitable\ nesting\ habitat\ (X\ acres)}{Territory\ size\ (1.5\ acres)}$$

NETWORK SCALE

Based on recent 2011 through 2013 surveys, the numbers of SHLA breeding pairs observed in the Network were 46, 46, and 61 pairs, respectively (Table 6). Based on the currently available suitable nesting habitat for SHLA and the assumptions about the possible number of breeding pairs habitat can support, the Network can support between 122 and 205 SHLA breeding pairs. This estimate is two to three times the observed number of pairs in recent years. This also assumes the population has a 1:1 sex ratio of males to females, across 315 acres of suitable habitat. This range is supported by population models which suggest SHLAs are not limited by the availability of suitable habitat, but rather by population demographics (adult and juvenile survival, nest success) (Pearson et al. 2008, Schapaugh 2009, Camfield et al. 2011). When the total extent of suitable habitat across the Network is lowest in 2015 (261 acres), the habitat could still support 93 to 157 SHLA pairs throughout the Columbia River, which is 55% more than what is estimated to occupy the lower river under current conditions (60 to 70 pairs). Over time, as suitable habitat conditions increase throughout the Network, it is assumed that the number of breeding pairs will also increase to a maximum range of breeding pairs between 253 and 426 across 643 acres of suitable habitat throughout the Network in 2018 (see Figure 49).

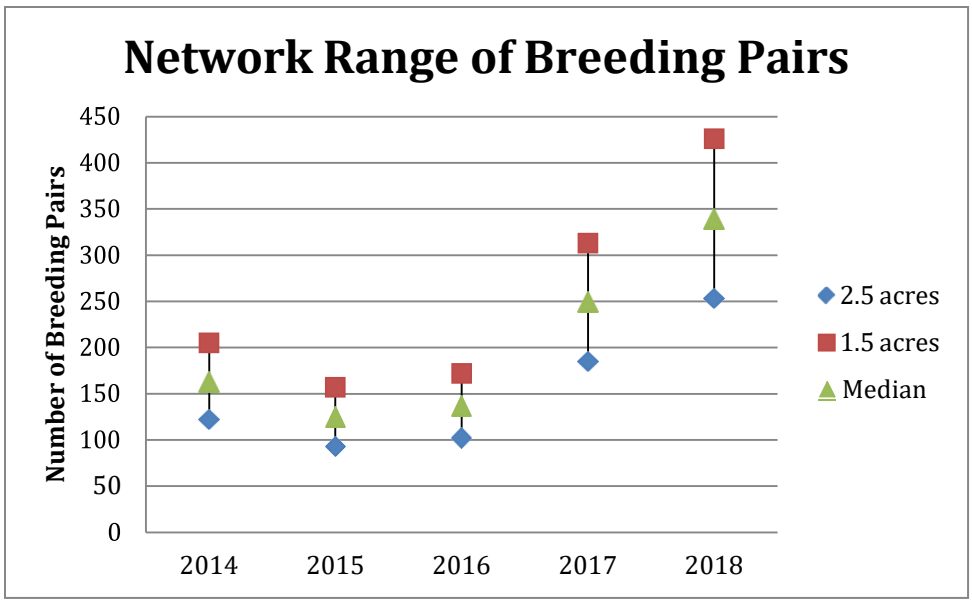

Figure 49: Potential Range of Breeding Pairs throughout Network, 2014-2018

GROUPS I AND VI

The analysis of impacts to breeding SHLA and effective territory size discussed below refers to Groups I through VI described earlier in this document. No breeding SHLA have been observed at any of the placement sites in Group I (Benson Beach and West Sand Island, the Group farthest downstream) or Group VI (Fazio Sand & Gravel, Gateway, and West Hayden Island, the Group farthest upstream). These sites do not contain suitable nesting habitat as identified by the NDVI data from 2011, as all sites in these groups have established vegetation or a high level of anthropogenic disturbances associated with sand and gravel removal or a lack of recent placement of dredged materials to re-start vegetation succession. For these reasons, it is assumed that no suitable habitat will develop on these placement sites for the duration of this consultation, and therefore no SHLA are assumed to breed and nest in these areas (see Figure 50).

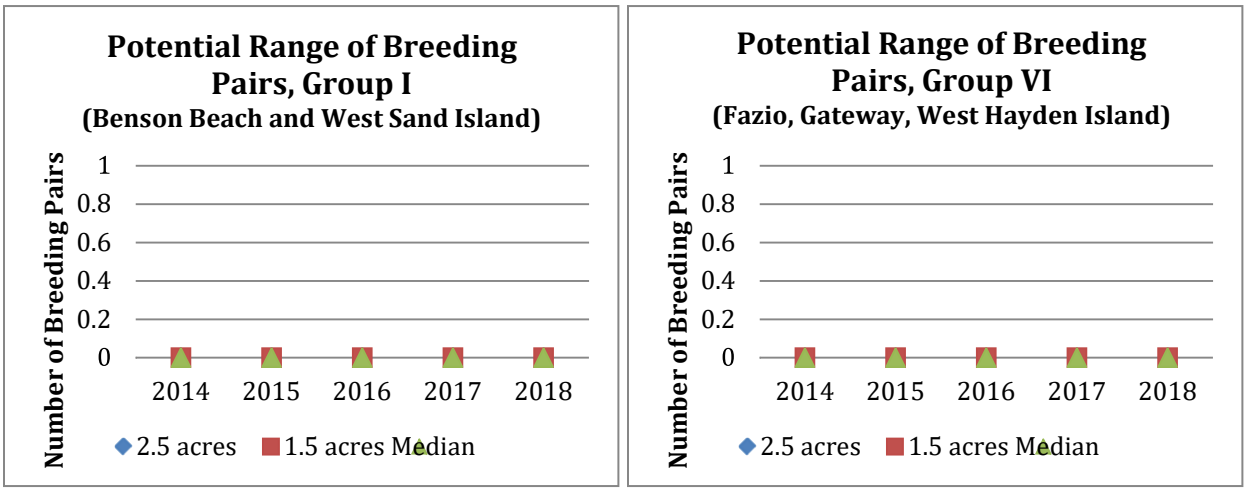

Figure 50: Potential Range of Breeding Pairs in Groups I and VI, 2014-2018

RICE ISLAND (RM 21.0)

Most of the SHLA observed in Group II were observed at Rice Island, where Anderson (2013) observed 22 singing males in 2013 (and assumed a singing male equals one breeding pair). Based on the analysis of habitat availability described above, 150 acres of suitable habitat are present under current conditions at Rice Island, which could support 60 to 100 breeding pairs of SHLA. Even though placement events are proposed for Rice Island in 2014 and 2017 covering upwards of 20% to 50% of the available suitable habitat, the minimum extent of available nesting habitat in any year is 122 acres. This area is expected to support between 48 and 81 breeding pairs (see Figure 51), which is a 118% increase over the actual number of observed breeding pairs at Rice Island.

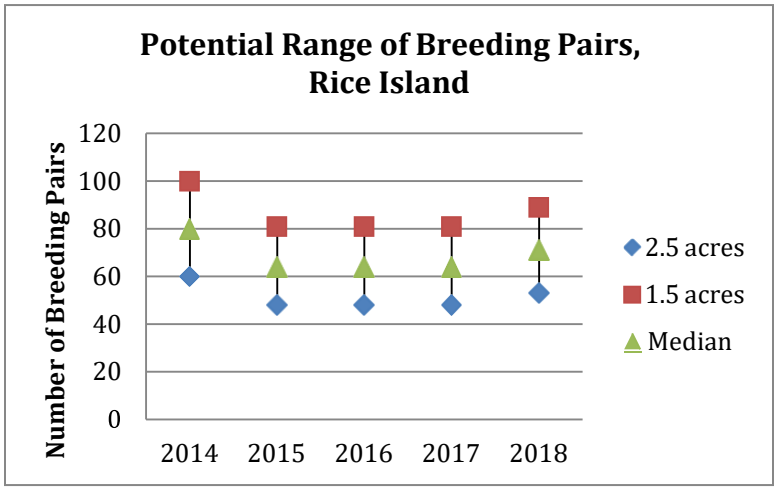

Figure 51: Potential Range of Breeding Pairs at Rice Island, 2014-2018

MILLER SANDS (RM 23.5)

Anderson observed five pairs (singing males) at Miller Sands Island in past years, but the upland habitat areas were mounded during past placement events in 2011, 2012 and 2013. It is unknown if SHLA nest successfully in these mounded areas and the Corps conservatively assumes that nesting might be precluded in the mounded areas. In an effort to maximize the availability of future nesting habitat in Group II when habitat conditions are lowest at Rice Island and Pillar Rock Islands, the mounds will be smoothed in 2014 to encourage vegetation establishment and development into suitable habitat in future years. It is anticipated that no breeding SHLA will be supported at Miller Sands Island in 2014, 2015, 2016, and 2017. It is assumed that SHLA will move to nearby Rice or Pillar Rock Islands for nesting in these years while vegetation is developing at Miller Sands Island. In 2018, it is assumed that vegetation will have transitioned into suitable habitat conditions and approximately 34 acres of suitable habitat will be available which could support between 13 and 22 breeding pairs of SHLA (see Figure 52).

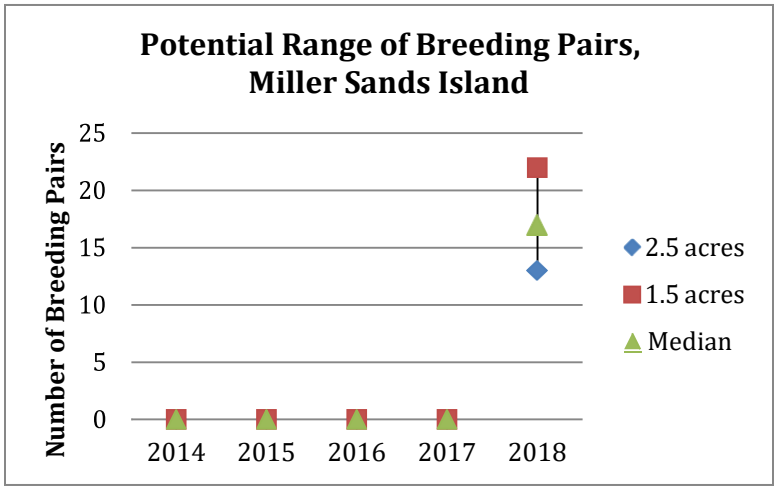

Figure 52: Potential Range of Breeding Pairs at Miller Sands Island, 2014-2018

PILLAR ROCK ISLAND (RM 27.2)

Only four acres are currently available as suitable habitat at Pillar Rock Island, and two pairs (singing males) are estimated to occupy this placement site. The island is significantly eroded, and shoreline placement is required to rebuild the site footprint before upland placement can occur to re-start vegetation succession. The Corps will begin shoreline placement immediately in 2014 so that suitable SHLA habitat can form as quickly as possible. All placement events at Pillar Rock Island between 2014 and 2016 will be shoreline events, so no suitable habitat will be lost to placement. As a result, habitat conditions are not expected to change between 2014 and 2016, and the available habitat is expected to support up to two breeding pairs of SHLA. However, the Corps assumes habitat conditions will become too vegetated in 2017 to support suitable nesting habitat, and therefore habitat conditions will not support any breeding pairs (see Figure 53) in 2017 or 2018.

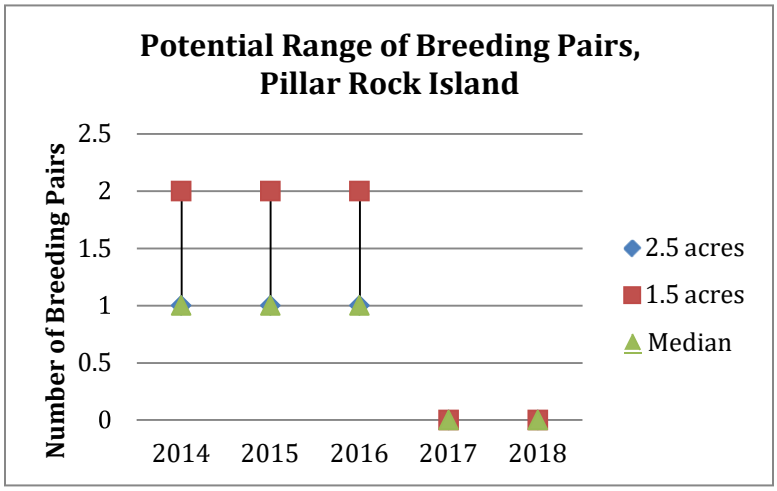

Figure 53: Potential Range of Breeding Pairs at Pillar Rock Island, 2014-2018

Upland placement events will occur at Pillar Rock Island in 2017 and 2018 where each will cover half of the upland portions of the island, re-starting vegetation succession for future years. In 2017,

it is assumed that the suitable habitat currently available will become too vegetated and no remnant suitable habitat will be available to support breeding SHLA and the only available suitable habitat within Group II will be at Rice Island. It is assumed that breeding SHLA will disperse to Rice Island in 2017, and Rice and Miller Sands Island in 2018 where habitat is available after upland placements at Pillar Rock Island.

GROUP II

The extent of suitable habitat across Group II (Rice, Miller Sands, and Pillar Rock Islands) is expected to increase by nine percent over the 5-year placement plan from 154 acres to a total of 168 acres in 2018. Following this increase in the availability of suitable habitat, it is assumed that the number of breeding pairs this habitat could support would also increase. Recent observations have estimated that Group II supports approximately 29 pairs of SHLA across the three sites (Anderson 2013). However, suitable habitat will decrease from 154 acres in 2014 to a low of 122 acres in 2017, a decrease of approximately 21%. Based on the assumptions about territory size, current conditions in Group II could potentially support a breeding population between 61 and 102 breeding pairs of SHLA in 2014. This estimate demonstrates the population has not reached saturation for population density and more suitable nesting habitat is available than breeding pairs are present to fill the available nesting habitat.

As the suitable habitat in Group II decreases to a low of 122 acres in 2017, the maximum density of breeding pairs is assumed to decrease to a range between by 48 and 81 breeding pairs, which is still 66% more than what is currently estimated to occupy Group II (see Figure 54). The range of breeding SHLA Group II could support is expected to increase to between 66 and 111 breeding pairs in 2018, when the available suitable habitat is at its maximum of 168 acres across Group II.

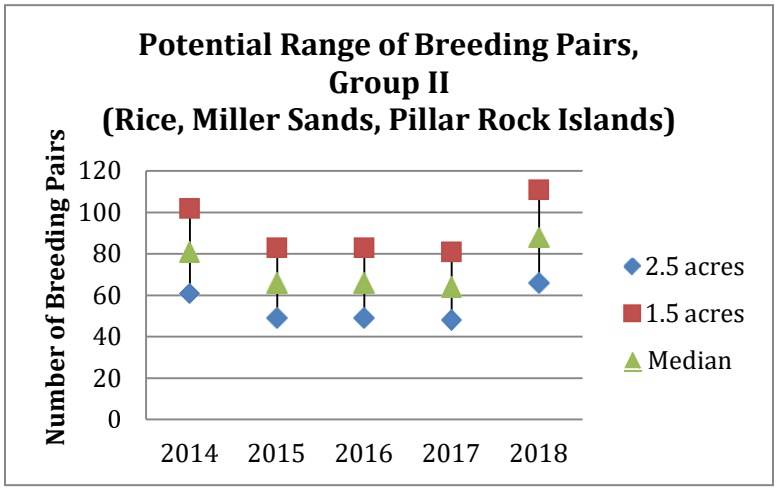

Figure 54: Potential Range of Breeding Pairs at Group II Sites, 2014-2018

SKAMOKAWA – VISTA PARK (RM 33.4)

As described above, the Corps assumes there is currently no suitable nesting habitat for breeding SHLA at Skamokawa – Vista Park and suitable nesting habitat would not develop during the course of this consultation due to the high level of human use and regular disturbance. It is therefore assumed that no SHLA would be present during the nesting season because no suitable habitat would support breeding activities (see Figure 55). No SHLA have been detected at this active borrow site.

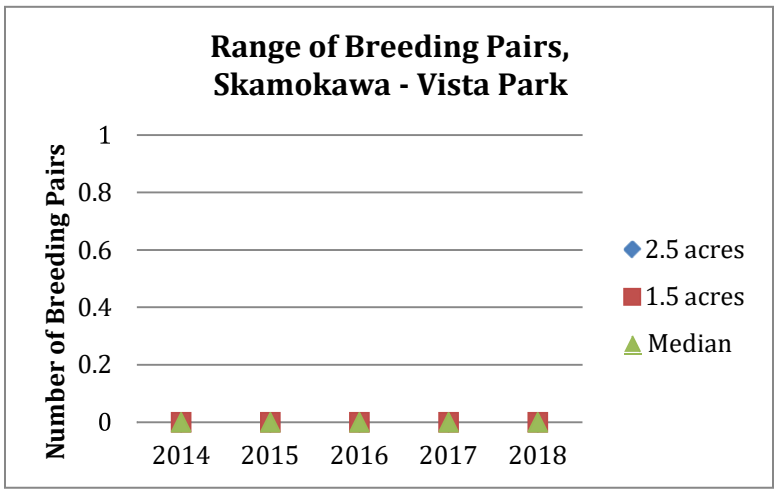

Figure 55: Potential Range of Breeding pairs at Skamokawa - Vista Park, 2014-2018

WELCH ISLAND (RM 34.0)

During the past three years of surveys, Welch Island only supported 1 breeding pair of SHLA in 2012 (Anderson 2013). Currently, there are 10 acres of suitable habitat at Welch Island, which could support upwards of 4 to 6 breeding pairs based on the assumptions about territory size and habitat conditions. The 2015 placement event will cover the entire placement site, eliminating all suitable nesting habitat in 2015 and 2016 (see Figure 56). No nesting habitat will be available until habitat transitions into suitable conditions in 2017, at which point 18 acres will be available for nesting and between 7 and 12 breeding pairs of SHLA could nest at Welch Island through 2018.

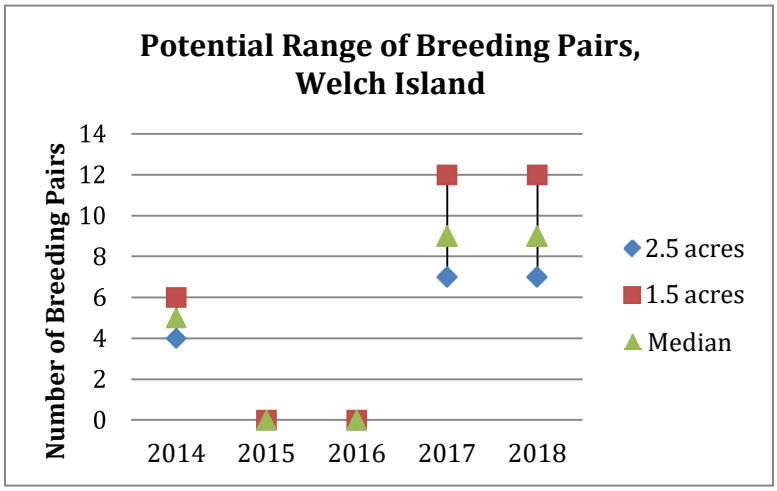

Figure 56: Potential Range of Breeding Pairs at Welch Island, 2014-2018

TENASILLAHE ISLAND (RM 38.3)

In the past three years, Tenasillahe Island has recently supported up to two breeding pairs of SHLA. No pairs were observed by Anderson during routine surveys in 2013, but the Corps detected a nesting pair prior to placement activities in 2013 and the nest was avoided during active placement (nest success is unknown). Current conditions at Tenasillahe Island estimate two acres of suitable nesting habitat are available at the beginning of the 2014 breeding season, which could support up

to one breeding pair in 2014. As habitat transitions into suitable condition in 2015, upwards of nine to 15 breeding pairs could nest at Tenasillahe Island (see Figure 57). The placement event in 2016 covers some suitable habitat, reducing the area available for nesting pairs to 10 acres, which could potentially support four to six breeding pairs in 2016 and 2017. Following the 2016 placement event, vegetation is estimated to transition into suitable condition and 23 acres of suitable habitat could support nine to 15 breeding pairs of SHLA in 2018.

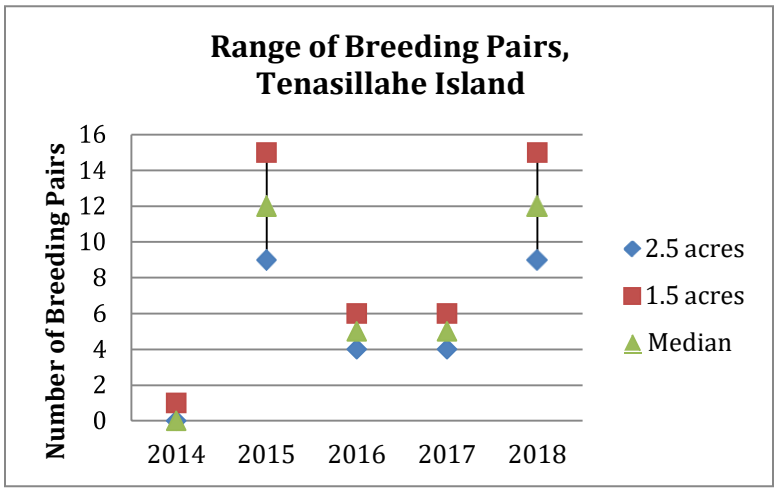

Figure 57: Potential Range of Breeding Pairs at Tenasillahe Island, 2014-2018

JAMES RIVER (RM 42.9)

James River has not been surveyed for potential SHLA occupation. The Corps estimates that there is currently no suitable nesting habitat for SHLA at James River. In addition, the Corps assumes that no suitable nesting habitat would develop during the course of this consultation due to the high level of human use and regular disturbance from sand extraction activities. It is therefore assumed that no SHLA would be present during the nesting season because no suitable habitat would support breeding activities (see Figure 58).

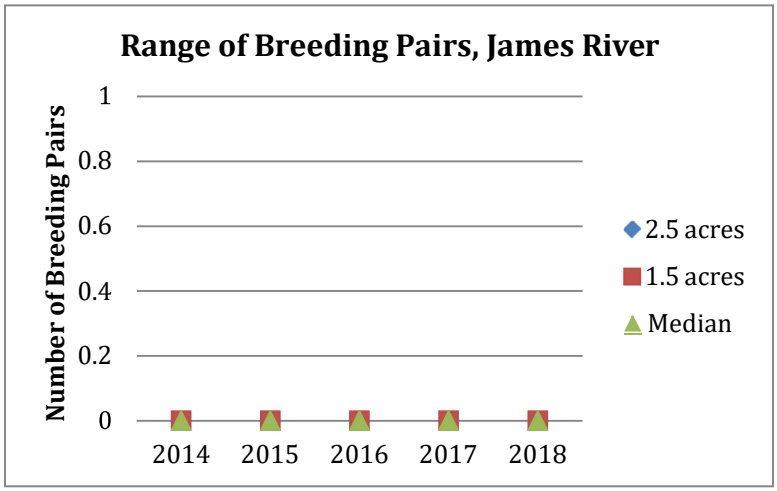

Figure 58: Potential Range of Breeding pairs at James River, 2014-2018

PUGET ISLAND (RM 44.0)

Similar to James River, Puget Island has not been surveyed for SHLA occupation, but it is assumed that SHLA are not present on site based on current agricultural land use activities associated with the area. Immediately following placement events at Puget Island in 2015 and 2018, the Corps will re-seed the entire site to promote a healthy vegetative cover to prevent wind erosion of placed sand onto adjacent agricultural lands. The landowner (independent of Corps action) may pasture cattle on site between placement events. It is assumed that habitat conditions would transition too quickly for suitable habitat to be maintained at Puget Island, in addition to the elevated levels of local disturbance from site maintenance and cattle. Furthermore, the Corps may plant trees and shrubs around the boundary of the site to reduce wind erosion of sediment following placement, precluding open habitat conditions favored by SHLA. For these reasons, no breeding SHLA are expected to occur at Puget Island throughout the 5-year placement plan (see Figure 59).

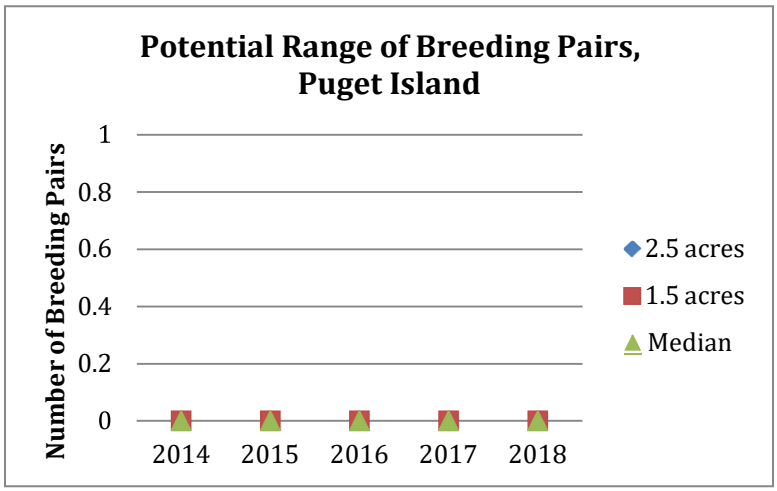

Figure 59: Potential Range of Breeding Pairs at Puget Island, 2014-2018

BROWN ISLAND (RM 46.3)

The majority of SHLA recently observed in Group III have been at Brown Island. In 2012 and 2013, 18 and 23 breeding pairs were observed on Brown Island, respectively, following post-breeding placement in 2011 over approximately 45 acres. Given that entire placement site is 102 acres with 45 acres unsuitable due to the 2011 placement, the Corps estimated that 27 acres were suitable in 2012, which is supported by aerial photography from that same year. Approximately 18 breeding pairs utilized the 27 acres of habitat in 2012, resulting in a territory size of approximately 1.5 acres in 2012. In 2013, 27 acres outside of the 2011 placement area were still suitable and the Corps assumes the entire 45-acre placement site from 2011 was suitable for nesting activities, providing 72 acres of suitable nesting habitat. With 72 acres potentially suitable for nesting, the 23 SHLA pairs observed by Anderson in 2013 may have nesting territories of two acres. This baseline is not expected to change in 2014.

Suitable habitat at Brown Island in 2015 is expected to decrease 70% from baseline conditions (72 acres to 21 acres following dredged material placement). This reduction in suitable nesting habitat may adversely impact nesting SHLA such that the remaining suitable habitat could only support 8 to 14 breeding pairs, which is 0 to 15 fewer pairs than nested in breeding years 2011 – 2013 and at least 50% fewer pairs than the estimated population (28 to 48 pairs in 2014) based on the availability of suitable habitat (see Figure 60).

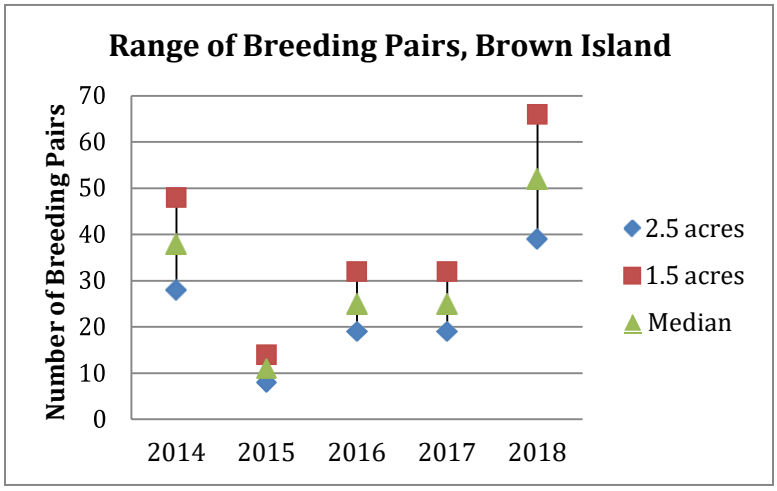

Figure 60: Potential Range of Breeding Pairs at Brown Island, 2014-2018

As mentioned in the discussion about Group III below, the Corps anticipates that SHLA would disperse to adjacent placement sites in 2015 when sufficient acres of suitable habitat are not available at Brown Island to support 20+ pairs of breeding birds. A sufficient quantity of suitable habitat will be available throughout Group III (primarily at Tenasillahe Island) to provide suitable nesting conditions for SHLA in any given year. Following the placement event in 2014, it is assumed that 49 acres of suitable habitat would be available in 2016 and 2017, and Brown Island could potentially support upwards of 19 to 32 breeding pairs. In 2018, following the placement activities in 2016, it is estimated that 99 acres of habitat will be suitable and this quantity of suitable nesting habitat could support 39 to 66 breeding pairs.

Group III

The extent of suitable habitat across Group III (Skamokawa-Vista Park, Welch and Tenasillahe Islands, James River, Puget and Brown Islands) is currently 85 acres and it is expected to increase by 65% to a total of 140 acres by 2018. Group III supports the second highest localized population of SHLA in the lower Columbia River, where 23 pairs were estimated to occupy Brown Island in 2013. The Corps discovered an active nest in 2012 and active nesting behavior in 2013 (nest not located) at Tenasillahe Island, during dredged material placement activities, but the fate of these nests is uncertain. Current conditions in Group III could support a breeding population between 32 and 55 breeding pairs in 2014, similarly demonstrating that more habitat is available than breeding birds are present to occupy nesting territories.

As shown is Figure 61, the availability of suitable habitat in Group III is lowest in 2015, and the estimated number of SHLA that could be supported is expected to range between 17 and 29 breeding pairs, which coincides with the current estimate of breeding pairs in this Group (23 birds in 2013, per Anderson 2013). As the amount of suitable habitat increases across Group III in 2016, 2017 and 2018, and it is estimated that the number of breeding pairs also increases, such that 55 to 93 pairs could potentially occupy nesting habitat across a broader range of placement sites within the Group III sites by 2018.

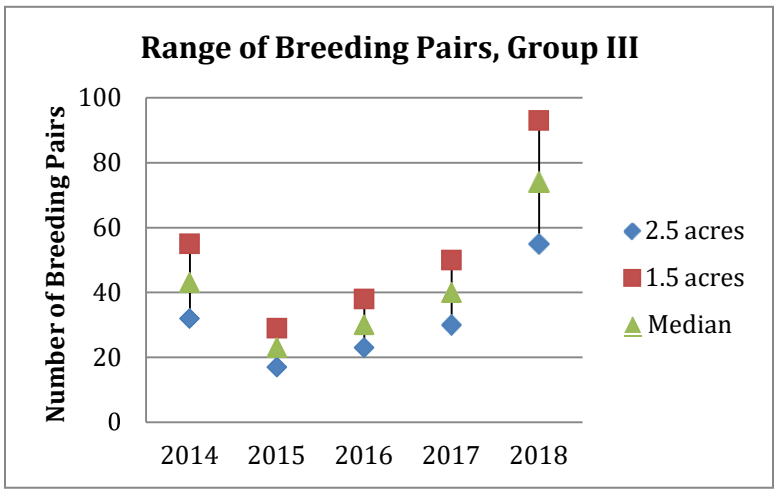

Figure 61: Potential Range of Breeding Pairs at Group III Sites, 2014-2018

CRIMS ISLAND (RM 57.0)

As shown in Figure 62, there are 25 acres of suitable habitat at Crims Island, which could support between 10 and 16 breeding pairs, assuming territories range between 1.5 and 2.5 acres. Surveys in 2011 detected seven breeding pairs of SHLA at Crims Island, and surveys in 2012 detected four pairs of birds (Anderson 2013). The number of breeding pairs declined between 2011 and 2013, even though suitable habitat conditions are assumed to have remained constant during this time. While only two pairs were detected in 2013, additional birds of unknown sex (perhaps females or additional paired males) were documented; this information suggests the number of birds was underestimated as a function of inadequacies in the survey protocol.

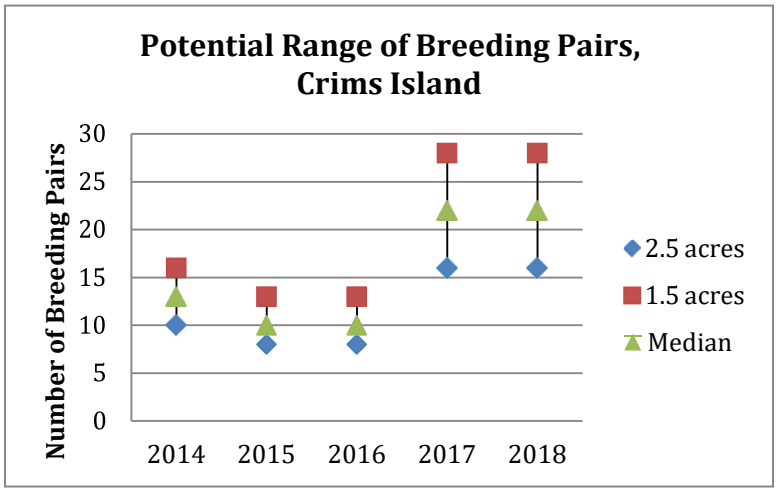

Figure 62: Potential Range of Breeding pairs at Crims Island, 2014-2018

A placement event in 2015 on Crims Island will cover five acres of suitable habitat, reducing the total habitat available for nesting SHLA to 20 acres in 2015 and 2016. However, 20 acres of suitable habitat are expected to support upwards of eight and 13 breeding pairs, which is more than the highest number of detections (7 pairs) in 2011. If some birds from Brown Island disperse onto Crims Island for nesting in 2015, it is assumed that sufficient habitat will be available to support some of these birds in both 2015 and 2016. As the 2015 placement event transitions into suitable

conditions in 2017, the entire island will be suitable for nesting in 2017 and 2018, totaling 42 acres, and it is assumed this area could potentially support 16 to 28 breeding pairs of SHLA.

HUMP ISLAND (RM 59.7)

Hump Island has not been surveyed for SHLA and it is unknown if suitable habitat conditions exist; the Corps assumes no suitable habitat conditions are present on the island due to the presence of extensive vegetation via aerial photographs and therefore no nesting habitat exists for breeding SHLA (see Hump Island Figure in Appendix C). Placement over the entire 65-acre site is planned to occur in 2014, and a portion of this area would develop into suitable nesting habitat conditions in 2016 due to a second placement covering 48 acres in 2015. In 2016, approximately 17 acres are assumed to be suitable, which could support six to 11 breeding pairs in 2016 and 2017 (see Figure 63). The additional habitat from the 2015 placement event is expected transition into suitable habitat conditions in 2018, and the entire placement is expected to be suitable and could potentially support upwards of 26 to 43 breeding pairs of SHLA.

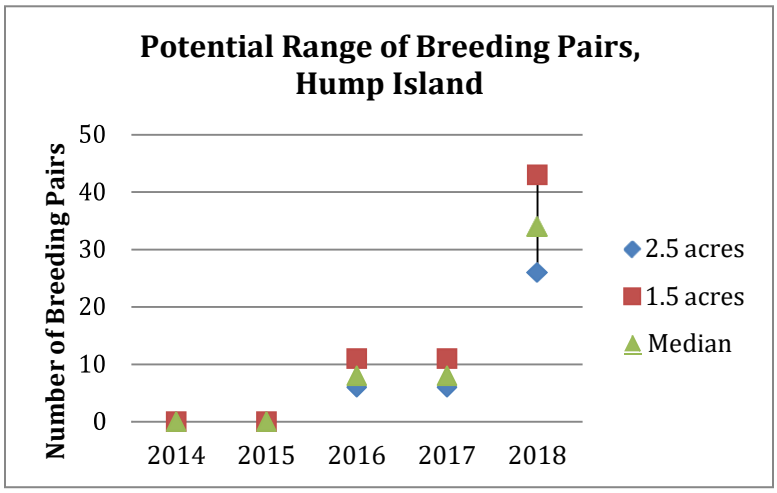

Figure 63: Potential Range of Breeding Pairs at Hump Island, 2014-2018

LORD ISLAND – UPSTREAM (RM 63.5)

Like Hump Island, Lord Island Upstream has not been surveyed from SHLA. However, unlike Hump Island, the Corps assumes that 10 acres of suitable habitat exist on the island, based on NDVI data, which could support four to six breeding pairs of SHLA. It is assumed that habitat conditions will remain constant through the 2016 nesting season. In 2017, the Corps plans to place dredged materials over 20 acres of the site, covering the 10 acres of suitable habitat. This placement event will eliminate all suitable nesting conditions at Lord Island in 2017 and 2018 (see Figure 64). If any breeding SHLA occupy this area between 2014 and 2016 when suitable conditions exist, it is assumed birds could disperse to adjacent sites (Hump Island and Howard Island) where suitable habitat conditions support nesting in 2017 and 2018.

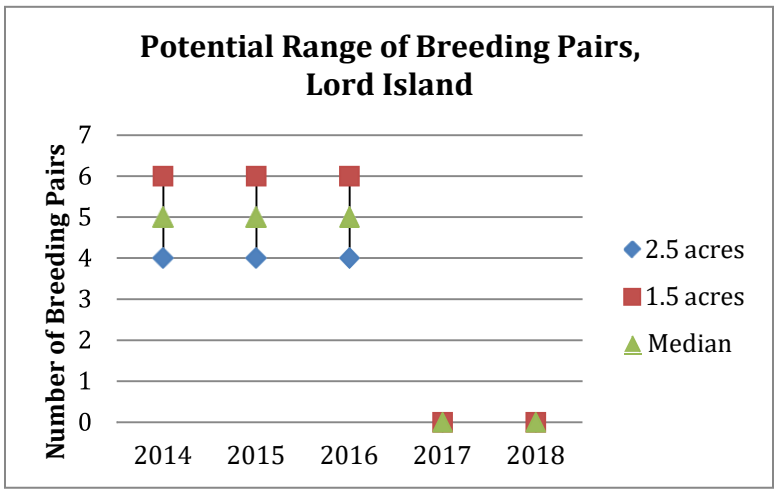

Figure 64: Potential Range of Breeding Pairs at Lord Island (upstream), 2014-2018

DIBBLEE POINT (RM 64.8)

Dibblee Point was surveyed for SHLA in 2013 and even though approximately one acre of suitable habitat was estimate per the 2011 NDVI data, no SHLA were detected. This placement site is an active borrow location where dredged materials are regularly removed for commercial purposes. It is assumed that the high anthropogenic use of this area precludes SHLA occupation of the site and no nesting habitat will be available over the course of this consultation. No placement events are planned for Dibblee Point during the 5-year placement plan described above and no SHLA would be affected at this location because none are assumed to be present (see Figure 65).

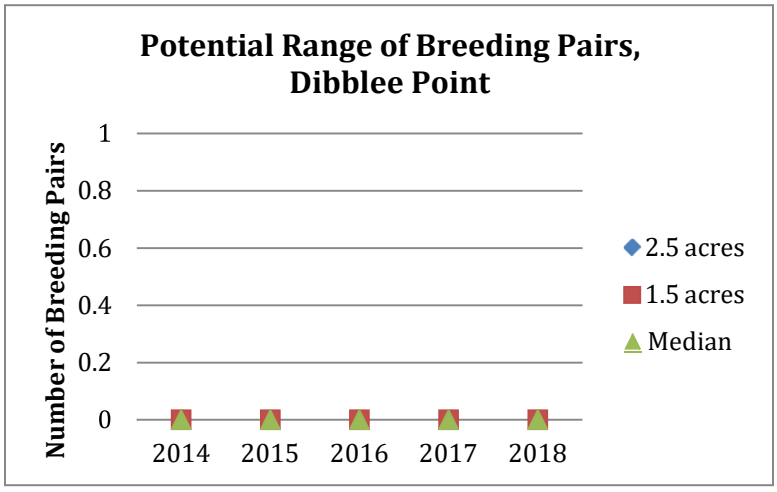

Figure 65: Potential Range of Breeding Pairs at Dibblee Point, 2014-2018

HOWARD ISLAND (RM 68.7)

Howard Island was not surveyed for SHLA in 2013, as much of the island is heavily vegetated. Of the 315 acres that make up the placement site, approximately five acres are currently suitable, based on NDVI data. If SHLA occupy Howard Island, it is assumed the current habitat conditions could support two to three breeding pairs (see Figure 66). In 2015, a 173-acre placement event will cover a portion of the island after the breeding season has ended and it is assumed that no suitable habitat conditions will be present on the island at the beginning of the breeding season in 2016,

supporting no SHLA will nest on Howard Island. This placement event is then expected to rotate into suitable habitat at the onset of the 2017 breeding season, where 173 acres of suitable habitat could support 69 to 115 breeding pairs of SHLA if territory sizes range between 1.5 and 2.5 acres. Suitable habitat conditions are assumed to remain constant in 2017 and 2018, and therefore the number of breeding pairs that could be supported on the island would also remain constant.

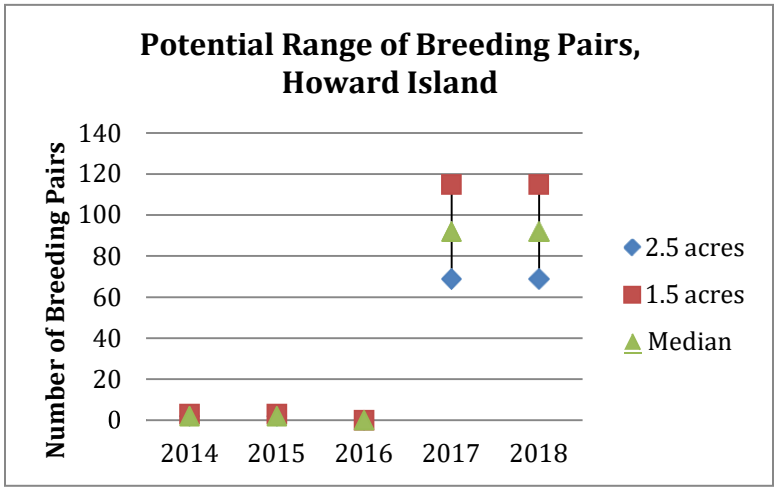

Figure 66: Potential Range of Breeding Pairs at Howard Island, 2014-2018

COTTONWOOD ISLAND (RM 70.1)

No SHLA have been observed at Cottonwood Island in recent years. The Corps does not anticipate that suitable habitat for breeding SHLA would develop at Cottonwood Island during the course of this consultation due to extensive vegetation surrounding the site that precludes an open view of the river and surrounding landscape. Therefore, no SHLA breeding pairs would be present during the nesting season because no suitable nesting habitat is available (see Figure 67).

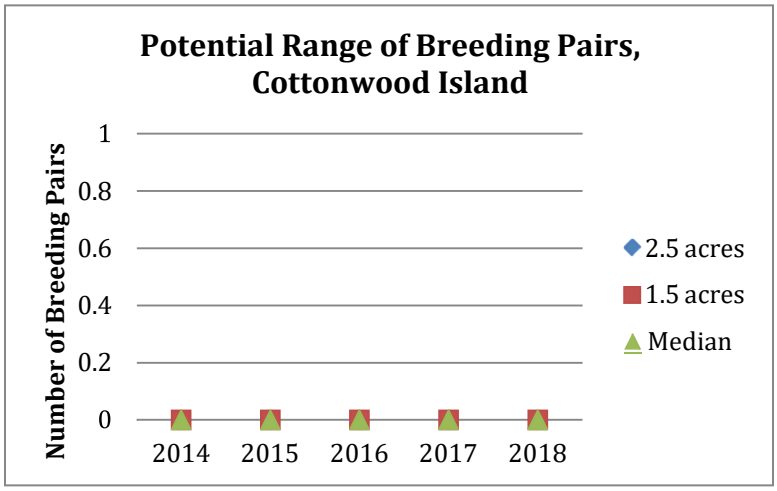

Figure 67: Potential Range of Breeding Pairs at Cottonwood Island, 2014-2018

NORTHPORT (RM 71.9)

Northport is designated as a borrow site, however commercial sand extraction has not occurred in recent years. Three pairs of SHLA were detected during annual surveys in 2013 (Anderson 2013). The NDVI baseline data estimates three acres of suitable habitat conditions were present at the site, which could support one to two breeding pairs under the assumption that territory sizes range between 1.5 and 2.5 acres. If three pairs nested at Northport in 2013, territory sizes would have been lower (1 to 1.5 acres) based on the estimated three acres of suitable habitat conditions present. Breeding behavior (singing males and female presence) was observed at Northport, and the presence of young-of-the-year juveniles indicate SHLA were nesting successfully at Northport.

Habitat conditions at Northport are expected to remain similar to current conditions until 2016, when habitat is expected to become too vegetated (greater than 50% cover) and conditions are no longer suitable for nesting by SHLA (see Figure 68). No placement of dredged materials by the Corps is planned to re-start vegetation succession at Northport during the five-year placement plan. If SHLA continue to occupy Northport and are present in 2016, it is assumed that birds would disperse to favorable nesting conditions on Howard Island in Group IV or Sandy Island in Group V, where suitable habitat is available in 2016 and 2017.

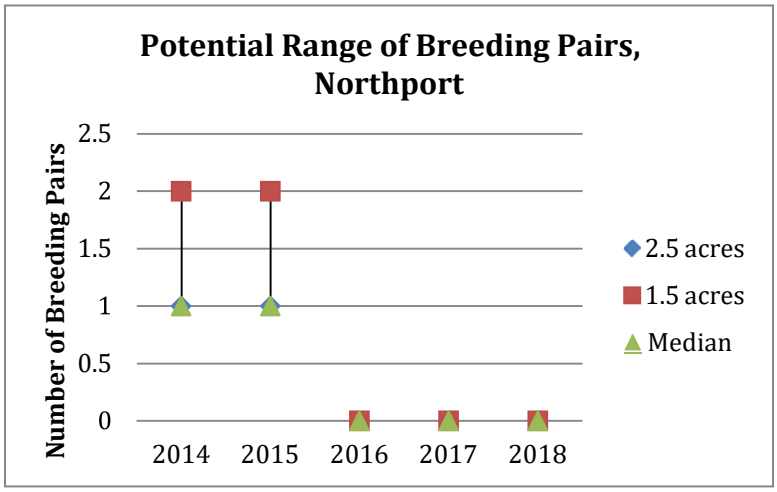

Figure 68: Potential Range of Breeding Pairs at Northport, 2014-2018

GROUP IV

Group IV (Crims, Hump, and Lord Islands, Dibblee Point, Howard and Cottonwood Islands, and Northport) have had comparatively low numbers of observed SHLA breeding pairs in recent years (Anderson 2013). Surveys only detected larks on Crims Island and Northport, where current suitable habitat conditions could potentially support upwards of 17 to 27 breeding pairs. Across the Group, suitable habitat is expected to increase from 43 acres in 2014 to 280 acres in 2018, following a substantial placement event at Howard Island in 2016. This increase in suitable habitat conditions could potentially support 111 to 186 breeding pairs of SHLA by 2018 (see Figure 69).

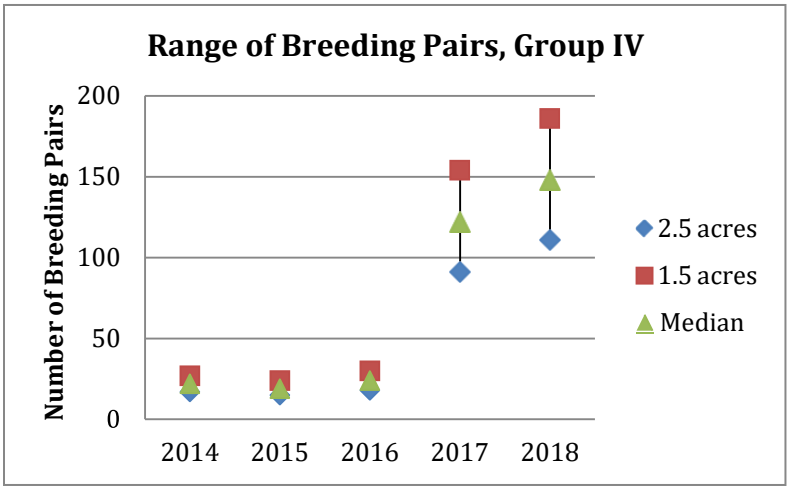

Figure 69: Potential Range of Breeding Pairs at Group IV Sites, 2014-2018

SANDY ISLAND (RM 75.8)

All 32 acres of the Sandy Island placement site is currently classified as suitable nesting habitat. In 2013, Anderson observed four pairs of SHLA in 2013, one pair in 2012, and two pairs in 2011 (2013). No placement events are planned during the 5-year placement plan and the entire island is expected to remain in suitable condition, potentially supporting a constant localized population of SHLA (see Figure 70). Suitable habitat is not expected to transition beyond suitable conditions (greater than 50% vegetation cover) until after 2018. Based on the assumptions regarding the range of territory size, Sandy Island could support between 12 and 21 breeding pairs in all years, providing sufficient space for the recently observed birds, and any offspring that return to their natal site for breeding.

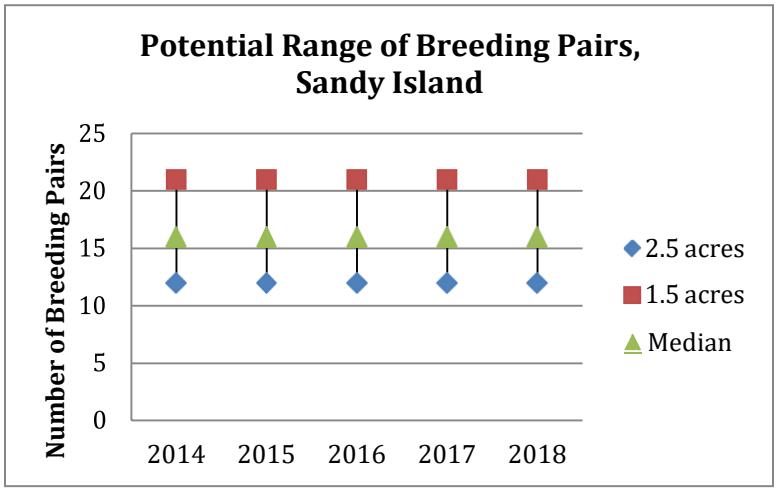

Figure 70: Potential Range of Breeding Pairs at Sandy Island, 2014-2018

LOWER DEER ISLAND (RM 77.0)

No SHLA have been observed at Lower Deer Island in recent years, and no suitable nesting habitat is currently available in the placement area. The 11-acre placement event in 2015 is assumed to trigger vegetation succession and suitable nesting habitat conditions will be present on the downstream portion of the island at the beginning of the second breeding season (2017). The 11

acres of then suitable habitat is expected to support between four and seven breeding pairs in 2017 (see Figure 71). Similarly, a 12-acre placement event on the upstream half of the site in 2016 will initiate vegetation succession that will transition into suitable nesting habitat in 2018. In 2018, 23 acres of suitable habitat could then support between nine and 15 breeding pairs of SHLA.

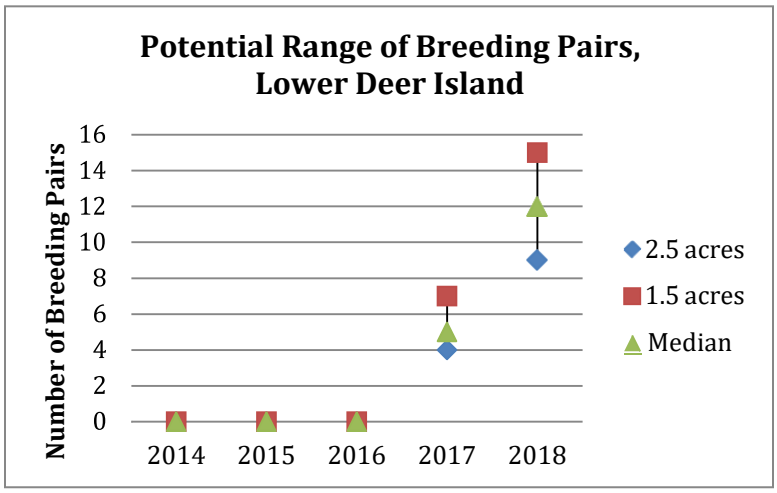

Figure 71: Potential Range of Breeding Pairs at Lower Deer Island, 2014-2018

MARTIN BAR (RM 82.0)

The Corps estimates that there is currently no suitable nesting habitat for breeding SHLA at Martin Bar and assumes that suitable nesting habitat would not develop during the course of this consultation due to the high level of human use and regular disturbance. It is therefore assumed that no SHLA would be present during the nesting season because no suitable habitat would support breeding activities (see Figure 72).

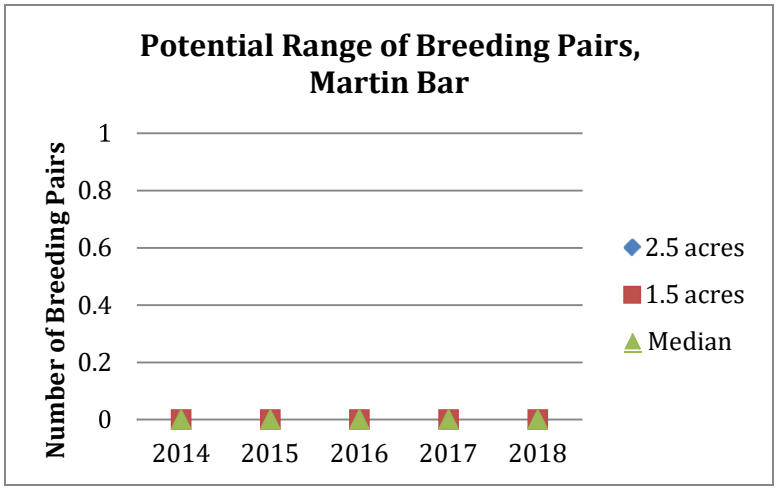

Figure 72: Potential Range of Breeding Pairs at Martin Bar, 2014-2018

SAND ISLAND (RM 86.2)

Currently, there is one acre of suitable nesting habitat at Sand Island according to the 2011 NDVI habitat analysis, but no SHLA have been observed on this placement site. The amount of suitable

habitat under baseline conditions is assumed to be too small to support breeding of SHLA. The placement events in 2015 and 2017 are shoreline placement events that will not affect the availability of suitable nesting habitat in upland areas, providing no habitat for breeding SHLA. As a result, no SHLA are assumed to be present at the site for the duration of the consultation because no suitable habitat occurs at the site (see Figure 73).

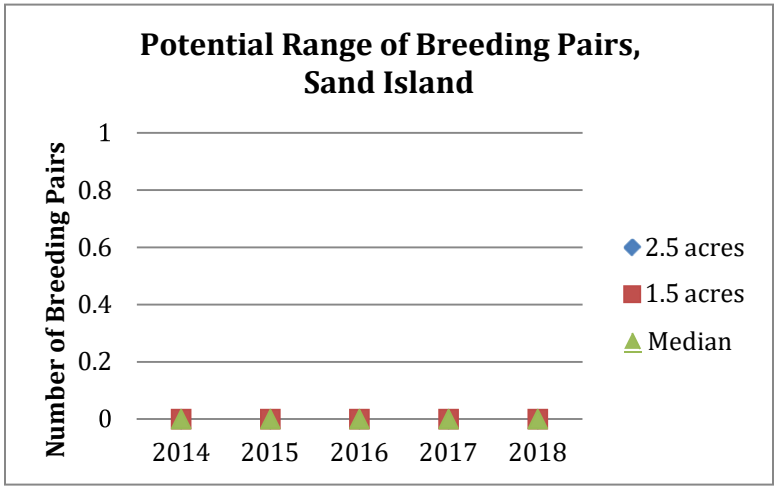

Figure 73: Potential Range of Breeding Pairs at Sand Island, 2014-2018

AUSTIN POINT (RM 86.5)

Similar to other sites that include commercial sand removal activities, the Corps does not anticipate that suitable habitat for breeding SHLA would develop at Austin Point during the course of this consultation. Due to the high level of human use and regular disturbance and it is therefore assumed that no SHLA would be present during the nesting season because no suitable habitat would be available (see Figure 74).

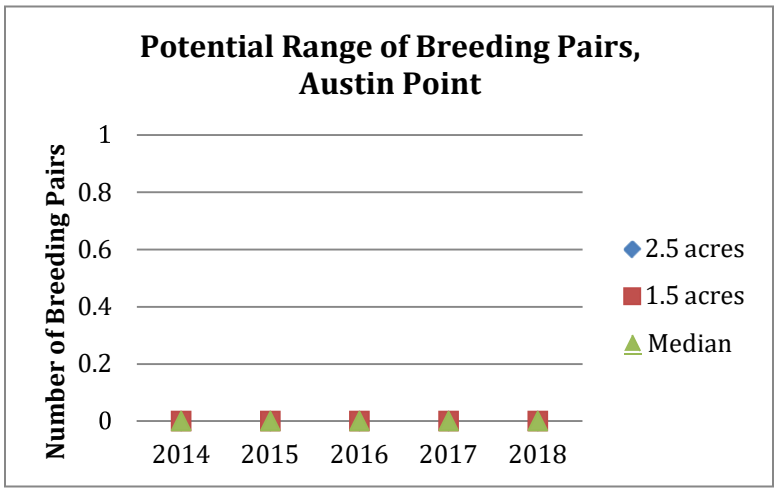

Figure 74: Potential Range of Breeding Pairs at Austin Point, 2014-2018

GROUP V

Group V (Sandy and Lower Deer Islands, Martin Bar, Sand Island and Austin Point) has also had relatively low numbers of observed SHLA breeding pairs in recent years (Anderson 2013). Only surveys at Sandy Island have detected nesting SHLA, where four pairs were observed in 2013. However, it should be noted that non-breeding larks were observed by Corps personnel during a pre-placement site survey at Austin Point in 2013. It is unknown if larks nested at Austin Point in 2013, or if these birds were juveniles dispersing from adjacent islands/sites after the breeding season ended.

Under current conditions, suitable nesting habitat in Group V only occurs at Sandy and Sand Islands, where 32 acres are suitable at Sandy Island and one acre is suitable as Sand Island. Together, the 33 acres of habitat could support between 12 and 21 breeding SHLA, which is at least 200% more pairs than the four observed pairs in recent years. Habitat conditions across Group V are expected to remain constant through 2017. Lower Deer Island will become suitable and the one acre at Sand Island is expected to succeed beyond suitable conditions and become unsuitable to nesting SHLA. In 2017, a total of 43 acres could support 16 to 28 breeding pairs, and in 2018, the extent of suitable nesting habitat is expected to further increase to 55 acres, which could support 21 to 36 breeding pairs of SHLA (see Figure 75).

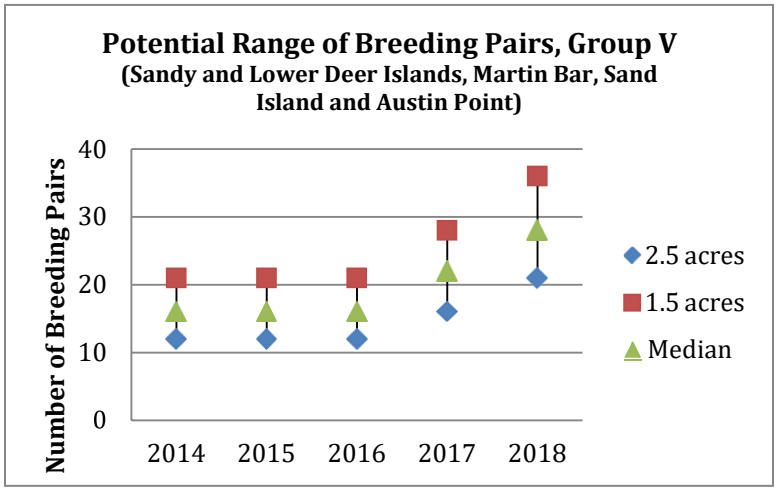

Figure 75: Potential Range of Breeding Pairs at Group V Sites, 2014-2018

POST-PLACEMENT MODIFICATIONS

As discussed above, all temporary equipment (weirs, outfall pipes, valves, etc.) is removed from a placement site following placement of dredged materials. In addition, any habitat modifications (grading, trenching, mounding) that is prescribed will be implemented immediately following placement of materials. The Corps anticipates direct effects to SHLA resulting from these actions to be negligible, as no birds are expected to be present in the placement footprint at the conclusion of a placement event.

Individuals in areas adjacent to the placement footprint (but outside of the placement boundary) are expected to experience similar effects to actions in the placement footprint, including flushing adults and/or young, increased exposure of individuals to weather and predation, nest abandonment and/or destruction. In addition, juveniles and young-of-the-year birds that move into the dredged material placement footprint are expected to have sufficient flight capabilities to flush from the area upon initiation of active material placement or other disturbances. If adults are

repeatedly flushed from nests as a result of human disturbance during post-placement modifications, nest abandonment, increased predation of adults and nestlings, decreased foraging opportunities, and increased energetic expenditures could occur.

Similar to the indirect effects resulting from the placement of dredged materials and habitat succession, some post-placement actions are expected to result in beneficial effects to SHLA. Where settling ponds are left undisturbed, vegetation is expected to establish sooner and create suitable habitat conditions favored by SHLA for nesting. Conversely, topographic modifications and/or dissuasion materials may be installed to prevent SHLA use of an area where anthropogenic use could be detrimental to SHLA. In these instances, while the loss of potential habitat could adversely affect birds by reducing the amount of nest habitat, these dissuasion actions would reduce direct harm or mortality of individuals later in time.

MONITORING

Implementing the monitoring plan discussed above would likely result in effects similar to those described in the dissuasion and site preparation sections. Birds will likely be flushed inadvertently while walking transects through the placement site. However, personnel conducting the surveys are expected to be trained in field protocols to minimize any unnecessary flushing and disturbance associated with monitoring, particularly to adults on nests and especially when predators (gulls, crows, ravens, falcons, etc.) are present in the vicinity. It is also very unlikely that monitoring personnel would inadvertently injure or kill eggs or young during survey efforts. As a result, any adverse effects that may occur during the monitoring surveys are expected to be minor and temporary in nature, and are not expected to result in permanent effects to SHLA or their habitats.

EFFECTS OF THE ACTION ON CRITICAL HABITAT

The PCEs contain the physical and biological features essential to the conservation of the species. The PCEs of SHLA designated critical habitat include areas having a minimum of 16% bare ground with sparse, low-stature vegetation comprised primarily of grasses and forbs less than 13 inches in height. In addition, these features are found in flat areas (zero to five percent slope), are 300 acres in size or within a landscape context where ground-dwelling SHLA have visual access to open water or fields.

The placement of dredged materials, site preparation for the placement of dredged materials, and the dissuasion of SHLA from nesting within planned placement locations will physically alter suitable nesting habitat within designated critical habitat subunits. These alterations are described above in the Proposed Action and Effects sections for site preparation, upland placement of dredged materials, and dissuasion of SHLA. These actions are expected to temporarily alter the PCEs of designated critical habitat by removing vegetation, leveling sites, and installing visual deterrents to preclude SHLA from nesting in planned placement locations. In one to three years, the placement areas within critical habitat are expected to transition into suitable nesting habitat that represents the PCEs of critical habitat on these subunits. This will be a beneficial effect to critical habitat by increasing the amount of nesting habitat.

SUITABILITY OF CRITICAL HABITAT IN UNIT 3: WASHINGTON COAST AND COLUMBIA RIVER ISLANDS

Critical Habitat Unit 3 is previously described in the Status Critical Habitat section. It totals 2,899 acres. The acreage of suitable SHLA nesting habitat on the four Washington coast subunits in Unit 3 is not quantified. Therefore, it is not feasible to determine the total acreage of suitable SHLA

nesting habitat within Unit 3 or the Washington coast subunits that is currently available and will be suitable through 2018. The Corps is able to collectively and individually estimate the availability of suitable SHLA nesting habitat for the lower Columbia River subunits from 2014 through 2018. The following narrative details the availability of suitable SHLA nesting habitat on designated critical habitat within the lower Columbia River collectively and individual subunits.

FIVE-YEAR DREDGED MATERIAL PLACEMENT PLAN ON SITES THAT OVERLAP WITH DESIGNATED CRITICAL HABITAT SUBUNITS

Of the 20 sites with planned placement in the next five years, seven (7) sites overlap with designated critical habitat subunits for SHLA: Rice Island, Miller Sands, Pillar Rock Island, Welch Island, Tenasillahe Island, Brown Island, and Crims Island. No placement is planned for the Sandy Island (RM 75.8) in the next five years; therefore, no placement will occur within the Sandy Island critical habitat subunit. For the seven placement sites that overlap with designated SHLA critical habitat and have planned placements of dredged materials in the next five years, only portions of each critical habitat subunit will be used in any given year, with the exception of Welch Island in 2015. In 2015, the entire 41-acre Welch Island site (RM 41) is planned for upland placement. However, only 37 acres of placement will overlap with the 43-acre Welch Island critical habitat subunit. Partial placements on all other critical habitat subunits will allow suitable breeding habitat to be available on each critical habitat subunit in every year. Placements of dredged material and availability of suitable SHLA nesting habitat on each designated critical habitat subunit in the Network are displayed on figures located in Appendix D.

Table 8 and the following discussion details the acreages of currently available suitable SHLA nesting habitat, placements of dredged material, regrading events, and the shifting mosaic of yet-to-be suitable to suitable to unsuitable SHLA nesting habitats on each of the designated critical habitat subunits that overlap with the Network from 2014 through 2018. The Wallace Island subunit is included even though it is not within the Corps Network, for reasons described in the following discussion. Figures for each subunit, placement event over the next five years, and suitable SHLA nesting conditions are located in Appendix D.

Table 8: Availability of Suitable Streaked Horned Lark Nesting Habitat within the Designated Critical Habitat Subunits of the Lower Columbia River (2014-2018)

[1] Wallace Island is not included in the placement network, and therefore will not be impacted by placement activities.

[2] All calculations for baseline suitable habitat, suitable habitat affected (by the placement event), and the suitable, yet-to-be, and unsuitable habitat represent the number of acres within the Critical Habitat subunit, not those acres within the placement site boundary.

[3] Baseline suitable habitat in 2014 equals the extent of habitat within the CH boundary which is suitable for SHLA at the beginning of the breeding season based on the best scientific information available (Anderson 2013). In addition, the area is calculated by subtracting a 25m buffer from the edge of shorelines, unsuitable vegetation (trees, shrubs). While larks are known to forage in these areas, they are not known to nest and breed in these areas.

[4] Baseline suitable habitat for 2015, 2016, 2017, and 2018 estimate suitable habitat within the CH boundary at the beginning of the breeding season. These values are assumed to equal the quantity of suitable habitat remaining from the preceding year plus any areas that become suitable from previous placement events. Where placement occurs after the breeding season, any loss of suitable habitat acres are not realized until the beginning of the following breeding season, and thus reflected in the baseline suitable conditions.

NETWORK WIDE-DESIGNATED CRITICAL HABITAT SUITABILITY

Figure 76 below shows suitable SHLA nesting habitat on designated critical habitat subunits throughout the Network during to the 5-year placement plan, as detailed in Table 8. Suitable nesting habitat for SHLA typically contains all the PCEs of SHLA designated critical habitat. However, designated SHLA critical habitat is not always suitable for nesting because of natural vegetative succession both within and adjacent to specific subunits. A total of 665 acres of critical habitat are designated across the lower Columbia River, but only 590 acres of critical habitat overlap with the Corps dredged material placement Network. The remaining 75 acres of critical habitat in the lower Columbia River consist of the 13-acre Wallace Island subunit and numerous small areas adjacent to the Corps' site boundary that are open water, vegetated land, shorelines, or wetlands.

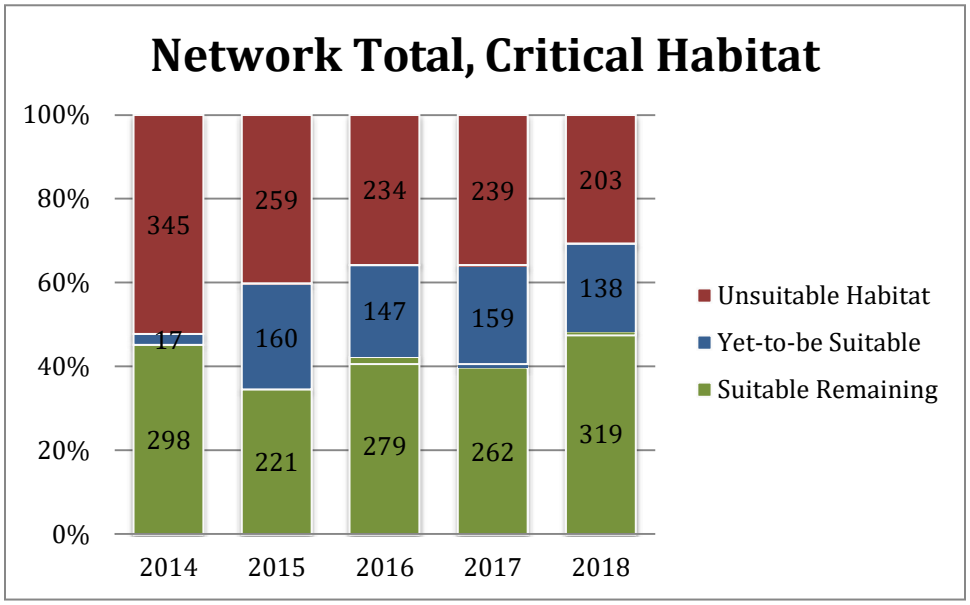

Figure 76: Availability of SHLA Nesting Habitat within Designated Critical Habitat across the Network including Wallace Island, 2014-2018

The Wallace Island critical habitat subunit is not in the Corps dredged material placement Network and no Corps placement will occur on Wallace Island. However, the 13-acre subunit is included in this discussion because it is within the same geographic reach of the lower Columbia River as the Corps' Network, it has been surveyed recently for breeding pairs, and it has been evaluated for suitable SHLA nesting habitat using the 2011 NDVI data. Therefore, this discussion will provide a more complete analysis of the availability of suitable SHLA nesting habitat within designated critical habitat on the lower Columbia River.

The 665 acres of designated critical habitat are categorized as suitable habitat (contains the PCEs of critical habitat), yet-to-be suitable habitat, or unsuitable habitat based on the assumptions previously discussed. Based on the 2011 NDVI habitat data, Corps placement events in 2011, 2012, 2013, and placement events during the 2014 nesting season, the Corps anticipates there will be 298 acres (45% of 665 acres) of suitable SHLA nesting habitat available within the designated critical habitat sub-units on the lower Columbia River for the nesting season in 2014. Following the placements in 2014, the suitable acreage of designated critical habitat will initially experience a

26% reduction (loss of 77 acres) of suitable SHLA nesting habitat to a low of 221 acres in 2015. The acreage of suitable nesting habitat available within designated critical habitat increases by 8 acres (4% of 221 acres) to 229 acres in 2016 due to placement of dredged materials and vegetation succession. The acreage of suitable nesting habitat available within designated critical habitat decreases 33 acres (14% of 229 acres) to 262 acres in 2017 due to placement of dredged materials and vegetation succession. The acreage of suitable nesting habitat available within designated critical habitat increases 57 acres (22% of 262 acres) to 319 acres in 2018 due to placement of dredged materials and vegetation succession. Overall, suitable SHLA nesting habitat within designated critical habitat will increase to 107% of the 2014 baseline conditions (298 acres) for the nesting season (319 acres) in 2018. Thereby, the proposed action will result in an increase of suitable nesting habitat containing the PCEs of critical habitat that will allow for further conservation and recovery of the species.

RICE ISLAND SUBUNIT

The Rice Island subunit is 224 acres, but only 219 acres are within the Corps placement site. Upland placement events on the Rice Island critical habitat subunit occur late in the summer, after the SHLA nesting season ends in mid-August/early-September. Therefore, placement actions on Rice Island are not expected to alter critical habitat during the year of dredged material placement. This subunit is within the Corps' Group II.

In 2014, the baseline of suitable breeding habitat within the 224-acre subunit is 150 acres with the remaining 74 acres of the site as unsuitable. The 2014 placement events will occur after the breeding season has ended and will cover 52 acres of critical habitat currently classified as a suitable (28 acres) and unsuitable (24 acres) conditions. The placement events will occur in two locations on the subunit: (1) on the downstream end of the island which is currently covered by short vegetation, and (2) along a strip of low-ground in the interior portion of the island. In addition to the placement of dredged materials, four acres on the upstream end of the subunit, which was trenched following placement activities in September 2013, will be smoothed out after the 2014 breeding season. This regraded area will develop into suitable breeding habitat in 2018.

Approximately 122 acres will remain in suitable nesting conditions within the subunit for the SHLA breeding season in 2015. No placement will occur in 2015 on the Rice Island subunit and therefore no designated critical habitat will be affected. The 56 acres covered by the 2014 placements and regrading work are expected to be mostly bare sand for the duration of 2015. Therefore, the 56 acres of yet-to-be suitable habitat do not possess the PCEs. All remaining areas (46 acres) of the subunit are considered unsuitable as breeding habitat in 2015 and do not possess the PCEs.

No placement will occur in 2016 on the Rice Island subunit, and therefore no designated critical habitat will be affected. Approximately 122 acres are available SHLA nesting habitat, possessing the PCEs. The areas covered by the 2014 placement events (56 acres total) will be yet-to-be suitable habitat and the remaining 46 acres are unsuitable.

Approximately 122 acres will be available as suitable nesting habitat on the Rice Island subunit in the 2017 breeding season. The 56 acres of yet-to-be suitable habitat from the 2014 re-grading and placement activities will be in the third year of vegetation succession and the remaining 46 acres of the site are still expected to unsuitable nesting habitat. The placement event in 2017 will cover approximately 104 acres in the center of the island after the breeding season, whereupon 64 acres of suitable habitat and 27 acres of yet-to-be suitable habitat would be lost to nesting SHLA in the following breeding season.

Approximately 85 acres will be suitable nesting habitat on the Rice Island subunit in the 2018 breeding season. The change is due to the loss of 64 acres of suitable habitat by the placement

event in 2017 and the addition of the remaining 27 acres from the 2014 placement and regraded areas that were yet-to-be suitable becoming suitable in 2018. The 104-acre placement event in 2017 is yet-to-be suitable habitat and the remaining 35 acres are expected to remain unsuitable in 2018. A 2018 placement event will cover approximately four acres at the upstream end of the subunit after the breeding season, resulting in a loss of four acres of suitable breeding habitat in the subsequent three years on the Rice Island subunit. These four acres had recently transitioned into viable nesting habitat from the 2014 re-grading event. The four-acre placement event will increase the acreage of yet-to-be suitable habitat in subsequent three years.

In summary, placement will occur in three of the five years on the Rice Island subunit resulting in a loss of suitable habitat from 150 acres to 122, a gain of yet-to-be suitable habitat from 0 acres to 104 acres, and a loss of unsuitable habitat from 74 acres to 35 acres. Figure 77 displays the availability of suitable SHLA nesting habitat containing the PCEs of critical habitat over the next five years on the Rice Island subunit.

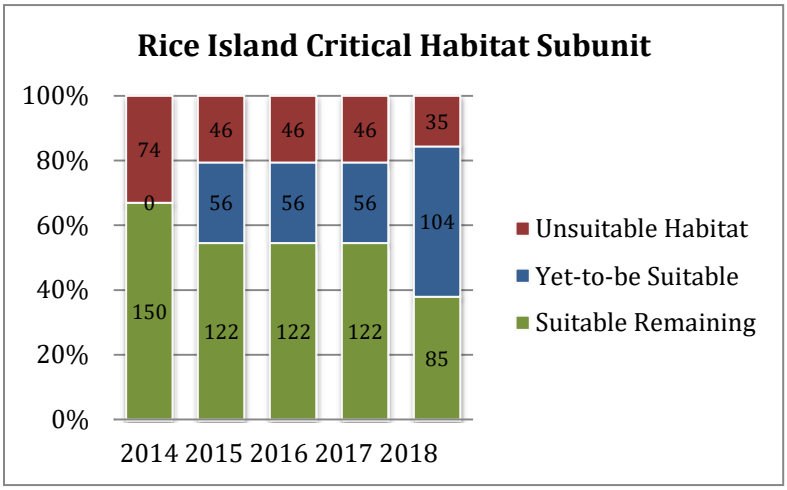

Figure 77: Availability of SHLA Nesting Habitat on the Rice Island Critical Habitat Subunit, 2014-2018

MILLER SANDS ISLAND SUBUNIT

The Miller Sands critical habitat subunit is 123 acres, but only 88 acres overlap with the Corps placement site. Shoreline placements occur during the SHLA nesting season and are not expected to affect critical habitat PCEs. Shoreline placements on Miller Sands are not expected to typically develop into the PCEs (suitable SHLA nesting habitat) of critical habitat because the placements are expected to erode away in subsequent years. The Miller Sands subunit is within the Corps' Group II.

In 2014, the baseline of suitable breeding habitat is zero (0) acres due to the succession of vegetation on the Miller Sands subunit. The entire 123-acre subunit are considered unsuitable and do not possess the PCEs of critical habitat. In 2014, a five-acre shoreline placement will occur during the breeding season on the upstream tip of the subunit. In addition to the shoreline placement, 34 acres on the middle of the island will be smoothed during the 2014 breeding season. This area was previously mounded to dissuade tern and cormorant use. This regraded area is expected to develop PCEs and become suitable SHLA breeding habitat in 2018.

No suitable SHLA nesting conditions will be present on the Miller Sands subunit in 2015. The 34-acre regraded mound area is expected to be yet-to-be suitable habitat and does not possess the PCEs of critical habitat. All remaining areas (89 acres), including the prior shoreline placement, are

considered unsuitable 2015. A 14-acre shoreline placement will occur on the mid-downstream portion of the subunit, during the 2015 breeding season.

No suitable SHLA nesting conditions will be present on the Miller Sands subunit in 2016. The 34-acre re-graded mound area is expected to be in its second year of yet-to-be suitable habitat and does not possess the PCEs of critical habitat. All remaining areas (89 acres), including the prior shoreline placements, are considered unsuitable in 2016. An 11-acre shoreline placement will occur on two downstream portions of the subunit, during the 2016 breeding season.

No suitable SHLA nesting conditions will be present on the Miller Sands subunit in 2017. The 34-acre re-graded mound area is expected to be in its third year of yet-to-be suitable habitat and does not possess the PCEs of critical habitat. All remaining areas (89 acres), including the prior shoreline placements, are considered unsuitable as breeding habitat in 2017. A nine-acre shoreline placement will occur where necessary to repair erosion, during the 2017 breeding season.

Approximately 34 acres will be develop PCEs of critical habitat and will be available as suitable SHLA nesting habitat on the Miller Sands subunit in the 2018. The 34 acres are the regraded mound area from 2014. All remaining areas (89 acres), including the prior shoreline placements, are considered unsuitable as breeding habitat in 2018. A nine-acre shoreline placement will occur where necessary to repair erosion, during the 2018 breeding season.

In summary, shoreline placement will occur each year on the Miller Sands subunit but will not affect the PCEs of critical habitat. The 2014 regrading event will result in 34 acres developing the PCEs of critical habitat by 2018. By 2018, unsuitable habitat will decrease from 123 acres in 2014 to 89 acres. No yet-to-be suitable habitat will be on the site in 2018. Figure 78 displays the availability of suitable SHLA nesting habitat containing the PCEs of critical habitat over the next five years on the Miller Sands Critical Habitat subunit.

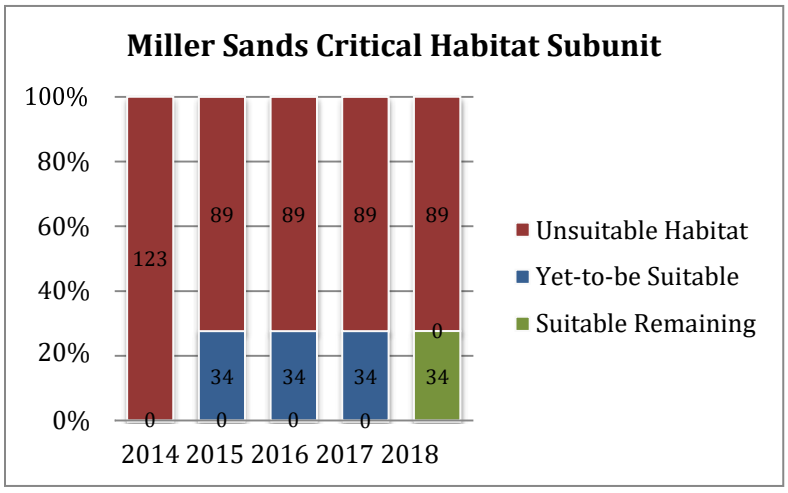

Figure 78: Availability of SHLA Nesting Habitat on the Miller Sands Critical Habitat Subunit, 2014-2018

PILLAR ROCK ISLAND SUBUNIT

The Pillar Rock Island critical habitat subunit is 44 acres, but only 41 acres overlap with the Corps placement site. Both shoreline and upland placement events on the subunit occur during the SHLA nesting season. Shoreline placements are not expected to affect critical habitat PCEs or to typically develop into the PCEs (suitable SHLA nesting habitat) of critical habitat because the placements are expected to erode away in subsequent years. Upland placement will require early season site preparation activities that will include vegetation removal and dissuasion techniques to preclude

SHLA nesting in planned upland placement locations. Upland placement could result in the loss of habitat containing the PCEs of critical habitat if suitable habitat is lost. However, no suitable habitat will be lost on the Pillar Rock Island subunit due to upland placement. The Pillar Rock Island subunit is within Corps' Group II.

In 2014, the baseline of suitable SHLA breeding habitat containing the PCEs is four acres due to the succession of vegetation and active erosion of the Pillar Rock Island subunit. The remaining 40 acres of the subunit are considered unsuitable and do not possess PCEs. In 2014, a 14-acre shoreline placement will occur on the northern portion to rebuild the shore. The 2014 shoreline placement event will occur during the breeding season.

In 2015, the baseline of suitable SHLA breeding habitat containing the PCEs is four acres. The remaining 40 acres of the subunit are considered unsuitable and do not possess PCEs. In 2015, a 14-acre shoreline placement will occur on the northern portion to rebuild the shore. The 2015 shoreline placement event will occur during the breeding season.

In 2016, the baseline of suitable SHLA breeding habitat containing PCEs is four acres. The remaining 40 acres of the subunit are considered unsuitable and do not possess PCEs. In 2016, a 14-acre shoreline placement will occur on the northern portion to rebuild the shore. The 2016 shoreline placement event will occur during the breeding season on the shore.

No habitat possessing the PCEs of critical habitat (suitable SHLA nesting habitat) will be present on the Pillar Rock Island subunit in 2017 due to the succession of vegetation since the upland placement last occurred in 2001, 15 years prior. A 14-acre placement will occur during the breeding season in 2017 on the subunit. Approximately one acre will be shoreline placement to maintain the shore and the other 13 acres will be placed in uplands that had vegetation removed and SHLA dissuasion techniques installed in the early spring. The entire 44-acre subunit is considered unsuitable for SHLA nesting in 2017.

No habitat possessing the PCEs of critical habitat (suitable SHLA nesting habitat) will be present on the Pillar Rock Island subunit in 2018. Approximately 13 acres of yet-to-be suitable habitat is expected from the 2017 upland placement. The remaining 31 acres of the subunit are considered unsuitable 2018. A 14-acre placement will occur during the breeding season in 2018 on the Pillar Rock Island subunit. Approximately one acre will be shoreline placement to maintain the shore and the other 13 acres will be placed in uplands that had vegetation removed and SHLA dissuasion techniques installed in the early spring. The 13-acre upland placement in 2018 will not overlap with the 2017 upland placement.

In summary, shoreline placement will occur each year on the Pillar Rock Island subunit but will not affect the PCEs of critical habitat. Upland placement will occur in 2017 and 2018, but no critical habitat containing PCEs will be affected because the subunit will become too vegetated in 2017. By 2018, upland placement will result in a gain of yet-to-be suitable habitat from 0 acres to 13 acres and a loss of unsuitable habitat from 44 acres to 31 acres. Figure 79 displays the suitability of SHLA nesting habitat containing the PCEs of critical habitat over the next five years on the Pillar Rock Island Critical Habitat subunit.

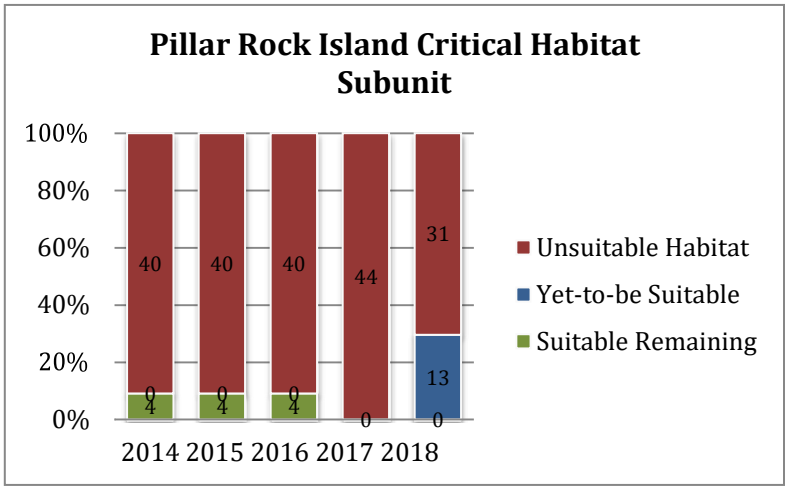

Figure 79: Availability of SHLA Nesting Habitat on the Pillar Rock Island Critical Habitat Subunit, 2014-2018

WELCH ISLAND SUBUNIT

The Welch Rock Island critical habitat subunit is 43 acres, but only 37 acres overlap with the Corps placement site. Placement events on the Welch Island critical habitat subunit occur in the summer, during the SHLA nesting season. Upland placement will require early season site preparation activities that will include vegetation removal and dissuasion techniques to preclude SHLA nesting in planned upland placement locations. Upland placement could result in the loss of habitat containing the PCEs of critical habitat if suitable habitat is lost. The Welch Island subunit is within Corps' Group III.

In 2014, the baseline of suitable SHLA breeding habitat containing critical habitat PCEs is 10 acres with the remaining 33 acres of the subunit as unsuitable habitat. No placements are planned in 2014 and critical habitat will not be affected.

In 2015, the baseline of suitable SHLA breeding habitat is 10 acres. However, the 37 acres of the subunit will used for upland placement during the breeding season resulting is a loss of 10 acres of suitable habitat containing the PCEs of critical habitat. Therefore, the entire 43-acre subunit would be unsuitable for SHLA nesting in 2015.

In 2016, no habitat containing the PCEs of critical habitat (suitable SHLA breeding habitat) will be available on the subunit. The 37-acre placement event from 2015 is classified as yet-to-be suitable and the remaining six acres of subunit are unsuitable and do not possess the PCEs of critical habitat. No placement is planned in 2016 and critical habitat will not be affected.

In 2017, the baseline of habitat containing the PCEs of critical habitat (suitable SHLA nesting habitat) is 17 acres. This increase is due to 37 acres of yet-to-be suitable habitat transitioning into suitable SHLA nesting habitat and a 20-acre placement during the breeding season on the upstream portion of the subunit. The remaining 26 acres of the subunit will be unsuitable habitat and do not possess the PCEs of critical habitat.

In 2018, the baseline of habitat containing the PCEs of critical habitat (suitable SHLA nesting habitat) is 17 acres. Approximately 20 acres of yet-to-be suitable habitat from the 2017 upland placement and the remaining six acres of the subunit will be unsuitable habitat and do not possess the PCEs of critical habitat. No placement is planned in 2018 and critical habitat will not be affected.

In summary, placement will occur in two of the five years on the Welch Island subunit resulting in a gain of suitable habitat from 10 acres to 17 acres, a gain of yet-to-be suitable habitat from 0 acres to 20 acres, and a loss of unsuitable habitat from 33 acres to six acres. Figure 80 displays the availability of suitable SHLA nesting habitat containing the PCEs of critical habitat over the next five years on the Welch Island subunit.

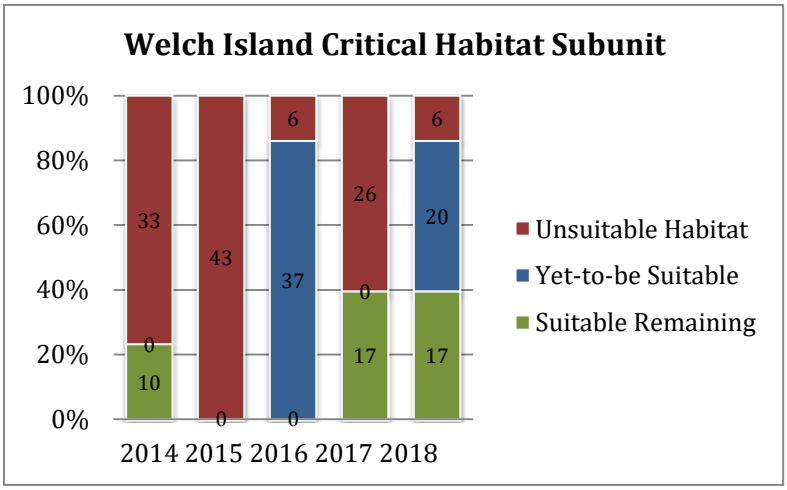

Figure 80: Availability of SHLA Nesting Habitat on the Welch Island Critical Habitat Subunit, 2014-2018

TENASILLAHE ISLAND SUBUNIT

The Tenasillahe Island critical habitat subunit is 23 acres and all 23 acres overlap with the Corps placement site. Upland placement events on the 23-acre Tenasillahe Island critical habitat subunit occur in the summer, during the SHLA nesting season. Upland placement will require early season site preparation activities that will include vegetation removal and dissuasion techniques to preclude SHLA nesting in planned upland placement locations. Upland placement could result in the loss of habitat containing the PCEs of critical habitat if suitable habitat is lost. The Tenasillahe Island subunit is within the Corps' Group III.

In 2014, a two-acre placement is planned during the breeding season on the downstream portion of the subunit, resulting in a loss of approximately 0.3 acre of habitat containing the PCEs of critical habitat (suitable SHLA nesting habitat). Therefore, the baseline of suitable SHLA breeding habitat in 2014 is two acres on the subunit. Approximately 17 acres of yet-to-be suitable habitat are anticipated due to placements in 2012 and 2013 and approximately four acres on the subunit is unsuitable and do not contain the PCEs of critical habitat.

In 2015, the baseline of suitable SHLA breeding habitat containing PCEs is 19 acres because the 17 acres of placement in 2013 have become suitable habitat. The two-acre placement in 2014 is classified as yet-to-be suitable in 2015 with the remaining two acres as unsuitable habitat on the subunit. No placement is planned in 2015 and critical habitat will not be affected.

In 2016, a 12-acre placement is planned during the breeding season on the downstream portion of the subunit, resulting in a loss of 10 acres of suitable nesting habitat that possess the PCEs of critical habitat. Therefore, the baseline of habitat containing PCEs (suitable SHLA nesting habitat) on the subunit in 2016 is nine acres. The remaining 14 acres are unsuitable habitat.

In 2017, the baseline of habitat containing PCEs (suitable SHLA breeding habitat) on the subunit is nine acres. The 12-acre placement area from 2016 is yet-to-be suitable habitat and the remaining

two acres of the site is unsuitable habitat. No placement is planned in 2017 and critical habitat will not be affected.

In 2018, the baseline of habitat containing PCEs (suitable SHLA nesting habitat) on the subunit is 19 acres. A two-acre placement is planned during the breeding season on the downstream portion the subunit, preventing two acres of suitable SHLA nesting habitat developing from the 12-acre placement event in 2016. However, there will be a net gain of 10 acres of suitable habitat. The remaining four acres are considered unsuitable habitat.

In summary, placement will occur in three of the five years on the Tenasillahe Island subunit resulting in a gain of suitable habitat from two acres to 19 acres, a loss of yet-to-be suitable habitat from 17 acres to 0 acres, and no change in unsuitable habitat (4 acres). Figure 81 displays the availability of suitable SHLA nesting habitat containing the PCEs of critical habitat over the next five years on the Tenasillahe Island subunit.

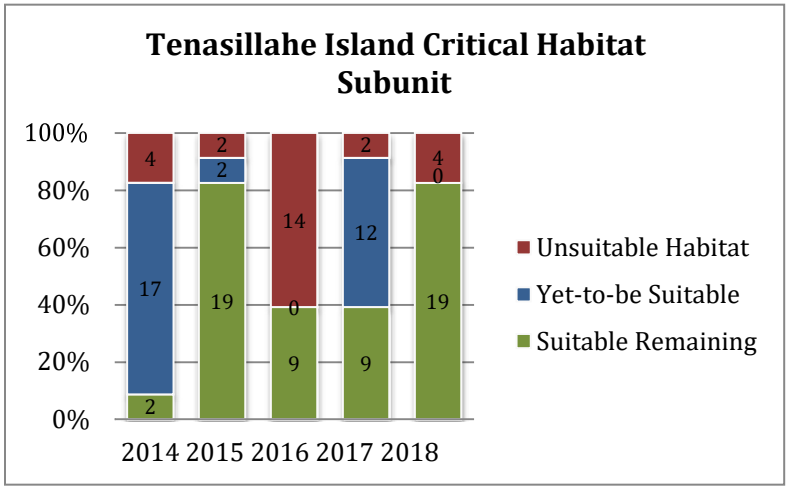

Figure 81: Availability of SHLA Nesting Habitat on the Tenasillahe Island Critical Habitat Subunit, 2014-2018

BROWN ISLAND SUBUNIT

The Brown Island critical habitat subunit is 98 acres, but only 97 acres overlap with the Corps placement site. Upland placement events on the Brown Island Critical Habitat subunit typically occur in the summer, during the SHLA nesting season. Upland placement will require early season site preparation activities that will include vegetation removal and dissuasion techniques to preclude SHLA nesting in planned upland placement locations. Upland placement could result in the loss of habitat containing the PCEs of critical habitat if suitable habitat is lost. Placement actions after the breeding season are not expected to alter critical habitat during the year of dredged material placement. The Brown Island subunit is within the Corps' Group III.

In 2014, the baseline of habitat containing PCEs (suitable breeding habitat) on the subunit is 72 acres due to placement activities in 2011. The remaining 26 acres of the subunit are unsuitable during the nesting season. A 68-acre placement is planned after the nesting season, resulting is a loss of 51 acres of suitable nesting habitat (PCEs) in the following year. The placement will occur adjacent the shoreline and downstream end of the subunit.

In 2015, the baseline of habitat containing PCEs (suitable breeding habitat) on the subunit is 21 acres. Approximately 68 acres of yet-to-be suitable habitat and nine acres of unsuitable habitat occur in the subunit. No placement is planned in 2015 on Brown Island and critical habitat will not be affected.

In 2016, 39 acres of habitat containing PCEs (suitable SHLA nesting habitat) will be available during 2016 breeding season due to a 50-acre placement on the north side and downstream end of the subunit will occur during the breeding season. The 50-acre placement will result in a loss of 21 acres of suitable nesting habitat and prevent 29 acres of yet-to-be habitat (68 acres) becoming suitable 2016. Therefore, the remaining 39 acres of the 68-acre placement event in 2014 will become suitable nesting habitat containing the PCEs of critical habitat. The remaining 59 acres of the subunit will be unsuitable habitat.

In 2017, the baseline of habitat containing PCEs (suitable SHLA nesting habitat) will be 39 acres. The 50-acre placement event in 2016 will be yet-to-be suitable habitat with nine acres of unsuitable habitat. No placement is planned in 2017 on the Brown Island subunit and critical habitat will not be affected.

In 2018, the 50-acre placement event from 2016 will become suitable. Therefore, the baseline of habitat containing PCEs (suitable SHLA nesting habitat) in 2018 on the Brown Island subunit is approximately 89 acres. The remaining nine acres will be unsuitable. No placement is planned in 2018 on the Brown Island subunit and critical habitat will not be affected.

In summary, placement will occur in two of the five years on the Brown Island subunit resulting in a gain of suitable habitat from 72 acres to 89 acres, no change in yet-to-be suitable habitat (0 acres), and a loss of unsuitable habitat from 26 acres to nine acres. Figure 82 displays the availability of suitable SHLA nesting habitat containing the PCEs of critical habitat over the next five years on the Brown Island subunit.

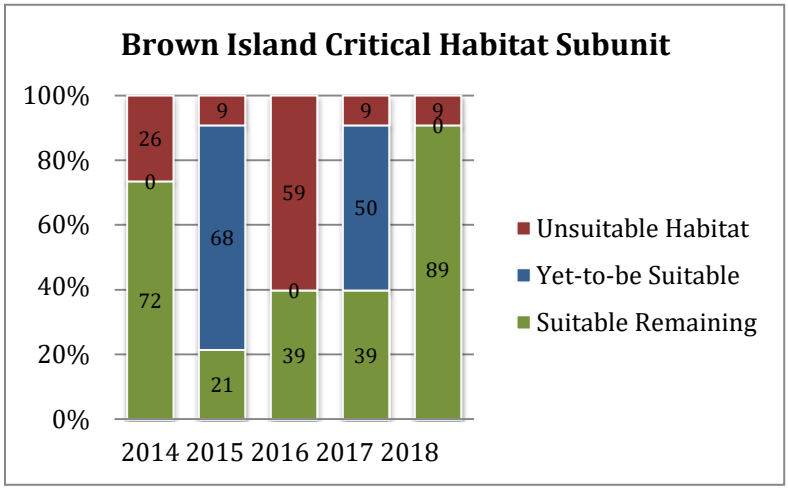

Figure 82: Availability of SHLA Nesting Habitat on the Brown Island Critical Habitat Subunit, 2014-2018

WALLACE ISLAND SUBUNIT

The Wallace Island critical habitat subunit is not in the Corps' dredged material placement Network and no Corps placement will occur on the subunit. However, the 13-acre subunit is included in this discussion because it is within the same geographic reach of the lower Columbia River as the Corps' Network, it has been surveyed recently for breeding pairs, and it has been evaluated for suitable SHLA nesting habitat using the 2011 NDVI data. Therefore, this discussion will provide a more complete analysis of the availability of habitat containing the PCEs of critical habitat (suitable SHLA nesting habitat) within designated critical habitat subunits on the lower Columbia River.

Wallace Island is located near RM 47, between the Corps' placement sites on Brown Island (RM 46.3) and Crims Island (RM 57.0). One pair of breeding larks was observed in 2012. No pairs were

observed in 2011 or 2013 surveys. In 2011, the NDVI analysis identified three suitable acres of SHLA nesting habitat on the 13-acre subunit.

From 2014 through 2018, the Corps anticipates that three acres of suitable SHLA nesting habitat will remain available on the Wallace Island subunit due to the absence of known placements of dredged materials by others or other habitat altering events.

Figure 83 displays no change in habitat containing the PCEs of critical habitat (suitable SHLA nesting habitat) over the next five years on the Wallace Island critical habitat subunit.

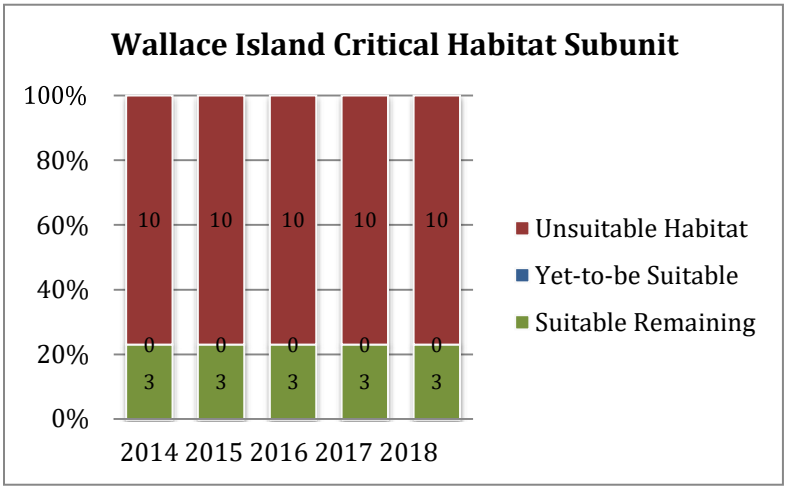

Figure 83: Availability of SHLA Nesting Habitat on the Wallace Island Critical Habitat Subunit, 2014-2018

CRIMS ISLAND SUBUNIT

The Crims Island critical habitat subunit is 60 acres, but only 53 acres overlap with the Corps placement site. Upland placement events on the Crims Island critical habitat subunit occur in the summer, during the SHLA nesting season. Upland placement will require early season site preparation activities that will include vegetation removal and dissuasion techniques to preclude SHLA nesting in planned upland placement locations. Upland placement could result in the loss of habitat containing the PCEs of critical habitat if suitable habitat is lost. The Crims Island subunit is within the Corps' Group IV.

In 2014, the baseline of habitat containing PCEs (suitable SHLA nesting habitat) is 25 acres with the remaining 35 acres of the subunit as unsuitable habitat. No placements are planned in 2014 on the Crims Island subunit and critical habitat will not be affected.

In 2015, a 20-acre placement on the downstream end of the subunit during the breeding season will result in a loss of five acres of suitable SHLA nesting habitat. Therefore, there will be an estimated 20 acres of habitat containing PCEs (suitable SHLA nesting habitat) in 2015. The remaining 40 acres will be unsuitable habitat.

In 2016, the baseline of habitat containing PCEs (suitable SHLA nesting habitat) is 20 acres. The 20-acre placement event in 2015 will be yet-to-be suitable habitat and the remaining 20 acres will be unsuitable habitat. No placement is planned in 2016 on the Crims Island subunit and critical habitat will not be affected.

In 2017, the 20-acre placement event in 2015 will transition to suitable habitat. Therefore, there will be an estimated 40 acres of habitat containing PCEs (suitable SHLA nesting habitat) in 2017.

The remaining 20 acres will be unsuitable habitat. No placement is planned in 2017 on the Crims Island subunit and critical habitat will not be affected.

In 2018, the baseline of habitat containing PCEs (suitable SHLA nesting habitat) is 40 acres. The remaining 20 acres will be unsuitable habitat. No placement is planned in 2018 on the Crims Island subunit and critical habitat will not be affected.

In summary, placement will occur in one of the five years on the Crims Island subunit resulting in a gain of suitable habitat from 25 acres to 40 acres, no change in yet-to-be suitable habitat (0 acres), and a loss of unsuitable habitat from 35 acres to 20 acres. Figure 84 displays the availability of suitable SHLA nesting habitat containing the PCEs of critical habitat over the next five years on the Crims Island subunit.

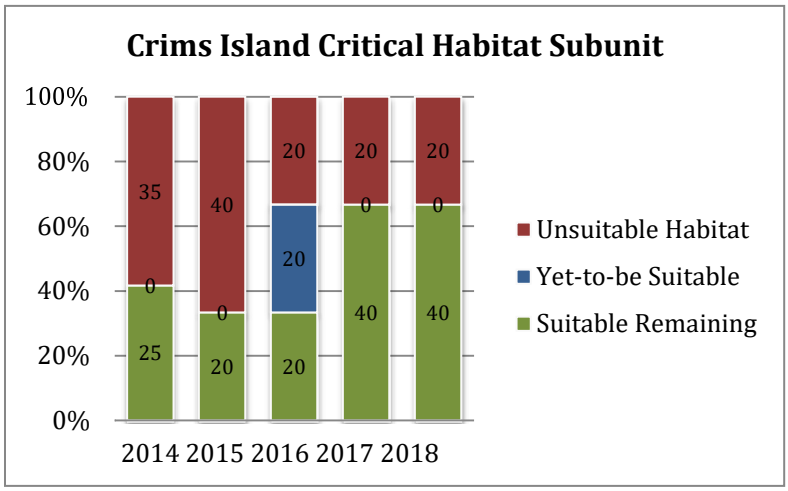

Figure 84: Availability of SHLA Nesting Habitat on the Crims Island Critical Habitat Subunit, 2014-2018

SANDY ISLAND SUBUNIT

The Sandy Island critical habitat subunit is 37 acres, but only 32 acres overlap with the Corps placement site. No placements are planned on the Sandy Island critical habitat subunit from 2014 to 2018. In 2014, the baseline of habitat containing PCEs (suitable SHLA nesting habitat) is 32 acres on the subunit due to a 32-acre placement in 2011. The remaining five acres of the subunit are unsuitable habitat through 2018. The 32 acres of suitable SHLA nesting habitat is expected to become unsuitable after the 2018 nesting season. The Sandy Island subunit is within the Corps' Group V. Figure 85 displays the availability of suitable SHLA nesting habitat containing the PCEs of critical habitat over the next five years on the Sandy Island subunit.

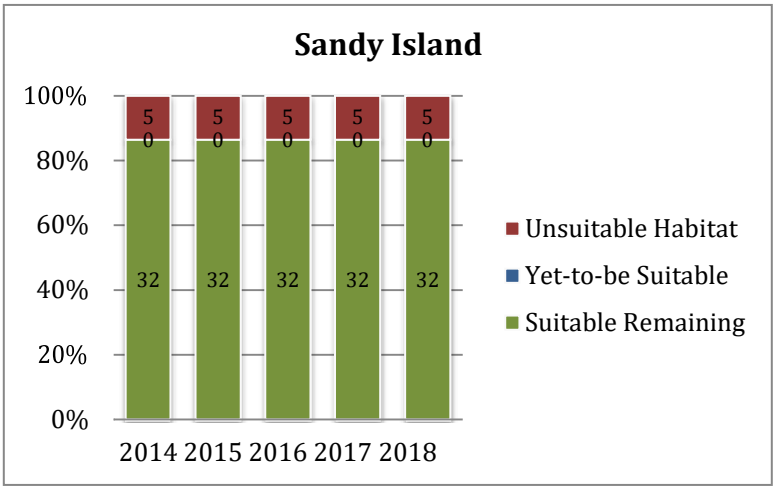

Figure 85: Availability of SHLA Nesting Habitat on the Sandy Island Critical Habitat Subunit, 2014-2018

In summary, the proposed action will result in an increase of suitable SHLA nesting habitat containing the PCEs of critical habitat that will allow for further conservation and recovery of the species.

EFFECTS FROM INTER-RELATED AND INTER-DEPENDANT ACTIONS

Interrelated actions are part of a larger action and depend on the larger action for their justification (50 CFR § 402-02). Interrelated actions are typically associated with the proposed action. The Corps considered whether the following action may be interrelated or interdependent to the continued dredging and placement activities of the Project:

Inter-related and interdependent effects of the Corps action include changes in other avian species that use the placement sites. The placement of dredged material at shoreline and upland sites in the lower Columbia River, particularly at Rice Island, Miller Sands, and Pillar Rock Island, has in part, increased the nesting habitat for Caspian terns and cormorants (FR 78, #192, 2013). The nesting of these larger avian species may reduce the quality, quantity, and success of SHLA nesting habitat on Corps placement sites in the Columbia River estuary. As described in the effects section above, efforts to reduce the establishment of other avian species (terns and cormorants) include habitat modifications and physical barriers (placing fences in open areas); these deterrent actions are also expected to reduce available habitat for larks; currently the overlap of potentially suitable habitat occurs only on Pillar Rock Island.

Commercial sand mining currently occurs at several upland placement sites within the Network. These commercial facilities operate as a result of the Corps' placement of dredged material at these sites. Due to the frequent site disturbance at active sediment borrow sites (Skamokawa, James River, Dibblee Point, Northport, Martin Bar, and Gateway) and Austin Point (heavy equipment training school) and lack of suitable nesting habitat, it is unlikely that SHLA will use these sites and be exposed to potential adverse effects in the future. However, the effects to SHLA from these actions are discussed above in the effects section and will not be analyzed in detail here. In summary, the effects from on-going commercial sand mining at upland placement sites within the Network will generally preclude SHLA from nesting due to the amount of human activity and constant habitat disturbance that prevents suitable nesting habitat from developing.

There may be requests in the future to mine or borrow placed dredged materials from current, non-commercial dredged material placement sites. On-going placement of dredged material creates a source of sediment for commercial purposes, independent from the Corps' action. The Corps does not own or maintain any of the placement sites, or own the dredged material following placement, and therefore the Corps has no authority for long-term management or control of the sites or the dredged materials. The Corps is aware that the State of Oregon, Department State Lands (DSL) has recently received a proposal for sediment extraction at Rice Island. It is uncertain at this point when or if this will occur. If the proposal is approved by Oregon DSL, the Corps expects modifications to SHLA critical habitat and adverse effects to individual SHLAs and its habitat. However, given the known use of the site by SHLA, it is reasonable to expect that the DSL will work with the USFWS to secure a Habitat Conservation Plan prior to issuing a permit to remove sand from the island.

CUMULATIVE EFFECTS

Cumulative effects are those effects of future state or private activities, not involving Federal activities, that are reasonably certain to occur within the Action Area of the Federal Action subject to consultation (50 CFR § 402.02). To determine whether there are other future actions reasonably certain to occur in the Project Area, local and state government websites were reviewed and local entities queried. Current non-Federal activities in the area that are anticipated to continue at relatively the same levels include: upland and shoreline recreation, including camping, fishing, and all-terrain (ATV) and/or off-highway vehicle (OHV) operations, continued regional and shoreline development in support of economic growth by local communities, and non-federal actions to protect and restore habitat within the river and estuary.

The Portland/Vancouver metro area has grown 10.3% over the past decade. Residential, commercial, industrial, or recreational development may occur within the vicinity of the project area. As the metro area expands, there are increasing needs for recreational areas and greenspace. Easily accessible placement sites will likely continue to be popular recreational use areas for the foreseeable future, including ATV and/or OHV use. Those sites that are only accessible by boat generally will have very limited access, but still may receive some use, mostly for shoreline camping and recreational fishing. These recreational activities may cause adult SHLA to be disturbed, likely flush from the area that could result in nest abandonment, increased predation, decreased foraging opportunities and increased energetic expenditures. In the event that nests are in the area, recreational activities may result in the direct mortality to eggs and nestlings; adults are expected to flush from the area and avoid direct mortality. However, areas that receive a high amount of recreational activity likely preclude use by SHLA, so the number of birds directly affected is likely very low.

The Corps is not aware of any further non-federal actions within the Network that may affect SHLA or their designated critical habitat. Future federal actions that may affect SHLA or their designated critical habitat within the Network are required to undergo Section 7 consultation with the USFWS to evaluate the effects of those actions on species listed under the ESA.

SUMMARY OF EFFECTS

SUMMARY OF EFFECTS TO STREAKED HORNED LARKS AND THEIR HABITATS

Implementation of the proposed action will result in a range of beneficial and adverse effects to SHLA and their habitat. Site preparation and sediment placement will likely disturb adults and subadults from suitable nesting habitat and sediment placement may lead to the direct mortality of

eggs and nestlings. Disturbance-related effects are expected to cause flushing of adults and subadults and could result in nest abandonment, nest failure, and increased susceptibility of eggs and chicks to predation. While some very low levels of direct mortality of eggs and juvenile SHLA may occur during placement of dredged materials (via burial), it is anticipated that adults will not be buried during placement activities and would instead flush from the area. However, despite these short-term adverse effects to individual SHLAs, the on-going dredging and sediment placement activities over the next five-years will result in a considerable increase in the amount of suitable nesting habitat within the Network.

Dredged material placement at shoreline and upland sites results in temporary modifications of nesting habitat, but is outweighed by the long-term benefits of maintaining a broad network of large, suitable nesting habitat areas within the lower Columbia River. Because the natural process of vegetation succession reduces the suitability of habitats for SHLA over time, upland dredged material placement can periodically reset the vegetative successional clock returning these areas to a more suitable habitat condition. While some areas may experience an immediate, short-term loss of suitable nesting habitat in the first two – four years following placement of dredged materials, these areas are expected to transition into suitable habitat as vegetation becomes established soon thereafter and remain suitable for six to 12 years following the placement event, provided no additional disturbance occurs which alters the vegetation communities. Therefore, habitat modification throughout the Network will result in both short-term adverse and long-term beneficial effects depending on existing habitat condition, the timing of placement relative to nesting, as well as the extent, frequency, and location of upland dredged material placements.

Within the entire 1,826-acre Network, there are currently 315 acres (17% of Network acreages) of suitable nesting habitat for SHLA. Through the five-year placement plan, suitable habitat ranges from a low of 241 acres in 2015 to a high of 643 acres (35% of Network acreages) by 2018 (104% increase over 2014 acreage), the final year of the current placement plan. The proposed action effectively doubles that acreage of suitable SHLA nesting habitat across the Network. Similarly, given this potential increase in suitable habitat, the potential number of breeding pairs that could occupy nesting habitat across the Network also doubles over the five-year placement plan (see Figure 86). However, recent literature and the best available scientific information suggests the regional population of SHLA is not limited by a lack of suitable nesting habitat, but rather by demographics, specifically adult and juvenile survival (Pearson and Hopey, 2005, Schapaugh 2009, USFWS 2014). Therefore, even with the temporary reduction in amount of suitable habitat in 2015, there is adequate suitable habitat remaining across the Network to support more than the current SHLA population within the lower Columbia River.

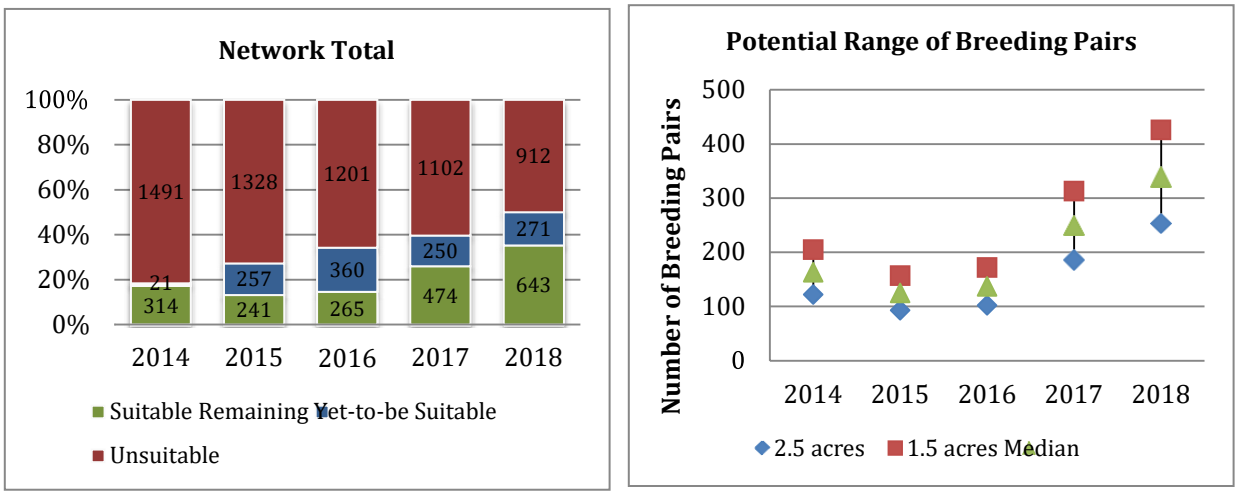

Figure 86: Summary of effects to suitable habitat and potential range of breeding pairs, 2014 – 2018.

Without periodic placement of dredged materials, the 1,826 acres of the Network would eventually transition to conditions unsuitable SHLA nesting habitat in the next 12 to 20 years. Figure 87 below shows habitat condition and associated number of potential SHLA breeding pairs without implementation of shoreline and upland placement of dredged material within the Network (compared to Figure 86 above). Implementation of the five-year dredged material placement plan more than doubles the amount of suitable nesting habitat within the Network, while also providing a substantial amount of yet-to-be suitable habitat acres ready to transition into suitable after 2018. Without implementation of the five-year dredging plan, suitable habitat acreage within the Network is reduced by about a third, with zero acres of yet-to-be suitable habitat available to transition into suitable after 2018. Therefore, while the analysis in this BA is only for the years 2014 – 2018, comparing Figure 86 Figure 87 clearly indicates the long term benefits to suitable SHLA habitat from the periodic placement of dredged materials at shoreline and upland sites across the Network and the downward trajectory of suitable habitat condition that could support the local population of SHLA that would result without these activities.

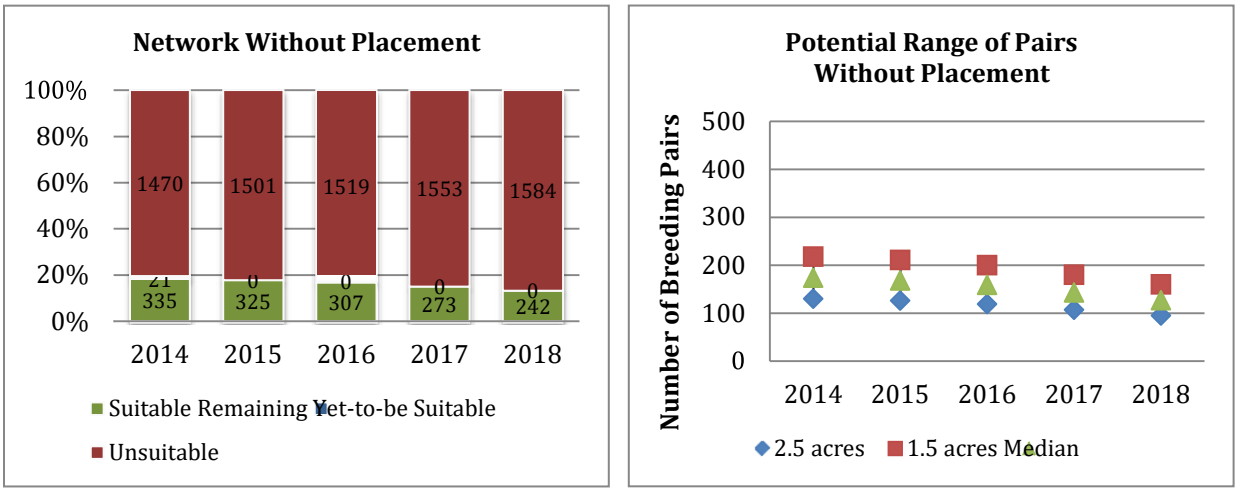

Figure 87: Summary of effects to suitable habitat and potential range of breeding pairs if no placement occurs, 2014-2018

As stated above, only eight dredged material sites overlap with designated critical habitat subunits for SHLA: Rice Island, Miller Sands, Pillar Rock Island, Welch Island, Tenasillahe Island, Brown Island, Crims Island, and Sandy Island. No placement is planned for the Sandy Island (RM 75.8) in the next five years; therefore, no effect to the Sandy Island critical habitat subunit will occur. The Wallace Island subunit is not within the Corps' Network and will not be affected by the proposed action. Only portions of each critical habitat subunit in the Corps' Network will be used in any given year. Placements on critical habitat subunits will allow suitable breeding habitat to be available on the Rice Island, Tenasillahe, Brown Island, Wallace Island, Crims Island, and Sandy Island subunits in every year. The Miller Sands subunit will not have suitable habitat until 2018, which would not form without the Corps' action. The Pillar Rock Island subunit will lose its suitable habitat to natural vegetation succession while the Corps rebuilds the site with shoreline placements. The Welch Island subunit will not have suitable habitat in 2015 and 2016, but will increase suitable habitat from 2014 (10 acres) to 2018 (17 acres)

Not all habitats within individual subunits are suitable nesting habitat for SHLA. Currently, only 298 acres of the 665 acres designated as critical habitat contain all the PCEs that correlate with suitable nesting habitat (approximately 45% of all designated critical habitat in the lower Columbia River). Through the five-year placement plan, suitable nesting habitat within the designated critical habitat subunits ranges from current baseline (2014) estimates of 298 acres to a low of 221 acres (33%) in 2015 and a high of 319 acres (48%) by 2018, a seven percent increase over 2014 baseline acreage.

Without periodic dredged material placement within the designated critical habitat subunits, these areas would all eventually transition to unsuitable habitat conditions that do not support the necessary PCEs for SHLA. The long-term beneficial effects from periodically resetting the vegetative successional clock through shoreline and upland placement of dredged materials cannot be overstated. Through implementation of the proposed action, the Corps sustains the important habitat elements identified as PCEs within the critical habitat subunits within the Network. Should shoreline and upland placement cease in these critical habitat subunits, the long-term viability of critical habitat in the lower Columbia River will be in doubt.

DETERMINATION AND CONCLUSION

The abundance and geographic distribution of SHLA is not expected to be affected from implementing the proposed action, and therefore the placement of dredged materials is not expected to directly contribute to population declines throughout the lower Columbia River. However, based upon the above analysis and assessment of the direct effects, indirect effects, effects from interrelated and interdependent actions, and cumulative effects to SHLA resulting from the placement of dredged materials in the CR FNC, together with the conservations measure implemented as part of the proposed action, the Corps has determined that the proposed five-year placement plan ***"may affect, and is likely to adversely affect"*** to individual SHLA and their habitats in the lower Columbia River. In addition, based on the analysis of effects to designated critical habitat resulting from implementation of the proposed action, the Corps has determined the proposed five-year placement plan ***"may affect, and is likely to adversely affect"*** designated critical habitat in Unit 3.

Congressional Authorizations for the Columbia River Dredging Program

Congress authorized construction and maintenance of the Columbia River Federal Navigation Channel (CR FNC) from the Columbia River mouth to Bonneville Dam (River Mile (RM) -3.0 to 145). Several federally authorized projects are included in the CR FNC.

- Mouth of the Columbia River (MCR) Project (RM -3.0 to 3.0),
- Columbia River (RM 3.0 to 106.5) deep draft project, also includes lower 12 miles of Willamette River
- Columbia River from Vancouver to The Dalles (RM 106.5 to 145) Project,
- Nine (9) side channel projects (Baker Bay, Chinook Channel, Hammond Boat Basin, Skipanon Channel, Skamokawa Creek, Wahkiakum Ferry Channel, Westport Slough, Old Mouth Cowlitz River, and Upstream Entrance to Oregon Slough), and
- Portland-Vancouver Anchorages.

MOUTH OF THE COLUMBIA RIVER

The MCR Project was authorized under the Rivers and Harbors Act of 5 July 1884; however, the originally authorized project depth of 40 feet for the MCR was not completed until 1918. The South Jetty was completed in 1914 and the North Jetty completed in 1917. A spur jetty (Jetty A) was completed in 1939 for the purpose of channel stabilization. The Rivers and Harbors Act of 3 September 1954 authorized a 48-foot channel depth. Public Law 98-63 (30 July 1983) authorized deepening of the northernmost 2,000 feet of the channel to 55 feet.

Four to five MCY of sand are dredged from the MCR Project annually and placed at U.S. Environmental Protection Agency (EPA) approved disposal sites and one Clean Water Act site. In 2008, sand was placed on the north side of the MCR North Jetty for the purpose of protecting the jetty from scour as a result of storm surges. The South Jetty and North Jetty were constructed to maintain the FNC through the ocean entrance to the Columbia River. The South Jetty is about 6.6 miles long. The first 4.5 miles of the South Jetty were constructed from 1885 to 1895. It was extended to its present footprint length from 1913 to 1914; however, about 6,200 feet (head loss) have eroded. Portions of the South Jetty head loss were repaired in 1982. The North Jetty is about 2.5 miles long and was constructed from 1915 to 1917. Approximately 1,900 feet of head loss has occurred at the North Jetty. These existing project features were authorized by the Rivers and Harbors Acts of July 5, 1884; March 3, 1905; and September 3, 1954.

The jetties were constructed at the entrance to the Columbia River to confine tidal currents, to obtain scouring velocities in the bar and entrance channels for the purpose of maintaining the authorized channel dimensions, and to help protect vessels entering and exiting the river. The North and South Jetties at the MCR have experienced damage to both jetty heads and along the jetties at several locations. Some of these damages were repaired in 2005 to 2007.

COLUMBIA RIVER (DEEP DRAFT)

In the Rivers and Harbors Act of 18 June 1878, Congress authorized the Columbia River Project and directed the Corps to establish and maintain a 20-foot minimum channel depth. Maintaining this depth required dredging in only a few shallow reaches of the river where the natural controlling depths were in the 12 to 15 foot range. In the Rivers and Harbors Act of 13 July 1892, Congress increased the authorized navigation channel depth to 25 feet. The maintenance dredging associated with this increase was still limited to a few particularly shallow reaches where sporadic dredging was conducted, as needed. In the Rivers and Harbors Act of 13 June 1902, Congress adopted a 25-foot channel to the sea (which included the mouth of the Columbia River).

In the Rivers and Harbors Act of 25 July 1912, Congress increased the channel depth to 30 feet. At that time, the navigation channel width was established at 300 feet. Increasing the channel depth to 30 feet resulted in the need for increased maintenance dredging to ensure that authorized navigation depths were safe for shipping and to address shoaling associated with the new depth.

In the Rivers and Harbors Act of 3 July 1930, House Document 195, Congress increased the authorized depth from Portland to the sea to 35 feet. The navigation channel width was also increased to 500 feet and realigned in certain reaches. The channel modifications were completed in 1935. From 1936 to 1957, Congress authorized additional channel alignment adjustments that added to the dredging requirements. During this period, dredging averaged 6.7 million cubic yards (mcy) per year.

By 1958, the channel alignment had stabilized, but maintenance dredging was augmented to increase the advanced maintenance dredging (AMD) depth from two feet to five feet in areas of active shoaling. Advanced maintenance dredging removes additional material from a shoal for the purpose of maintaining the authorized depth of the navigation channel for a longer between dredging events. This AMD approach enhances navigational safety by maintaining the authorized channel depth (which is necessary to ensure adequate under-keel clearance) during periods of channel shoaling that occur between maintenance dredging events and is done at the same time as routine maintenance dredging.

The 40-foot deep by 600-feet wide navigation channel was authorized by the Rivers and Harbors Act of 23 October 1962, and construction took place in stages from 1964 to 1976.

The current 43-foot deep channel in the Columbia River from RM 3 to 106.5 was authorized by the Water Resources Development Act (WRDA) of 17 August 1999 (Public Law 106-53) and constructed from 2005 to 2010. The channel is 43 feet deep and 600 feet wide from RM 3.0 to 101.4; 43 feet deep and 400 feet wide from RM 101.4 to 105.5; 43 feet deep and 400 feet wide in the downstream 1.5 miles of Oregon Slough; and 35 feet deep from RM 105.5 to 106.5 (from the Burlington Northern and Santa Fe Railway Bridge to the Interstate 5 Bridge). Advanced maintenance dredging is authorized up to five feet below the authorized depth (-48 feet) and up to 100 feet outside the authorized channel width. The navigation channel generally follows the deepest part of the natural river channel. Most of the channel is naturally deeper than 43 feet; however, shoals tend to form in channel reaches where natural depths are less than 43 feet. The reach from RM 102.5 to 105.5 also includes the Portland/Vancouver Anchorage (Rivers and Harbors Act of 1960, Section 107 project), which consists of one deep-draft anchorage and one anchorage used primarily for empty vessels.

From 1976 to the onset of the most recent channel improvement, maintenance dredging averaged approximately 5.5 to 6.5 MCY per year, excluding emergency dredging related to the 1980 eruption of Mount St. Helens (Corps 1999). Since channel improvement was completed in 2010, the average volume of annual dredging required to maintain the channel has increased as expected. After unusually high flows in 2011 and 2012, it is difficult to predict shoaling volumes, which will need to be dredged over the next five years as the new channel, comes into equilibrium.

COLUMBIA RIVER FROM VANCOUVER TO THE DALLES

The portion of the Columbia River navigation channel from Vancouver, Washington to The Dalles, Oregon (RM 106.5-192), was authorized by the Rivers and Harbors Acts of 26 August 1937 and 24 July 1946. The portion of the navigation channel from Vancouver to Bonneville Dam is authorized for maintenance to a depth of 27 feet. Currently, this portion of the navigation channel is maintained for barge traffic only. Based on draft requirements of current users, the channel is maintained to a depth of 17 feet, with 2 feet of AMD for maximum channel depth of 19 feet.

AUXILIARY SIDE CHANNELS

The side-channel projects included in this BA were first authorized at various times, as shown below. Descriptions for the side channel projects, as well as their recent dredging history, can be provided, as requested for this consultation.

1933 – The Columbia River at Baker Bay was first authorized by the Rivers and Harbors Act of 11 December 1933. The Baker Bay West Channel is authorized by the Rivers and Harbors Act of 2 March 1945.

1938 – Chinook Channel was authorized by the Rivers and Harbors Act of 20 June 1938.

1975 – Hammond Boat Basin was authorized under Section 107 of the Rivers and Harbors Act of 1960.

1930 – Skipanon Channel was authorized by the Rivers and Harbors Act of 3 July 1930.

1919 – Skamokawa Creek was authorized by the Rivers and Harbors Act of 2 March 1919.

1993 – Wahkiakum Ferry was also authorized under Section 107 of the Rivers and Harbors Act of 1960.

1937 – Westport Slough was authorized by the Rivers and Harbors Act of 26 August 1937.

1945 – The Old Mouth of the Cowlitz River, as part of the Columbia (and Lower Willamette) deep draft project, was authorized by the Rivers and Harbors Act of 2 March 1945.

1946 – The Upstream Entrance to Oregon Slough, as part of the Columbia River from Vancouver to The Dalles project, was authorized by the Rivers and Harbors Act of 24 July 1946.

Columbia River Operations and Maintenance Dredging Program: Dredging, Placement, Ocean Disposal and the Placement Network

DREDGING

The Corps uses two general types of dredging equipment: hydraulic dredges and mechanical dredges. Hydraulic dredging is typically conducted by either a hopper dredge or a pipeline dredge. Mechanical dredging includes clamshell or backhoe dredging. Hopper and pipeline dredges currently handle the majority of operations and maintenance (O&M) dredging needs for the Columbia River Federal Navigation Channel (CR FNC). Each year, the Corps dredges 3-5 million cubic yards of sediment at mouth of the Columbia River (MCR) project to maintain the inlet's 6-mile long deep-draft navigation entrance channel, placing the dredging material in ocean disposal sites. In addition, approximately 6 to 9 million CY of material is dredged from the lower Columbia River and placed at upland, shoreline, or in-water dredged material placement sites.

DREDGING VESSELS

Figure 1 shows the four vessels, or types of vessels the Corps anticipates using to conduct the O&M dredging mission.

Figure 1: Dredging equipment

HYDRAULIC DREDGING

HOPPER DREDGE

Hopper dredges are typically self-propelled vessels that provide flexibility for dredging operations because of their maneuverability. They are most often used on small-volume sand wave shoals in the river, on large shoals in the estuary, and in the high-current areas at the mouths of rivers. As shown in Figure 2, hopper dredges use dragheads (1) at the end of drag- or trailer arms (2) located on both sides of the dredge. The dragheads are lowered to the channel bottom, and suction from the pump (3) is used to transport material through the dragarm and into the "hopper" or holding

area of the dredge (4). The Corps dredging procedures for hopper dredging (and pipeline dredging below) call for the draghead to be buried in the riverbed during operations or raised no more than three feet off the bottom when the pumps are running to prevent fish entrainment.

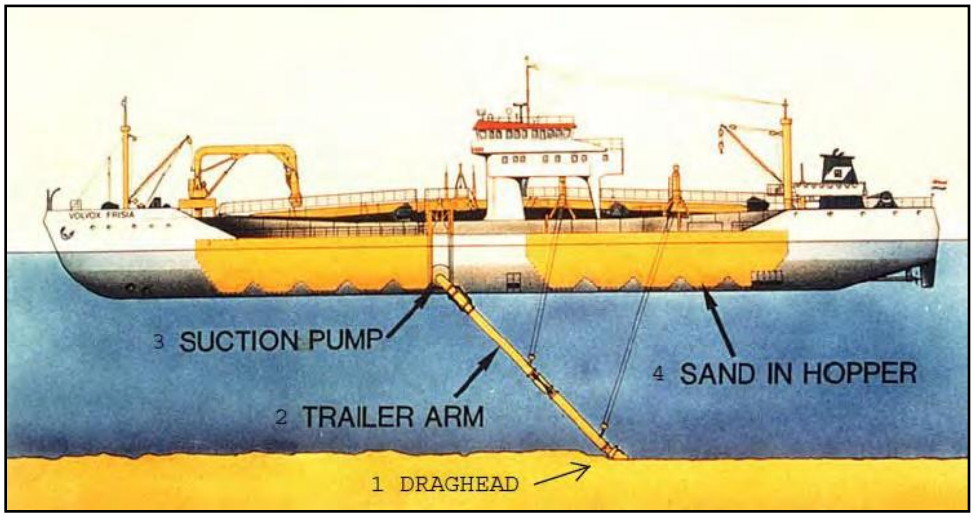

Figure 2: Hopper dredge

Hopper dredges collect dredged material in the hopper until it is near capacity. When the hopper is filled, the dragarms are raised and the vessel moves to the placement site. Some hopper dredges are of the "split hull" type, and some are of the "hopper door" type. Contractor hopper dredges typically employ a split-hull design. In split hull hopper dredges, the hull is split open for discharging and the rate of discharge is varied by how far the hull is opened. The split-hull method of placement is more rapid (time-efficient) than bottom-door hopper dredges and reduces the horizontal dispersal of dumped dredged material on the seabed. The Corps' hopper dredge, the *Essayons*, utilizes a series of doors located on the hull bottom to release each load of dredged material. The bottom doors are sequentially opened during placement until the entire load of dredged material is released from the vessel, resulting in a gradual release of dredged material from the vessel. In dredges with hopper doors, as the dredge is moving the hopper doors are opened and the material is discharged at varying rates, depending on how many hopper doors are opened. In some cases, the hopper dredge can use its pump to discharge the dredged material directly overboard or through a pipeline to a placement site not accessible by the hopper dredge (e.g. beach, upland or shallow nearshore locations). This process is often referred to as *pump-ashore* dredged material placement.

PIPELINE DREDGE

Pipeline dredges are used for large cutline shoals and areas with continuous sand wave shoals. Pipeline dredging in the Columbia River is typically used to remove material from the navigation channel between river mile (RM) 21 to 106.5. Only those shoals that have formed in a reach are dredged, not the entire reach. A typical shoal would include an area that is 250 to 300 feet wide by 2,000 to 4,000 feet long, though shoals vary in length, width and depth depending on flow conditions. Although many reaches of the navigation channel are annually dredged by pipeline, other reaches may require dredging on a less frequent basis depending upon the hydrographic surveys and flow conditions.

As shown in Figure 3, a pipeline dredge uses a "cutterhead" on the end of an arm that is buried three to six feet deep in the river bottom and swings in a 250- to 300-foot arc in front of the dredge. Spuds extend from the back of the dredge to the river bottom to anchor the dredge in place while

the cutterhead and suction arm are in operation. Dredged material is sucked up through the cutterhead, then pumped through the pipes to placement areas; the material is placed in upland sites, beach nourishment sites or in the flowlane.

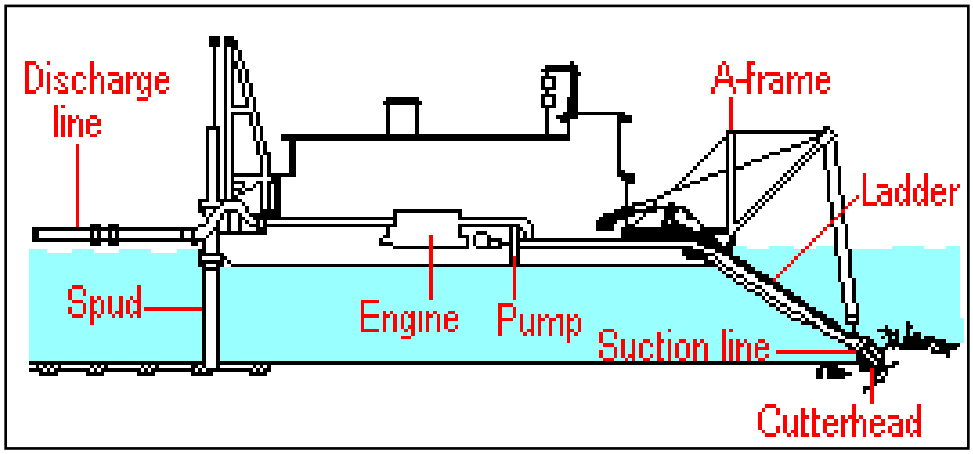

Figure 3: Pipeline dredge

MECHANICAL DREDGING

CLAMSHELL DREDGE

As shown in Figure 4, clamshell dredging is performed using a bucket operated from a crane or derrick that is mounted on a barge or operated from shore. Sediment from the bucket is usually placed on a barge for offloading and placement to an upland or in-water site. Because clamshell dredges are not self-propelled, they are not typically used in high traffic areas; rather, they are used in tighter spaces such as around docks and piers. Clamshell dredges can be used in restricted areas and shallow areas where draft restrictions may limit other dredges.

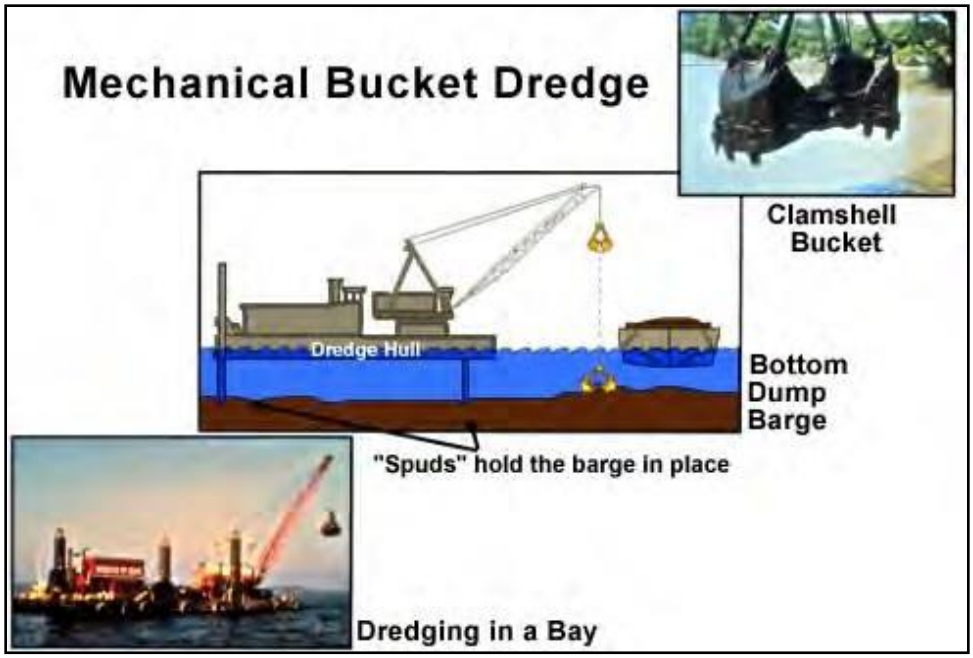

Figure 4: Clamshell dredge

Clamshell dredges equipped with special buckets are often regarded as being particularly useful when dredging silts or contaminated materials. Clamshell dredges are often used in areas with debris concerns which could damage other dredges. Also, a clamshell may be used if the placement site is very far from the dredging area, because multiple barges can be used to cycle to and from the placement area and keep the dredge working continuously, whereas hopper and pipeline dredges are limited by capacity and distance from the placement site. Clamshell dredges are primarily used for the side-channel projects related to the FNC.

BACKHOE DREDGE

Backhoe dredging, as seen in Figure 5, is performed using a bucket on the end of a backhoe arm. Although the backhoe is typically mounted on a barge, it can also be land-based and operated from shore. Backhoes can be used in both shallow- and deep-draft channels. Sediments removed by backhoe are usually placed on a barge for offloading and placement at an upland or in-water site. Backhoe dredges are often used to remove clays, rock, hard-packed materials, and fine-grained sediments, but also may be used in certain locations to remove sands. Like clamshell dredges, backhoes are often used in restricted areas near docks and in shallow-draft projects.

Figure 5: Backhoe dredge

BEST MANAGEMENT PRACTICES AND SPILL CONTROL FOR DREDGING

Table 1. Proposed Minimization Practices and BMPs for Dredging

Measure	Justification	Duration	Management Decision
Hopper Dredging			
Reverse purging of intake lines shall not be done with dragheads more than 3 ft off the bottom. If	This restriction minimizes or eliminates entrainment of juvenile	Continuous during dredging operations.	Maintain until new information becomes available that would warrant change.

Measure	Justification	Duration	Management Decision
water is pumped through the dragheads to clean the hopper, the dragheads must be -20 ft below the surface while dredging at the Mouth of the Columbia River, and the Columbia River RM 3 to RM 106.5; and -9 ft for RM 106.5-145 and the shallow-draft side channels.	salmon during normal dredging operations.		
Dredging in shallow water areas (less than 20 feet) outside of the Columbia River mainstem should occur only during the recommended ESA in-water work periods for the Columbia River.	The top 20 feet of the water column is considered salmon migratory habitat. Dredging or disposal in these areas could adversely impact salmonids, delay migration or reduce or eliminate food sources.	Continuous during dredging and disposal operations.	Maintain until new information becomes available that would warrant change.
Pipeline Dredging			
Maintain dragheads and/or cutterheads such that they do not exceed an elevation of 3 ft off the river bottom for dredging at the Mouth of the Columbia River, and the Columbia River RM 3 to RM 106.5; -9 ft for RM 106.5-145; and -9 ft for the shallow-draft side channels.	This restriction minimizes or eliminates entrainment of juvenile salmon during normal dredging operations.	Continuous during dredging operations.	Maintain until new information becomes available that would warrant change.
Typically, dredging in shallow water areas (less than 20 feet) only occurs during the recommended ESA in-water work periods for the Columbia River.	The top 20 feet is considered salmon migratory habitat. Dredging or placement in these areas could adversely impact salmonids, delay migration or reduce or eliminate food sources.	Continuous during dredging and placement operations.	Maintain until new information becomes available that would warrant change.
General Provisions for All Dredging			
The contractor shall not release any trash, garbage, oil, grease, chemicals, or other contaminants into the waterway.	The provision is enacted for the protection of water resources.	Life of contract or action.	If material is released, it shall be immediately removed and the area restored to a condition approximating the adjacent undisturbed area. Contaminated ground shall be excavated and removed and the area restored as directed. Any in-water release shall be immediately reported to the nearest U.S. Coast Guard Unit for appropriate response.

Measure	Justification	Duration	Management Decision
The contractor, where possible, will use, or propose for use, materials that may be considered environmentally friendly in that waste from such materials is not regulated as a hazardous waste or is not considered harmful to the environment. If hazardous wastes are generated, disposal shall be done in accordance with 40 CFR parts 260-272 and 49 CFR parts 100-177.	The provision describes the accepted disposal of hazardous wastes.	Life of contract or action.	If material is released, it shall be immediately removed and the area restored to a condition approximating the adjacent undisturbed area. Contaminated ground shall be excavated and removed and the area restored as directed. Any in-water release shall be immediately reported to the nearest U.S. Coast Guard Unit for appropriate response.

PLACEMENT OF DREDGING MATERIALS

PLACEMENT SITES

The placement method and type of site used for placing dredged materials can vary depending on the type of dredge used, distance from the shoal, site capacity, and available funding. Typical placement sites for dredging the CR FNC include in-water, ocean, upland, and shoreline sites.

OCEAN DREDGED MATERIAL DISPOSAL SITES

As mentioned above and in Appendix A, dredged material placement sites actively used for maintenance at the MCR include the Shallow Water Site (SWS), Deep Water Site (DWS), the North Jetty Site (NJS), and the South Jetty Site (SJS) (Figure 6). The SWS and DWS are Ocean Dredged Material Disposal Site (ODMDS) locations, which were designated by the U.S. Environmental Protection Agency (EPA) in 2005, and they can be used for the placement of material dredged from either the MCR or the Lower Columbia River. The NJS and SJS are Clean Water Act (CWA), Section 404 Sites that are limited to placement of dredged material from the MCR. Historically, dredged material originating from maintenance of the CR FNC from RM 3 to RM 30 has been placed within estuarine placement sites and not at the ocean sites.

The beneficial uses of dredged material placed at nearshore sites make utilization of these sites (SWS, NJS, and SJS) preferred over allocations of dredged material to the DWS where the sediment is lost to the active littoral system. However, due to safety restrictions (which limit access to the nearshore sites to one dredge at a time) it is sometimes necessary to use the DWS before capacity of the nearshore sites is fully utilized.

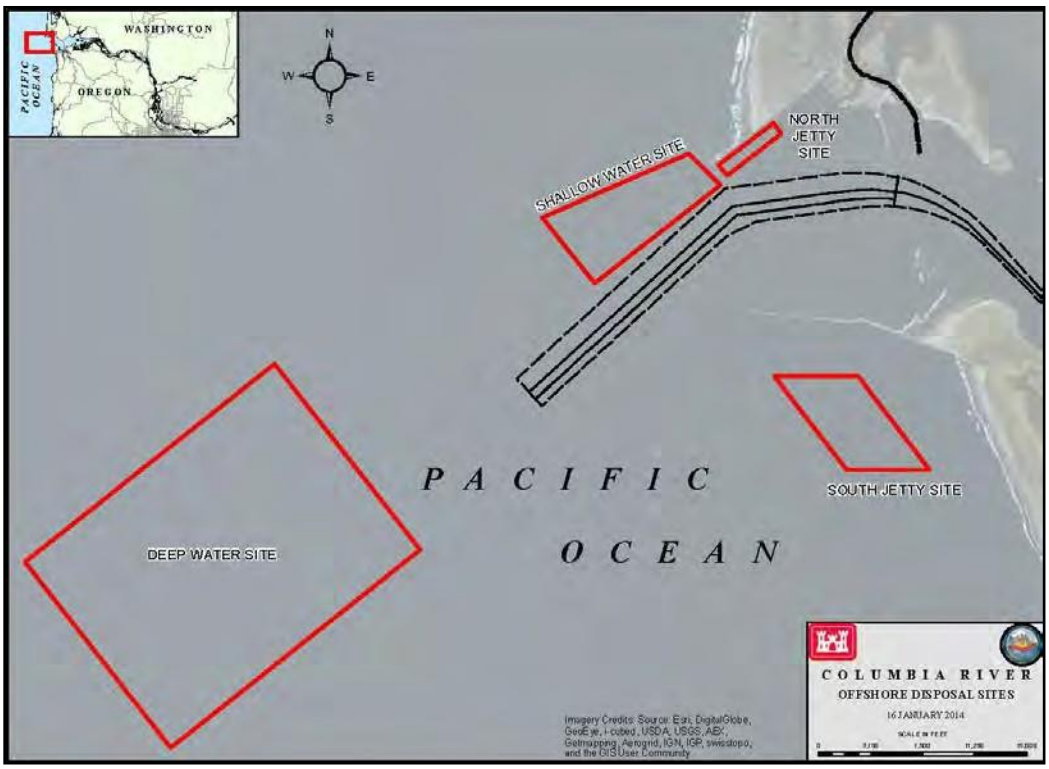

Figure 6: Shallow Water Site, Deep Water Site, North Jetty Site and South Jetty Site

Shallow Water Site

The Shallow Water Site (SWS), as seen in Figure 6, is a dispersive site that occupies a trapezoidal area of 3,100 to 5,600 feet wide by 11,500 feet long and lies within two miles of the MCR in a water ranging in depth from 45 feet to 75 feet. The overall site and placement area occupies approximately 1,198 acres or 1.4 square nautical miles (sq. nmi.). The SWS drop zone is 1,054 feet to 3,600 feet wide by 10,000 feet long and covers approximately 531 acres or 0.626 sq. nmi. The continual use of the SWS has supplemented Peacock Spit with 79 million cy of material since 1973, maintained the littoral sediment budget north of the MCR, protected the North Jetty from scour and wave attack, and has stabilized the MCR inlet. Site monitoring since 1997 has shown the released material temporarily deposits on the sea bottom, resulted in a truncated mound. The majority is subsequently eroded away to the north and northwest following the summer dredging season by the stronger winter waves and currents. Although this is a dispersive site, dredging operations in recent years have been limited in the use of this site and the North Jetty Site, described below, which is also a dispersive site because of bathymetric restrictions.

Deep Water Site

The Deep Water Site (DWS), as seen in Figure 6, is a non-dispersive site (material placed at the site remains in the site) that consists of an inner "placement area" and a surrounding buffer. The overall site (placement area and buffer) has a rectangular dimension of 17,000 feet by 23,000 feet and occupies approximately 8,975 acres or 10.5 sq. nmi. The inner placement area has a rectangular dimension of 11,000 feet by 17,000 feet, occupying an area of approximately 4,293 acres or 5.0 sq. nmi in the center of the site. Placement of dredged material within the DWS is limited to specific drop zones, which are inscribed within the DWS placement zone. Use of the DWS occurs only when the nearshore disposal sites have been used to the maximum extent practicable or when inclement weather conditions or operational constraints temporarily preclude the safe use of the other disposal sites. Sediment placed at these depths is lost to the active littoral system that feeds and maintains the coastline within the area.

North Jetty Site

The North Jetty Site, as seen in Figure 6, is located approximately 200 feet south of the MCR north jetty and occupies an area of 1,000 feet by 5,000 feet. The range in water depth within the NJs is 35 feet to 55 feet below MLLW. The NJS overall site boundaries coincide with the site's drop zone and placement area boundary. The NJS was selected in 1999, under Section 404 of the CWA, for the purpose of allowing placement of MCR dredged material along the toe of the North Jetty. Approximately 5.45 million cubic yards (MCY) were placed within the NJS during 1999-2012 to reduce erosion and scour. Approximately 100,000 to 500,000 CY of sand is placed at this site each year for these purposes.

South Jetty Site

The South Jetty Site, as seen in Figure 6, is a new nearshore site that was first used in 2012 under Section 404 of the CWA. The SJS occupies an area approximately 9,500 feet by 7,000 feet and is located approximately one mile south of the MCR inlet, in water ranging from 40 to 53 feet in depth. This sub-tidal site is intended to provide sand needed to reverse recent erosion in the nearshore area adjacent to the South Jetty. Erosion of nearshore substrates by the South Jetty is increasing, which, in turn, increases the intensity of waves hitting the jetty.

Dredged material disposal at this location would be a beneficial use, as the intent would be for dredged material to enter the littoral drift system along the coastline, mimicking conditions sediment accretion that existed historically at the mouth of the Columbia River. Studies indicate this area is losing between 88,000 and 270,000 CY per year and pre-historic clay layers are being

exposed. Use of this site is intended to reverse this trend and as the material gradually builds up at the new site, it would also serve to break waves at a distance from the South Jetty, which would decrease wave damage to the jetty itself. To protect aquatic wildlife, use of the site will be limited by site management provisions that only allow placement after August 15 when the crab season in Oregon ends. The estimated annual volume within the site is estimated to be between 200,000 to 500,000 cubic yards.

IN-WATER AND SUMPS

In-water dredged material placement is done throughout the CR FNC from RM 0 to RM 145, where placement depends on the condition of the channel each year. Most in-water placement occurs in the flowlane within or directly adjacent to the navigation channel by hopper or pipeline dredge, or by bottom-dump barges used with mechanical dredges. As deeper flowlane areas are filled with dredged material, new deep areas are formed elsewhere as a result of natural river processes. Maintenance activities within the navigation channel generally use flowlane sites between 20 and 65 feet in depth with occasional exceptions, when placement occurs in the flowlane where depths are greater than 65 feet. The average annual quantity of material disposed at in-water sites is approximately 4.5 MCY.

Hopper dredges collect material in the hopper of the vessel until it is near capacity and then move to a flowlane site and release material gradually while moving to avoid mounding. Conversely, discharge from pipeline dredges differs from hoppers in that material is continuously discharged during dredging operations. Placement of material at flowlane sites from a pipeline dredge is done using a down-pipe with a diffuser plate at the end. This down-pipe extends 20 feet below the water surface (-20 feet) to minimize impacts to migrating juvenile salmonids. During placement of dredged material, the down-pipe is frequently moved to minimize mounding on the river bottom.

A "sump" is a designated site outside the navigation channel, where a pipeline dredge can reach from the sump location to an upland or shoreline placement site. Sumps are used to most efficiently temporarily store and move material dredged from shoals to upland or shoreline placement sites. Material dredged from shoals may be initially placed in a sump until there is enough material in the sump to make it time and cost-efficient for a pipeline dredge to rehandle the material and place it at the nearby upland or shoreline placement site.

There are two sumps in the CR FNC: the Harrington Sump and the Puget Island Sump. The Harrington Sump, as seen in Figure 7, is located in the flow lane along Rice Island from RM 20 to 22 and is used by hopper and pipeline dredges for placement of dredged material when performing annual maintenance dredging between RM 17 to 25. Portions of the sump may be dredged annually to provide renewed capacity. The sump is dredged to -48 feet below Mean Lower Low Water (MLLW) with a pipeline dredge and the material is pumped to Rice Island for upland placement. On average, a total of approximately 0.2 to 1 MCY of sand is removed from Harrington Sump each time it is dredged. Its overall capacity is approximately 2 MCY.

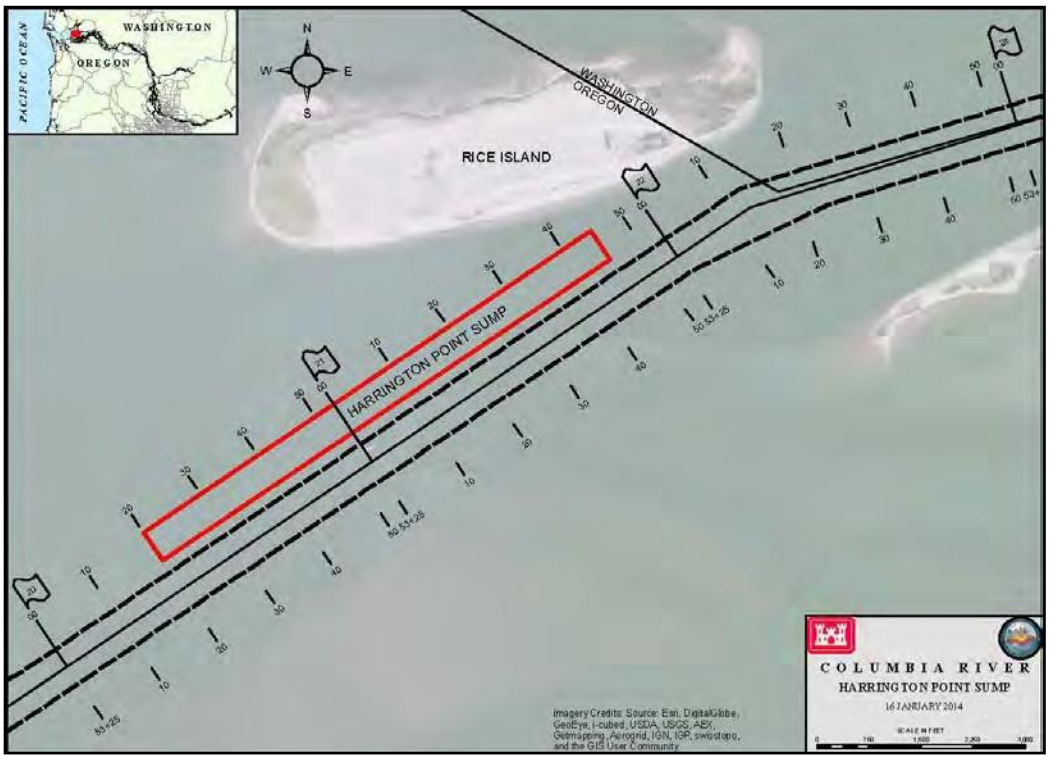

Figure 7: Harrington Point sump

The Puget Island sump (Figure 8) is located along the southern side of Puget Island from RM 44 to 45. The reach is used by hopper dredges and pipeline dredges for placement of dredged material when performing annual maintenance dredging in adjacent reaches. Portions of the sump may be dredged annually to provide renewed capacity. The Puget Island Sump may be dredged to -44 feet (CRD) with a pipeline dredge and the material is then pumped to Puget Island for upland placement. The 50-acre sump is located 300 feet north of the FNC and 400 feet south of Puget Island and is approximately 4,300 feet long and 500 feet wide. The depth of the existing profile is -30 to -40 feet. The initial material to be dredged is coarse grained sand, based on the proximity of the sump area to the FNC and nearby sandy beaches.

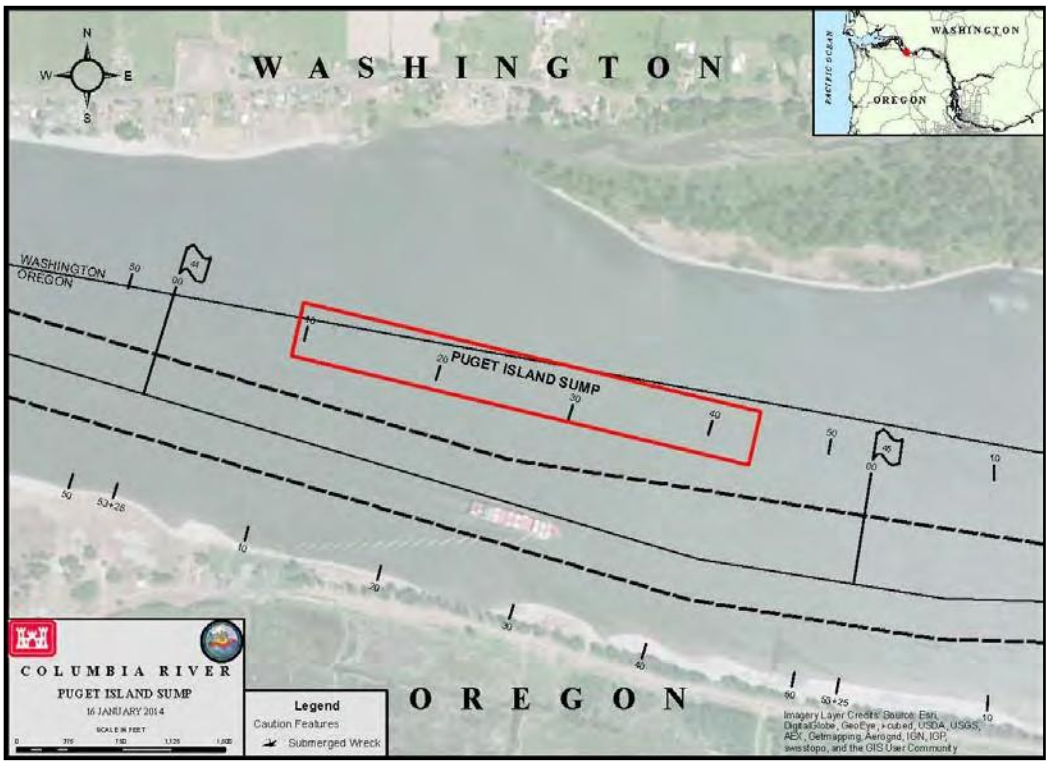

Figure 8: Puget Island sump

Additional in-water placement sites include Site BB-3 and Area D. Site BB-3 (Figure 9) is located immediately downstream of RM 3 and is primarily used when dredging side channel projects such as Baker Bay. The site may receive 100,000 to 150,000 CY of material annually.

Figure 9: In-water placement site BB-3

Area D (Figure 10) is within the Columbia River estuary north of the main CR FNC, at approximately RM 7. Area D is approximately 24-45 feet deep and it is not expected to receive more than 3.5 MCY of material between 2014 and 2018.

Figure 10: In-water placement Area D

Benson Beach Intertidal Site

The Benson Beach intertidal site, as seen in Figure 11, is located directly adjacent to the north side of the North Jetty. This27-acre beach placement site has been authorized for use since 2000 by Water Resources Development Act (WRDA). In 2002, sand was placed on Benson Beach for the first time. Since then, it has been a study placement area. The Corps identifies this intertidal placement area as a key component in the development of a network of ocean-based locations. This intertidal site was identified in 2007 as the zone within this region that would have the most potential for improved beach nourishment and drift restoration.

Dredged materials from the MCR Project would be placed directly onshore via pump-ashore hopper dredges, with the intent of minimizing erosion at Benson Beach and allow for sediment accretion along the beach. The materials would be naturally and mechanically distributed. Material placement would start 1,500 feet north of the North Jetty, in order to reduce the reintroduction of dredged materials southward towards the jetty. Typically, sand would be placed in the intertidal zone, between the elevations of -10 to +14 ft NAVD along a shoreline extent of 900 to 1,300 feet by 700 to 900 feet. A maximum of 500,000 CY of dredged material could be placed annually. The intent is for natural wave action to disperse the sediment within the littoral cell.

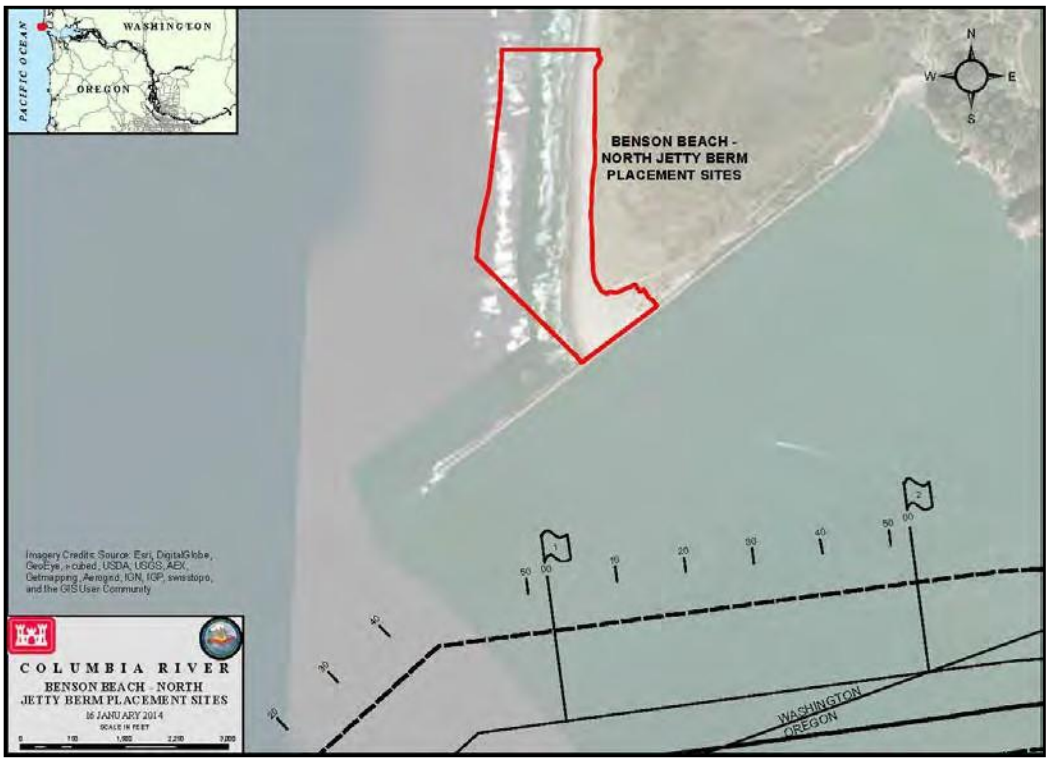

Figure 11: Benson Beach Intertidal Site

BEACH NOURISHMENT AND SHORELINE PLACEMENT

The combination of river flows, waves, and tidal effects naturally erodes material from shorelines. Beach nourishment is a method of replenishing material that has been eroded away from shorelines, and is conducted as needed. Beach nourishment or shoreline placement occurs at the sand/water interface, not in open water. Shoreline placement operations differ from beach nourishment operations in that the premise of placement is also used to directly protect a Corps asset. For example, shoreline placement is conducted when the integrity of an upland placement site is compromised by rapidly eroding shorelines. For the purposes of this Biological Assessment, shoreline placement and beach nourishment are used interchangeably with regards to placement methodology.

There are currently three beach nourishment sites available for use for the O&M program of the CR FNC: Miller Sands Island (RM 23.5), Skamokawa Vista Park beach (RM 33.4), and Sand Island (RM 86.2). Miller Sands and Sand Island are beach nourishments currently used in the State of Oregon; Skamokawa beach is in Washington. In 2011, the Corps placed approximately 227,586 CY of material at Washington and Oregon beach nourishment sites. In 2012, the Corps placed approximately 700,000 CY of material at Washington and Oregon beach nourishment sites. In 2013, the Corps placed approximately 300,000 CY of material at Washington and Oregon beach nourishment sites.

As part of the proposed action, the Corps is adding shoreline placement to the existing upland placement action at Pillar Rock Island. By conducting shoreline placement to the original footprint, the intended upland placement capacity will be restored and available. Once the site reaches upland capacity, shoreline placement will be used to maintain the integrity of the upland site.

Beach nourishment/shoreline placement involves pumping dredged material through a floating discharge pipe from the pipeline or hopper dredge to an existing shoreline. If necessary, the dredge

first pumps a landing area on the shoreline to establish a point from which additional material placement occurs. Dredged material is pumped out in a sand-and-water slurry (about 20 percent sand) and as it exits the pipe, sand settles out on the shoreline while the water returns to the river. Settling rates of Columbia River sands are very quick and turbidity from the operation is minimal. After sufficient sand has settled out and begins to increase in height, the settled sand is moved by bulldozers to match the elevation and profile of the existing shoreline at approximately the high water line.

During beach nourishment/shoreline placement, a temporary sand berm is constructed to retain sand on the beach during pump-out, otherwise much of the sand would be immediately lost to the river. The temporary berms typically are approximately 5 feet high and 12 feet wide at the base. The berms are built gradually by earth-moving equipment as pump-out continues and are created from existing beach sand, pumped sand, or a combination of both. The process continues by adding material to the shore and proceeding longitudinally along the shoreline. The length, width and depth of material placed on the shoreline are dependent on the quantity of material dredged from the channel and hydraulics of the river adjacent to the placement site. After placement, the slope of the shoreline is graded to a steepness of 10 to 15 percent to minimize the creation of areas where juvenile fish could be stranded from vessel wakes on the new shoreline.

UPLAND

Upland placement sites can be islands or locations on the mainland accessible from the riverbank. Upland placement is accomplished using clamshell, hopper, and pipeline dredges. Clamshell-dredged material deposited onto a barge can be off-loaded at a transfer point for placement at an upland site. Hopper and pipeline dredges pump sediments as a slurry mixture directly into a diked, upland site near the dredging area. Pipeline dredges are capable of placing material from approximately one mile away without a booster pump depending on site height; if a booster pump is available, the pipeline range can potentially increase up to two miles and pump to higher elevations. Hopper dredges can work in tandem with a pipeline dredge to maintain the navigation channel at distances farther than a pipeline dredge reach. When a hopper dredge is working in tandem with a pipeline dredge to place material upland or along the shoreline, the hopper dredge works on adjacent shoals and places its material temporarily in-water at the primary shoal which is being dredged or will be dredged by the pipeline dredge. The pipeline dredge then pumps all of the material from the primary and adjacent shoals to the upland or shoreline placement site.

Regardless of the type of dredge used, the placement area at an upland site is delineated and prepared prior to placement. Access to the site occurs either from the river via a landing barge or from local access roads if accessible from the mainland. Placement activities utilize earth-moving equipment (bulldozers, backhoes, etc.), and these vehicles are barged or driven to the site. Staging of all construction vehicles and placement equipment occurs within the boundary of the placement site. When equipment is barged in from the river, the barge(s) is maneuvered to the shoreline and anchored for the duration of the operation. A wide sand berm is constructed from the barge to land for movement of equipment. Sand from the site may be used to form a ramp to transport equipment from the shoreline up to higher elevations of the site.

To prepare a site for placement, a containment berm is constructed by pushing material from the center of the site outward to the edges of the placement footprint. One or two bulldozers are used to construct berms at each site. Woody vegetation may be removed from within the boundary of the dredged material placement site to prep the area for placement. Grassy forbs and shrubs may be covered during site preparations and/or placement of dredged material. A temporary weir system is installed for control of return water, consisting typically of two weirs, each having one 30-inch diameter outfall pipe. The weirs are typically installed and removed after each placement

event. Location of the outfall structures may vary with each placement event, but discharge typically occurs on the channel-ward side of the placement site.

A floating pipeline is used as a conduit for the slurry mixture between the dredge and the upland site, wherein the dredge pumps material directly into the interior of the placement site, pumping the sediment over the containment berm constructed during site preparations. As the slurry is discharged from the pipe, the sand quickly settles out and the water flows across the site before passing through the weir system and back to the river.

Discharged water is controlled by the strategic use of weirs and follows conditions permitted in state water quality certificates, such that as much sediment as possible settles out before water is discharged back to the river to minimize turbidity. Larger upland sites provide more distance/area/time for sediments to settle while the slurry flows across the site. Bulldozers are used throughout the placement process to move both the pipeline and discharged sediments at regular intervals to minimize unintentional mounding on the site. As the level of sand within the site nears berm height, some of the sand is pushed to the edges of the site (using bulldozers) to raise the containment berm and provide additional storage capacity. When placement is complete, all vehicles, piping, and temporary weirs are removed from the site.

BEST MANAGEMENT PRACTICES FOR PLACEMENT SITES

Table 2. Minimization Practices and BMPs for Placement

Measure	Justification	Duration	Management Decision
Ocean Disposal			
Placement in accordance with the site management and monitoring plan.	This action minimizes conflicts with users and impacts to ocean resources.	Continuous during dredging operations.	Maintain until new information becomes available that would warrant change.
Flow Lane Placement			
Placement of material in a manner that prevents mounding of the dredged material.	Spreading the material out will reduce the depth of the material on the river bottom, which minimizes adverse impacts to fish and invertebrate populations.	Life of contract or action.	Maintain until new information becomes available that would warrant change.
Maintain discharge pipe of pipeline dredge at or below 20 feet of water depth during placement.	This measure reduces the impact of placement and increased suspended sediment and turbidity to migrating juvenile salmonids, as they are believed to migrate principally in the upper 20 feet of the water column.	Continuous during placement operations.	Maintain until new information becomes available that would warrant change.
Shoreline Placement			
Grade placement site to a slope of 10 to 15 percent, with no swales, to reduce the possibility of stranding of juvenile salmonids.	Ungraded slopes can provide conditions on the shoreline that will create small pools or flat slopes that strand juvenile salmonids when washed up by wave action.	Continuous during placement operations.	Maintain until new information becomes available that would warrant change.
Upland Placement			
Berm upland placement	This action reduces the	Continuous during	Maintain until new

Measure	Justification	Duration	Management Decision
sites to maximize the settling of fines in the runoff water.	potential for increasing suspended sediments and turbidity in the runoff water	placement operations.	information becomes available that would warrant change.
Maintain 300-foot habitat buffer.	Maintains important habitat functions.	Life of contract or action.	Maintain until new information becomes available that would warrant a change.
Fine deposits should be deep-ripped after dredged material placement has occurred. Future settling area sediments should continue to be graded level or slightly convex to shed water and avoid concentrated low areas.	Prevent formation of wetlands within placement sites.	After placement operations.	Maintain until new information becomes available that would warrant a change.
General Provisions For All Placement			
The contractor, where possible, will use or propose for use, materials that may be considered environmentally friendly in that waste from such materials is not regulated as a hazardous waste or is not considered harmful to the environment. If hazardous wastes are generated, disposal of this material will be done in accordance with 40 CFR parts 260-272 and 49 CFR parts 100-177.	Dispose of hazardous waste.	Life of contract or action.	If material is released, it will immediately be removed and the area restored to a condition approximating the adjacent undisturbed area. Contaminated ground will be excavated and removed, and the area restored as directed. Any in-water discharge will be immediately reported the nearest U.S. Coast Guard Unit for appropriate response.

DREDGED PLACEMENT NETWORK

As mentioned above, the Columbia River Dredged Material Placement Network (Network) is a complex and varied assortment of upland and shoreline placement sites distributed throughout the lower river.

UPLAND AND SHORELINE/BEACH NOURISHMENT DREDGED MATERIAL PLACEMENT SITES

There are currently 25 dredged material placement sites associated with the CR FNC, between RM 3.1 to 105.0. These dredged material placement sites are strategically located throughout the lower Columbia River. Thirteen of the sites are located in Oregon. One site is shared by Oregon and Washington (Rice Island), and the remaining 11 sites are in Washington (see Table 3). There are 21 upland placement sites, two shoreline placement site, and two sites where both upland and shoreline placement occurs.

Table 3. Upland and Shoreline Dredged Material Placement Sites.

Site	State – River Mile	Site Type
West Sand Island	O-3.1	Upland
Rice Island	O/W-21.0	Upland, Sump
Miller Sands	O-23.5	Shoreline
Pillar Rock Island	O-27.2	Upland, Shoreline
Skamokawa - Vista Park	W-33.4	Upland, Shoreline
Welch Island	O-34.0	Upland
Tenasillahe Island	O-38.3	Upland
James River	O-42.9	Upland
Puget Island	W-44.0	Upland, Sump
Brown Island	W-46.3	Upland
Crims Island	O-57.0	Upland
Hump Island	W-59.7	Upland
Lord Island (Upstream)	O-63.5	Upland
Dibblee Point	O-64.8	Upland
Howard Island	W-68.7	Upland
Cottonwood Island	W-70.1	Upland
Northport	W-71.9	Upland
Sandy Island	O-75.8	Upland
Lower Deer Island	O-77.0	Upland
Martin Bar	W-82.0	Upland
Sand Island	O-86.2	Shoreline
Austin Point	W-86.5	Upland
Fazio Sand & Gravel	W-97.1	Upland, In-water
Gateway	W-101.0	Upland
W. Hayden Island	O-105.0	Upland

The narrative below describes the site history, existing environmental baseline conditions, details recent placement events, SHLA use, and human uses at each of the shoreline and/or upland placement sites in the dredged material placement Network for the CR FNC.

WEST SAND ISLAND (O-3.1)

The West Sand Island dredged material placement site is located on the west end of Sand Island. The irregularly shaped island is located in the Columbia River estuary in the southwestern end of Baker Bay and is approximately 530 acres, including approximately 50 acres of intertidal sand flats along the eastern and northern shorelines. Baker Bay is a shallow waterbody, totaling approximately 15 square miles. Sand Island separates the bay from the Columbia River. The island is in the state of Oregon, in Clatsop County.

West Sand Island is used for the placement of dredged material from the Baker Bay side channel, but was historically a low-lying island, rising only a few feet above the high tide line. The Corps has not used the site for placement since 1986. The West Sand Island dredged material placement site (Figure 12) is approximately 83 acres. The site is adjacent to the Baker Bay federal side channel project. Dredged materials from the Baker Bay side channel were historically placed on the site via pipeline.

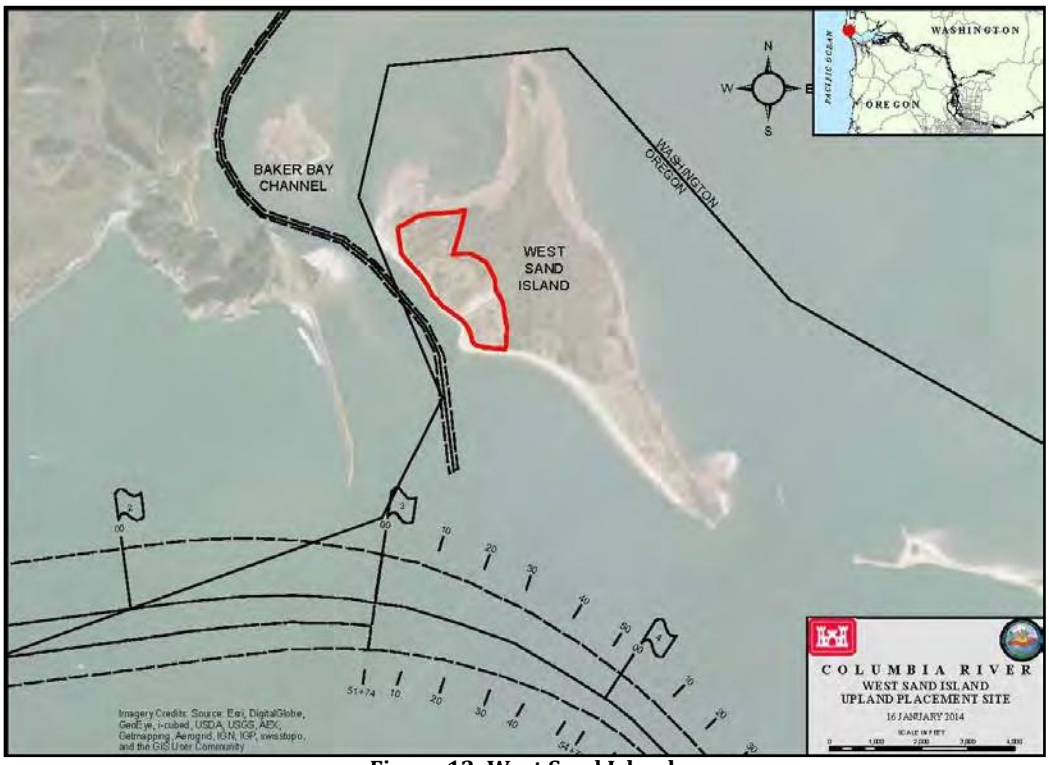

Figure 12: West Sand Island

West Sand Island is owned by the Corps. The estimated site capacity is 2,500,000 CY. Approximately 420,000 CY were placed between 1979 and 1986.

The site's elevations range from 0 feet (MLLW) to approximately 20 feet. There is a containment levee on the southern side of the site. The site is generally level, but slopes from east to west towards the water. No wetland delineation has been conducted on West Sand Island. The site is almost entirely vegetated, primarily with grasses, forbs, and low shrubs. Many low trees are visible in aerial photographs of the placement site, which are likely less than 30 years old. The shoreline is actively disturbed by wave action and does not support vegetation. The site is not designated critical habitat for SHLA. The site has not been assessed for suitable SHLA nesting habitat because of its dense vegetation and no lark surveys have been conducted. The Corps currently estimates that no suitable SHLA nesting habitat is available on the West Sand Island site.

There are two pile dikes that are perpendicular to the western boundary of the placement site. There are three other pile dikes west of the island that help maintain flows for the Baker Bay side channel. A third pile dike extends south from the southern tip of the island into the CR FNC. South of the West Sand Island placement site, native dune-grass communities dominant the southern tip of the island. Non-native plant species may be encroaching on this community. Revegetation of the placement site is restricted to plant species and planting techniques that would not negatively affect the native dune-grass community (CREST DMMP, 2002). The remaining portion of the island is heavily vegetated with low trees, scrub-shrub, and grasses.

RICE ISLAND (O/W-21.0)

Rice Island, which is located in the lower Columbia River estuary, is composed of approximately 365 acres, including approximately 100 acres of intertidal mudflats along the western and northern shorelines. The linear bar island is generally oriented from east-northeast to west-southwest, and it is bisected by the Oregon-Washington state line. The eastern tip of the island is within the State

of Washington. The states of Washington and Oregon own their respective portions of the island. The Harrington Sump is located adjacent to Rice Island, between RM 20 and 22.

Rice Island was created in the past with dredged material from the CR FNC. The Corps has used the site for upland placement of dredged material for several decades. The dredged material placement site (Figure 13) covers approximately 264 acres. The portion of the placement site in the State of Washington is approximately 37 acres; the remaining portion of the placement site in the State of Oregon and is approximately 227 acres. The entire placement site is located from approximate RM 21 to 22.3 and at its closest point, the site is 1,000 ft. north of the CR FNC.

Figure 13: Rice Island

The Port of Portland has 25-year easement with the State of Oregon (Department of State Lands [DSL]) for upland placement of dredged material by the Corps for the portion of the site in Oregon. The Port of Portland's easement from the Oregon DSL expires in 2030. The Washington ports have a 30-year easement with the State of Washington (Department of Natural Resources [DNR]) for upland placement of dredged material by the Corps for the portion of the site in Washington. The Washington ports' easement from the Washington DNR expires in 2037. Dredged material was last placed on the western tip prior to 2000. The Corps placed approximately 1,000,000 CY dredged material in 2002 on the remaining portion of the island in Oregon. In 2012, site preparation work was conducted on the Washington side of the island. In 2013, an estimated 3,350,000 CY of site capacity remained. In 2013, approximately 400,000 CY of dredged materials were placed on the Washington portion of the site.

Almost the entire upland portion of the island is above elevation 10 feet (Columbia River Datum [CRD]), up to 73 feet in the southwest portion of the placement area. The vast majority of the placement site is unvegetated, bare sands. One wetland was delineated in the Rice Island placement area in 2013. Wetland A is a 0.06-acre, palustrine emergent (PEMx) wetland-swale feature is located in the eastern portion of the placement area within the State of Oregon. It is approximately 20 feet above the river in the lowest part of a dredged material-settling basin. Itwas

formed as a depression and connecting swale near the vertical drainpipe. The wetland is dominated by hydrophytic plants, including dune willow, soft rush, Baltic rush, and Lyngbye's sedge. The wetland is fed by direct precipitation and subsurface water from precipitation within the eastern drainage basin area. There is no surface hydrologic connection between the wetland and Columbia River. Uplands immediately adjacent to Wetland A are dominated by broom fescue and silver hair grass, interspersed with thistle, yellow flag iris, blackberry, and clover.

One non-wetland aquatic feature, a 0.29-acre man-made pond, is located in the western settling basin, within the placement area in the State of Oregon. This basin area is used to infiltrate water during the placement of dredged material. This perennial retention pond is more than six feet deep, and it is fed by direct precipitation and runoff within the western drainage basin area. There is no hydrologic surface connection between the pond and Columbia River. Non-native, water milfoil is the dominant submerged aquatic vegetation in the pond.

Several bird species have been observed on the site, with nesting by gulls along the northwest portion of the site in 2013. Approximately 224 acres on the island have been designated as a critical habitat subunit for streaked horned larks. Approximately 219 acres of the placement site overlaps with designated critical habitat. Larks have been observed on this island during recent surveys. In 2013, 22 breeding pairs were recorded by the Center for Natural Lands Management (CNLM) on Rice Island. Based on USFWS information, larks are currently using the 180-acre bowl in the center of the site where placement occurred most recently in 2002. The CNLM estimated that approximately 146 acres of suitable lark breeding habitat existed on the site in 2011. The Corps currently estimates that there are approximately 150 acres of suitable SHLA breeding habitat on Rice Island and in the Rice Island critical habitat subunit.

The island's overall elevations range from 0 feet (CRD) at the riverward edge of the mudflats to 73 feet in placement area. The northern riparian edge adjacent to the placement area is dominated by cottonwood trees, Himalayan blackberry, dune willow, and Scotch broom. The northeastern tip of the island is dominated by dune grasses. A second wetland (Wetland B) is located outside the boundary of the Corps' placement area. It encompasses the northwest corner of the island and it is outside the toe of the dredged material placement slope. This approximately four-acre wetland transitions from an intertidal, estuarine emergent (E2EM) wetland to a palustrine, emergent (PEM) wetland. The palustrine portion of the wetland is dominated by Baltic rush, yellow flag iris, *Ludwigia* sp., *Eleocharis* sp., black cottonwood, and dune willow. Wetland B is directly influenced by the ebb and flow of tide and has a continuous hydrologic connection to the Columbia River. Dredged material is not placed in Wetland B on the northwest corner of island, nor along the northern shoreline's riparian edge. Fishermen use the island for shoreline fishing. The island has habitat for waterfowl, shorebirds, and sporadic aquatic mammals on the shores.

MILLER SANDS (O-23.5)

The Miller Sands dredged material placement site (Figure 14) is a horse shoe-shaped shoreline placement site. It forms a spit island in the lower Columbia River estuary, from approximate RM 22.2 to 24.6. The curvilinear site is oriented east to west with a sheltered embayment on the southern side.

Figure 14: Miller Sands

Historically, the site was formed as a flow control structure, approximately three miles long. It was a 90-acre site used primarily for the dredged material placement from the Miller Sands Bar. Currently, the site is approximately 117 acres. At its closest point, the site is approximately 400 feet south of the CR FNC. The Miller Sands site is in Clatsop County, Oregon.

The site is owned by the State of Oregon and the Port of Portland has a 25-year easement with Oregon DSL for placement by the Corps, expiring in 2030. Since the site is continually eroded by river currents, the available placement capacity is not fixed and it varies year to year. Shoreline placement occurred in 2007 on the center portion of the upstream edge, in 2008 on the upper portion of the upstream edge, in 2010 and 2011 on the center of the site, in 2012 on the downstream end of the site and the lower portion of the upstream edge, and in 2013 on the center of the upstream edge. Approximately 150,000 CY were placed in 2013.

The elevations on the site range from 0 feet (CRD) at the waterline to approximately 25 feet along the northern face at the site's midpoint. The site is relatively level, consisting of open sands. No wetland delineation has been conducted on the Miller Sands site. Beach grass, sparse shrubs, herbaceous plants, and trees form the southern edge of the site. Approximately 123 acres are designated as s critical habitat subunit for streaked horned larks at this island. Larks have been observed on this island during recent surveys. In 2013, five breeding pairs were recorded by the CNLM on Miller Sands. The CNLM estimated that approximately 29 acres of suitable lark breeding habitat existed on the site in 2011. The Corps currently estimates that there are zero (0) acres of suitable SHLA nesting habitat on Miller Sands due to vegetative succession on the site.

The embayment south of Miller Sands site is sheltered from the mainstem flows by the placement site. The embayment has a network of mud flats, tidal marsh, and sub-tidal waters and provides high value habitat for foraging shorebirds, waterfowl, eagles, other birds, and aquatic mammals. A secondary island is also located south of the site, separated by a narrow, tidal channel at the

upstream end of the placement site. The secondary island is vegetated with numerous trees, shrubs, and grasses.

PILLAR ROCK ISLAND (O-27.2)

Pillar Rock Island, which is in the Columbia River estuary, is a dredged material placement site for upland and shoreline placement. The linear island is oriented east to west and it is within the Lewis and Clark National Wildlife Refuge.

Historically, the island was a shoal and past placement practices in the 1980s and 1990s increased the island elevations. The current dredged material placement site (Figure 15) on the island is approximately 52 acres. Pillar Rock Island is in Clatsop County, Oregon. The site is located from approximate RM 26.8 to 28. At its closest point, the island is approximately 1,100 feet south of the CR FNC.

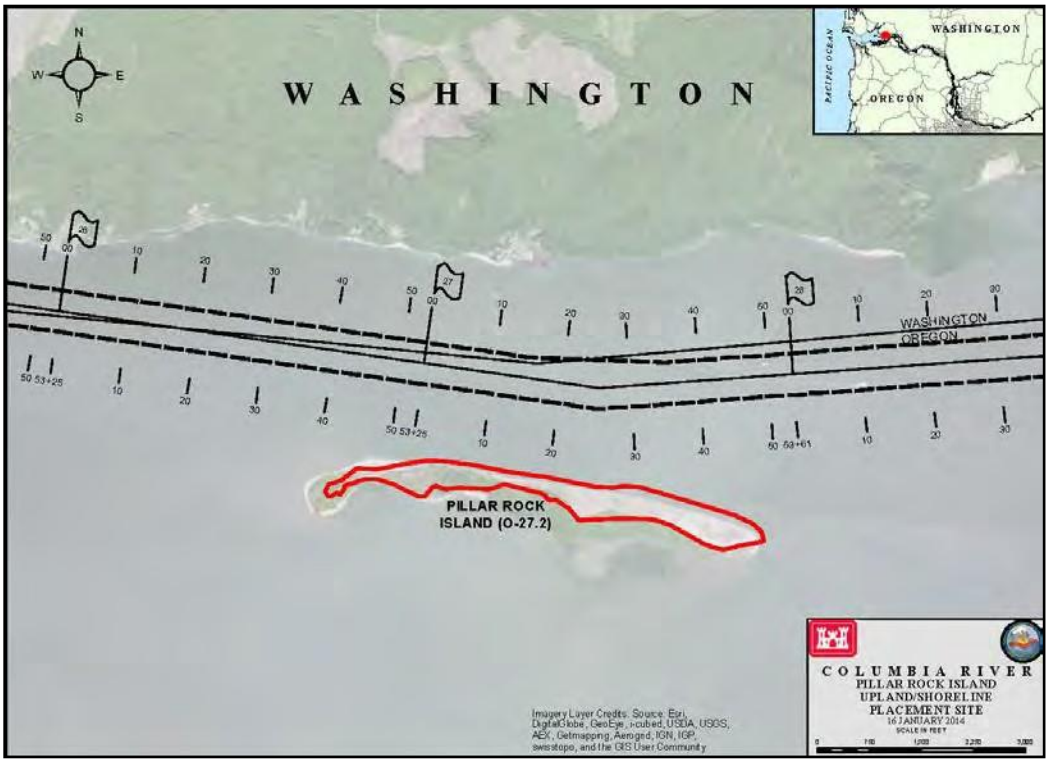

Figure 15: Pillar Rock Island

The site is owned by the State of Oregon and the Port of Portland has a 25-year easement with Oregon DSL for placement by the Corps. The Port of Portland's easement from the Oregon DSL expires in 2030. The Corps placed material on the downstream and middle portions of the site in 2000 and on the upstream quarter of the site in 2001. Approximately 250,000 CY were placed in 2001. In 2003, the estimated upland site capacity for placement of dredged material was 2,555,000 CY. Since the site is continually eroded by river currents, the site's available capacity is not fixed and it varies year to year. Between 2003 and 2013, approximately 32% of Pillar Rock Island eroded away, primarily from the north side of the island.

The elevations on the island range from 0 feet (CRD) at the low waterline to approximately 30 feet on the northern bank. Steep 10 to 25 feet banks exist along portions of the island but the island interior is relatively level. Two pile dikes extend north from the downstream portion of the island. Much of the placement site is covered in sandy dredged material. Stands of young cottonwoods, scattered shrubs, and forbs with grasses are visible on the island. The presence of vegetation is due

to Corps limited use of the site in the past five years. The upstream edge of the island has eroded away. Approximately 44 acres of Pillar Rock Island have been designated as a critical habitat subunit for streaked horned larks. Larks have been observed on this island during recent surveys. In 2013, two breeding pairs were recorded by then CNLM on Pillar Rock Island. The CNLM estimated that approximately two acres of suitable lark breeding habitat existed on the site in 2011. The Corps currently estimates that there are less than four acres of suitable SHLA nesting habitat on Pillar Rock Island site and within the critical habitat subunit due to natural erosion of the shoreline and vegetation succession.

There are approximately 50 acres of tidal flats and marsh located outside the placement site, along the southern side of the island. These aquatic habitats have developed over time due to the wind and current protection provided by the placement area. The island and tidal wetlands are used by waterfowl during the fall and winter and aquatic mammals throughout the year. Mudflats and intertidal marsh areas are used by shorebirds.

SKAMOKAWA-VISTA PARK (W-33.4)

The Skamokawa-Vista Park, which is located in the upper Columbia River estuary, is a multi-use county parcel. The park is on the northern bank of the Columbia River, at RM 33.4, downstream of Skamokawa Creek.

Historically, the dredged material placement site was used for several years and was then developed into a county park. The current placement site (Figure 16) is approximately 15 acres and it is approximately 2,400 feet long. The site is currently used as a shoreline and upland placement site from which materials are excavated by others. The site is located in Wahkiakum County, Washington. At its closest point, the site is approximately 200 feet northeast of the CRFNC.

Figure 16: Skamokawa-Vista Park

The site is owned by the Port of Wahkiakum II and the other Washington ports are pursuing a multi-year easement for placement by the Corps. Since the riverward portion of site is continually

eroded by river currents and the upland area has sand removal activities by others, the site capacity is variable year to year. In 2012, approximately 150,000 CY were placed over the entire site.

The elevations on the site range from 2 feet (CRD) at the waterline to approximately 22 feet at the highest point in the site's center. The site has a steep 10 to 12 foot edge on the upstream portion of the site that is adjacent to an open area of the park. The downstream portion of the site has a gentle slope from the waterline to the landward edge of the site, adjacent to a forested edge of the park. Minimal wildlife use is associated with the site due to the human recreational use of the park and limited available habitat. The site is not designated as critical habitat for streaked horned larks. The CNLM habitat analysis estimated that approximately five acres of suitable lark breeding habitat existed on the site in 2011. The site was surveyed for larks in 2013 by CNLM, but no individuals were observed. Despite the suitable habitat that was mapped from the 2011 CNLM data, the Corps assumes that no suitable habitat is available for SHLA nesting Skamokawa-Vista Park due to the amount of human activity that occurs on the site from commercial sand extraction. The adjacent park and forestlands are used by songbirds and small mammals.

WELCH ISLAND (O-34.0)

Welch Island, which is located in the upper end of the Columbia River estuary, is approximately 950 acres with multiple interior waterways. Welch Island and Tenasillahe Island form a discontinuous island, separated by a narrow waterway called Multnomah Slough. Welch Island is within the Lewis and Clark National Wildlife Refuge.

Historically, the Corps' placement area on Welch Island was used for both upland and shoreline placement of dredged materials. Currently, the Corps utilizes a 41-acre area (Figure 17) for upland placement on the northeast bank of Welch Island in Clatsop County, Oregon. The site is located from approximate RM 33.5 to 34.5. At its closest point, the site is approximately 2,800 feet southwest of the CR FNC.

Figure 17: Welch Island

The site is owned by the State of Oregon. The Port of Portland acquired a 25-year easement with Oregon DSL for upland placement by the Corps which expires in 2030. In 2003, the estimated site capacity for placement of dredged material was 400,000 CY. The most recent action by the Corps was the placement of approximately 400,000 CY over 40 acres in 2008. In 2013, the revised site capacity was 700,000 CY.

The elevations on the Corps' placement site range from 0 feet (CRD) at the low waterline to approximately 36 feet along the face of the downstream portion. The site is generally level, but gently increases in elevation from upstream to downstream. The majority of the Welch Island placement site is devoid of vegetation. A few scattered shrubs and grasses are visible in the central portion of the site. The landward (southern) boundary of the site is a forested riparian edge. The shoreline of the placement site is utilized by foraging shorebirds. Approximately 43 acres, including the placement site, have been designated as a critical habitat subunit for streaked horned larks. In 2012, one breeding pair was recorded but no birds were observed by CNLM during 2013 survey efforts. The CNLM estimated that approximately 10 acres of suitable lark breeding habitat existed on the site in 2011. The Corps currently estimates that there are 10 acres of suitable SHLA nesting habitat on Welch Island and within the critical habitat subunit. In March 2009, the USFWS funded habitat restoration trials on Welch Island, which involved tilling plots of land on the upstream quarter of the site. The Corps is not aware of any further actions on the site.

The remainder of Welch Island, outside of the placement site, ranges from 4 feet to 12 feet. The majority of Welch Island outside the Corps placement site is dominated by tidal scrub-shrub and emergent wetlands. The adjacent wetlands on Welch Island provide high-quality wildlife habitats for birds and aquatic mammals.

TENASILLAHE ISLAND (O-38.3)

Tenasillahe Island, which is located in the upper end of the Columbia River estuary, is approximately 2,050 acres. Tenasillahe Island is generally heart-shaped and it is approximately 2.8 miles long by 1.7 miles wide. Tenasillahe Island is separated from the Oregon mainland by Clifton Channel. Tenasillahe Island is within the Julia Butler Hansen National Wildlife Refuge for Columbian white-tailed deer.

Historically, the Tenasillahe Island placement site was a shoreline placement site. Currently, the Corps utilizes a 41-acre site (Figure 18) on the southeastern, upstream tip of the island for upland placement. This tip of the island encompasses approximately 105 acres and is separated from the rest of Tenasillahe Island by a narrow tidal flat. The placement site is located from approximate RM 37.9 to 38.4, in Clatsop County, Oregon. The site is generally oriented south to north and at its closest point, it is approximately 1,000 feet west of the CR FNC.

Figure 18: Tenasillahe Island

The site is owned by the State of Oregon and the Port of Portland has a 25-year easement with Oregon DSL for placement by the Corps, which expires in 2030. The downstream portion of the site was last used for placement prior to 2000. In 2003, the estimated site capacity for placement of dredged material was 2,300,000 CY. In 2012, material was placed in the remaining upstream portion of the site, excluding an area where streaked horned larks were nesting in 2012. In 2013, the revised site capacity was 1,270,000 CY. In 2013, 300,000 CY of material were placed on the upstream portion of the site, excluding an area where larks were nesting in 2013. The 2013 lark nesting location was different from the 2012 location.

The elevations on the Corps' placement site range from 5 feet (CRD) at the low waterline to approximately 38 feet in southern portion of the site. The site is generally level, but gently slopes from upstream to downstream. A pile dike is located off the southeast corner of the site.

The northern portion of the site is dominated by grasses, but has a row of shrubs and trees in the center. The western and northern boundary of the site is bound by trees that transition to an adjacent tidal wetland and marsh. One 0.17-acre wetland was delineated in the northeast portion of the placement site. The wetland is classified as a palustrine shrub scrub (PSS) wetland-swale that is hydrologically connected to Columbia River during periodic high river flows. The dominant wetland vegetation is dune willow, red-osier dogwood, reed canary grass, and cocklebur. The adjacent upland vegetation with the placement area is dominated by scotch broom, blackberry, and silver hair grass, interspersed with thistle. The bank area provides a narrow foraging area for wading and shorebirds. The western site boundary of trees and shrubs provides additional riparian habitat for birds, small mammal, and other wildlife. Approximately 23 acres of the island has been designated as a critical habitat subunit for streaked horned larks. Larks have been observed on this island during recent years, but were not observed in 2013 CNLM surveys. In 2012 and 2013, one breeding pair was recorded by the Corps on Tenasillahe Island. The CNLM estimated that approximately 11 acres of suitable lark breeding habitat existed on the site in 2011. The Corps

currently estimates that there are three acres of suitable SHLA nesting habitat on Tenasillahe Island and two acres within the critical habitat subunit due to placement activities in 2012 and 2013. Bald eagles were historically known to nest near the Tenasillahe Island placement site.

JAMES RIVER (O-42.9)

The James River site, which is on the south bank of the Columbia River and immediately downstream of the lower entrance to Westport Slough, is located near RM 42.9 of the Columbia River. The site (Figure 19) is irregularly shaped and has an access road from State Highway 30 that crosses the Portland and Western Railroad. The site is in Clatsop County, Oregon.

Figure 19: James River

Historically, the site was used as an upland placement area for dredged material from federal navigation channels. Trees were removed in the past by the owner to expand the site to its current extent of 53 acres. The upland placement site is privately owned and actively used for commercial sand removal. At its closest points, the Corps' upland placement site is approximately 400 feet south of the CR FNC and approximately 600 feet west of the Westport Slough and Wahkiakum Ferry FNCs.

The site is owned by a private landowner and the Port of Portland has a 20-year easement for placement by the Corps, which expires in 2027. The Corps has not used the site since before 2000. In 2003, the estimated site capacity for placement of dredged material was 1,280,000 CY. In 2013, the revised site capacity was 1,350,000 CY.

The elevations on the placement site range from 10 feet (CRD) in the unused portions of the site to 30 feet along the top of the containment berm. The berm extends along the western, southern, and eastern boundaries of the 53-acre site. The recently used or disturbed portions of the site are bare sand, while the remaining portions of the site are covered in grasses and shrubs. Much of the site has been actively graded and leveled due to use by others and the Corps' placement of dredged materials. The site provides limited wildlife habitat due to its frequent use and disturbance by the

landowner. The site is not designated critical habitat for streaked horned larks and it has not been surveyed due to expected low habitat value and frequent site disturbance. The CNLM estimated that approximately 14 acres of suitable lark breeding habitat existed on the site in 2011. However, the Corps assumed that no suitable SHLA nesting habitat is available at James River because of the amount of human activity and commercial sand extraction that occurs.

The Columbia River is the northern site boundary and the railroad is the southern boundary. An open grassy area is adjacent to the northwest portion of the site and the remaining adjacent lands area forested. The adjacent upland habitats are used by songbird, deer, and small mammals.

PUGET ISLAND (W-44.0)

Puget Island, which is located in the lower Columbia River, is approximately 4,785 acres and it is oriented southeast to northwest. Cathlamet Channel separates Puget Island from the Washington shoreline. Puget Island has multiple sloughs and several smaller islands along its perimeter. The majority of Puget Island is protected by levees that sever direct hydrologic surface connections for the interior sloughs. Puget Island is entirely within the State of Washington.

Historically, the Puget Island site has been in agricultural use. The Puget Island upland placement site (Figure 20) is located in the southern interior of Puget Island, near RM 44. The Corps' 96-acre placement site (approximately 2 % of the entire island) is bound by East Sunny Sands Road to the south and agricultural fields on the remaining sides. The roughly rectangular site is in Wahkiakum County, Washington. At its closest point, the Corps' placement site is approximately 2,000 feet north of the CR FNC. The Puget Island Sump (Figure 8) is located immediately south of the placement site, between RM 44 and 45.

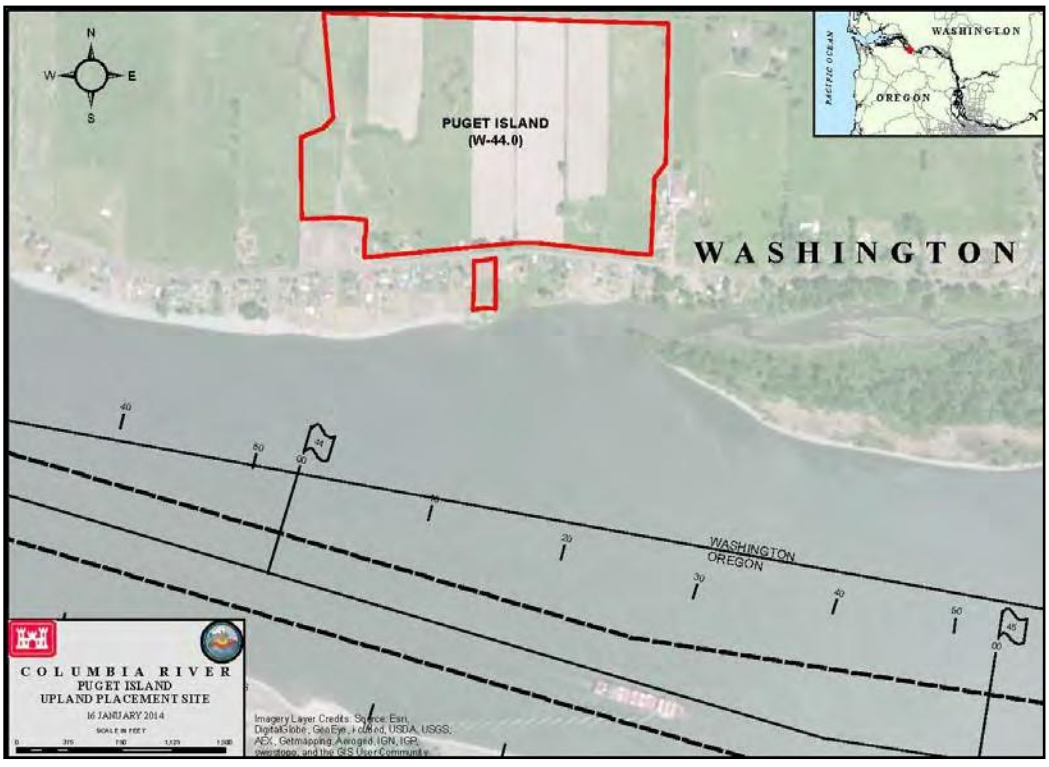

Figure 20: Puget Island

The site is composed of six contiguous properties, five of which are owned by ports in Washington and one by a private landowner. The Corps has 20-year right of entry (ROE) agreements for the five properties owned by the Washington ports, expiring in 2025 or 2030. The Washington ports

are currently in negotiation for access to the private property. As required by the Ports' the pending easement, the site will be reseeded with grass after each placement. Trees will be planted along the perimeter of the site to prevent wind erosion of the sand onto adjacent properties. The landowner may lease the site for cattle between placement events. The Corps has not placed material at the site. In 2013, the site capacity was 3,500,000 CY.

The sites elevations range from 5 feet to 10 feet (CRD) across the site. East Sunny Sands Road, south of the site, is a levee with a road top elevation of 16 feet. The site is generally flat due to agricultural practices. The site is partitioned by narrow fence lines that have scattered shrubs along their lengths. Farmed wetlands are known on the site and account for approximately 5.4 acres. The upper end of Gilbertson Slough extends west from the site. Due to existing levees, the site does not have a direct hydrologic surface connection to the Columbia River. The site has limited wildlife habitat value beyond foraging of croplands by birds and small mammals. The site is not designated critical habitat for streaked horned larks and has not been surveyed for larks. The CNLM estimated no suitable SHLA breeding habitat existed on the site in 2011 due to ongoing agricultural activities. The Corps currently estimates that there is no suitable SHLA nesting habitat on Puget Island.

The adjacent parcels are active farm lands and have limited wildlife habitat values. Deer, songbirds, raptors, waterfowl, and small mammals utilize the adjacent agricultural lands for foraging and resting.

BROWN ISLAND (W-46.3)

Brown Island is located off the upstream end of Puget Island in the Columbia River and is approximately 170 acres. Brown Island is currently connected to Whites Island but they are separated from Puget Island by Cut-Off Slough.

Historically, the placement site was a shoreline extension to Brown Island to reduce downstream erosion and to provide an upland placement area on the upstream end. This work was done to promote wildlife use in the created uplands. The Corps' upland placement site (Figure 21) currently encompasses 102 acres on the upstream portion of Brown Island. The site is from RM 45.8 to 46.9, in Wahkiakum County, Washington. At its closest point, the upland placement site is approximately 1,200 feet north of the CR FNC.

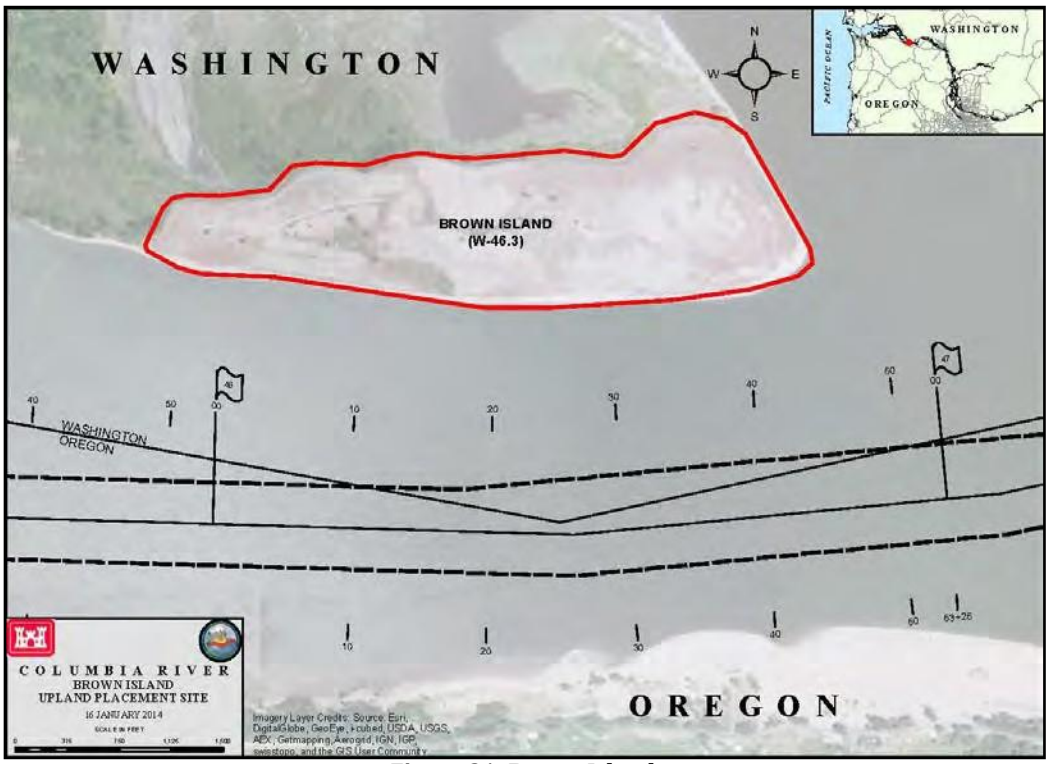

Figure 21: Brown Island

The site is owned by the State of Washington and the Washington ports have a 30-year easement with Washington DNR for placement by the Corps expiring in 2037. In 2003, the estimated site capacity for placement of dredged material was 4,700,000 CY. Material was placed on the entire site footprint in 2006. In 2011, 200,000 CY of material was placed in the upstream portion of the site. In 2013, the site capacity was 4,700,000 CY.

The elevations on site range from 5 feet (CRD) at the low water line to 50 feet in the west-central portion of the site and 56 feet at the upstream bank. The perimeter of the site has steep banks of 10 to 40 feet in height. The upstream portion of the site is bare sand while the lower third is vegetated with sparse grasses. A few scattered shrubs are visible in the central portion of the site. Waterfowl have nested on the upland portion of the site. Approximately 98 acres of the island have been designated as a critical habitat subunit for streaked horned larks. Larks were observed on this island during CNLM surveys. In 2013, 23 breeding pairs were recorded on Brown Island. The CNLM estimated that approximately 61 acres of suitable lark breeding habitat existed on the site in 2011. The Corps currently estimates that there are 72 acres of suitable SHLA nesting habitat on the site and the critical habitat subunit.

The adjacent portions of Brown Island have elevations of 5 to 15 feet (CRD). Wetlands and several tidal channels occur north and west of the placement site. The marsh habitats are used for foraging, resting, and rearing young waterfowl.

<u>CRIMS ISLAND (O-57.0)</u>

Crims Island is located in a bend of the lower Columbia River and it is separated from the Oregon shoreline by Bradbury Slough. Gull Island is located on the northern (downstream) end of Crims Island. Crims Island is dissected by several natural and manipulated waterways.

Historically, this site was used as a beach nourishment site on a former sand spit to shelter adjacent wetlands on Crims Island. The Corps' 59-acre, upland placement area (Figure 22) is oriented

southeast to northwest, upstream of Crims Island. The placement area is separated from Crims Island by a narrow channel. The placement area is located from approximate RM 56 to 57, in Columbia County, Oregon. A pile dike protects the upstream end of the placement area. Three short pile dikes extend perpendicular from the northeastern shore of the placement site. At its closest point, the upland placement site is approximately 2,400 feet southwest of the CR FNC.

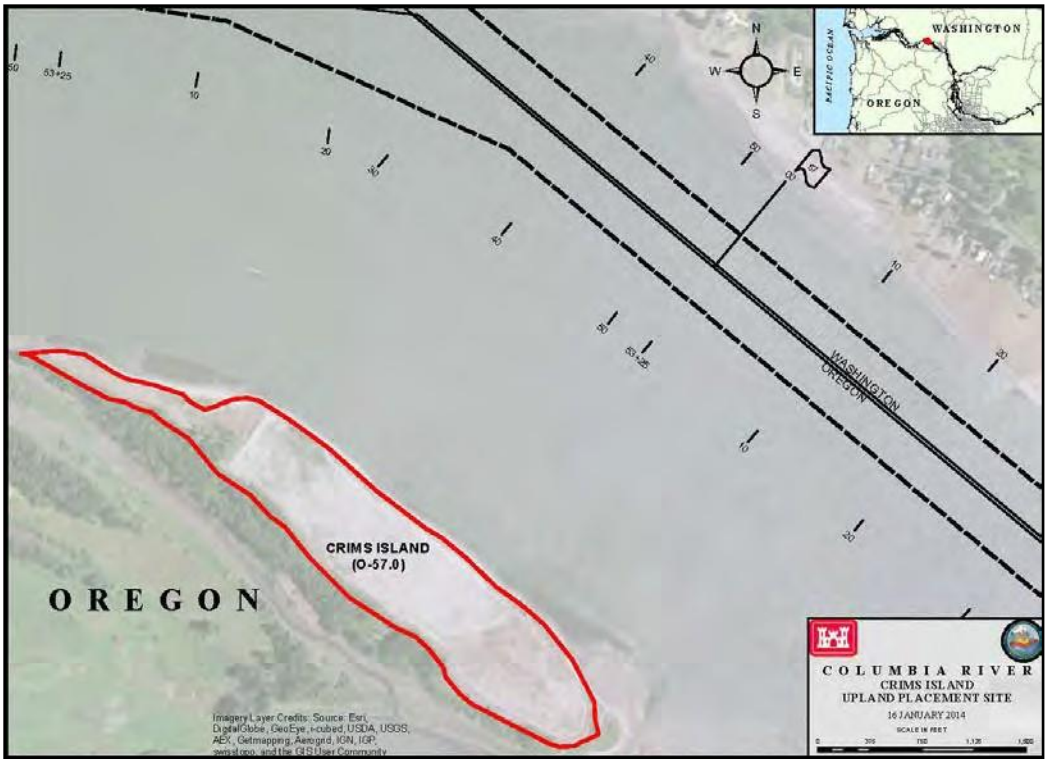

Figure 22: Crims Island

The site is owned by the State of Oregon and the Port of Portland has a 25-year easement with Oregon DSL for placement by the Corps. The Port of Portland's easement from the Oregon DSL expires in 2030. The downstream third of the site has not had material placed since before 2000. In 2003, the estimated site capacity for placement of dredged material was 1,600,000 CY. In 2008, the upper two thirds of the site received dredged materials. In 2010, approximately 250,000 CY of dredged materials were placed in the upstream end of the site. In 2013, the revised site capacity was 880,000 CY.

The elevations on site range from 5 feet (CRD) at the low waterline to 40 feet in the center of the site. The downstream (west) portion of the site tapers to a point and it has a level elevation of 12 feet. The downstream, tapered portion of the site is vegetated with grasses and herbaceous cover, and a few shrubs and trees. The 40-foot high center of the site is relatively flat. The upstream portion of the site is concave from 38 feet at its edge down to 20 feet in the center. The central and upstream portions of the 59-acre site are largely bare sand with very little vegetation and scattered shrubs. Known wildlife use of the site includes waterfowl and shorebirds. Approximately 60 acres of the island are a designated critical habitat subunit for streaked horned larks. Larks have been observed on this island during recent USFWS-sponsored surveys and in 2013, at least two breeding pairs were recorded on Crims Island. The CNLM estimated that approximately 25 acres of suitable lark breeding habitat existed on the site in 2011. The Corps currently estimates that there are 25 acres of suitable SHLA nesting habitat on placement site and critical habitat subunit.

The adjacent land, west of the site, is forested, with an elevation of approximately 16 feet. This forested area is densely covered with cottonwood trees and it has a marshy margin along the narrow channel. Nearby eagle nests are known on Crims Island and Gull Island. Shorebirds and waterfowl use both islands.

HUMP ISLAND (W-59.7)

Hump Island, which is located in the middle reach of the lower Columbia River, is approximately 77 acres. The linear island is oriented from southeast to northwest. The southeastern end of Hump Island is connected to Fisher Island by mudflats and vegetated lowlands. Hump Island is south of Fisher Island, separated by a shallow lagoon. Fisher Island Slough is a side channel of the Columbia River that separates Fisher Island from the Washington shoreline.

Historically, the Hump Island site had extensive placement activities since it acts as a flow control structure. As a properly functioning flow control structure, Hump Island minimizes the need for maintenance dredging of the CR FNC. Repeated upland placement and grading is necessary to maintain proper functioning. The Corps' 65-acre placement area (Figure 23) covers the riverward shore and inland area of Hump Island from its downstream (northwest) end to the island's upstream connection with Fisher Island. The site is in Cowlitz County, Washington, from RM 58.6 to 60.3. At its closest point, the Corps' upland placement site is approximately 500 feet north of the CR FNC.

Figure 23: Hump Island

The site is owned by the State of Washington and the Washington ports have a 30-year easement with Washington DNR for placement by the Corps, which expires in 2037. No materials have been placed on site since before 2000. In 2003, the estimated site capacity for placement of dredged material was 1,500,000 CY. In 2013, the revised site capacity was 550,000 CY.

The elevations of the placement site range from 10 feet (CRD) at the low water line to 30 feet at the downstream end. The site is vegetated with grasses, woody shrubs, saplings, and trees. Dominant

vegetation includes Scotch broom, cottonwood, blackberry, barnyard grass, and brome grasses. No wetlands were delineated within the Corps placement site in 2013. Fishermen use the site for shoreline fishing. Hump Island is not designated as critical habitat for streaked horned larks and it has not been surveyed recently due to the lack of open habitat larks prefer. The CNLM estimated that no suitable SHLA breeding habitat existed on the site in 2011 due to extensive vegetation and the Corps currently estimates that there is no suitable SHLA nesting habitat on Hump Island. The placement area provides avian and mammal terrestrial habitats.

The 10-acre riparian area on the backside (north) of the island ranges in elevation from 0 to 15 feet (CRD). The riparian area is densely vegetated and dominated by trees, shrubs, and blackberries. Tidally and non-tidally influenced forested wetlands were observed north of the riparian buffer. Historically, waterfowl and eagle nesting are known to occur near the site. The lagoon between the islands provides avian foraging habitat, as well as tidal and sub-tidal aquatic habitats for fish and small mammals.

LORD ISLAND UPSTREAM (O-63.5)

Lord Island, which is located in the middle reach of the lower Columbia River, is approximately 415 acres, excluding intertidal mudflats along the northwestern shorelines of the island. A 2,000-foot long pile dike runs parallel to the upstream end of the island, approximately 200 ft from shore. Lord Island is oriented from southeast to northwest.

Historically, the Lord Island placement site was an upland site that became vegetated with alder and cottonwoods. The current 24-acre upland dredged material placement site, Lord Island Upstream, (Figure 24) is situated on the southern-most tip of the island across from Longview, Washington. The site is located from approximately RM 63.4 to 63.8, in Columbia County, Oregon. At its closest point, the site is approximately 750 feet southwest of the CR FNC.

Figure 24: Lord Island Upstream

This island is owned by the State of Oregon and the Port of Portland has a 25-year lease with Oregon DSL for placement by the Corps, which expires in 2030. In 2003, the estimated site capacity for placement of dredged material was 1,500,000 CY. In 2009, approximately 200,000 CY of material was placed over the entire footprint. In 2013, the revised site capacity was 550,000 CY.

The dredged material placement site elevations range from 10 feet (CRD) at the low waterline to 56 feet at its high peak. Steep 20 to 40 foot banks drop off along the edges of the site to the Columbia River. The interior of the dredged material site slopes to the island profile adjacent to the dredged material placement site. The placement site's riparian edges are primarily vegetated with cottonwood trees. The vast majority of the Lord Island Upstream site is unvegetated, bare sands. Patches of Himalayan blackberry, dune willow, and Scotch broom populate the sandy interior parts of the dredged material placement site. The eastern tip of the site is dominated by dune grasses. An established riparian forest lies to the west and northwest boundary of the dredged material placement site. The island is not designated critical habitat for streaked horned larks and has not been surveyed for larks. The CNLM estimated that approximately four acres of suitable lark breeding habitat existed on the site in 2011. The Corps currently estimates that there are 10 acres of suitable SHLA nesting habitat on the Lord Island Upstream site.

The remainder of Lord Island, aside from the dredged material placement site, is covered with riparian forest and shallow channels. The island is used for fishing access and waterfowl, foraging and resting.

DIBBLEE POINT (O-64.8)

The Dibblee Point peninsula is on the southern bank of the Columbia River, in Columbia County, Oregon. The point was created from dredged material placement. The artificial peninsula has been heavily modified over time by land clearing, dredged material placement, and excavation activities. Portions of the peninsula have been undisturbed and are vegetated with mature trees and shrubs.

The entire Dibblee Point peninsula was historically used for placement of dredged material. Currently, the approximately 52-acre placement site is used as an upland placement and borrow site. An approximately 500-foot long pile dike runs perpendicular out from the dredged material placement site. The site (Figure 25) is between RM 64 and 65, downstream of Rainier, Oregon. At its closest point, the site is approximately 650 feet southwest of the CR FNC.

Figure 25: Dibblee Point

The site is owned by the State of Oregon and the Port of Portland has a 25-year lease with Oregon DSL for placement by the Corps expiring in 2030. In 2003, the estimated site capacity for placement of dredged material was 2,235,000 CY. In 2009, 1,500,000 CY of the material was placed over the entire site. The site was last used in 2010 for placement of 1,000,000 CY of material from the CRCIP. Since the site is an active borrow site, its long-term capacity varies as material is removed by others.

The elevations on the site range from 10 feet (CRD) at the waterline to 65 feet in the western portion of the placement area. The southwest corner of the property is utilized by a sand and gravel mining operation. Dibblee Point has high levels of human activity and is sparsely vegetated with grasses with some shrubs clustered throughout the site. The west, south, and east perimeters of the current site boundary are comprised of well established stands of hardwoods. The site is not designated as critical habitat for streaked horned larks. The site was surveyed for larks in 2013, but none were observed by the CNLM. The CNLM estimated that approximately one acre of suitable lark breeding habitat existed on the site in 2011. However, the Corps assumes that no suitable nesting habitat occurs at Dibblee Point because sand extraction activities preclude site use by SHLA.

Outside of the placement site boundary, the ground surface slopes downhill from the center of the peninsula to the Columbia River on the north and towards a backwater slough to the south. Portions of this peninsula are heavily vegetated with mature cottonwoods, while other areas contain wetlands and pond areas. There is a tidal marsh to the south of the buffer of cottonwoods and willows. The peninsula shoreline is used for fishing access, while the backwater slough is used for waterfowl resting.

HOWARD ISLAND (W-68.7)

Howard and Cottonwood Islands were combined into an approximately 950-acre island during dredging and placement activities following the Mount St. Helen's eruption. This larger island extends from RM 68.2 to 71.7 of the Columbia River. The island is composed of two placement

areas, Howard Island and Cottonwood Island, as well as forests, shrub lands, wetlands, ponds, and several waterways. A disturbed area is largely a dredged material placement site, with approximately 500 acres of exposed sand or sand covered by a layer of moss and lichen. Carrolls Channel, on the northern and eastern sides of the larger island, separates the island from the Washington shoreline.

Historically, the Howard Island site was used as an upland and beach nourishment site. This site has been used for approximately 50 years. Currently, the Corps has a 315-acre site (Figure 26) for upland placement on the downstream end of the larger island. The Howard Island Site is located from RM 68.2 to 70, in Cowlitz County, Washington. At its closest point, the site is 450 feet northeast of the CR FNC.

Figure 26: Howard Island

The site is composed of two parcels, separately owned by the Washington ports and the State of Washington. The Corps' 20-year ROE agreement for the ports-owned parcel expires in 2033. The Washington ports have a 28-year easement with Washington DNR for the State's parcel for placement by the Corps that expires in 2037. In 2003, the estimated site capacity for placement of dredged material was 6,400,000 CY. Approximately 200,000 CY of material was placed on the downstream side of Carrolls Channel in 2007. The remainder of the site has not been used since prior to 2000. In 2013, the revised site capacity was 2,700,000 CY.

The site elevations range from 10 feet (CRD) at the waterline to 50 feet at the downstream tip of the site. Although the site slopes from northwest to southeast based on past placement efforts, it is uniformly level along certain reaches. There are steep banks (20 ft banks) that drop off to the Columbia River and Carrolls Channel. The vegetated area consists of mixed deciduous habitat. A lowland area with a pond and wetlands are located adjacent to the northwestern site boundary and Carrolls Channel. A small drainage channel runs north from the pond into the channel. The wetland area is avoided during placement activities. The island is not designated as critical habitat for streaked horned larks and has not been surveyed for larks. The CNLM estimated that

approximately seven acres of suitable lark breeding habitat existed on the Howard and Cottonwood sites, combined, in 2011. The Corps currently estimates that there are five acres of suitable SHLA nesting habitat on Howard Island. The site is used by deer, songbirds, and small mammals.

Forests, wetlands, and a former, inactive placement area abut the placement site's northeastern and eastern boundary. There are several ponds situated on the island near the site. Eight pile dikes are situated along the Columbia River side of the island, and other navigation aids and groins are distributed along the shoreline. The Corps also maintains a 110-acre wildlife mitigation site on Port-owned lands in the center of the Howard-Cottonwood Island that was constructed as part of the 43-foot Columbia River channel improvement project in 2011. The wildlife mitigation site includes tree and shrub plantings and wetland habitat. In 2012, the USFWS planted about 16 acres of forage grass for Columbian white-tailed deer on Port-owned lands outside the placement area. While there is no direct access to the island, the area is not closed to the public and it is commonly used as a recreational site for camping and fishing. Bald eagles nest on the island and the waters around the island are regularly used for waterfowl hunting.

COTTONWOOD ISLAND (W-70.1)

As described in the Howard Island narrative, Cottonwood and Howard Islands were combined into one island following emergency dredging in the wake of the Mount St. Helens eruption. Historically, the Cottonwood Island site was a beach nourishment site prior to the Mount St. Helens placement. The site has been continuously used for placement and the Corps currently uses the 62-acre site (Figure 27) for upland placement on Cottonwood Island. The site is located on the interior of the island, at the upstream end of the larger island. The Cottonwood Island site is located from RM 70.5 to 71.5, in Cowlitz County, Washington. At its closest point, the site is approximately 600 feet east of the CR FNC.

Figure 27: Cottonwood Island

The site is owned by Washington ports and is available for placement by the Corps. The Corps' 20-year ROE agreement from the Washington ports expires in 2027. In 2003, the estimated site capacity for placement of dredged material was 3,200,000 CY. In 2008, approximately 1,400,000 CY of material was placed on the upstream half of the site. In 2013, the revised site capacity was 640,000 CY.

The elevations on the site range from 20 to 30 feet (CRD) in upstream half of the site to 30 to 60 feet in the downstream portion of the site. Unlike Howard Island, the Cottonwood Island site does not abut the Columbia River or Carrolls Channel. The island is not designated as critical habitat for streaked horned larks. The downstream portion of the site has a few stands of trees but it is largely covered by grasses, mosses, and lichens. The elevated, upstream portion of the site is covered by grasses, mosses, and lichens. Surveys were conducted by CNLM staff in 2010 and no SHLA were detected, even though the vegetation structure appeared adequate to support breeding larks. The CNLM estimated that approximately seven acres of suitable lark breeding habitat existed on the combined Howard and Cottonwood island sites in 2011. The Corps currently estimates that there is no suitable SHLA nesting habitat on Cottonwood Island. Larks are not expected to utilize the site for nesting due to the trees that surround the placement site. Waterfowl are known to rest on the site and the site is used by deer, songbirds, and small mammals. In 2012, the USFWS planted forage grass for Columbian white-tailed deer on a portion of the site filled in 2008.

Forests and open lands abut the placement site. There are steep banks dropping to both the Columbia River and Carrolls Channel along the upstream reaches of this island. The island has some beacons and five timber pile dikes adjacent to or on the site. There are visible trails, but no developments are on the island other than the Corps wildlife mitigation site discussed in the Howard Island narrative above. There is no direct access to the island, but recreational camping and fishing has been observed. Bald eagles nest on the island and the waters around the island are used for waterfowl hunting.

NORTHPORT (W-71.9)

The Northport placement site is on a peninsula contiguous with the Port of Kalama. The peninsula is located on the eastern shore of the Columbia River from RM 71.7 to 72.2. The Port's developed land is from the upstream entrance to Carrolls Channel south to the Kalama River. This area includes the Port of Kalama's waste water treatment area, open industrial land, and an active industrial dock.

Historically, the Corps used the Northport site as a shoreline placement area. The Corps has a 31-acre site (Figure 28) for upland placement from which others borrow placed materials. The site is on the downstream end of the Port's property, in Cowlitz County, Washington. At its closest point, the site is approximately 1,000 feet west of the CR FNC.

Figure 28: Northport

The site is owned by the Port of Kalama and is available for placement by the Corps. The Corps' 20-year ROE agreement from the Port of Kalama expires in 2024. In 2003, the estimated site capacity for placement of dredged material was 900,000 CY. Approximately 500,000 CY of material was placed on 27 acres of the site in 2008. In 2013, the revised site capacity was 200,000 CY.

The elevations on the site range from 10 feet (CRD) to 41 feet. The western, riverward site boundary is 30 to 20 feet above the river. The site is used by others to excavate placed dredged materials during which the property is routinely traversed by vehicles and heavy equipment. A relic weir remains on the site, surrounded by dense Scotch broom. Portions of the site are covered in sparse moss, grasses, and lichens, as well as excavated bare areas. Streaked horned larks are known to use the site due to its sparse vegetation, but the site is not designated as critical habitat. Three pairs were observed during CNLM surveys in 2013, and for this reason, placed materials have not been removed recently, even though the site is regularly accessed by public vehicles. The CNLM estimated that approximately three acres of suitable lark breeding habitat existed on the site in 2011 which the Corps estimates is still available as suitable SHLA nesting habitat. While the site has little wildlife value, it is used by coyotes, raccoons, and birds, such as crows, killdeer, and various raptors. Bald eagles forage in the vicinity of the site.

The rectangular peninsula is bordered by the river to the west, port lands to the south and southeast, and forested lands to the east and northeast. Most of the peninsula and the adjoining properties to the south have received fill from previous placement operations. The public uses the site for dog walking.

SANDY ISLAND (O-75.8)

Sandy Island, which is located in lower Columbia River near Kalama, Washington, is approximately 340 acres, excluding several waterways and side channels. Sandy Island is bean shaped and is separated from the Oregon shore by a side channel of the Columbia River. There is a 5,500-foot

long pile dike along the upstream portion of the island, parallel to the flow of the river and the island.

Historically, the placement site on Sandy Island was used for upland and beach nourishment placement. The island is likely a relic sand bar and approximately 2.5 miles of beach nourishment have occurred on Sandy Island. The Corps currently uses 32 acres as an upland site (Figure 29). The upland placement site is located on the upstream, southern tip of Sandy Island, from RM 75.8 to 76.2. At its closest point, the site is approximately 1,300 feet west of the CR FNC, in Columbia County, Oregon.

Figure 29: Sandy Island

The site is owned by the State of Oregon and the Port of Portland has a 25-year lease with Oregon DSL for placement by the Corps. The Port of Portland's easement from the Oregon DSL expires in 2030. In 2003, the estimated site capacity for placement of dredged material was 1,100,000 CY. In 2011, approximately 400,000 CY of material was placed on the entire site footprint. In 2013, the site was evaluated and it was determined that the site had reached capacity, such that materials need to be removed to provide capacity for future placement.

The site elevations range from 10 feet (CRD) at the waterline to 50 feet on the upstream bank of the site. The topography of the site is relatively flat with a sloping center from east to west. Steep 40 to 50 foot banks are located along the northern, eastern, and southern boundaries of the site. Dikes were constructed to manage dredged material during prior placement events. The site is mostly bare sand with a small, triangular cluster of approximately 20 trees in the northwest portion of the site. Approximately 37 acres have been designated as a critical habitat subunit for streaked horned larks, including the 32-acre placement site. Larks have been observed on this island during recent USFWS-sponsored surveys. In 2013, four breeding pairs were recorded on Sandy Island. The CNLM estimated that approximately 13 acres of suitable lark breeding habitat existed on the site in 2011. The Corps currently estimates that there are 32 acres of suitable SHLA nesting habitat on the

Sandy Island site and within the critical habitat subunit. The site is used for fishing access, as well as low-quality songbird habitat and resting waterfowl, deer and small mammals.

The topography of Sandy Island is relatively flat. It is vegetated by forests, shrub land, wetlands, and some open grassland along the eastern bank.

LOWER DEER ISLAND (O-77.0)

Deer Island is located in the lower Columbia River near Saint Helens, Oregon and is approximately 2,900 acres. The island is approximately 5.2 mile long, with pointed tips and a wide middle. It is generally oriented south to north, and it is separated from the Oregon shore by Deer Island Slough. It has a levee around its perimeter that runs the entire western boundary of the island and physically separates the island's interior from the direct flows of the Columbia River. Pumps and tide gates are used to control interior water levels in the sloughs on the island.

Historically, the Corps' placement area was used to replace sediments that had eroded away. Currently the Corps uses the 24-acre Lower Deer Island site (Figure 30) for upland placement. The placement area is almost entirely composed of previously dredged material and it is located at the downstream, northern end of the island in Columbia County, Oregon. The site is located from approximate RM 76.5 to 77.1. At its closest point, the site is approximately 580 feet west of the CR FNC.

Figure 30: Lower Deer Island

This placement area is owned by the State of Oregon and the Port of Portland has a 25-year easement with Oregon DSL for placement by the Corps expiring in 2030. There has been no placement of dredged materials or site preparation work at the site since 1995. In 2003, the estimated site capacity for placement of dredged material was 1,500,000 CY. In 2013, the site capacity was revised to 650,000 CY.

The elevations in the placement area range from 8 feet (CRD) at the river's edge to 32 feet in the northern portion. The majority of the placement area is above elevation 10 feet. Dredged material has historically been placed above elevation of 10 feet. The Lower Deer Island placement area is riverward of the levee on Deer Island. There are three pile dikes perpendicular to the site which extend into the river, all of which are in satisfactory to poor condition. The dredged material placed near the southern tip of the placement area is partially stabilized with herbaceous vegetation, but the downstream portion is also eroding due to river currents.

Both a natural gas pipeline and a fiber optic cable pass through this site, dividing it roughly in half. Placement is not allowed within the 3.4-acre pipeline easement area. The site is dominated by herbaceous vegetation, moss, and lichens, with sparse shrubs. The shrubs on the site are typically scotch broom and the site is bounded by young stands of woody vegetation. No wetlands were delineated on the site in 2013. The island is not designated as critical habitat for streaked horned and it has not been surveyed. The CNLM estimated that no suitable SHLA breeding habitat existed on the site in 2011 due to extensive vegetation and visual separation from the river. The Corps currently estimates that there is no suitable SHLA nesting habitat on Lower Deer Island. Fishermen regularly use the site for shoreline fishing.

There is an extensive tidally influenced emergent, shrub, and forested wetland outside of the placement area, adjacent to the site's northern end. Forested wetlands are located west of the southern portion of the placement area. Vegetation adjacent to the dredged material placement site is either a mix of herbaceous plants and shrubs or stands of cottonwoods. The adjacent riparian habitat and forest on Deer Island provide good wildlife value.

MARTIN BAR (W-82.0)

The Martin Bar area is located on the eastern shoreline of the lower Columbia River. The area is composed of two separate parcels, Martin Bar North (~17 acres) and Martin Bar South (~23 acres). The parcels are separated by an unimproved road and a cluster of trees that form Lions Day Park and boat launch area. Both parcels are riverward of a levee.

Martin Bar North is leased for farming and Martin Bar South is used as for upland placement and it is a borrow site. Combined, the parcels form a 40-acre site (Figure 31) from RM 81.8 to 82.3, in Cowlitz County, Washington. At its closest point, the site is approximately 1,000 feet west of the CR FNC.

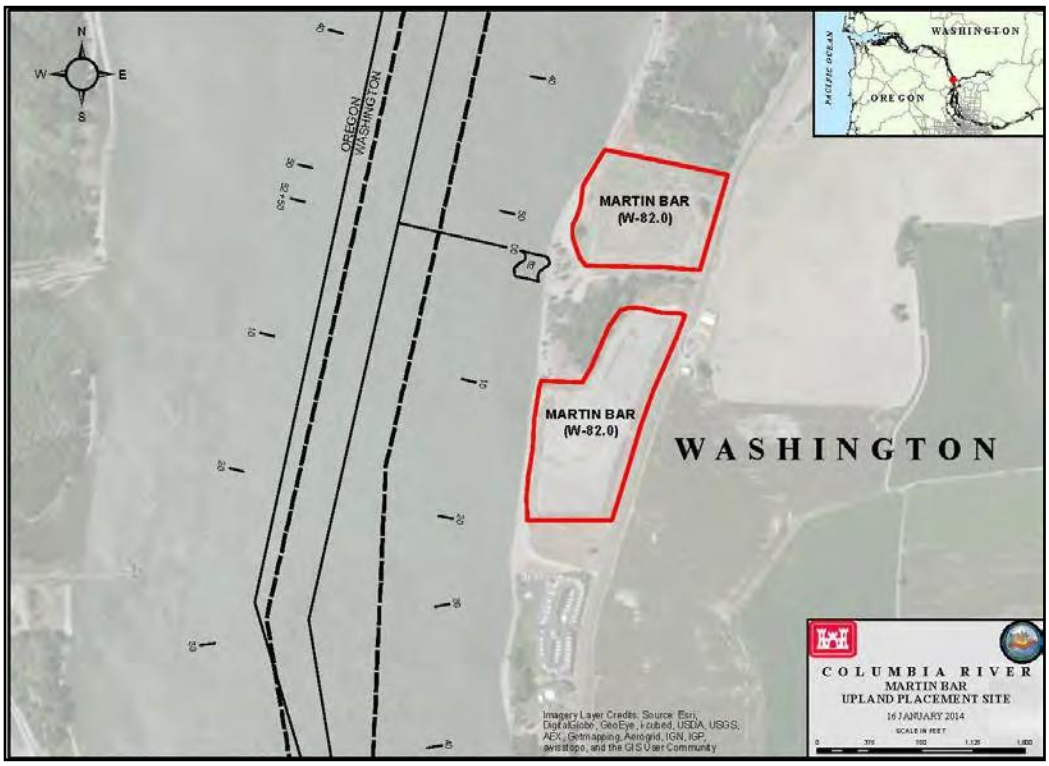

Figure 31: Martin Bar

The upland placement sites are owned by the Port of Woodland and available for placement by the Corps. The Corps' 20-year ROE agreement from the Port expires in 2025. In 2003, the estimated site capacity for placement of dredged material was 1,500,000 CY. In 2008, the Martin Bar South parcel was filled with 500,000 CY of material. The Port of Woodland leased the site for sand mining and most of the sand placed in 2008 has been removed. In 2008, the Martin Bar North site had exterior diking work, but no placement occurred even though the external berms remain in place. In 2013, the site capacity was estimated at 720,000 CY.

The elevation on the north parcel averages approximately 20 feet (CRD). The elevation on the south parcel averages approximately 29 feet (CRD). One pile dike protects the shoreline of the southern parcel. The northern parcel is vegetated with grasses, while the southern parcel is mostly bare sand with scattered low plants. The parcels are not designated as a critical habitat subunit for streaked horned larks due to the farming and borrowing activity. Larks are not known to use the site and it has not been recently surveyed. The CNLM estimated that approximately five acres of suitable lark breeding habitat existed on the site in 2011. The Corps currently estimates that there is no suitable SHLA nesting habitat on Martin Bar South due to the site's exterior berms and regular use as a borrow site. No habitat is expected on Martin Bar North due to current agricultural practices. Together, the parcels provide little to no wildlife habitat.

Cottonwoods populate the area north of the northern parcel. Nearby improvements include a beacon for navigational purposes and groin placed perpendicular to the shoreline, fencing, shed, an outhouse, and several unimproved roads. An RV park is located south of the southern parcel. The lands east of the levee are used for agricultural farming.

SAND ISLAND (O-86.2)

Sand Island is approximately 55 acres and is located at the downstream entrance to Multnomah Channel. The Multnomah Channel separates Sand Island from the town of Saint Helens, Oregon.

Sand Island is immediately downstream of Sauvie Island. The island is developed as a marine park, has two boating piers on its western shore, and it is used for public recreation.

Historically, Sand Island served as a flow control structure to minimize maintenance dredging of the adjacent St. Helens Bar. Dredged materials were placed on the east bank of the island to maintain the structure and replace eroded sediments. Currently, the Corps has 28-acre shoreline placement site (Figure 32) along the east side of Sand Island, in Columbia County, Oregon. The shoreline site extends beyond the existing island's footprint to the north, east, and south. A 1,920-foot long pile dike extends along the upstream end of the site. At its closest point, the site is approximately 750 west of the CR FNC.

Figure 32: Sand Island

The placement site is owned by the State of Oregon and the Port of Portland has 25-year easement for placement by the Corps expiring in 2030. In 2003, the estimated site capacity for placement of dredged material was 1,250,000 CY. In 2012, material was placed on the downstream shoreline of the site. In 2013, approximately 150,000 CY of material was placed on the upstream shoreline and tip of the island. The site capacity varies annually due to continual erosion of the shoreline by river flows.

The elevations in the placement site range from -15 feet (CRD) at the downstream limit to 20 feet on the landward edge adjacent to the park. The site is a highly erosive beach of mostly bare sand, with sparse grasses and ground cover on the higher portions. Current recreational use of island excluded the area from designation as critical habitat for streaked horned larks. Larks have historically occupied the site, but no larks were observed during 2013 surveys by the CNLM. The CNLM estimated that approximately one acre of suitable lark breeding habitat existed on the site in 2011. The Corps currently estimates that there is approximately one acre of suitable SHLA nesting habitat on Sand Island and due to the high level of human disturbance during the summer, SHLA are not expected to utilize the site for breeding.

The interior and western bank of the island is forested, interspersed open grassland and beach areas. The island has approximately 25 acres of well-established woody vegetation. Areas with woody vegetation are outside the dredged material placement boundaries. Dredged material is placed on the island to support beach nourishment along this reach. The wooded portions of site provide songbird and raptor habitats, while the beaches are used by shorebirds and a few waterfowl. Anglers use the site for shoreline fishing.

AUSTIN POINT (W-86.5)

The Austin Point placement site is located on east bank of the lower Columbia River, outside of the levee for Woodland, Washington. Austin Point is at the confluence of the Lewis River with the Columbia River.

Historically, this site was a beach nourishment site to facilitate wildlife mitigation efforts on Austin Point 30 to 40 years ago. The site was also used for upland placement. Currently, the Corps' 30-acre upland placement site (Figure 33) is used as a heavy equipment, crane, and rigging training school in Cowlitz County, Washington. The site is located from RM 86.0 to 86.3. At its closest point, the site is approximately 600 feet west of the CR FNC.

Figure 33: Austin Point

The Austin Point placement site is owned by the Port of Woodland and available for placement by the Corps. The Corps' 20-year ROE from the Port of Woodland expires in 2025. In 2003, the estimated site capacity for placement of dredged material was 1,645,000 CY. In 2008, material was placed on the entire site. In 2013, 250,000 CY of material was placed on the downstream 2/3 of the site. Material will need to be removed from the site to provide capacity for future placement events.

The site elevations range from15 to 35 feet (CRD). The topography of site is open, level, and devoid of vegetation. An elevated dike runs along the western edge of the property. The site is primarily a large, undulating sand pit. Current site uses excluded designating the site as critical habitat for

streaked horned larks. Although larks are not known to historically occupy the site and no formal lark surveys have been conducted recently, several juvenile larks were observed by the Corps in September 2013 prior to placing dredged material. The CNLM estimated that approximately 14 acres of suitable lark breeding habitat existed on the site in 2011. The Corps placed dredged material on the downstream two thirds of the site in 2013. The Corps currently estimates that there is no suitable SHLA nesting habitat on Austin Point due to ongoing heavy equipment school site grading activities. Overall, the site provides low wildlife habitat values.

A water supply well house and groundwater well for the equipment school are situated near the site. There is approximately 150 feet of open sand between the shoreline and the western edge of the dredged material placement site. Two pile dikes extend perpendicular from the shoreline into the river. Blackberries, weedy grasses, low-lying shrubs, and cottonwoods are located north and south of the site. Bald eagles nest in the area and forage downstream of the site. Fishermen use the area for shoreline fishing, while songbirds, small mammals, and waterfowl use the nearby lands and waterways.

FAZIO SAND & GRAVEL (W-97.1)

The Fazio Brothers Sand Company, Inc. has a 220-acre sand and gravel facility located on the east bank of the Columbia River, near RM 97. The company has been in operation at this site since the 1950's. This company has an open parcel upstream of their facility that is used for sorting and processing sandy materials removed from the river. The operation is located in Clark County, Washington upstream of the Ridgefield National Wildlife Refuge.

The Corps has placed dredged materials in-water near the 17-acre upland site (Figure 34). Materials are currently placed riverward of the shoreline. The placed materials are mined by dredging and processed by the company under a separate permit for commercial uses. The site is located from RM 97.1 to 97.3. At its closest point, the site is approximately 1,400 feet east of the CR FNC.

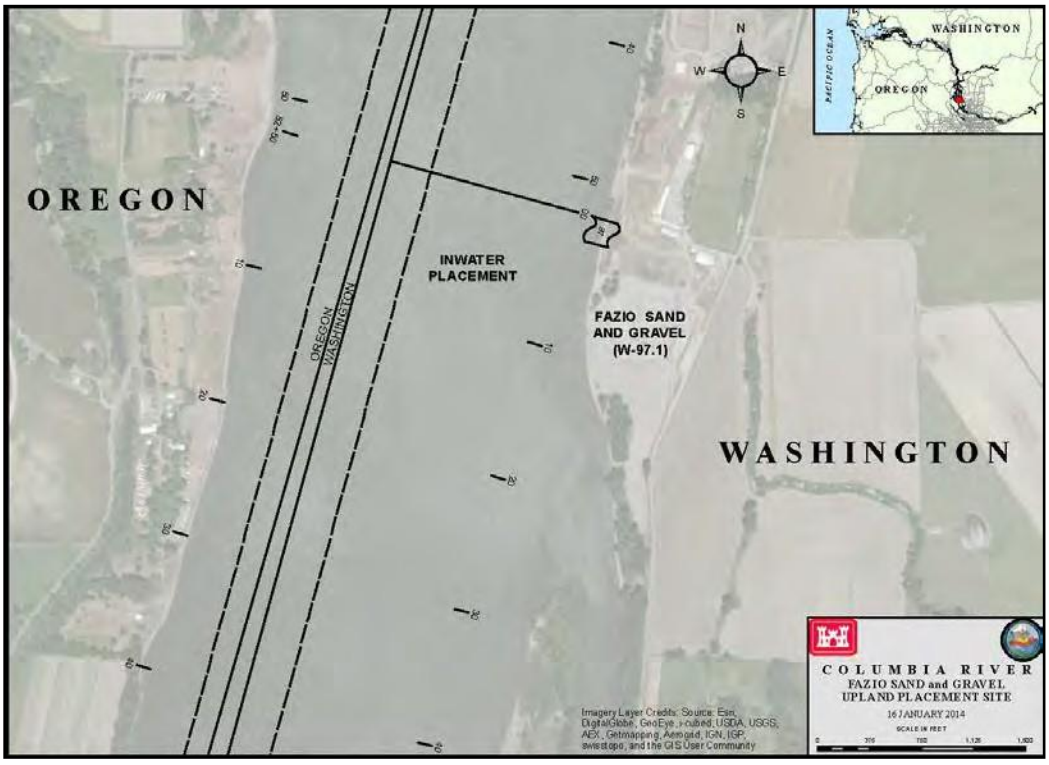

Figure 34: Fazio Sand & Gravel

The Washington Ports have an easement with the Fazio Brothers Sand Company, Inc. for direct placement of dredged material by the Corps into their upland processing area. However, the current practice by the Corps is to place material in-water in the State of Washington so Fazio Brothers Sand Company, Inc. can later mine the material for upland processing at their site under separate permitting. In 2003, the estimated upland site capacity for placement of dredged material was 1,200,000 CY for the life of the project. The Corps intends to continue placing material in-water annually as Fazio Brothers Sand Company, Inc. mining operations continue to provide in-water placement capacity each year.

The site elevations range from 10 feet (CRD) at the shoreline placement area to 45 feet in the processing area. The upland area is open, bare sands. A few stands of cottonwood trees are located along the shore. The site is not designated as critical habitat for streaked horned larks and has not been recently surveyed for larks. The CNLM did not map suitable habitat at Fazio Sand & Gravel in 2011 because the habitat status cannot be inferred through imagery. The Corps currently estimates there is no suitable SHLA nesting habitat on the Fazio Sand & Gravel site. Due to the active sand mining and processing activities, the site provides little wildlife habitat and it is assumed to provide no suitable nesting habitat for larks.

GATEWAY (W-101.0)

The Gateway upland placement site is located at RM 101 of the Columbia River, in Clark County, Washington. The site is located approximately 500 feet inland from the river and 450 feet south of a man-made channel, known as the Vancouver Lake Flushing Channel. This area is located between the Columbia River and Vancouver Lake, downstream from the City of Vancouver.

Historically, the Gateway site was a major placement area. Currently the 40-acre placement site (Figure 35) is used for upland placement and as an active borrow site. The site is located from approximately RM 100.9 to 101.2 and at its closest point is approximately 2,200 feet northeast of the CR FNC.

Figure 35: Gateway

The site is owned by the Port of Vancouver and available for placement by the Corps. The Corps' 20-year ROE agreement from the Port of Vancouver expires in 2025. The site was constructed in 2005 with a height-restricted capacity of 2,000,000 CY. In 2005 and 2007, the Corps placed approximately 1,150,000 CY of material over the entire site. The Port of Vancouver has removed all but 3,000 CY of materials, leaving a renewed site capacity of 2,000,000 CY.

The site elevations range from 20 feet (CRD) in the interior to 40 feet along portions of the site's containment berm. The site is actively used to borrow placed materials, which precludes the establishment of woody shrubs or trees onsite. The majority of the site is bare, with some areas of grasses and low herbaceous plants. The site was not designated as critical habitat and there is no known SHLA breeding at the site. The site has not been recently surveyed by the USFWS for larks but the Port performed surveys from April to July and in November 2013, following the Washington Department of Fish and Wildlife (WDFW) survey protocol. The only larks observed during the surveys were three females who touched down briefly (5-15 seconds). No other larks or any nests were observed by the Port in 2013. The CNLM did not map suitable habitat at Gateway in 2011 because the habitat status cannot be inferred through imagery. The site has exterior visual barriers (containment berms and trees), and therefore the Corps currently estimates there is no suitable SHLA nesting habitat on the Gateway site. Due to borrow activities, topography of the site, visual barriers (trees) between the site and the river, and lack of suitable foraging opportunities, the site provides little wildlife value.

This site is bounded to the north, east, and south by agricultural lands used for growing corn for silage. Woodlands are located to the west, separating the site from the Columbia River. The woodlands are cottonwoods and with some shrubs. The adjacent agricultural lands have limited wildlife habitat, though some songbirds, raptors, waterfowl, and small mammals utilize the adjacent agricultural lands for foraging and resting.

WEST HAYDEN ISLAND (O-105.0)

Hayden Island is located in the lower Columbia River, upstream of the confluence of the Willamette and Columbia Rivers. Hayden Island is approximately 1,400 acres and it is oriented southeast to northwest. Hayden Island is entirely within Multnomah County, Oregon and it is separated from the Oregon shore by Oregon Slough. The Oregon shore across from the island is developed for commercial and industrial land uses, including docks for the Port of Portland and others.

The eastern portion of the island is within the City of Portland and it is heavily developed for commercial, retail, residential, and recreational land uses. There are many houseboat and boat moorages along the banks of the eastern portion of the island, primarily along Oregon Slough. The western portion of island, which is delineated from the eastern portion by a railroad line, is not developed but has been altered by utility lines, prior dredged material placement, and land clearing.

Historically, the Corps has used the downstream portion of Hayden Island for placement of dredged material. Material has been placed as beach nourishment in the past. Currently, the Corps has a 116-acre upland placement site (Figure 36), referred to as the West Hayden Island site, on the northern side of the island from RM 104.6 to 105.4. At its closest point, the site is approximately 1,200 feet southwest of the CR FNC.

Figure 36: West Hayden Island

The site is owned by the Port of Portland and available for placement by the Corps. The Corps' 20-year ROE agreement from the Port of Portland expires in 2025. In 2003, the estimated site capacity was 5,750,000 CY. In 2011, approximately 50,000 CY of materials were placed in the southern corner of the site as part of the Corps maintenance program in the Willamette River. In 2013, the site capacity remained the same.

The site elevations range from 15 feet (CRD) at the top of the riverbank to 40 feet in the center of the site. The site is undulating due containment berms and grading activities from placement of dredged materials. Large portions of the site are comprised of open sand and weedy grasses. Two

stands of trees are located in the northwest portion of the site. An unimproved dirt road provides land access to the site and there are several weirs placed throughout the site. The site is actively used by the Port for placing their dredged materials, dredging equipment, and other storage. The Port maintains roads on the site and manages the island to prevent the establishment of trees. The site is not designated as a critical habitat subunit for streaked horned larks. The CNLM surveyed the site in 2013, but no larks were observed. The CNLM did not map suitable habitat at West Hayden Island in 2011 because the habitat status cannot be inferred through imagery. The site has exterior visual barriers (containment berms and trees), and therefore the Corps currently estimates there is no suitable SHLA nesting habitat on the West Hayden Island site. The site does provide open habitats for songbirds and shorebirds.

A deciduous forest is located to the east, south, and west of the placement site. The Columbia River is the northeast perimeter of the site. The western portion of Hayden Island is largely vegetated and provides high quality forested, riparian, wetland, and pond habitats for resident and migratory wildlife.

Washington Department of FISH and WILDLIFE

PROPOSED METHODS FOR WILDLIFE DATA COLLECTION "FORM B"

(Consult instructions before completing this form)

This form should be attached to "Form A" when completed

Submitted by:_____ Date:_____

Mailing Address:

Brief description of proposed activity (copy from Form A):	Conduct surveys to detect presence and acquire indices of abundance of the Streaked Horned Lark (*Eremophila alpestris*) by visual and/or auditory detection during the breeding season on known occupied habitat.
1. Species:	**Streaked Horned Lark (*Eremophila alpestris*)**
2. Objectives:	■Confirm the presence of Streaked horned larks by conducting line transect surveys throughout occupied habitat at Joint Base McChord-Ft Lewis -- airfields, artillery impact area, 13th Division Prairie, Ranges 74/76/51; Olympia Airport; Shelton Airport, outer WA coast; Columbia R islands. □ Acquire estimates of abundance □ Provide a non-invasive method of inventory □ Provide an efficient and repeatable survey design □ Provide consistency among surveyors □ Provide standardized protocol for survey and management

3. Describe in detail the methods that will be used to complete the above activity
(Or attach description to this form)**:**

Surveys to detect presence: Streaked horned larks are migrant, ground-dwelling passerines that have adapted to nesting on open grasslands, sparsely vegetated beaches and dredge spoil islands (Stinson 2005). They prefer bare ground and vegetation no more than several inches tall (Beason 1995, Altman 1999, Rogers 2000, Pearson and Hopey 2005). Streaked horned larks are loosely colonial nesters, with both males and females detectable during the breeding season, which occurs roughly from March through August. Survey timing is designed to coincide with clutch initiation curves – first clutches are initiated at the end of April at all sites and taper off dramatically in the Puget Sound area in early July; later on the coast and Columbia River (Pearson et at. 2005). Mates are socially monogamous for the breeding season. Males are easier to detect because they sing on the ground and also perform aerial courtship displays.

Methods: Surveys should begin within ½ hour of sunrise and end by 12:00 noon on days when wind is less than 20 mph with little to no precipitation (light drizzle and brief showers are fine). Surveys should end by 11:00 a.m. or earlier on days when the predicted maximum temperature is 80 F or higher. Four surveys per location should be conducted between 19 April and the first week of July in the Puget lowlands and between 19 April and mid-July for the outer coast and Columbia River as follows:

Survey 1: last two weeks of April **Survey 2:** mid two weeks of May **Survey 3:** mid two weeks of June
Survey 4: first week of July (Puget lowlands) through second week of July (outer coast and Columbia River).
At sites where access is limited, priority should be given to May – July surveys.

Line transects – observers should be positioned 75 m from the survey boundary and 150 m apart (to avoid

double-counting and to maximize detection ability) on predetermined transects/routes and should maintain a slow-moderate pace. Observers should stop every 150 m for approximately 1 minute to listen and scan for larks. Pausing to confirm a detection is allowed, however all observers should remain parallel. Transects should cover as much suitable habitat as possible in the allowed time window. Surveyors should familiarize themselves with vocalizations of male streaked horned larks, flight display behavior, and differentiating larks by sex and age. Young of the year birds look markedly different from adult birds. Every effort should be made to cover all areas with suitable habitat, preferably each time an area is surveyed. However, varying the area surveyed during each of the four surveys is acceptable for large expanses to ensure complete coverage. Observers should rotate between sites/transects and walk the survey route in the opposite direction on subsequent surveys.

Observers will independently record the approximate detection location of each bird on an area orthographic map, as well as the corresponding bird number from the field form. Environmental conditions, age, sex and behavior (see below). Observers may communicate with each other by radio or mobile if necessary. Waypoints should be verified at the beginning, end, and intermediate locations for each transect to verify observers remain on transect. Observers may briefly leave a line to avoid flushing birds or disturbing nests.

Data Recording: (field form attached)

- To avoid confusion between American (month/day/year) vs European (day/month/year) methods of writing dates with Arabic numbers, date should be written with a two-digit numeric for day first, the month using a three-letter abbreviation (e.g., Feb, Mar) second, and the year as a four-digit number last (ex. 26FEB2008).
- The lead observer should record surveyors' full names (not just initials), cloud cover, wind, precipitation, and air temperature at the beginning and end of the survey.
- Record the survey start/stop times. Time should be recorded on a 24-hour clock to avoid confusion with differentiating AM versus PM (e.g., 5:00 PM is 17:00).
- Each observer will receive an ortho map of the survey area, containing transect lines or routes and reference waypoints.
- Each observer will receive a data sheet for recording detections.
- Data to record for each detection include:
  AGE – AD (adult), YOY (young of the year), U (unknown)

  SEX – M (male), F (female), U (unknown and young of the year)

  BEHAVIOR (when first observed; can use more than one code) **–** S = Song, C = call, F = Foraging, FD = flight display, FL = flight, A = agonistic behavior, AI = alert posture (**standing erect with neck extended and appearing vigilant but not singing or calling)**, FC = food carry, CO = copulation, NM = carrying nest material.

- Record any incidental nests found (mark location on ortho, coordinates and contents on data form in Notes section).

ORDINANCE NO. 1283
INTRODUCED BY ALL COMMISSIONERS

AN ORDINANCE AMENDING THE CITY OF WARRENTON COMPREHENSIVE PLAN AND WARRENTON MUNICIPAL CODE TO ADOPT AN EXCEPTION TO STATEWIDE PLANNING GOAL 16 AND MODIFY STANDARDS REGARDING FLOWLANE DISPOSAL IN THE COLUMBIA RIVER

WHEREAS, the United States Army Corps of Engineers (USACE) is federally mandated to maintain the Federal Navigation Channel of the Columbia River, which includes dredging and disposal of dredged material to maintain the deep draft channel; and

WHEREAS, in 2002, the Columbia River Estuary Study Taskforce (CREST) completed the *Columbia River Estuary Dredged Material Management Plan,* which refined the dredging and disposal policies in the City of Warrenton's Comprehensive Plan and inventoried an adequate number of disposal sites with sufficient capacity to accommodate projected disposal needs for at least a five-year period; and

WHEREAS, the City of Warrenton adopted the necessary provisions from the *Columbia River Estuary Dredged Material Management Plan* in Article 5 of the City of Warrenton Comprehensive Plan and Section 16.160 of the Warrenton Municipal Code; and

WHEREAS, Section 16.160 of the Warrenton Municipal Code currently allows flow lane disposal in areas designated aquatic development; and

WHEREAS, in approximately 2010, the United States Army Corps of Engineers (USACE) altered its dredge material disposal practices to include the river thalweg within contour depths of 20 feet or greater as part of its flowlane disposal area; and

WHEREAS, the expanded flowlane/thalweg area encompasses in-water areas that are designated Conservation Aquatic, which does not allow flowlane disposal; and

WHEREAS, this discrepancy between USACE practices and City of Warrenton policies was identified in 2023; and

WHEREAS, it has been demonstrated that the use of the expanded flowlane/thalweg is required to maintain the river's sediment budget and to reduce shoaling and that no other alternatives are available that would meet these requirements; and

WHEREAS, in September 2024, the Oregon Department of State Lands (DSL) submitted an application for an exception to Goal 16: Estuarine Resources, to allow the disposal of dredged materials in water areas designated Conservation Aquatic; and

WHEREAS, the application meets the criteria outlined in the City of Warrenton Comprehensive Plan and Warrenton Municipal Code and it is in the public's best interest to adopt this exception to Goal 16: Estuarine Resources; and

NOW THEREFORE, the City of Warrenton ordains as follows:

Section 1. Section 5.110 of the City of Warrenton Comprehensive Plan is amended to read as follows:

Section 5.110 Estuary Channels Subarea Findings

(1) General Description - This subarea includes the deep water portions of the estuary from Jetty A (RM 3) to the upper end of Rice Island (RM 22.5). The subarea contains the authorized navigation channel. The subarea boundary generally follows the 20-foot bathymetric contour; however, it varies from this contour in the vicinity of cities and other subareas containing deep channels. There are no intertidal wetland or shoreland areas. Portions of Clatsop, Pacific and Wahkiakum Counties, and Astoria and Warrenton are within this subarea. The Warrenton portion comprises only a small portion of this 16,500 acre subarea.

(2) Aquatic Designations - All aquatic areas in the Estuary Channels Subarea in Warrenton are designated Conservation except:

(a) The main navigational channel and a flowlane disposal area on each side of the channel (either 600 feet wide or extending to the 20 foot bathymetric contour, whichever is narrower) is designated Aquatic Development.

(b) Dredged material disposal sites CC-E-8.5 and CC-E-2LO, listed in the *Columbia River Estuary Dredged Material Management Plan,* are designated Aquatic Development.

(3) Goal Exception - An exception to Goal 16 to allow in-water disposal of dredged material in the expanded flowlane in depths greater than 20 feet and contiguous to the Federal Navigation Channel, which encroach into designated Conservation Aquatic areas, was approved by Ordinance 1283 on January 28, 2024.

Section 2. Section 5.120 of the City of Warrenton Comprehensive Plan is amended to read as follows:

Section 5.120 Tansy Point/Alder Cove Subarea Findings

(1) General Description - This subarea includes aquatic areas in Alder Cove and the Columbia River out to the pierhead line, and shorelands between the waterward extension of Railroad Drive (the old Warrenton/Hammond boundary) and the mouth of Alder Creek. This subarea contains about 600 acres of both shorelands and aquatic areas within the City of Warrenton.

(2) Aquatic and Shoreland Designations

(a) Development Aquatic:

- The aquatic area bounded by the shoreline on the South, the pierhead line to the North, the waterward extension of Railroad Drive on the West and Tansy Point on the East.
- The barge moorage area on the East side of Tansy Point.
- The flowlane disposal area south of the main channel (600 feet wide or to the 20-foot bathymetric contour, whichever is narrower).

(b) Conservation Aquatic:

- The area at the southern end of Alder Cove where effluent from the Warrenton sewage ponds is discharged.
- The mouth of Alder Cove from the 3-foot bathymetric contour north to the flowlane disposal area.

(c) Natural Aquatic:

- Remaining aquatic area within Alder Cove.

(d) Water-Dependent Development Shorelands:

- All shoreland areas are designated Water-Dependent Development Shorelands, except for a portion of dredged material disposal site Wa-S-9.4, which is designated Development Shorelands.

(e) The regulatory shoreland boundary is 50 feet from the Columbia River Estuary shoreline, or from the landward toe of dikes and associated toe drains, whichever is greatest, except where it extends further inland to include the following features:

- Shoreland areas designated Water-Dependent Development Shorelands.
- Mitigation site M3 from the *Mitigation and Restoration Plan for the Columbia River Estuary*.
- Dredged material disposal site Wa-S-9.4 from the *Columbia River Estuary Dredged Material Management Plan*.
- A wetland at Tansy Creek identified as significant under Oregon Statewide Planning Goal 17.

(3) Goal Exception - An exception to Goal 16 to allow in-water disposal of dredged material in the expanded flowlane in depths greater than 20 feet and contiguous to the Federal Navigation Channel, which encroach into designated Conservation Aquatic areas, was approved by Ordinance 1283 on January 28, 2024.

Section 3. Section 5.150 of the City of Warrenton Comprehensive Plan is amended to read as follows:

Section 5.150 Mouth of the Skipanon River Subarea Findings

(1) General Description - This subarea contains filled and diked shorelands north of Harbor Drive and east of Skipanon Drive; the Skipanon River from the Harbor Drive Bridge to its mouth; the East and West Skipanon Peninsulas; and adjacent Columbia River waters out to the navigation channel. Parts of downtown Warrenton are also included.

(2) Aquatic and Shoreland Designations

(a) Development Aquatic:

- The Skipanon waterway between the Harbor Drive Bridge and the main navigation channel.

- Approximately 7.8 acres of tidal marsh and flats on the west side of the West Peninsula.

- The flowlane disposal area south of the main channel (600 feet wide or to the 20-foot bathymetric contour, whichever is narrower).

- The area from the Skipanon Channel to the eastern boundary of the Subarea and from the line of aquatic vegetation on the East Peninsula north to the Columbia River navigation channel.

(b) Conservation Aquatic:

- The aquatic area between the shoreline and the flowlane disposal area west of the Skipanon Channel.

(c) Development Shoreland:

- The area adjacent to the mooring basin east to N.E. Iredale Avenue.

- The area north of Harbor Drive on the east side of the Skipanon waterway.

- An area on the south side of the West Peninsula.

- The area east of Holbrook Slough.

(d) Water-Dependent Development Shorelands:

- All other shorelands are designated Water-Dependent Development.

(e) The regulatory shoreland boundary is 50 feet from the Columbia River Estuary shoreline, or from the landward toe of dikes and associated toe drains, whichever is greatest, except where it extends further inland to include the following features:

- The East Skipanon Peninsula including all shoreland areas on the northern 96 acres of the East Skipanon Peninsula.

- The West Skipanon Peninsula including all upland adjacent to Alder Cove and east of N. E. Skipanon Drive, with the exception of the area designated commercial by the City of Warrenton Zoning Ordinance;

dredged material disposal site Wa-S-10.7 from the Columbia River Estuary Dredged Material Management Plan; and The Holbrook Slough wetland, classified as significant under Oregon Statewide Planning Goal 17.

(3) Goal Exception - An exception to Goal 16 to allow in-water disposal of dredged material in the expanded flowlane in depths greater than 20 feet and contiguous to the Federal Navigation Channel, which encroach into designated Conservation Aquatic areas, was approved by Ordinance 1283 on January 28, 2024.

Section 4. Section 5.305(10) of the City of Warrenton Comprehensive Plan is amended to read as follows:

Section 5.305 Dredging and Dredged Material Disposal

(10) Flowlane disposal sites shall only be allowed in Development Aquatic areas within or adjacent to a channel or where an exception to Goal 16 has been approved. The Development Aquatic area adjacent to the channel shall be defined by a line 600 feet from either side of the channel or the 20-foot bathymetric contour, whichever is closer to the channel. Flowlane disposal within this area shall only be allowed where:

(a) Sediments can reasonably be expected to be transported downstream without excessive shoaling,

(b) Interference with recreational and commercial fishing operations, including snag removal from gillnet drifts, will be minimal or can be minimized by applying specific restrictions on timing or disposal techniques,

(c) Adverse hydraulic effects will be minimal,

(d) Adverse effects on estuarine resources will be minimal, and

(e) The disposal site depth is 20 feet below MLLW or deeper.

(f) An exception to Goal 16 to allow in-water disposal of dredged material in the expanded flowlane in depths greater than 20 feet and contiguous to the Federal Navigation Channel, which encroach into designated Conservation Aquatic or Natural Aquatic areas, has been approved.

Section 5. Section 16.76.030 of the Warrenton Municipal Code is amended to read as follows:

A. High-intensity water-dependent recreation including boat ramps, marinas, and individual docks.
B. Aquaculture and water-dependent portions of aquaculture facilities.
C. Active restoration for purposes other than protection of habitat, nutrient, fish, wildlife and aesthetic resources.
D. Temporary alterations.
E. Filling in conjunction with listed conditional uses, pursuant to the applicable standards in Section 16.160.060.
F. Minor navigational improvement.
G. Mining and mineral extraction.
H. Dredging in conjunction with any of the listed conditional uses pursuant to the applicable standards in Section 16.160.040.
I. Low-intensity water-dependent commercial or industrial uses requiring occupation of water-surface area by means other than fill.
J. In-water log storage.
K. Communication facilities subject to the standards of Chapter 16.148.
L. Piling in conjunction with any of the listed conditional uses.
M. Flow lane disposal of dredged material where an exception to Statewide Goal 16 has been approved.
N. Similar uses to those listed in this section.

Section 6. Section 16.160.050(E) of the Warrenton Municipal Code is amended to read as follows:

E. Flow lane disposal shall be in aquatic development areas, or areas where an exception to Goal 16 has allowed in-water disposal of dredged material in depths greater than 20 feet and contiguous to the Federal Navigation Channel which encroach into designated Conservation Aquatic areas, that have been identified as low in benthic productivity and use of these areas shall not have adverse hydraulic effects. Use of flow lane disposal areas in the estuary shall be allowed only when no feasible alternative land or ocean disposal sites with less damaging environmental impacts can be identified and the biological and physical impacts of flow lane disposal are demonstrated to be insignificant. The feasibility and desirability of alternative sites shall take into account, at a minimum:
    1. Operational constraints such as distance to the alternative sites;
    2. Sediment characteristics at the dredging site;
    3. Timing of the operation;
    4. Environmental Protection Agency constraints on the use of designated ocean disposal sites;

5. The desirability of reserving some upland sites for potentially contaminated material only. Long term use of a flow lane disposal area may only be allowed if monitoring confirms that the impacts are not significant. Flow lane disposal is contingent upon demonstration that:
   a. Significant adverse effects due to changes in biological and physical estuarine properties will not result; and
   b. Flow lane disposal areas shall be shown able to transport sediment downstream without excessive shoaling, interference with recreational and commercial fishing operations, including the removal of snags from gillnet drifts, undesirable hydraulic effects, or adverse effects on estuarine resources (fish runs, spawning activity, benthic productivity, wildlife habitat, etc.).
6. When determining whether a proposal is within the expanded flowlane/thalweg disposal area covered by an approved Goal 16 exception, the Columbia River Estuary Thalweg map adopted by Ordinance 1283 shall be consulted. It is important to note that the text description of "expanded flowlane/thalweg disposal" are the regulating boundaries of this exception area. Maps and GIS data layers used by the City are a representation of those boundaries. In cases of any doubt, the text description should be used to resolve any boundary confusion.

Section 7. The Columbia River Thalweg map shown in Exhibit 1 is hereby adopted and incorporated into the Warrenton Comprehensive Plan as Appendix III.

Section 8. This ordinance shall take full force and effect 30 days after its adoption by the Commission of the City of Warrenton.

First Reading: April 8, 2025
Second Reading:

ADOPTED by the City Commission of the City of Warrenton, Oregon this ___ day of _____, 2025.

City Commission Agenda Memo

Meeting Date: April 8th, 2025
From: Kevin Gorman, Public Works Director
Subject: Request for Commission Approval to Advertise for Bids – Hammond Transmission Waterline Phase 1

Summary:

Staff requests authorization to advertise for construction bids for the Hammond Waterline Phase 1 Project. The design for the entire project has been completed, and it will be constructed in two phases. Phase 1 involves the installation of approximately 4,500 linear feet of 18-inch diameter PVC water transmission pipe, isolation valves, and other water system appurtenances, along with connections to existing water mains and services. The transmission main will be installed along Fort Stevens Highway (OR-104) and NW 13th Street.

Phase 1 will provide significant improvements to the City's water infrastructure, with Phase 2 planned as the final phase to complete the project. The City is actively working to secure funding for Phase 2, which will follow Phase 1 as soon as resources are available.

Recommendation/Suggested Motion:

"I move to authorize the advertisement for construction bids for the Hammond Waterline Phase 1 Project."

Alternative:

Other action as deemed appropriate by the City Commission
OR
None recommended

Fiscal Impact:

The project includes funding from Business Oregon's Safe Drinking Water Revolving Loan Fund (SDWRLF), the Environmental Protection Agency (EPA), and a smaller portion of local funds. The project is fully funded with no additional fiscal impact beyond the $3 million already allocated in the adopted FY 2024-2025 budget.

Attachments:

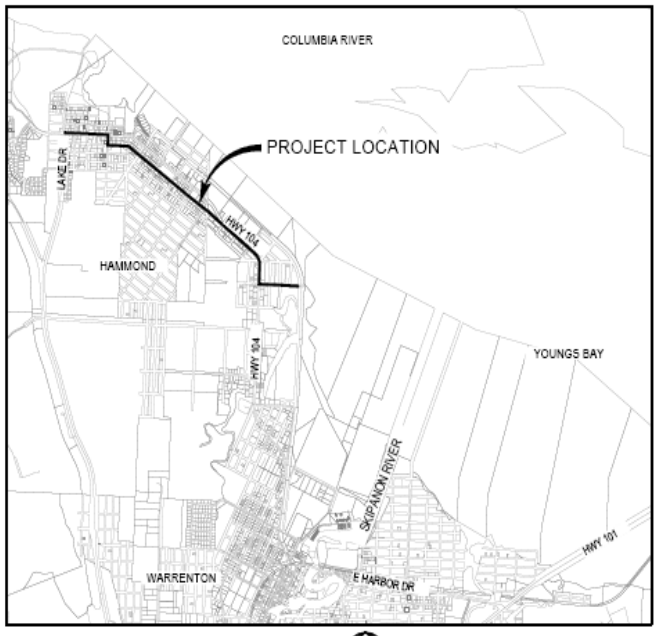
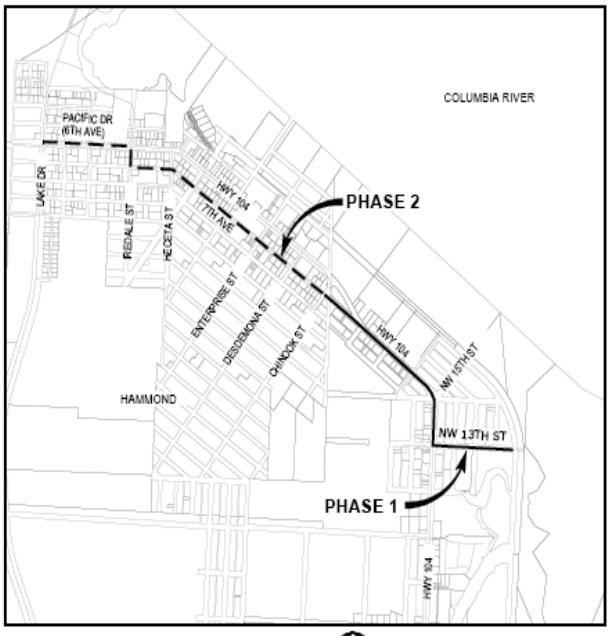
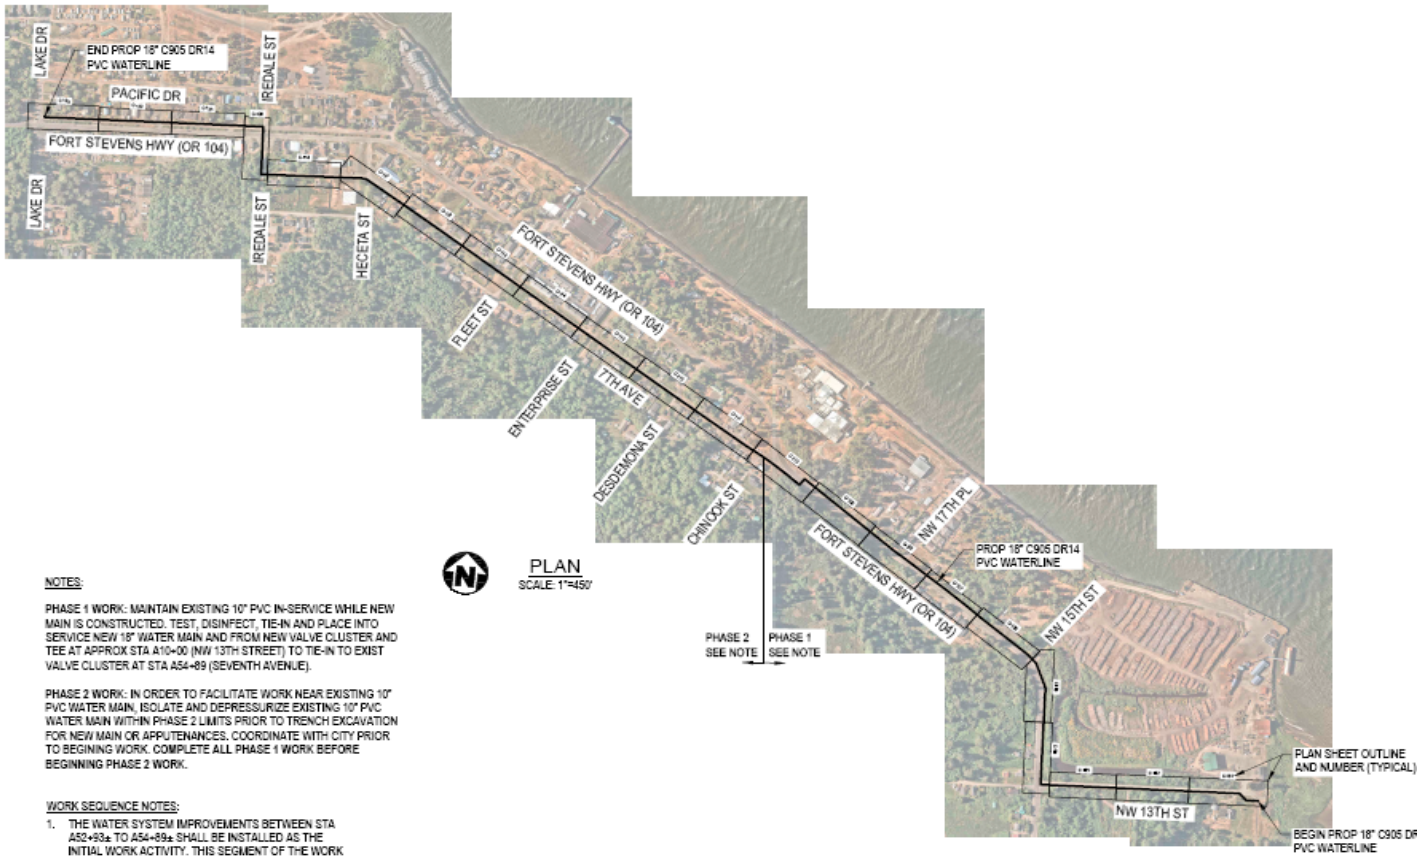
Approved by City Manager: Esther Moberg



VICINITY MAP
SCALE: 1" = 5000'



LOCATION MAP
SCALE: 1" = 1000'



PLAN
SCALE: 1"=450'

NOTES:

PHASE 1 WORK: MAINTAIN EXISTING 10" PVC IN-SERVICE WHILE NEW MAIN IS CONSTRUCTED. TEST, DISINFECT, TIE-IN AND PLACE INTO SERVICE NEW 18" WATER MAIN AND FROM NEW VALVE CLUSTER AND TEE AT APPROX STA A10+00 (NW 13TH STREET) TO TIE-IN TO EXIST VALVE CLUSTER AT STA A54+89 (SEVENTH AVENUE).

PHASE 2 WORK: IN ORDER TO FACILITATE WORK NEAR EXISTING 10" PVC WATER MAIN, ISOLATE AND DEPRESSURIZE EXISTING 10" PVC WATER MAIN WITHIN PHASE 2 LIMITS PRIOR TO TRENCH EXCAVATION FOR NEW MAIN OR APPURTENANCES. COORDINATE WITH CITY PRIOR TO BEGINING WORK. COMPLETE ALL PHASE 1 WORK BEFORE BEGINNING PHASE 2 WORK.

WORK SEQUENCE NOTES:

1. THE WATER SYSTEM IMPROVEMENTS BETWEEN STA A52+93± TO A54+89± SHALL BE INSTALLED AS THE INITIAL WORK ACTIVITY. THIS SEGMENT OF THE WORK REQUIRES ARCHAEOLOGIST MONITORING OF EXCAVATION AND TRENCHING ACTIVITIES. THIS SEGMENT OF WORK SHALL BE INSTALLED, TESTED AND DISINFECTED. THE CUT-OFF VALVES WILL BE CLOSED TO ISOLATE IT FROM THE EXISTING 10-INCH WATER MAIN, THE WATER SHALL BE DRAINED FROM THE PIPE AND A TEMPORARY CAP INSTALLED.
2. UPON COMPLETION OF THE PREVIOUS WORK SEGMENT, THE WATERLINE INSTALLATION SHALL RESUME BEGINNING AT STA A10+00 AND PROCEEDING WEST/NORTH IN STATION ASCENDING ORDER. THE WATER SYSTEM IMPROVEMENTS SHALL BE INSTALLED, TESTED, DISINFECTED AND ACCEPTED IN LOGICAL SEQUENCE.
3. UPON REACHING THE TEMPORARY CAP INSTALLED IN STEP 1, THE TEMPORARY CAP SHALL BE REMOVED, WATERLINE CONNECTED, AND THE PIPE SEGMENT SHALL BE TESTED, DISINFECTED, AND ACCEPTED.
4. REFER TO SECTIONS 00 73 00, SPECIAL PROVISIONS, AND 01 12 16, WORK SEQUENCE, FOR ADDITIONAL INFORMATION.

PROCUREMENT REQUIREMENTS

SECTION 00 11 13 - ADVERTISEMENT FOR BIDS

CALL FOR BIDS - PUBLIC WORKS IMPROVEMENT

Sealed bids will be received up to the hour of 2:00 PM, local time, on MONTH DAY, YEAR, by Kevin Gorman, Public Works Director, at the front desk of Warrenton City Hall, 225 South Main Street, Warrenton, OR 97146:

HAMMOND TRANSMISSION WATERLINE PROJECT – PHASE 1

PROJECT DESCRIPTION

The intent of this contract is to enhance the City's water transmission system in the Hammond community. The following is a summary of the major elements of Work that are to be provided by the Contractor.

1. Installation of approximately 4,500 linear feet of buried 18-inch diameter PVC C900 DR 18 water transmission pipe, isolation valves and other water system appurtenances, and connections to existing watermains and services. The water transmission main will be installed along Ft Stevens Highway (OR-104) and NW 13th Street.

Project Substantial Completion shall be 120 calendar days from Notice to Proceed and Project Final Completion shall be 150 calendar days from Notice to Proceed.

A voluntary pre-bid meeting will be held on MONTH DAY, YEAR, at 10:00 AM, local time, at Warrenton City Hall, PO Box 250, 225 South Main Street, Warrenton, OR 97146. A project site tour will follow the pre-bid meeting.

Any bids received after the above specified time will not be considered. The carrier, including the United States Postal Service, is considered an agent of the bidder.

Solicitation Documents may be obtained via email request to tvittetoe@warrentonoregon.us. Documents are available at no charge in electronic file format (PDF).

Questions regarding the project during the bid period shall be submitted to Twyla Vittetoe, Engineering Technician, City of Warrenton via phone at 503-861-0912 or email at tvittetoe@warrentonoregon.us.

Bids will be publicly opened and read by the Public Works Director at 2:00 PM, local time on MONTH DAY, YEAR, in the Warrenton Fire Training Room. All bids must be accompanied by a certified check, a cashier's check, or bid bond in an amount equal to at least 5% of the total bid.

If the total bid exceeds $50,000.00 the contract will be subject to Prevailing Wage Statute ORS 279C.800 to 279C.870. The contract is subject to federal prevailing wage rates under the Davis-Bacon Act (40 U.S.C. 3141 et seq).

Prior to submission of its bid, bidder shall be registered with the Oregon Construction Contractor's Board as required by ORS 701.055, and thereafter comply with the requirements of ORS 701.035 to 701.055.

Bidders shall be qualified in accordance with the applicable parts of ORS 279C in order to submit a bid for public works in Oregon.

Work under this contract is funded by the federal Safe Drinking Water Revolving Loan Fund through Business Oregon, a grant from the Environmental Protection Agency, and a partnership of Local and/or Private Funds.

This contract is subject to federal statutory requirements of American Iron and Steel (AIS) and Build America Buy America (BABA) Act.

By: Kevin Gorman, Public Works Director
City of Warrenton, Oregon

END OF SECTION

SECTION 00 41 43 - BID PROPOSAL FORM

The undersigned, having full knowledge of the quality and quantity of work and material required, hereby proposes to furnish all labor, material and equipment required to complete the work of:

HAMMOND TRANSMISSION WATERLINE – PHASE 1

in accordance with the ODOT/APWA 2015 Oregon Standard Specifications for Construction and the Special Provisions, Plans and Specifications hereto, and at the following Bid Schedule prices by the following completion dates:

- Substantial Completion –120 calendar days from Notice to Proceed
- Final Completion – 150 calendar days from Notice to Proceed

Enclosed herewith is a bid surety deposit in the amount of at least five percent (5%) of the bid.

The undersigned bidder hereby represents as follows: That this bid is made without connections with any person, firm or corporation making a bid for same, and is in all respects fair and without collusion or fraud.

Contractor agrees comply with ORS 279C.838 or ORS 279C.840 or 40 USC3141, et seq, if the contract is subject to state or federal prevailing wage laws.

The undersigned is _____YES _____NO a resident bidder, as defined in ORS 279A.120. (PLEASE CHECK ONE)

Oregon Construction Contractor Board No. _____.

SECTION 00 43 93 – BID SUBMITTAL CHECKLIST

FORMS TO EXECUTE FOR SUBMISSION OF BID

The Bidder's attention is especially called to the following forms which must be executed in full before bid is submitted:

(a) Bid Form: The Bid Form is to be filled in and signed by the bidder and returned with bid.

(b) Bond Accompanying Bid: All bids shall be accompanied by a guarantee equal to at least five percent (5%) of the bid amount. This guarantee may be in the form of a bond, certified check, or cashier's check. Bid bonds will be accompanied by a power of attorney bearing the same date as the bond.

(c) Certification of Nondiscrimination: This form must be signed and submitted with bid.

(d) Certification Regarding Lobbying: This form must be signed and submitted with bid.

(e) DBE Proposed Utilization: Documentation of good faith efforts for solicitation and proposed utilization/contracting with Disadvantaged Business Enterprises ("DBE").

(f) If applicable, First-Tier Subcontractor Disclosure form, within 2 hours of bid closing.

Facsimile transmissions of bids, bid security or subcontractor disclosure forms will not be accepted.

FORMS TO EXECUTE AFTER AWARD OF BID

(a) Contract: The agreement provided in these Solicitation Documents is to be executed by the successful bidder within 14 calendar days of award of the contract.

(b) Insurance must comply with the General Conditions and Special Provisions of the Contract Documents. Proof of such insurance and additional insured certificate must be delivered to the Agency at the same time the contract is signed.

(c) The contractor shall furnish a performance bond and a payment bond each in an amount equal to one hundred percent (100%) of the contract price as security for the faithful performance of this contract and for the protection of claimants under ORS 279C.600.

SECTION 00 45 46.02 - CERTIFICATION REGARDING LOBBYING

(Awards to Contractors and Subcontractors in Excess of $100,000)

The undersigned certifies, to the best of his or her knowledge and belief, that:

(1) No Federal appropriated funds have been paid or will be paid, by or on behalf of the undersigned, to any person for influencing or attempting to influence an officer or employee of any agency, a Member of Congress, an officer or employee of Congress, or an employee of a Member of Congress in connection with the awarding of any Federal contract, the making of any Federal grant, the making of any Federal loan, the entering into of any cooperative agreement, and the extension, continuation, renewal, amendment, or modification of any Federal contract, grant, loan or cooperative agreement.

(2) If any funds other than Federal appropriated funds have been paid or will be paid to any person for influencing or attempting to influence an officer or employee of any agency, a Member of Congress, an officer or employee of Congress, or an employee of a Member of Congress in connection with this Federal contract, grant, loan, or cooperative agreement, the undersigned shall complete and submit Standard Form-LLL, "Disclosure Form to Report Lobbying," in accordance with its instructions.

(3) The undersigned shall require that the language of this certification be included in the award documents for all subawards at all tiers (including subcontracts, subgrants, and contracts under grants, loans, and cooperative agreements) and that all subrecipients shall certify and disclose accordingly.

This certification is a material representation of fact upon which reliance was placed when this transaction was made or entered into. Submission of this certification is a prerequisite for making or entering into this transaction imposed by section 1352, title 31, U.S. Code. Any person who fails to file the required certification shall be subject to a civil penalty of not less than $10,000 and not more than $100,000 for each such failure.

SECTION 00 52 13 – CONTRACTOR AGREEMENT

1.00 - GENERAL

THIS AGREEMENT, made and entered into this ____ day of _____, 20__, by and between _____, hereinafter called "CONTRACTOR" and the City of Warrenton, a municipal corporation, hereinafter called "CITY."

WITNESSETH:

That the said CONTRACTOR and the said CITY, for the consideration hereinafter named agree as follows:

2.00 - DESCRIPTION OF WORK

The CONTRACTOR agrees to perform the work of:

HAMMOND TRANSMISSION WATERLINE PROJECT – PHASE 1

and do all things required of it as per his Bid, all in accordance with the described Bid, a copy of which is hereto attached and made a part of this Contract.

3.00 - COMPLETION OF CONTRACT

The CONTRACTOR agrees that the Work under this Contract shall be completed by the following dates:

- Substantial Completion – 120 calendar days from Notice to Proceed
- Final Completion – 150 calendar days from Notice to Proceed

If said CONTRACTOR has not fully completed this Contract within the time set or any extension thereof, it shall pay liquidated damages in accordance with Section 00180.85 of the General Conditions.

4.00 - CONTRACT PRICE

The Contract Price for this project is _____. Payment will be made in accordance with ORS 279C.560 including progress payments at the end of each month. Retainage will be withheld in accordance with ORS 279C.550 - .565.

5.00 - CONTRACT DOCUMENTS

The CONTRACTOR and the CITY agree that the plans, specifications (including the ODOT/APWA 2015 Oregon Standard Specifications for Construction and Contract Documents defined in Section 00110.20 of the Contract Documents General Conditions and all modifications thereto) and bid are, by this reference, incorporated into this Contract and are fully a part of this contract.

6.00 - NONDISCRIMINATION

It is the policy of the City of Warrenton that no person shall be denied the benefits of or be subjected to discrimination in any City program, service, or activity on the grounds of age, disability, race, religion, color, national origin, sex, sexual orientation, gender identity and expression. The City of Warrenton also requires its contractors and grantees to comply with this policy.

7.00 - CONTRACTOR IS INDEPENDENT CONTRACTOR

A. CONTRACTOR acknowledges that for all purposes related to this Contract, CONTRACTOR is and shall be deemed to be an independent CONTRACTOR and not an employee of CITY, shall not be entitled to benefits of

any kind to which an employee of the CITY is entitled and shall be solely responsible for all payments and taxes required by law; and furthermore in the event that CONTRACTOR is found by a court of law or an administrative agency to be an employee of the CITY for any purpose, CITY shall be entitled to repayment of any amounts from CONTRACTOR under the terms of the Contract; to the full extent of any benefits or other remuneration CONTRACTOR receives (from CITY or third party) as result of said finding and to the full extent of any payments that CITY is required to make (to CONTRACTOR or to a third party) as a result of said finding.

B. The undersigned CONTRACTOR hereby represents that no employee of the CITY of Warrenton, or any partnership or corporation in which a CITY employee has an interest, has or will receive any remuneration of any description from the CONTRACTOR, either directly or indirectly, in connection with the letting or performance of this Contract, except as specifically declared in writing.

8.00 - SUBCONTRACTS - RELATIONS WITH SUBCONTRACTORS, ASSIGNMENTS AND DELEGATION

A. Assignment or Transfer Restricted. The CONTRACTOR shall not assign, sell, dispose of, or transfer rights nor delegate duties under the contract, either in whole or in part, without the CITY's prior written consent. Unless otherwise agreed by the CITY in writing, such consent shall not relieve the CONTRACTOR of any obligations under the contact. Any assignee or transferee shall be considered the agent of the CONTRACTOR and be bound to abide by all provisions of the contract. If the CITY consents in writing to an assignment, sale, disposal or transfer of the CONTRACTOR's rights or delegation of the CONTRACTOR's duties, the CONTRACTOR and its surety, if any, shall remain liable to the CITY for complete performance of the contract as if no such assignment, sale, disposal, transfer or delegation had occurred unless the CITY otherwise agrees in writing.

B. CONTRACTOR may not discriminate against a subcontractor in awarding a subcontract because the subcontractor is a minority, women or emerging small business enterprise certified under ORS 200.055 or a business enterprise that is owned or controlled by or that employs a disabled veteran, as defined in ORS 408.225. If CONTRACTOR violates this prohibition, the CITY will regard the violation as a breach of contract and may either terminate the contract or exercise any other remedy for breach of contract.

9.00 - NONWAIVER

The failure of the CITY to insist upon or enforce strict performance by CONTRACTOR of any of the terms of this Contract or to exercise any rights hereunder shall not be construed as a waiver or relinquishment to any extent of its right to assert or rely upon such terms or rights on any future occasion.

10.00 - LABORERS AND MATERIALMEN, CONTRIBUTIONS TO INDUSTRIAL ACCIDENT FUND, LIENS AND WITHHOLDING TAXES

CONTRACTOR shall make payment promptly, as due, to all persons supplying CONTRACTOR labor or material for the prosecution of the work provided for this contract.

CONTRACTOR shall pay all contributions or amounts due the Industrial Accident Fund from CONTRACTOR or any subcontractor incurred in the performance of the contract.

CONTRACTOR shall not permit any lien or claim to be filed or prosecuted against the CITY on account of any labor or material furnished.

CONTRACTOR shall pay to the Department of Revenue all sums withheld from employees pursuant to ORS 316.167.

11.00 - CERTIFICATION OF COMPLIANCE WITH TAX LAWS

As required by ORS 305.385(6), CONTRACTOR certifies under penalty of perjury that the CONTRACTOR, to the best of CONTRACTOR's knowledge, is not in violation of any of the tax laws described in ORS 305.380(4).

12.00 - CITY BUSINESS LICENSE

Prior to starting work, CONTRACTOR shall pay the CITY business license tax and provide the Project Director with a copy of business license receipt. CONTRACTOR shall, likewise, require all subcontractors to pay the CITY business license tax and provide a copy of the receipt to the Project Director prior to commencement of work.

SECTION 00 61 13.13 - PERFORMANCE BOND

AMOUNT $ _____

BOND NO. _____

KNOW ALL PEOPLE BY THESE PRESENTS:

That we, _____, hereinafter called
(Name of Contractor)

the PRINCIPAL, as Principal, and _____,
(Name of Surety)

a corporation and existing under and by virtue of the laws of the State of _____ and authorized to transact a surety business in the State of Oregon, hereinafter called the SURETY, as Surety, are held and firmly bound unto the City of Warrenton, a Municipal Corporation of the State of Oregon, hereinafter called the OBLIGEE, in the

penal sum of _____ Dollars

($_____) for the payment of which sum well and truly to be made, the said PRINCIPAL and the said SURETY bind ourselves, our heirs, executors, administrators, successors, and assigns, jointly and severally, firmly by these presents.

THE CONDITION OF THE ABOVE OBLIGATION IS SUCH THAT:

Whereas on the _____ day of _____, 20___ the PRINCIPAL entered into a certain contract with the OBLIGEE, a copy of which is hereto attached and made a part hereof for the construction of:

HAMMOND TRANSMISSION WATERLINE PROJECT – PHASE 1
City of Warrenton, Oregon

NOW, THEREFORE, if the PRINCIPAL herein shall faithfully and truly observe and comply with the terms of the contract and shall well and truly perform all matters and things undertaken to be performed under said contract upon the terms proposed therein and shall promptly make payments to all persons supplying labor or material for any prosecution of the work provided for each contract and shall not permit any lien or claim to be filed or prosecute against the OBLIGEE on account of any labor or material furnished, and shall promptly pay all contributions or amounts due the State Accident Insurance Fund and all contributions or amounts due the State Un-employment Compensation Trust Fund incurred in the performance of said contract and shall promptly, as due, make payment to the person, co-partnership, association or corporation entitled thereto of the moneys and sums mentioned in Section 279 of the Oregon Revised Statutes, then this obligation is to be void, otherwise to remain in full force and effect.

This performance bond shall also guarantee the improvement against defects in materials or workmanship for a period of one (1) year from the date of written Substantial Completion acceptance of the subject project by the OBLIGEE.

The total amount of the SURETY's liability under this bond both to the OBLIGEE and to the persons furnishing labor or materials, provisions and goods and to any other person or persons, shall in no event exceed the penalty hereof.

Provided, however, that the conditions of the obligation shall not apply to any money loaned or advanced to the PRINCIPAL or to any subcontractor or other person in the performance of any such work, whether specifically provided for in the contract or not.

This bond is executed for the purpose of complying with Chapter 279 of Title 26, Oregon Revised Statutes, the provisions of which are hereby incorporated herein and made a part hereof.

IN WITNESS WHEREOF, this instrument is executed in three counterparts each one of which

shall be deemed an original, this the _____day of _____, 20___.

IMPORTANT: Surety company executing BOND must be authorized to transact business in the State of Oregon.

END OF SECTION

SECTION 00 61 13.16 - PAYMENT BOND

AMOUNT $ _____

BOND NO. _____

KNOW ALL PEOPLE BY THESE PRESENTS:

That we, _____, hereinafter called
(Name of Contractor)

the PRINCIPAL, as Principal, and _____,
(Name of Surety)

a corporation and existing under and by virtue of the laws of the State of _____ and authorized to transact a surety business in the State of Oregon, hereinafter called the SURETY, as Surety, are held and firmly bound unto the City of Warrenton, a Municipal Corporation of the State of Oregon, hereinafter called the OBLIGEE, and unto all persons, firms and corporations who or which may furnish labor, or who furnish materials to perform as described under the contract and to their successors and assigns in the total

aggregate penal sum of _____ Dollars

($_____) for the payment of which sum well and truly to be made, the said PRINCIPAL and the said SURETY bind ourselves, our heirs, executors, administrators, successors, and assigns, jointly and severally, firmly by these presents.

THE CONDITION OF THE ABOVE OBLIGATION IS SUCH THAT:

Whereas on the _____ day of_____, 20___ the PRINCIPAL entered into a certain contract with the OBLIGEE, a copy of which is hereto attached and made a part hereof for the construction of:

HAMMOND TRANSMISSION WATERLINE PROJECT – PHASE 1
City of Warrenton, Oregon

NOW, THEREFORE, if the PRINCIPAL shall promptly make payment to all persons, firms, and corporations furnishing materials for, or performing labor in the prosecution of the WORK provided for in such contract, and any authorized extensions or modification thereof, including all amounts due for materials consumed or used in connection with the construction of such WORK, and for all labor cost incurred in such WORK including that by a SUBCONTRACTOR, and to any mechanic or material man lien holder whether it acquires its lien by operation of State or Federal law; then this obligation shall be void, otherwise to remain in full force and effect.

PROVIDED, that beneficiaries or claimants hereunder shall be limited to the SUBCONTRACTORS, and persons, firms, and corporations having a direct contract with the PRINCIPAL or its SUBCONTRACTORS.

PROVIDED, FURTHER, that the said SURETY for value received hereby stipulates and agrees that no change, extension of time, alteration or addition to the terms of the contract or to the WORK to be performed thereunder or the specifications accompanying the same shall in any way affect its obligation on this BOND, and it does hereby waive notice of any such change, extension of time, alteration or addition to the terms of this contract or to the WORK or to the SPECIFICATIONS.

PROVIDED, FURTHER, that no suit or action shall be commenced hereunder by any claimant: (a) Unless claimant, other than one having a direct contract with the PRINCIPAL shall have given written notice to any two of the following: the PRINCIPAL, the OBLIGEE, or the SURETY above named within one hundred twenty (120) days after such claimant did or performed the last of the work or labor, or furnished the last of the materials for which said claim is made, stating the materials were furnished, or for whom the work or labor was done or performed. Such notice shall be served by mailing the same by registered mail or certified mail, postage prepaid, in an envelope addressed to the PRINCIPAL, OBLIGEE, or SURETY, at any place where an office is regularly maintained for the transaction of business, or served in any manner in which legal process may be served in the state in which the aforesaid project is located, save that such service need not be made by a public officer. (b) After the expiration of one (1) year following the date on which PRINCIPAL ceased work on said CONTRACT, it being understood, however, that if any limitation embodied in the BOND is prohibited by any law controlling the construction hereof, such limitation shall be deemed to be amended so as to be equal to the minimum period of limitation permitted by such law.

PROVIDED, FURTHER, that it is expressly agreed that this BOND shall be deemed amended automatically and immediately, without formal and separate amendments hereto, upon amendment to the Contract not increasing the contract price more than 25 percent, so as to bind the PRINCIPAL and the SURETY to the full and faithful performance of the Contract as so amended. The term "Amendment", wherever used in this BOND and whether referring to this BOND, the contract or the loan Documents shall include any alteration, addition, extension or modification of any character whatsoever.

PROVIDED, FURTHER, that no final settlement between the OBLIGEE and the PRINCIPAL shall abridge the right of any beneficiary hereunder, whose claim may be unsatisfied.

IN WITNESS WHEREOF, this instrument is executed in three counterparts each one of which shall be deemed an original, this the _____day of _____, 20___.

PART 00100 - GENERAL CONDITIONS

Section 00110 - Organization, Conventions, Abbreviations, and Definitions

Organization

00110.00 Organization of Specifications - The Specifications are comprised of the following:

- The "General Conditions for Construction for the City of Warrenton (Agency)," published by the Agency, which contain Part 00100 "General Conditions", which deal with the solicitation process and contractual relationships;
- The "2018 Oregon Standard Specifications for Construction," which contain Parts 00200 through 03000, published by the Oregon Department of Transportation which contain the detailed "Technical Specifications" involved in prosecution of the Work, organized by subject matter; and
- The Special Provisions.

In addition, throughout the Specifications:

- Each Part is divided into Sections and Subsections.
- Reference to a Section includes all applicable requirements of the Section.
- When referring to a Subsection, only the number of the Subsection is used; the word "Subsection" is implied.
- Where Section and Subsection numbers are not consecutive, the interval has been reserved for use in the Special Provisions or future expansion of the Standard Specifications.

Conventions

00110.05 Conventions Used Throughout the Specifications Include:

(a) Grammar – The "General Conditions for Construction for the City of Warrenton (Agency)", part 00100 "General Conditions", is written in the indicative mood, in which the subject is expressed. The "2018 Oregon Standard Specifications for Construction", published by the Oregon Department of Transportation, which contain parts 00200 through 03000, the detailed "Technical Specifications", are generally written in the imperative mood, in which the subject is implied. Therefore, throughout Parts 00200 through 03000, and on the Plans:

- The subject, "the Contractor", is implied.
- "Shall" refers to action required of the Contractor, and is implied.
- "Will" refers to decisions or actions of the Agency and/or the Engineer.
- The following words, or words of equivalent meaning, refer to the actions of the Agency and/or the Engineer, unless otherwise stated: "allowed", "directed", "established", "permitted", "ordered", "designated", "prescribed", "required", "determined".

- The words "approved", "acceptable", "authorized", "satisfactory", "suitable", "considered", and "rejected", "denied", "disapproved", or words of equivalent meaning, mean by or to the Agency and/or the Engineer, subject in each case to Section 00150 of the General Conditions.
- The words "as shown", "shown", "as indicated", or "indicated" mean "as indicated on the Plans".
- Certain Subsections labeled "Payment" contain statements to the effect that "payment will be made at the Contract amounts for the following items" (followed by a list of items). In such cases the Agency shall pay for only those Pay Items listed in the Schedule of Items.

(b) Capitalization of Terms - Capitalized terms, other than titles, abbreviations, and grammatical usage, indicate that they have been given a defined meaning in the Standard Specifications. Refer to Section 00110.20 "Definitions". Defined terms will always be capitalized in Part 00100; in Parts 00200 through 03000, defined terms will generally not be capitalized, with the notable exception of "the Contractor", "the Agency", and "the Engineer".

(c) Punctuation - In this publication the "outside method" of punctuation is employed for placement of the comma and the period with respect to quotation marks. Only punctuation that is part of the quoted matter is placed within quotation marks.

(d) References to Laws, Acts, Regulations, Rules, Ordinances, Statutes, Orders, and Permits - References are made in the text of the Specifications to "laws", "acts", "rules", "statutes", "regulations", "ordinances", etc. (collectively referred to for purposes of this Subsection as "Law"), and to "orders" and "permits" (issued by a governmental authority, whether local, State, or federal, and collectively referred to for purposes of this Subsection as "Permits"). Reference is also made to "applicable laws and regulations". The following conventions apply in interpreting these terms, as used in the Specifications.

- Statutes and Rules - Oregon Revised Statutes (ORS) and Oregon Administrative Rules (OAR) referenced in the Specifications are accessible on line, including through the Oregon Legislative Counsel Committee web site and through the Oregon Secretary of State Archives Division web site.

- Law - In each case, unless otherwise expressly stated therein, the Law is to be understood to be the current version in effect. This also applies where a specific Law is referenced or cited, regardless of whether the text of the Law has been included in the Specifications or not, and regardless of whether the text of the Law has been summarized or paraphrased. In each case, the current version of the Law is applicable under any Contract. The reader is therefore cautioned to check the actual text of the Law to confirm that the text included in the Specifications has not been modified or superseded.

- Permits - Orders and permits issued by a government agency may be modified during the course of performing the Work under a Contract. Therefore, wherever the term "order" or "permit" is used in the Specifications, it is intended to refer to the then-current version. That version may be embodied in a modified, superseding order or permit, or it may consist of all terms and conditions of prior orders or permits that have not been superseded, as well as the additional terms added by amendment or supplement. In certain cases, the orders and/or permits are identified by name in the Specifications; in other cases the terms are used in the generic sense. The reader is cautioned to check the text(s) of each order and permit identified either by name or by generic reference.

- **Applicable Laws and Regulations** - Where the phrase "applicable laws and regulations" appears, it is to be understood as including all applicable laws, acts, regulations, administrative rules, ordinances, statutes, and orders and permits issued by a governmental or regulatory authority.

Abbreviations

00110.10 Abbreviations - Following are meanings of abbreviations used in the Standard Specifications, in the Special Provisions, on the Plans, and in other Contract Documents. Other abbreviations and meanings of abbreviations may be in the individual Sections of the Standard Specifications to which they apply, in the Special Provisions, and in OAR 731-005 and OAR 731-007.

AAR - Association of American Railroads
AASHTO - American Association of State Highway and Transportation Officials
ABC - Associated Builders and Contractors, Inc.
AC - Asphalt Concrete
ACI - American Concrete Institute
ACP - Asphalt Concrete Pavement
ACWS - Asphalt Concrete Wearing Surface
AGC - Associated General Contractors of America
AIA - American Institute of Architects
AISC - American Institute of Steel Construction
AISI - American Iron and Steel Institute
AITC - American Institute of Timber Construction
ANSI - American National Standards Institute
APA - Engineered Wood Association
APWA - American Public Works Association
AREMA - American Railway Engineering and Maintenance of Right-of-Way Association
ASCE - American Society of Civil Engineers
ASME - American Society of Mechanical Engineers
ASTM - American Society for Testing and Materials
ATPB - Asphalt Treated Permeable Base
AWG - American Wire Gauge
AWPA - American Wood Protection Association
AWS - American Welding Society
AWWA - American Water Works Association
CAgT - Certified Aggregate Technician
CAT-I - Certified Asphalt Technician I
CAT-II - Certified Asphalt Technician II
CBM - Certified Ballast Manufacturers
CCO - Contract Change Order
CCT - Concrete Control Technician

CDT - Certified Density Technician
CEBT - Certified Embankment and Base Technician
CMDT - Certified Mixture Design Technician
CPF - Composite Pay Factor
CRSI - Concrete Reinforcing Steel Institute
CFR - Code of Federal Regulations
CS - Commercial Standard, Commodity Standards Division, U.S. Department of Commerce
D1.1 - Structural Welding Code - Steel, American Welding Society, current edition
D1.5 - Bridge Welding Code, American Welding Society, current edition
DBE - Disadvantaged Business Enterprise
DEQ - Department of Environmental Quality, State of Oregon
DOGAMI - Department of Geology and Mineral Industries, State of Oregon
DSL - Department of State Lands, State of Oregon
EAC - Emulsified Asphalt Concrete
EPA - U.S. Environmental Protection Agency
ESCP - Erosion and Sediment Control Plan
FHWA - Federal Highway Administration, U.S. Department of Transportation
FSS - Federal Specifications and Standards, General Services Administration
GSA - General Services Administration
ICEA - Insulated Cable Engineers Association (formerly IPCEA)
IES - Illuminating Engineering Society
IMSA - International Municipal Signal Association
ISO - International Standards Organization
ITE - Institute of Transportation Engineers
JMF - Job Mix Formula
MFTP - Manual of Field Test Procedures (ODOT)
MIL - Military Specifications
MSC - Minor Structure Concrete
MUTCD - Manual on Uniform Traffic Control Devices for Streets and Highways, FHWA, U.S. Department of Transportation
NEC - National Electrical Code
NEMA - National Electrical Manufacturer's Association
NESC - National Electrical Safety Code
NIST - National Institute of Standards and Technology
NPDES - National Pollutant Discharge Elimination System
NPS - Nominal Pipe Size (dimensionless)
OAR - Oregon Administrative Rules
ODA - Oregon Department of Agriculture
ODOT - Oregon Department of Transportation
ORS - Oregon Revised Statutes
OR-OSHA - Oregon Occupational Safety and Health Division of the Department of Consumer and Business Services
OSHA - Occupational Safety and Health Administration, U.S. Department of Labor
PCA - Portland Cement Association
PCC - Portland Cement Concrete

PCI	-	Precast/Prestressed Concrete Institute
PCP	-	Pollution Control Plan
PF	-	Pay Factor of a constituent
PLS	-	Professional Land Surveyor
PMBB	-	Plant Mixed Bituminous Base
PTI	-	Post-Tensioning Institute
PUC	-	Public Utility Commission, State of Oregon
QA	-	Quality Assurance
QC	-	Quality Control
QCT	-	Quality Control Technician
QL	-	Quality Level
QPL	-	Qualified Products List
RAP	-	Reclaimed Asphalt Pavement
REA	-	Rural Electrification Administration, U.S. Department of Agriculture
RMA	-	Radio Manufacturers Association or Rubber Manufacturers Association
SAE	-	Society of Automotive Engineers
SI	-	International System of Units (Système Internationale)
SRCM	-	Soil and Rock Classification Manual (ODOT)
SSPC	-	Society for Protective Coatings
T	-	Tolerances, AASHTO Test Method
TM	-	Test Method (ODOT)
TV	-	Target Value
UBC	-	Uniform Building Code (as adopted by the State of Oregon)
UL	-	Underwriters Laboratory, Inc.
UPC	-	Uniform Plumbing Code (as adopted by the State of Oregon)
USC	-	United States Code
WAQTC	-	Western Alliance for Quality Transportation Construction
WCLIB	-	West Coast Lumber Inspection Bureau
WWPA	-	Western Wood Products Association

Definitions

00110.20 Definitions - Following are definitions of words and phrases used in the Standard Specifications, in the Special Provisions, on the Plans, and in other Contract Documents. Other definitions may be in the individual Sections of the Standard Specifications to which they apply, in the Special Provisions, and in OAR 731-005 and OAR 731-007.

Act of God or Nature - A natural phenomenon of such catastrophic proportions or intensity as would reasonably prevent performance.

Addendum - A written or graphic modification, issued before the opening of Bids, which revises, adds to, or deletes information in the Solicitation Documents or previously issued Addenda.

Additional Work - Increased quantities of any Pay Item for which a unit price has been established, or the increase of Work within the scope of the Contract.

Advertisement - The public announcement (Call for Bids) inviting Bids for Work to be performed or Materials to be furnished.

Agency - The City of Warrenton, a municipal corporation of the State of Oregon, which has entered into a Contract with the Contractor.

Agency-Controlled Lands - Lands owned by the Agency, or controlled by the Agency under lease or agreement, or under the jurisdiction and control of the Agency for the purposes of the Contract.

Aggregate - Rock of specified quality and gradation.

Attorney in Fact - An Entity appointed by another to act in its place, either for some particular purpose or for the transaction of business in general.

Award - Written notification to the Bidder that the Bidder has been awarded a Contract.

Base - A Course of specified material of specified thickness placed below the Pavement.

Bid - A competitive offer, binding on the Bidder and submitted in response to an invitation to bid.

Bid Bond - The Surety bond for Bid guarantee.

Bid Booklet - The bound paper version included in the Solicitation Documents that contain the information identified in 00120.10.

Bid Closing - The date and time after which Bids, Bid modifications, and Bid withdrawals will no longer be accepted.

Bid Documents - See under Solicitation Document.

Bid Opening - The date and time Bids are opened.

Bid Schedule – The lump sum Pay Item; or the list of Pay Items, their units of measurement, and estimated quantities. (When a Contract is awarded, the Bid Schedule becomes the Schedule of Items.)

Bid Section - The portion of the Bid Booklet containing all pages after the Bidder's checklist and before the appendix.

Bidder - An Entity that submits a Bid in response to an invitation to bid.

Bike Lane - A lane in the Traveled Way, designated by striping and Pavement markings for the preferential or exclusive use of bicyclists.

Borrow - Material lying outside of planned or required Roadbed excavation used to complete Project earthwork.

Boulders - Particles of rock that will not pass a 12 inch square opening.

Bridge - A single or multiple span Structure, including supports, that carries motorized and non-motorized vehicles, pedestrians, or utilities on a Roadway, walk, or track over a watercourse, highway, railroad, or other feature.

Buttress - A rock fill placed at the toe of a landslide or potential landslide in order to resist slide movement.

Calendar Day - Any day shown on the calendar, beginning and ending at midnight.

Call for Bids - The public announcement inviting Bids for Work to be performed or Materials to be provided.

Camber - A slight arch in a surface or Structure to compensate for loading.

Change Order - A written order issued by the Engineer to the Contractor modifying Work required by the Contract, or adding Work within the scope of the Contract, and, if applicable, establishing the basis of payment for the modified Work.

Class of Work - A designation referring to the type of Work in which Bidders must be pre-qualified.

Clay - Soil passing a No. 200 sieve that can be made to exhibit plasticity (putty-like properties) within a range of water contents.

Clear Zone - Roadside border area, starting at the edge of the Traveled Way, that is available for safe use by errant vehicles. Establishing a minimum width Clear Zone implies that rigid objects and certain other hazards within the Clear Zone should be relocated outside the Clear Zone, or shielded, or remodeled to make them break away on impact or be safely traversable.

Close Conformance - Where working tolerances are given on the Plans or in the Specifications, Close Conformance means compliance with those tolerances. Where working tolerances are not given, Close Conformance means compliance, in the Engineer's judgment, with reasonable and customary manufacturing and construction tolerances.

Coarse Aggregate - Crushed Rock or crushed Gravel retained on a 1/4 inch sieve, with allowable undersize.

Cobbles - Particles of Rock, rounded or not, that will pass a 12 inch square opening and be retained on a 3 inch sieve.

Commercial Grade Concrete - Concrete furnished according to Contractor proportioning, placed in minor Structures and finished as specified.

Construction Contracts Unit - Agency's office that administers construction contracts.

Contract - The written agreement between the Agency and the Contractor, including without limitation all Contract Documents, describing the Work to be completed and defining the rights and obligations of the Agency and the Contractor.

Contract Administration Engineer - The Agency representative presiding over Agency-level claims review under 00199.40.

Contract Amount - Lump sum Pay Item or the sum of the Pay Item amounts computed by multiplying the Pay Item quantities by the unit prices in the Schedule of Items.

Contract Documents - Solicitation Documents, Specifications, Plans, Contract booklet, Change Orders, Force Account Work orders, pay documents issued by the Agency, Materials certifications, Project Work schedules, final estimate, written orders and authorizations issued by the Agency, Material source development and reclamation plans, and permits, orders and authorizations obtained by the Contractor or Agency applicable to the Project, as well as all documents incorporated by reference therein.

Contract Time - The amount of time allowed to complete the Work under the Contract.

Contractor - The Entity awarded the Contract according to the solicitation.

Correction Period - Period from Second Notification to Final Acceptance as per Subsection 00170.85(b).

Course - A specified Surfacing Material placed in one or more Lifts to a specified thickness.

Coverage - One Pass by a piece of Equipment over an entire designated area.

Cross Section - The exact image formed by a plane cutting through an object, usually at right angles to a central axis, to determine area.

Day - A Calendar Day including weekdays, weekends, and holidays, unless otherwise specified.

Defective – An adjective which when modifying the word "Work" refers to work that: (1) is unsatisfactory, faulty or deficient; (2) does not conform to the Contract Documents; (3) does not meet the requirements of any inspection, test for approval referred to in the Contract Documents; or (4) has been damaged prior to Engineer's recommendation for final payment.

Durable Rock - Rock that has a slake durability index of at least 90% based on a two-cycle slake durability test, according to ASTM D 4644. In the absence of test results, the Engineer may evaluate the durability visually.

Emulsified Asphalt - Emulsified asphalt cement.

Emulsified Asphalt Concrete - A mixture of Emulsified Asphalt and graded Aggregate.

Engineer - The Engineer who represents the Agency and who is designated by the Agency to administer the Contract.

Entity - A natural person capable of being legally bound, sole proprietorship, limited liability company, corporation, partnership, limited liability partnership, limited partnership, profit or nonprofit unincorporated association, business trust, two or more persons having a joint or common economic interest, or any other person with legal capacity to contract, or a government or governmental subdivision.

Equipment - All machinery, tools, manufactured products, and fabricated items needed to complete the Contract or specified for incorporation into the Work.

Establishment Period - The time specified to assure satisfactory establishment and growth of planted Materials.

Existing Surfacing - Pavements, slabs, curbs, gutters, walks, driveways, and similar constructions of bricks, blocks, portland cement concrete, bituminous treated materials, and granular surfacing materials on existing Highways.

Extra Work - Work not included in the Contract, but deemed by the Engineer to be necessary to complete the Project.

Field Order – A written order issued by the Engineer which requires minor changes in the Work but which may not involve a change in the Contract Amount or the Contract Times.

Final Acceptance - Written confirmation by the Agency that the Project has been completed according to the Contract including all corrective work identified by the Agency during the Correction Period, with the exception of latent defects and Warranty obligations, if any, and has been accepted.

Final Inspection - The inspection conducted by the Engineer to determine that the Project has been completed according to the Contract.

Fine Aggregate - Crushed Rock, crushed Gravel, or Sand that passes a 1/4 inch sieve, with allowable oversize.

First Notification - Written Notice to Proceed provided by the Engineer.

Force Account Work - Items of Extra Work ordered by the Engineer that are to be paid according to Section 00197.

Granular Material - Graded and selected free-draining material composed of particles of Rock, Sand, and Gravel.

Gravel - Particles of Rock, rounded or not, that will pass a 3 inch sieve and be retained on a No. 4 sieve.

Highway - Every road, street, thoroughfare and place, including bridges, viaducts and other structures within the boundaries of the State, open, used or intended for use by vehicular traffic.

Incidental - A term identifying those acts, services, transactions, property, Equipment, labor, Materials, or other items for which the Agency will make no separate or additional payment.

Inspector - The representative of the Engineer authorized to inspect and report on Contract performance.

Leveling - Placing a variable-thickness Course of Materials to restore horizontal and vertical uniformity to existing Pavements, normally continuous throughout the Project.

Lift - The compacted thickness of material placed by Equipment in a single Pass.

Mandatory Source - A material source provided by the Agency from which the Contractor is required to obtain Materials. (see 00160.00(b) and 00160.40)

Materials - Any natural or manmade substance specified for use in the construction of the Project or for incorporation into the Work.

Median - The portion of a divided Highway separating traffic traveling in opposite directions.

Milestone – A principal event specified in the Contract Documents relating to an intermediate completion date or time prior to Substantial Completion of all the Work.

Multiple Course Construction - Two or more Courses, exclusive of Patching or Leveling, placed over the entire Roadway width.

Multi-Use Path - That portion of the Highway Right-of-Way or a separate Right-of-Way, physically separated from motor vehicle traffic and designated for use by pedestrians, bicyclists and other non-motorized users.

Neat Line - Theoretical lines specified or indicated on the Plans for measurement of quantities.

Nondurable Rock - Rock that has a slake durability index of less than 90% based on a two-cycle slake durability test, as tested by ASTM D 4644, or Rock that is observed to readily degrade by air, water, and mechanical influence.

Notice to Proceed - Written notice authorizing the Contractor to begin performance of the Work.

On-Site Work - Any Work taking place on the Project Site, including designated staging areas adjacent to the Project Site, except for installation of covered temporary signs according to Section 00225.

Organic Soil - A Soil with sufficient organic content to influence the Soil properties.

Panel - The width of specified Material being placed by Equipment in a single Pass.

Pass - One movement of a piece of Equipment over a particular location.

Patching - Placing a variable-thickness Course of Materials to correct sags, dips, and/or bumps to the existing grade and Cross Section, normally intermittent throughout the Project.

Pavement - Asphalt concrete or portland cement concrete placed for the use of motor vehicles, bicycles, or pedestrians on Roadways, Shoulders, Multi-Use Paths and parking areas.

Pay Item (Contract Item) - A specific unit of Work for which a price is provided in the Contract.

Payment Bond - The approved security furnished by the Contractor's Surety as a guaranty of the Contractor's performance of its obligation to pay promptly in full all sums due for Materials, Equipment, and labor furnished to complete the Work.

Peat - A Soil composed primarily of vegetative matter in various stages of decomposition, usually with an organic odor, dark brown to black color, and a spongy consistency.

Performance Bond - The approved security furnished by the Contractor's Surety as a guaranty of the Contractor's performance of the Contract.

Plans - Standard and Supplemental Drawings, and approved unstamped and reviewed stamped Working Drawings. (see 00150.10 and 00150.35)

Project - The sum of all Work to be performed under the Contract.

Project Manager - The Engineer's representative directly responsible for administration of a Contract.

Project Site - The geographical dimensions of the real property on which the Work is to be performed, including designated contiguous staging areas.

Prospective Source - A Material source provided by the Agency, from which the Contractor has the option of obtaining Materials. (see 00160.00(a) and 00160.40)

Publicly-Owned Equipment - Equipment acquired by a state, county, municipality or political subdivision primarily for use in its own operations.

Public Traffic - Vehicular or pedestrian movement, not associated with the Contract Work, on a public way.

Railroad - Publicly or privately owned rail carriers, including passenger, freight, and commuter rail carriers, their tenants, and licensees. Also, Utilities that jointly own or use such facilities.

Right-of-Way - Land, property, or property interest, usually in a strip, acquired for or devoted to transportation or other public works purposes.

Roadbed - Completed excavations and embankments for the Subgrade, including ditches, side slopes, and slope rounding, if any.

Roadside - The area between the outside edges of the Shoulders and the Right-of-Way boundaries. Unpaved median areas between inside Shoulders of divided Highways and infield areas of interchanges are included.

Roadway - That portion of a Highway improved, designed, or ordinarily used for vehicular travel, exclusive of the berm or Shoulder. If a Highway includes two or more separate Roadways, the term "Roadway" refers to any such Roadway separately, but not to all such Roadways collectively. (see Traveled Way)

Rock - Natural deposit of solid material composed of one or more minerals occurring in large masses or fragments.

Sand - Particles of Rock that will pass a No. 4 sieve and be retained on a No. 200 sieve.

Schedule of Items - The list of Pay Items, their units of measurement, estimated quantities, and prices.

Schedule of Values - The breakdown of the values of the component elements comprising a lump sum Pay Item.

Second Notification - Written acknowledgment by the Engineer of the Substantial Completion of the Work according to 00180.50(g).

Shoulder - The part of a Roadbed contiguous to the Traveled Way or Roadway, whether paved or unpaved, for accommodating stopped vehicles, for emergency use and for lateral support of Base and surface Courses.

Silt - Soil passing a No. 200 sieve that is nonplastic or exhibits very low plasticity.

Single Course Construction - A wearing Course only, not including patching or leveling Courses or partial width Base Course.

Slope - Vertical distance to horizontal distance, unless otherwise specified.

Soil - Accumulations of particles produced by the disintegration of Rock, which sometimes contains organic matter. Particles may vary in size from Clay to Boulders.

Solicitation Document - Documents which define the procurement of a public improvement Project, including, but not limited to, the Bid Booklet, Agency-provided Plans, Standard Specifications, Special Provisions, Addenda, and which includes all documents incorporated by reference. May also be called Bid Documents.

Special Provisions - The special directions, provisions, and requirements specific to a Project that supplement or modify the Standard Specifications. Permits and orders governing the Project that are issued directly to the Agency by a governmental or regulatory authority are considered to be part of the Special Provisions, to the extent and under the conditions stipulated in the Special Provisions.

Specifications - The Standard Specifications and Special Provisions, together with all provisions of other documents incorporated therein by reference.

Standard Drawings - The Agency-prepared detailed drawings for Work or methods of construction that normally do not change from project to project.

Standard Specifications – The "General Conditions for Construction for the City of Warrenton" published by the Agency, and the "2018 Oregon Standard Specifications for Construction", Parts 00200 through 03000, "Technical Specifications", published by the Oregon Department of Transportation as amended by the Agency. It provides directions, provisions, and requirements necessary for performing public improvement projects.

State - The State of Oregon.

Structures - Bridges, retaining walls, endwalls, cribbing, buildings, culverts, manholes, catch basins, drop inlets, sewers, service pipes, underdrains, foundation drains, and other similar features which may be encountered in the Work.

Subbase - A Course of specified material of specified thickness between the Subgrade and a Base.

Subcontractor - An Entity having a direct contract with the Contractor or another Subcontractor, to perform a portion of the Work.

Subgrade - The top surface of completed earthwork on which Subbase, Base, Surfacing, Pavement, or a Course of other Material is to be placed.

Substantial Completion – The time at which the Work (or a specified part thereof) has progressed to the point where, in the opinion of Engineer, the Work (or a specified part thereof) is sufficiently complete, in accordance with the Contract Documents, so that the Work (or a specified part thereof) can be utilized for the purposes for which it is intended.

Substructure - Those parts of a Structure which support the Superstructure, including bents, piers, abutments, and integrally built wingwalls, up to the surfaces on which bearing devices rest. Substructure also includes portions above bearing surfaces when those portions are built integrally with a Substructure unit (e.g., backwalls of abutments). When Substructure and Superstructure elements are built integrally, the division between Substructure and Superstructure is considered to be at the bottom soffit of the longitudinal or transverse beam, whichever is lower. Culverts and rigid frames are considered to be entirely Substructure.

Superstructure - Those parts of a Structure above the Substructure, including bearing devices.

Supplemental Drawings - The Agency-prepared detailed drawings for Work or methods of construction that are Project specific, and are denoted by title in the Project title block.

Supplier - The Entity that furnishes goods to be incorporated into the Work.

Surety - The Entity that issues the bond.

Surfacing - The Course or Courses of material on the Traveled Way, auxiliary lanes, Shoulders, or parking areas for vehicle use.

Third Notification - Written acknowledgment by the Engineer, subject to Final Acceptance, that as of the date of the notification the Contractor has achieved Final Completion of the Project according to the Contract, including without limitation completion of all minor corrective work, Equipment and plant removal, site clean-up, and submittal of all certifications, bills, forms and documents required under the Contract.

Ton - One short ton of 2,000 pounds (Ton, ton, Tn, or T).

Topsoil - Soil ready for use in a planting bed.

Traffic Lane - That part of the Traveled Way marked for moving a single line of vehicles.

Traveled Way - That part of the Highway for moving vehicles, exclusive of berms and Shoulders.

Typical Section - That Cross Section established by the Plans which represents in general the lines to which the Contractor shall work in the performance of the Contract.

Unsuitable Material - Frozen material, or material that contains organic matter, muck, humus, peat, sticks, debris, chemicals, toxic matter, or other deleterious materials not normally suitable for use in earthwork.

Utility - A line, facility, or system for producing, transmitting, or distributing communications, power, electricity, heat, gas, oil, water, steam, waste, storm water not connected with highway drainage, or any other similar commodity which directly or indirectly serves the public. The term may also mean the utility company, district, or cooperative owning and operating such facilities, including any wholly-owned or controlled subsidiary.

Warranty Bond - The approved security furnished by the Contractor's, Subcontractor's, Manufacturer's, Installer's or Supplier's Surety as a guaranty of performance of their respective warranty obligations.

Wetlands - Areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, vegetation typically adapted for life in saturated Soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas.

Work - The furnishing of all Materials, Equipment, labor, and Incidentals necessary to successfully complete any individual Pay Item or the entire Contract, and the discharge of duties and obligations imposed by the Contract.

Work Change Directive – A written statement to Contractor issued on or after the Date of the Agreement and signed by Owner and recommended by Engineer ordering an addition, deletion, or revision in the Work, or responding to differing or unforeseen subsurface or physical conditions under which the Work is to be performed or to emergencies. A Work Change Directive will not change the Contract Amount or the Contract Times but is evidence that the parties expect that the change ordered or documented by a Work Change Directive will be incorporated in a subsequently issued Change Order following negotiations by the parties as to its effect, if any, on the Contract Amount or Contract Times.

Work Day - Every Calendar day excluding Saturdays, Sundays and legal holidays as listed in ORS187.010.

Worker - Any person performing work under the contract, including employees of the Contractor or subcontractor, and persons having full or partial ownership of the Contractor or subcontractor. (This definition is not intended to nor does it alter the definition or meaning of the term "worker" as used in any applicable laws or regulations, including but not limited to for purposes of paying prevailing wage rates.)

Working Drawings - Supplemental Plans, not furnished by the Agency, that the Contractor is required to submit to the Engineer. (see 00150.35)

Workplace Violence - Any act of physical, verbal or written aggression by an individual in or related to the work place and/or project sites. This includes, but is not limited to, verbal abuse, threats or intimidation and physical intimidation, assault or battery by a worker or former worker. Work place violence may also include destruction or abuse of property.

Section 00120 - Bidding Requirements and Procedures

00120.01 Receipt of Bids; Opening – See Special Provisions.

00120.02 Prequalification of Bidders – See Special Provisions.

00120.03 Request for Solicitation Documents – See Special Provisions.

00120.04 Pre-Bid Meeting – See Special Provisions

00120.10 Bid Booklet - The Bid Booklet may include, but is not limited to:

- Call for Bids
- Bidder's Checklist
- Bid Section
- Appendix, which includes required time-sensitive forms, sample forms, and other informational pages

The Call for Bids and Bid Section may include, but is not limited to:

- Description and location of the proposed Project
- Time, date, and location for opening Bids
- Project completion time
- Class of Work
- Bid statement
- Certificate of non-collusion
- Certificate of Nondiscrimination
- Certificate of noninvolvement in any debarment or suspension (for Federal-Aid Projects)
- Certificate regarding lobbying activities (for Federal-Aid Projects)
- Certificate of residency (for State Projects)
- Certificate of compliance with Oregon tax laws
- Bid Schedule
- Identification of Bidder(s) and Sureties
- Bid signature page
- Bid Bond form
- First-tier Subcontractor Disclosure form

Other certificates or statements may be bound within the Bid Section. Plans, Specifications, and other documents referred to in the Bid Section will be considered part of the Bid.

00120.15 Examination of Work Site and Solicitation Documents; Consideration of Conditions to be Encountered - Before submitting a Bid, Bidders shall make a careful visual examination of the site of the proposed Work, the Bid Booklet, Plans, and Specifications. Bidders shall also review any subsurface investigation material referenced in 00120.25 that may be available and conduct additional investigation of any unusual condition apparent during the visual site examination. As soon as reasonably practicable after noting any such unusual condition, Bidder shall notify Agency, in writing, of any such unusual condition and the additional investigation undertaken by Bidder. Submission of a Bid will constitute confirmation that the Bidder has examined the Project Site and finds the Plans and Specifications to be sufficiently detailed and accurate to enable Bidder to properly perform the Work, and understands the conditions to be encountered in performing the Work and all requirements of the Contract.

The Bidder is responsible for loss or unanticipated costs suffered by the Bidder because of the Bidder's failure to fully examine the site and become fully informed about all conditions of the Work, or failure to request clarification of Plans and Specifications Bidder believes to be erroneous or incomplete.

Any clarification of Plans and Specifications needed by the Bidder shall be requested in writing by email through the Engineer. Unless the procurement period is shorter than one week, requests for changes or clarification shall be submitted at least seven days prior to the date of Bid Closing. The Agency will respond to each request at least 72 hours prior to the date of Bid Closing. If the Procurement period is less than seven days, requests shall be submitted within one day after the Procurement is issued and the Agency will issue its response to each such request at least 24 hours prior to Bid Closing. Failure to timely request clarification or changes shall be deemed acceptance of all of the terms and conditions of the Procurement. Oral explanations or interpretations given before receiving Bids for a Project will not be binding. To be binding, interpretation of the Plans and Specifications by the Agency must be made by written Addendum furnished to all Holders of Bidding Plans according to 00120.30. Notification of erroneous or incomplete Plans or Specifications shall also be submitted to the Engineer. Such notification shall also be made in sufficient time for the Agency to make any necessary modifications and issue Addenda to Bidders prior to Bid Closing.

00120.16 Material, Equipment, and Method Substitutions - When the Contract specifies certain Materials, Equipment, and/or methods, the Bidder shall include those Materials, Equipment, and/or methods in the Bid. Substitution after execution of Contract is specified in 00180.31(b), 00180.31(c), and 00180.31(d).

00120.17 Use of Agency-Owned Land for Staging or Storage Areas - The Contractor may use Agency-owned property for staging or storage areas, subject to the following limitations:

(a) Within Normal Right-of-Way Limits - If approved by the Engineer, the Contractor may use available property within the normal Right-of-Way limits for the purpose of constructing improvements under the Contract. Where the Agency owns, or has rights to, other adjacent properties in the Project area, "normal Right-of-Way" is limited to a line drawn across that property connecting the normal Right-of-Way limits on either side of the property.

(b) Outside Normal Right-of-Way Limits - The Contractor may not use Agency-owned property outside of normal Right-of-Way limits for the Project without the approval of the Engineer.

If a Bidder obtains approval before submitting a Bid, use of the property will be at no cost to the Contractor, or at a cost stated by the Engineer upon granting approval, as confirmed by Addendum.

If approval is not obtained before submitting a Bid, and the Contractor proposes to use Agency-owned property outside the normal Right-of-Way limits, then use of the property may be approved by the Engineer, but the Contractor will be assessed fair market value, as determined by the Engineer, for use of the property.

(c) Restrictions on Use - Contractors shall comply with all applicable laws, ordinances, and regulations pertaining to use of Agency-owned property, and shall:

- Not cause unreasonable impacts on traffic and other facility users.
- Clean up all hazardous materials deposited by, or resulting from, Contractor operations.
- Be responsible for all costs associated with use of the property.

00120.20 Interpretation of Quantities in Bid Schedule - Quantities appearing in the Bid Schedule are approximate and are provided only for comparison of Bids. The Agency does not warrant that the actual individual items, amount of Work, or quantities will correspond to those shown in the Bid Schedule. Payment to the Contractor will be made only for actual quantities of Work performed and accepted or Materials furnished and accepted, as required by the Contract. Quantities of Work to be performed and Materials to be furnished may each be increased, decreased, or omitted as provided in 00120.30 and 00140.30.

00120.25 Subsurface Investigations - If the Agency or its consultant has conducted subsurface or geologic investigations of the proposed Project Site or contiguous to the Project Site, the results of the investigations may be included in written reports. If reports have been prepared, such reports shall be included in the Solicitation Documents and shall be considered as part of the Contract Documents to the extent that the Contractor may rely upon the accuracy of the "technical data" contained in such reports. If the Agency has retained subsurface samples, they will also be available for inspection. Bidders and the Contractor may make arrangements for viewing the samples through the Engineer's office.

The availability of subsurface information from the Agency is solely for the convenience of the Bidder and shall not relieve the Bidder or the Contractor of any risk, duty to make examinations and investigations as required by 00120.15, or other responsibility under the Contract Documents. It is mutually agreed to by all parties that:

- The subsurface investigations made by the Agency are for the purpose of obtaining data for planning and design of the Project.
- The data for individual test boring logs apply only to that particular boring and is not intended to be conclusive as to the character of any material between or around test borings.
- If Bidders use this information in preparing a Bid, it is used at their own risk, and Bidders are responsible for all conclusions, deductions, and inferences drawn from this information.

- Contractor may not rely upon or make any claim against Owner or Engineer, or any of their officers, directors, members, partners, employees, consultants, or subcontractors with respect to any Contractor interpretation of or conclusion drawn from any "technical data" or any such other data, interpretations, opinions, or information.

00120.30 Changes to Plans, Specifications, or Quantities before Opening of Bids - The Agency reserves the right to issue Addenda making changes or corrections to the Plans, Specifications, or quantities. Only holders of Solicitation Documents obtained from the Agency's office who have been identified by the Agency as Holders of Bidding Plans will be notified of these Addenda by mail, delivery service, electronic facsimile (FAX) or email sent to the Bidder's mail, street or email address or FAX number as it appears in the Agency's files.

The Agency may extend Bid closing if Agency determines prospective bidders need additional time to review and respond to addenda. Agency will not, except to the extent required by a countervailing public interest, issue Addenda less than 72 hours before Bid closing unless the Addendum also extends Bid closing.

The Agency will not be responsible for failure of Bidders to receive Addenda sent as described in the preceding paragraph. Bids shall incorporate all Addenda. Bids may be rejected if opened and found by the Agency to not be based on all Addenda issued before Bid Closing.

00120.40 Preparation of Bids:

(a) General:

(1) Bids - The Bidders shall not alter, in any manner, the documents within the Bid Section. Bidders shall complete the certifications and statements included in the Bid Section of the Bid Booklet according to the instructions. Signature of the Bidder's authorized representative thereon constitutes the Bidder's confirmation of an agreement to all certifications and statements contained in the Bid Booklet. Entries on the documents in the Bid Section shall be in black or blue ink or typed. Signatures and initials shall be in ink.

The Bidder shall properly complete and bind all the documents in the Bid Section, as specified in 00120.10, between the front and back covers of the Bid Booklet, except that the Bid Bond is not required if another permissible type of Bid guaranty is provided. (see 00120.40(d))

(b) Bid Schedule Entries:

(1) Bid Schedule Entries - Using figures, Bidders shall fill in all blank spaces in the Bid Schedule. For each item in the Bid Schedule, Bidders shall enter the unit price and the product of the unit price multiplied by the quantity given. The unit price shall be greater than zero, shall contain no more than two decimal places to the right of the decimal point, and shall be expressed in U.S. dollars and cents (for example, $150.25 or $0.37). Unit prices submitted which contain more than two decimal places, will be truncated by the Agency at the second decimal place to determine the product of the unit price and quantity. No rounding will be considered or paid. Bidders Bid shall also enter the total amount of the Bid obtained by adding amounts for all items in the paper Bid Schedule. Corrections or changes of item entries shall be in ink, with incorrect entry lined out and correct entry entered and initialed.

(c) Bidder's Address and Signature Pages - Bidders shall include in the Bid the address to which all communications concerning the Bid and Contract should be sent. The Bid must be signed by a duly authorized representative of the Bidder.

d) Bid Guaranty - All Bids shall be accompanied by a Bid guaranty in the amount of 5% of the total amount of the Bid.

(1) Bid Guaranty The Bid guaranty shall be either a Surety bond, irrevocable letter of credit issued by an insured institution as defined in ORS 706.008 or security in the form of a cashier's check or certified check made payable to the Agency. (see ORS 279C.365(4))

If a Surety bond is submitted, Bidders shall use the Agency's standard Bid Bond form included with the Bid Booklet. Bidders shall submit the bond with original signatures and the Surety's seal affixed. The Bid guaranty shall be submitted by mail, delivery service, or hand delivered to the offices and addresses, and at the times given in the Bid Booklet.

- Acceptable Surety companies are limited to those authorized to do business in the State of Oregon.

- Forfeiture of Bid guaranties is covered by 00130.60, and return of guaranties is covered by 00130.70.

(e) Disclosure of First-Tier Subcontractors - If a Bidder's Bid on a public improvement Project exceeds $100,000, the Bidder shall, within 2 working hours of the time Bids are due to be submitted, submit to the Agency, on a form provided by the Agency, a disclosure identifying any first-tier Subcontractors that will furnish labor or labor and Materials, and whose contract value is equal to or greater than:

- 5% of the total Project Bid, but at least $15,000; or
- $350,000, regardless of the percentage of the total Project Bid.

For each Subcontractor listed, Bidders shall state:

- The name of the Subcontractor;
- The dollar amount of the subcontract; and
- The category of Work that the Subcontractor would be performing.

If no subcontracts subject to the above disclosure requirements are anticipated, a Bidder shall so indicate by entering "NONE" or by filling in the appropriate check box. For each Subcontractor listed, Bidders shall provide all requested information. An incomplete form will be cause for rejection of the Bid.

The Subcontractor Disclosure Form may be submitted for a Bid either:

- By filling out the Subcontractor Disclosure Form included in the Bid Booklet and submitting it together with the Bid at the time and place designated for receipt of Bids;
- By removing it from the Bid Booklet, filling it out and submitting it separately to the Agency at the address given in the Bid Booklet; or

- The Subcontractor Disclosure Form shall be sealed in a separate envelope, addressed to Public Works Director, City of Warrenton, 225 S Main Ave, Warrenton, OR 97146, showing on the outside of the envelope the name of the Bidder and the Contract title preceded by the words "Subcontractor Disclosure Form". **Facsimile submissions of Subcontractor Disclosure Form will not be accepted.**

Subcontractor Disclosure Forms submitted by any method will be considered late if not received by the Agency within two 2 working hours of the time designated for receiving Bids.

THE AGENCY MUST REJECT A BID IF THE BIDDER FAILS TO SUBMIT THE DISCLOSURE FORM WITH THIS INFORMATION BY THE STATED DEADLINE (see OAR 137-049-0360).

00120.45 Submittal of Bids:

(a) **Bids** - Bids may be submitted by mail, parcel delivery service, or hand delivery to the Agency, and at the times given in the Bid Booklet. Bids may not be submitted by FAX or electronic means. Submit Bids in a sealed envelope addressed to Public Works Director, City of Warrenton, 225 S Main Ave, Warrenton, Oregon 97146. Date of opening and Project title must be plainly marked on the outside of the sealed envelope preceded by the words "Sealed Bid". If a delivery or courier service is used, the Bidder shall place the sealed envelope containing the paper Bid inside the delivery or courier service's envelope.

Bids submitted after the time set for receiving Bids will not be opened or considered. The Agency assumes no responsibility for the receipt and return of late Bids.

Preparation and submission of Bids is at the sole risk and expense of the Bidder and is not a cost of contract performance.

00120.60 Revision or Withdrawal of Bids:

(a) **Bids** - Information entered into the Bid Booklet by the Bidder may be changed after the Bid has been delivered to the Agency, provided that:

- Changes are prepared according to the instructions identified in the Bid Booklet; and
- Changes are received at the same offices, addresses, and times identified in the Bid Booklet for submitting Bids; and
- The changes are submitted in writing, signed by an individual authorized to sign the Bid.

A Bidder may withdraw its Bid after it has been delivered to the Agency, provided that:

- The written withdrawal request is submitted in person on the Bidder's letterhead; and
- The request is signed by an individual who is authorized to sign the Bid, and proof of authorization to sign the Bid accompanies the withdrawal request; and
- The request is received at the same offices, addresses, and prior to the time identified in the Bid Booklet for submitting Bids.

No Bid can be withdrawn after having been opened.

00120.65 Opening and Comparing Bids - Bids will be opened and the total price for each Bid will be read publicly at the time and place indicated in the Call for Bids. Bidders and other interested parties are invited to be present.

Bids for each Project will be compared on the basis of the total amount of each Bid. The total amount of the Bid will be the total sum computed from quantities listed in the Bid Schedule and unit prices entered by the Bidder.

In case of conflict between the unit price and the corresponding extended amount, the unit price shall govern, and the Agency may make arithmetic corrections on extension amounts.

00120.70 Rejection of Nonresponsive Bids - A Bid will be considered irregular and will be rejected if the irregularity is deemed by the Agency to render the Bid non-responsive. Examples of irregularities include without limitation:

- The Bid Section documents provided are not properly used or contain unauthorized alterations.
- The Bid is incomplete or incorrectly completed.
- The Bid contains improper additions, deletions, alternate Bids, or conditions.
- The Bid is submitted on documents not obtained directly from the Agency, or is submitted by a Bidder who has not been identified by the Agency as a Holder of Bidding Plans, as required by 00120.03.
- The Bid or Bid modifications are not signed by a person authorized to submit Bids or modify Bids, as required by 00120.40 and 00120.60.
- A member of a joint venture and the joint venture submit Bids for the same Project. Both Bids may be rejected.
- The Bid has entries not typed or in ink, or has signatures or initials not in ink.
- Each change or correction is not individually initialed.
- White-out tape or white-out liquid is used to correct item entries.
- The price per unit cannot be determined.
- The Bid guaranty is insufficient or improper.
- The original Bid Bond form is not used or is altered.
- The Oregon Construction Contractors Board registration number and expiration date are not shown on the Bid if required in the Solicitation Document. This requirement applies to Agency and State-funded Projects, with the exception of Aggregate production and landscape Projects. (not required on Federal-Aid Projects)
- A disclosure of qualified first-tier Subcontractors, if required under 00120.40(e), is not received within 2 working hours of the time Bids are due to be submitted, or the disclosure form is not complete.
- The Bidder has not complied with the DBE requirements of the solicitation.
- The Bid does not acknowledge all issued Addenda.
- The Bid contains entries that are not greater than zero.
- The Bid entries are not expressed in U.S. dollars and cents.

- The Agency determines that any Pay Item is significantly unbalanced to the potential detriment of the Agency.

In addition, the Agency may reject all Bids for good cause upon its finding that it is in the public interest to do so. The Agency may also waive minor informalities or irregularities.

00120.80 Reciprocal Preference for Oregon Resident Bidders - This Subsection applies only to Contracts for Projects financed without federal funds.

Bidders shall complete the certificate of residency provided by the Agency in the Bid Booklet. Failure to properly complete the form will be cause to reject the Bid.

As used in the certificate of residency and this Subsection, "Resident Bidder" means a Bidder who has:

- Paid unemployment taxes or income taxes in the State of Oregon during any of the 12 calendar months immediately preceding submission of the Bid;
- A business address in the State of Oregon; and
- Certified in the Bid that the Bidder qualifies as a Resident Bidder.

"Nonresident Bidder" means a Bidder who is not a Resident Bidder as defined above.

In determining the lowest Bid, the Agency will, for the purpose of awarding the Contract, add a percentage increase to the Bid of a Nonresident Bidder equal to the percentage, if any, of the preference given to that Bidder in the state in which the Bidder resides (ORS 279A.120). The percentage preference applied in each state will be published on or before January 1 of each year by the Oregon Department of Administrative Services. The Agency may rely on these percentages without incurring liability to any Bidder (ORS 279A.120).

This increase will only be applied to determine the lowest Bid, and will not cause an increase in payment to the Contractor after Award of the Contract.

00120.90 Disqualification of Bidders - The Bid(s) of a disqualified Bidder will be rejected. Any of the following reasons is sufficient to disqualify a Bidder:

- More than one Bid is submitted for the same Work by an Entity under the same or different name(s).
- Evidence of collusion among Bidders. Participants in collusion will be found not responsible, and may be subject to criminal prosecution.
- Any of the grounds for disqualification cited in ORS 279C.440.

A Bidder will be disqualified if the Bidder has:

- Not been prequalified as required by 00120.02;
- Been declared ineligible by the Commissioner of the Bureau of Labor and Industries under ORS 279C.860;

- Not been registered (licensed) by the Oregon Construction Contractors Board (CCB) or been licensed by the State Landscape Contractors Board before submitting a Bid (ORS 279C.365(1)(k), ORS 701.021, ORS 701.026, and ORS 671.530). The Bidder's registration number and expiration date shall be shown in the Bid form, if requested. Failure to furnish the registration number, if requested, will render the Bid non-responsive and subject to rejection. (not required on Federal-Aid projects); or
- Been determined by the CCB under ORS 701.227 not to be qualified to hold or participate in a public contract for a public improvement.

00120.91 Rejection of Bid on Grounds of Nonresponsibility of Bidder - The Bid of a Bidder who is found to be nonresponsible according to the criteria listed in 00130.10 or ORS 279C.375(3) will be rejected.

Section 00130 - Award and Execution of Contract

00130.00 Consideration of Bids - After opening and reading Bids, the Agency will check them for correct extensions of unit prices and totals. (see 00120.65) The total of extensions, corrected where necessary, will be used by the Agency for Award purposes. Discrepencies between words and figures will be resolved in favor of words. In selecting the lowest responsive Bid, the Agency reserves the right to take into consideration any or all alternatives called for in the Bid Form.

The Agency reserves the right to waive minor informalities and irregularities, and to reject any or all Bids for irregularities under 00120.70 or for good cause after finding that it is in the public interest to do so (ORS 279C.395). An example of good cause for rejection in the public interest is the Agency's determination that any of the unit Bid prices are materially unbalanced to the Agency's potential detriment. A materially unbalanced Bid is defined as, “a Bid which generates a reasonable doubt that award to the Bidder submitting a mathematically unbalanced Bid will result in the lowest ultimate cost to the Agency.

The Agency may correct obvious errors, when the correct information can be determined from the face of the document, if it finds that the best interest of the Agency and the public will be served thereby.

Bids will be considered and a Contract awarded, if at all, within 30 Calendar Days from the date of Bid Opening, unless an extension beyond that time is agreed to by both parties and acknowledged in writing by the Bidder.

00130.10 Award of Contract - After the Bids are opened and a determination is made that a Contract is to be awarded, the Contract will be awarded to the lowest responsible Bidder. For the purposes of this Section, "lowest responsible Bidder" means the responsible Bidder that submitted the lowest responsive Bid who is not on the list created by the Construction Contractors Board according to ORS 701, and who has:

- Substantially complied with all prescribed public bidding procedures and requirements.
- Available the appropriate financial, Materials, Equipment, facility and personnel resources and expertise, or ability to obtain the resources and expertise, necessary to indicate the capability of the prospective Bidder to meet all contractual responsibilities.
- A satisfactory record of performance. In evaluating a Bidder's record of performance, the Agency may consider, among other things, whether the Bidder completed previous contracts of a similar nature with a satisfactory record of performance. For purposes of evaluating a Bidder's performance on previous contracts of a similar nature, a satisfactory record of performance means that to the extent that the costs associated with and time available to perform a previous contract remained within the Bidder's control, the Bidder stayed within the time and budget allotted for the procurement and otherwise performed the contract in a satisfactory manner.
- A satisfactory record of integrity. In evaluating a Bidder's record of integrity, the Agency may consider, among other things, whether the Bidder has previous criminal convictions for offenses related to obtaining or attempting to obtain a contract or subcontract or in connection with the Bidder's performance of a contract or subcontract.
- Qualified legally to contract with the Agency.
- Supplied all necessary information in connection with the Agency’s inquiry concerning responsibility. If a prospective Bidder fails to promptly supply information requested by the Agency concerning

responsibility, the Agency shall base the determination of responsibility upon any available information, or may find the prospective Bidder not to be responsible.

- Not been disqualified by the public contracting agency under ORS 279C.440.

If the Bidder is found not to have a satisfactory record of performance or integrity, the Agency will document the record and the reasons for the unsatisfactory finding.

The Agency will provide the Notice of Intent to Award to the Bidders, and may provide Notice of Intent to Award on the Agency's web site.

The Award will not be final until the later of the following:

- Seven calendar days after the Notice of Intent to Award has been issued; or
- The Agency has provided a written response to each timely protest, denying the protest and affirming the Award.

If the Agency accepts a Bid and awards a Contract, the Agency will send the successful Bidder written notice of acceptance and Award.

Notice of Award and Contract booklets ready for execution will be sent within 60 Calendar Days of the opening of Bids or within the number of Calendar Days specified in the Special Provisions or a written mutual agreement.

00130.15 Right to Protest Award - Adversely affected or aggrieved Bidders, limited to the three apparent lowest Bidders and any other Bidder directly in line for Contract Award, may submit to the Agency a written protest of the Agency's intent to Award within seven Calendar days following the date of the Notice of Intent to Award. The protest shall specify the grounds upon which it is based.

An aggrieved Bidder may protest an award only if the Bidder alleges, in its written protest, that it should have received the award because:

(a) All lower Bids are non-responsive;

(b) The Agency failed to conduct the Bid process as described in the Bid Document;

(c) The Agency has abused its discretion in rejecting the protestor's Bid as non-responsive or non-responsible; or

(d) The Agency's evaluation of Bids or subsequent determination of award is otherwise in violation of ORS Chapters 279A and 279C or the Agency's public contracting rules.

The written protest must describe the facts that support the protest. The Agency may not consider late protests or protests that do not describe facts that would support a finding that the Bidder is aggrieved for one of the reasons in clauses (a) through (d) above.

00130.20 Cancellation of Award - Without liability to the Agency, the Agency may for good cause cancel Award at any time before the Contract is executed by all parties to the Contract, as provided by ORS 279C.395 for rejection of Bids, upon finding it is in the public interest to do so.

00130.30 Contract Booklet - The Contract booklet may include but is not limited to:

- Special Provisions
- Addenda
- Schedule of Items
- Contract (Agreement)
- Performance Bond
- Payment Bond
- Certification of workers' compensation coverage

00130.40 Contract Submittals - Before the Agency will execute the Contract, the successful Bidder shall furnish the following:

(a) Performance and Payment Bonds - When Awarded the Contract, the successful Bidder shall furnish a Performance Bond and a Payment Bond of a Surety authorized to do business in the State of Oregon.

The successful Bidder shall submit the standard bond forms, which are bound in the Contract booklet. Faxed or photocopied bond forms will not be accepted. The amount of each bond shall be equal to the Contract Amount. The Performance Bond and the Payment Bond must be signed by the Surety's authorized Attorney-in-Fact, and the Surety's seal must be affixed to each bond. A power of attorney for the Attorney-in-Fact shall be attached to the bonds in the Contract booklet, which must include bond numbers, and the Surety's original seal must be affixed to the power of attorney. Bonds shall not be canceled without the Agency's consent, nor will the Agency normally release them, prior to Contract completion. The amount of the Performance and Payment Bonds shall be increased to equal the new Contract Amount whenever the Contract Amount is increased for any reason.

(b) Certificates of Insurance - The successful Bidder shall furnish the Agency certificates of insurance applicable to the Project, according to 00170.70. The insurance coverages shall remain in force throughout the performance of the Contract and shall not be allowed to lapse without prior written approval of the Agency. Bidders shall refer to 00170.70 for minimum coverage limits and other requirements.

For specified Contracts, certified copies, and in some instances the original, of insurance policies may be required by the Special Provisions.

(c) Workers' Compensation - To certify compliance with the workers' compensation insurance coverage required by 00170.61(a) and 00170.70(d), the successful Bidder shall complete and sign the "Certification of Workers' Compensation Coverage" form bound in the Contract booklet.

(d) Registration Requirements:

(1) ORS 701.021, ORS 701.026, and ORS 671.530 require that Bidders be registered with the Oregon Construction Contractors Board or licensed by the State Landscape Contractors Board prior to submission of a Bid on a Project not involving federal funds. Registration with the Construction Contractors Board or licensing by the State Landscape Contractors Board is not a prerequisite to bidding on Federal-Aid Projects; however, the Agency will not execute a Contract until the Contractor is so registered or licensed.

(2) Bidders must be registered with the Corporation Division, Oregon Secretary of State, if bidding as a corporation, limited liability company, joint venture, or limited liability partnership, or if operating under an assumed business name and the legal name of each person carrying on the business is not included in the business name.

(3) A Contractor registered under ORS 701 may bid on a landscaping Project or perform a construction project that includes landscape contracting as a portion of the project if the landscape contracting is subcontracted to a licensed landscaping business as defined in ORS 671.520.

(4) A landscaping business may bid on a Project or perform a Contract that includes the phase of landscape contracting for which it is not licensed if it employs a landscape contractor, or subcontracts with another licensed landscaping business, licensed for that phase.

(e) Tax Identification Number - The successful Bidder shall furnish the Agency the Bidder's Federal Tax Identification Number.

00130.50 Execution of Contract and Bonds:

(a) By the Bidder - The successful Bidder shall deliver the required number of Contract booklets with the properly executed Contract, Performance Bond, Payment Bond, certification of workers' compensation coverage, and the required certificates of insurance, to the Agency within 14 Calendar Days after the date on which the Contract booklets are sent or otherwise conveyed to the Bidder under 00130.10. The Bidder shall return the originals of all documents received from the Agency and named in this Subsection, with original signatures. Certificates of insurance shall also be originals. Certificates of insurance for coverages that are permitted by the Agency under 00170.70(a) to be obtained by appropriate subcontractors shall be delivered by the Contractor to the Agency together with the Contractor's request under 00180.21 for approval of the subcontract with that subcontractor. No copies of these documents will be accepted by the Agency.

Proper execution requires that:

- If the Contractor is a partnership, limited liability partnership, joint venture, or limited liability company, an authorized representative of each Entity comprising it shall sign the Contract, Performance Bond, and Payment Bond, and an authorization to sign shall be attached.
- If the Contractor is a corporation, the President and the Secretary of that corporation shall sign the Contract, Performance Bond, and Payment Bond. However, if other corporate officers are authorized to execute contracts and bonds, the successful Bidder shall furnish with those documents a certified, true and correct copy of the corporate bylaws or minutes stating that authority. If only one officer is signing, then the bylaws or minutes must include the authority to

sign without the signature of others. The successful Bidder shall also include the title(s) or corporate office(s) held by the signer(s).

(b) By the Agency - Within 10 Working Days after the Agency has received and verified the properly executed documents specified in 00130.50(a), and received legal sufficiency approval from the Agency's attorney (if required), the Agency will execute the Contract. The Agency will then send a fully-executed original Contract booklet to the successful Bidder, who then officially becomes the Contractor.

00130.60 Failure to Execute Contract and Bonds - Failure of the successful Bidder to execute the Contract and provide the required certificates, certifications, and bonds may be cause for cancellation of the Award, and may be cause for forfeiture of the Bid guaranty under ORS 279C.385.

Award may then be made to the next lowest responsible Bidder, the Project may be re-advertised, or the Work may be performed otherwise as the Agency decides.

The forfeited Bid guaranty will become the Agency's property, not as a penalty but as liquidation of damages resulting from the Bidder's failure to execute the Contract and provide the certificates, certifications, and bonds as required by these Specifications.

00130.70 Release of Bid Guaranties - Bid guaranties will be released and checks returned 7 Calendar Days after Bids are opened, except for those of the three apparent lowest Bidders on each Project. The guaranties of the three apparent lowest Bidders will be released and checks returned to unsuccessful Bidders within 7 days of the Agency's execution of the Contract.

00130.75 City's Business License – Successful Bidder shall have current business license with the City of Warrenton prior to entering into an agreement. Before permitting a subcontractor to begin work, Contractor shall verify that subcontractor has a current City of Warrenton business license.

00130.80 Project Site Restriction - Until the Agency sends the Contractor written Notice to Proceed with the Work, and the Contractor has filed the public works bonds required in 00170.20, the Contractor shall not go onto the Project Site on which the Work is to be done, nor move Materials, Equipment, or workers onto that Project Site.

The Contractor will not automatically be entitled to extra compensation because the commencement of Work is delayed by failure of the Agency to send the Contract for execution. However, if more than 60 Calendar Days elapse between the date the Bid is opened and the date the Agency sends the Contract to be executed, the Agency will consider granting an adjustment of time for completion of the Work to offset any actual delay to Contract completion resulting directly from delay in commencement.

00130.90 Notice to Proceed - Notice to Proceed will be issued within 5 Calendar Days after the Contract is executed by the Agency.

Should the Agency fail to issue the Notice to Proceed within 5 Calendar Days of Contract execution, the Contractor may apply for an adjustment of Contract Time according to 00180.80(c).

Section 00140 - Scope of Work

00140.00 Purpose of Contract - The purpose of the Contract is to set forth the rights and obligations of the parties and the terms and conditions governing completion of the Work. The Contractor's obligations shall include without limitation the following:

- The Contractor shall furnish all Materials, Equipment, labor, transportation, and Incidentals required to complete the Work according to Plans, Specifications, and terms of the Contract.
- The Contractor shall perform the Work according to the lines, grades, Typical Sections, dimensions, and other details shown on the Plans, as modified by written order, or as directed by the Engineer.
- The Contractor shall perform all Work determined by the Engineer to be necessary to complete the Project.
- The Contractor shall contact the Engineer for any necessary clarification or interpretation of the Contract.

00140.10 Typical Sections - The Typical Sections are intended to apply in general. At other locations where the Typical Section is not appropriate, the Contractor shall perform construction to the identified alignment as directed by the Engineer.

00140.20 Thickness - The thickness of Courses of Materials shown on the Plans, given in the Specifications, or established by the Engineer is considered to be the compacted thickness. Minor variations are acceptable when within tolerances specified in the Specifications or Plans, or when approved by the Engineer.

00140.30 Agency-Required Changes in the Work - Changes to the Plans, quantities, or details of construction are inherent in the nature of construction and may be necessary or desirable during the course of Project construction.

Without impairing the Contract, the Agency reserves the right to require changes it deems necessary or desirable within the scope, which in the Specifications means general scope, of the Project. These changes may modify, without limitation:

- Specifications and design
- Grade and alignment
- Cross Sections and thicknesses of Courses of Materials
- Method or manner of performance of Work
- Project Limits

or may result in:

- Increases and decreases in quantities
- Additional Work
- Elimination of any Contract item of Work
- Acceleration or delay in performance of Work

Upon receipt of a Change Order, the Contractor shall perform the Work as modified by the Change Order. If the Change Order increases the Contract Amount, the Contractor shall notify its Surety of the increase and direct the Surety to increase the amount of the performance and payment bonds to equal the new Contract Amount. The Contractor's performance of Work according to Change Orders shall neither invalidate the Contract nor release the Surety. Payment for changes in the Work will be made according to 00195.20. Contract Time adjustments, if any, will be made according to 00180.80. A Change Order signed by the Contractor is the agreement that the adjustment in the Contract Amount or Contract Time indicated is full compensation for all change order items including the impact of the change order on the balance of the Work to be accomplished.

00140.40 Differing Site Conditions - The following constitute differing Project Site conditions provided such conditions are discovered at the Project Site after commencement of the Work:

- Type 1 - Subsurface or latent physical conditions that could not have been discovered by careful examination of the Project Site, utilities and available records as described in 00120.15 and differ materially from those indicated in the Contract Documents; or
- Type 2 - Unknown physical conditions of unusual nature that differ materially from those ordinarily encountered and generally recognized as inherent in the Work provided for in the Contract.

The party discovering such a condition shall promptly notify the other party, in writing, of the specific differing conditions before they are disturbed and before the affected Work is performed. The Contractor shall not continue Work in the affected area until the Engineer has inspected such condition according to 00195.30 to determine whether an adjustment to Contract Amount or Contract Time is required.

Payment adjustments due to differing Project Site conditions, if any, will be made according to 00195.30. Contract Time adjustments, if any, will be made according to 00180.80.

00140.50 Environmental Pollution Changes - ORS 279C.525 will apply to any increases in the scope of the Work required as a result of environmental or natural resources laws enacted or amended after the submission of Bids for the Contract. The Contractor shall comply with the applicable notice and other requirements of ORS 279C.525. The applicable rights and remedies of that statute will also apply.

In addition to ORS 279C.525, the Agency has compiled a list at 00170.01 of those federal, State, and local agencies, of which the Agency has knowledge, that have enacted ordinances, rules, or regulations dealing with the prevention of environmental pollution and the preservation of natural resources that may affect the performance of Agency contracts.

00140.60 Extra Work - If directed by the Engineer's written order, the Contractor shall perform work not included in the Contract. The Contractor shall perform this work according to:

- Standard Specifications
- Standard Drawings
- Other Plans and Specifications issued by the Engineer

Payment for Extra Work will be made according to Section 00196. Contract Time adjustments, if any, will be made according to 00180.80.

00140.65 Disputed Work - The Contractor may dispute any part of a Change Order, written order, or an oral order from the Engineer by the procedures specified in Section 00199.

00140.70 Cost Reduction Proposals - The Contractor may submit written proposals to the Engineer that modify Plans, Specifications, or other Contract Documents for the sole purpose of reducing the total cost of construction. Unless otherwise agreed to in writing by the Agency, a proposal that is solely or primarily a proposal to reduce estimated quantities or delete Work, as determined by the Engineer, is not eligible for consideration as a cost reduction proposal and will instead be addressed under 00140.30, whether proposed or suggested by the Agency or the Contractor.

(a) Proposal Requirements - The Agency will not adopt a cost reduction proposal that impairs essential functions or characteristics of the Project including but not limited to service life, economy of operation, ease of maintenance, designed appearance, or design and safety standards.

To conserve time and funds, the Contractor may first submit a written request for a feasibility review by the Engineer. The request should contain a description of the proposal together with a rough estimate of anticipated dollar and time savings. The Engineer will, within a reasonable time, advise the Contractor in writing whether or not the proposal would be considered by the Agency, should the Contractor elect to submit a detailed cost reduction proposal.

A detailed cost reduction proposal shall include without limitation the following information:

- A description of existing Contract requirements for performing the Work and the proposed change;
- The Contract items of Work affected by the proposed change, including any quantity variation caused by the proposed change;
- Pay Items affected by the proposed change including any quantity variations;
- A detailed cost estimate for performing the Work under the existing Contract and under the proposed change. Cost estimates shall be made according to Section 00197. Costs of re-design, which are incurred after the Agency has accepted the proposal, will be included in the cost of proposed work; and
- A date by which the Engineer must accept the proposal in order to accept the proposed change without impacting the Contract Time or cost reduction amount.

(b) Continuing to Perform Work - The Contractor shall continue to perform the Work according to Contract requirements until the Engineer issues a Change Order incorporating the cost reduction proposal. If the Engineer fails to issue a Change Order by the date specified in the proposal, the proposal shall be deemed rejected.

(c) Consideration of Proposal - The Engineer is not obligated to consider any cost reduction proposal. The Agency will not be liable to the Contractor for failure to accept or act upon any cost reduction proposal submitted.

The Engineer will determine in its sole discretion whether to accept a cost reduction proposal as well as the estimated net savings in construction costs from the adoption of all or any part of the proposal. In determining the estimated net savings, the Engineer may disregard the Schedule of Items. The Engineer

will establish prices that represent a fair measure of the value of Work to be performed or to be deleted as a result of the cost reduction proposal.

(d) Sharing Investigation Costs - As a condition for considering a Contractor's cost reduction proposal, the Agency reserves the right to require the Contractor to share in the Agency's costs of investigating the proposal. If the Agency exercises this right, the Contractor shall provide written acceptance of the condition to the Engineer. Such acceptance will authorize the Agency to deduct its share of investigation costs from payments due or that may become due to the Contractor under the Contract.

(e) Acceptance of Proposal Requirements - If the Contractor's cost reduction proposal is accepted in whole or in part, acceptance will be made by a Change Order that will include without limitation the following:

- Statement that the Change Order is made according to 00140.70;
- Revised Contract Documents that reflect all modifications necessary to implement the approved cost reduction measures;
- Any conditions upon which the Agency's approval is subject;
- Estimated net savings in construction costs attributable to the approved cost reduction measures; and
- A payment provision according to which the Contractor will be paid 50% of the estimated net savings amount as full and adequate consideration for performance of the Work of the Change Order.

The Contractor's cost of preparing the cost reduction proposal and the Agency's costs of investigating the proposal, including any portion paid by the Contractor, will be excluded from determination of the estimated net savings in construction costs. Costs of re-design, which are incurred after the Agency has accepted the proposal, will be included in the cost of the Work attributable to cost reduction measures.

If the Agency accepts the cost reduction proposal, the Change Order that authorizes the cost reduction measures will also address any Contract Time adjustment.

(f) Right to General Use - Once submitted, the cost reduction proposal becomes the property of the Agency. The Agency reserves the right to adopt the cost reduction proposal for general use without additional compensation to the Contractor when it determines that a proposal is suitable for application to other contracts.

00140.80 Use of Publicly Owned Equipment - The Contractor is prohibited from using publicly-owned Equipment except in the case of emergency. In an emergency, the Contractor may rent publicly-owned Equipment provided that:

- The Engineer provides written approval that states that such rental is in the public interest; and
- Rental does not increase the Project cost.

00140.90 Final Trimming and Cleanup - Before Final Inspection as described in 00150.90, the Contractor shall neatly trim and finish the Project and remove all remaining unincorporated Materials and debris. Final trimming and cleanup shall include without limitation the following:

- The Contractor shall retrim and reshape earthwork, and shall repair deteriorated portions of the Project Site.
- Where the Work has impacted existing facilities or devices, the Contractor shall restore or replace those facilities to their pre-existing condition.
- The Contractor shall clean all drainage facilities and sanitary sewers of excess Materials or debris resulting from the Work.
- The Contractor shall clean up and leave in a neat, orderly condition, Rights-of-Way, Materials sites, and other property occupied in connection with performance of the Work.
- The Contractor shall remove temporary buildings, construction plants, forms, falsework and scaffolding, surplus and discarded Materials, and rubbish.
- The Contractor shall dispose of Materials and debris including without limitation forms, falsework, scaffolding, and rubbish resulting from clearing, grubbing, trimming, clean-up, removal, and other Work. These Materials and debris become the property of the Contractor. The Contractor shall dispose of these Materials and debris immediately.
- The Contractor shall restore and replant or resurface adjoining properties to match existing grades and existing surfaces.
- The Contractor shall install erosion and sediment control needed to stabilize the Project Site.

Unless the Contract specifically provides for payment for this item, the Agency will make no separate or additional payment for final trimming and cleanup.

00140.95 "AS-BUILT" Records – The Contractor shall maintain a current and accurate record of Work completed during the course of this Contract and submit to the Engineer updated copies of the project "As-Builts" on a weekly basis. These "As-Builts" drawings shall be kept by accurately marking a designated set of the Contract plans with the specified information as Work proceeds. Accurate, complete and current "As-Built" drawings are a specified requirement for full or partial payment of the Work completed. "As-Builts" shall be reviewed for completeness before recommendation of payment is granted. Incomplete or insufficient "As-Builts" will be returned to the Contractor and recommendation for progress payment denied. At project completion and as a condition of final payment, the Contractor shall deliver an acceptable complete and legible set of "As-Built" drawings to the Engineer.

The "As-Built" drawings shall show the information listed below. Where the term "locate" or "location" is used, it shall mean record of position with respect to both the construction vertical datum and either construction horizontal datum or a nearby permanent improvement.

- Record location of underground services and utilities as installed
- Record location of existing underground utilities and services that are to remain and that are encountered during the course of the Work
- Record changes in dimension, location, grade or detail to that shown on plans
- Record changes made by change order
- Record details not in original plans
- Provide fully completed shop drawings reflecting all revisions

Upon completion of the construction, the Contractor shall review and certify the construction set of “As-Built” drawings for completeness and accuracy of representation of any changes. Final payment will not be processed until “As-Built” drawings have been submitted and approved.

Section 00150 - Control of Work

00150.00 Authority of the Engineer - The Engineer has full authority over the Work and its suspension. (see Section 00180) The Contractor shall perform all Work to the complete satisfaction of the Engineer. The Engineer's determination shall be final on all matters, including but not limited to the following:

- Quality and acceptability of Materials and workmanship
- Measurement of unit price Work
- Timely and proper prosecution of the Work
- Interpretation of Contract Documents
- Payments due under the Contract

The Engineer's decision is final and, except as provided in 00180.80 for adjustments of Contract Time and Section 00199 for claims for additional compensation, may be challenged only through litigation.

Work performed under the Contract will not be considered complete until it has passed Final Inspection by the Engineer and has been accepted by the Agency.

Interim approvals issued by the Engineer, including but not limited to Third Notification, will not discharge the Contractor from responsibility for errors in prosecution of the Work, for improper fabrication, for failure to comply with Contract requirements, or for other deficiencies, the nature of which are within the Contractor's control.

00150.01 Project Manager's Authority and Duties - The Engineer may designate a Project Manager as its representative on the Project with authority to enforce the provisions of the Contract.

When the Engineer has designated a Project Manager, the Contractor should direct all requests for clarification or interpretation of the Contract, in writing, to the Project Manager. The Project Manager will respond within a reasonable time. Contract clarification or interpretation obtained from persons other than the Project Manager will not be binding on the Agency.

The Project Manager shall have the authority to appoint Inspectors and other personnel as required to assist in the administration of the Contract.

00150.02 Inspector's Authority and Duties - To the extent delegated under 00150.01, Inspectors are authorized to represent the Engineer and Project Manager to perform the following:

- Inspect Work performed and Materials furnished, including without limitation, the preparation, fabrication, or manufacture of Materials to be used;
- Orally reject defective Materials and to confirm such rejection in writing;
- By oral order, temporarily suspend the Work for improper prosecution pending the Engineer's decision; and
- Exercise additional delegated authority.

Inspectors are not authorized to:

- Accept Work or Materials.
- Alter or waive provisions of the Contract.
- Give instructions or advice inconsistent with the Contract Documents.

00150.10 Coordination of Contract Documents - The Contract Documents, including but not limited to Contract Change Orders, the Special Provisions, the Plans, and the Standard Specifications are intended to collectively describe all of the items of Work necessary to complete the Project. The Contract Documents are complementary; what is required by one is as binding as if required by all.

(a) Order of Precedence - The Engineer will resolve any discrepancies between these documents in the following order of precedence:

1. Permits from outside agencies;
2. Contract (Agreement)
3. Addenda;
4. Bid Schedule;
5. Special Provisions;
6. General Conditions;
7. Standard Specifications;
8. Geotechnical Data Reports;
9. Agency-prepared drawings specifically applicable to the Project and bearing the Project title;
10. Standard Drawings;
11. Reviewed and accepted, stamped Working Drawings;
12. Approved Unstamped Working Drawings.

Change Orders, Work Change Directives, Field Orders, and Engineer's written interpretation and clarifications, in precedence listed, will take precedence over all other Contract Document components referenced herein.

Notes on a drawing shall take precedence over drawing details. Dimensions shown on the drawings, or that can be computed, shall take precedence over scaled dimensions. The Drawings with the higher level of detail take precedence over less detailed Drawings.

(b) Immaterial Discrepancies - The Contract Documents specify details for the construction and completion of the Work. If Contract Documents describe portions of the Work in sufficient detail but are silent in some minor respect, the Contractor may proceed utilizing the current best industry practices.

(c) Material Discrepancies - If the Contractor identifies a discrepancy, error, or omission in the Contract Documents that cannot be resolved by the approach specified in (b) above, the Contractor shall immediately request clarification from the Engineer.

00150.15 Construction Stakes, Lines, and Grades:

(a) Agency Responsibilities - The Engineer will provide the location of the existing benchmarks and horizontal control locations used to design the project and prepare the Plans.

(b) Contractor Responsibilities - The Contractor shall:

- Accurately measure detailed dimensions, elevations, and slopes from the Engineer's benchmarks and horizontal control locations;
- Provide all labor, materials and equipment to properly stake out the project so that it can be constructed in accordance with the Contract Documents. Any changes made shall be recorded and the changed vertical and horizontal locations incorporated into the “as-built” drawings.
- Inform the Engineer of any property corners monuments and/or survey markers that are not shown on the Plans and are found during construction activities prior to disturbing the monuments. Allow the Agency 2 Work days for referencing all found markers before they are removed. Monuments that are noted on the Plans to be protected and are disturbed by the Contractor's activities shall be replaced by the Contractor’s surveyor at the Contractor's expense in accordance with ORS Chapter 209.

00150.20 Inspection:

(a) Inspection by the Engineer - The Engineer may test Materials furnished and inspect Work performed by the Contractor to ensure Contract compliance. The Contractor shall notify the Engineer 48 hours (two full Work Days) in advance for inspection of each portion of the Work.

Contractor shall not begin placing successive Courses or portions of Work until preceding Courses or portions of the Work have been inspected.

If the Contractor performs Work without the Engineer's inspection or uses Materials that the Engineer has not approved, the Engineer may order affected portions of the Work removed at the Contractor's expense.

At the Engineer's direction, any time before the Work is accepted, the Contractor shall uncover portions of the completed Work for inspection. After inspection, the Contractor shall restore these portions of Work to the standard required by the Contract. If the Engineer rejects Work due to Materials or workmanship, or if the Contractor performed such Work without providing sufficient advance request for inspection to the Engineer, the Contractor shall bear all costs of uncovering and restoring the Work. If the Engineer accepts the uncovered Work, and the Contractor performed the Work only after providing the Engineer with sufficient advance notice, the costs of uncovering and restoring the Work will be paid for by the Agency according to 00195.20.

(b) Inspection Facilities - The Contractor shall furnish walkways, railings, ladders, shoring, tunnels, platforms, and other facilities necessary to permit the Engineer to have safe access to the Work to be inspected. The Contractor shall require producers and fabricators to provide safe inspection access as requested by the Engineer.

(c) Sampling - When directed by the Agency, the Contractor shall furnish the Engineer with samples of Materials that the Engineer will test. All of the Contractor's costs related to this required sampling are Incidental.

(d) Inspection by Third Parties - Where third parties have the right to inspect the Work, the Contractor shall coordinate with the Engineer and shall provide safe inspection access.

(e) Contractor's Duty to Make Corrections - The Contractor shall perform all Work according to the Contract Documents. The Contractor shall correct Work that does not comply with the Contract Documents at its own expense. Inspection of the Work by the Engineer does not relieve the Contractor of responsibility for improper prosecution of the Work.

00150.25 Acceptability of Materials and Work - The Contractor shall furnish Materials and shall perform Work in Close Conformance to the Contract Documents. If the Engineer determines that the Materials furnished or the Work performed are not in Close Conformance with the Contract Documents, the Engineer may:

- Reject the Materials or Work and order the Contractor, at the Contractor's expense, to remove, replace, or otherwise correct any non-conformity; or
- Accept the Materials or Work as suitable for the intended purpose, adjust the amount paid for applicable Pay Items to account for diminished cost to the Contractor or diminished value to the Agency, document the adjustment, and provide written documentation to the Contractor regarding the basis of the adjustment.

The Engineer's decisions concerning acceptability of Materials or Work will be final.

00150.30 Delivery of Notices - Written notices to the Contractor by the Engineer or the Agency will be delivered:

- In person;
- by electronically confirmed facsimile transmission;
- By U.S. Postal Service first class mail or priority mail (which at the sender's option may include certified or registered mail return receipt requested), to the current office address as shown in the records of the Agency; or
- By overnight delivery service of a private industry courier, to the current office address as shown in the records of the Agency.

Notices shall be considered as having been received by the Contractor:

- At the time of actual receipt when delivered in person or by facsimile transmission;

- At the time of actual receipt or 7 Calendar Days after the postmarked date when deposited for delivery by first class or priority mail, whichever is earlier; or
- At the time of actual receipt or 3 Calendar Days after deposit with a private industry courier for overnight delivery service, whichever is earlier.

Written notices to the Engineer or the Agency by the Contractor shall be delivered to the Agency address shown in the Special Provisions, unless a different address is agreed to by the Engineer, and shall be delivered:

- In person;
- By U.S. Postal Service first class mail or priority mail (which at the sender's option may include certified or registered mail return receipt requested); or
- By overnight delivery service of a private industry courier.

Notices will be considered as having been received by the Agency:

- At the time of actual receipt when delivered in person or by facsimile transmission;
- At the time of actual receipt or 7 Calendar Days after the postmarked date when deposited for delivery by first class or priority mail, whichever is earlier; or
- At the time of actual receipt or 3 Calendar Days after deposit with a private industry courier for overnight delivery service, whichever is earlier.

00150.35 Submittals:

(a) Description - Submittals covered by these requirements include manufacturers' information, shop drawings, test procedures, test results, samples, requests for substitutions, and miscellaneous Workrelated submittals. Submittals shall also include, but not be limited to, all mechanical, electrical and electronic equipment and systems, materials, reinforcing steel, fabricated items, and piping and conduit details. The Contractor shall furnish all drawings, specifications, descriptive data, certificates, samples, tests, methods, schedules, and manufacturer's installation and other instructions as specifically required in the Contract Documents to demonstrate fully that the materials and equipment to be furnished and the methods of work comply with the provisions and intent of the Contract Documents.

(b) Contractor's Responsibilities

(1) The Contractor shall be responsible for the accuracy and completeness of the information contained in each submittal and shall assure that the material, equipment or method of work shall be as described in the submittal. The Contractor shall verify that all features of all products conform to the specified requirements. Submittal documents shall be clearly edited to indicate only those items, models, or series of equipment, which are being submitted for review. All extraneous materials shall be crossed out or otherwise obliterated. The Contractor shall ensure that there is no conflict with other submittals and notify the Engineer in each case where his submittal may affect the work of another contractor or the Agency. The Contractor shall coordinate submittals among its subcontractors and suppliers including those submittals complying with unit responsibility requirements specified in applicable technical sections.

(2) The Contractor shall coordinate submittals with the Work so that Work will not be delayed. It shall coordinate and schedule different categories of submittals, so that one will not be delayed for lack of coordination with another. No extension of time will be allowed because of failure to properly schedule submittals. The Contractor shall not proceed with Work related to a submittal until the submittal process is complete. This requires that submittals for review and comment shall be returned to the Contractor with the indication "No Exceptions Taken" or "Make Corrections Noted."

(3) The Contractor shall certify on each submittal document that it has reviewed the submittal, verified field conditions, and complied with the contract documents.

(4) The Contractor may authorize in writing a material or equipment supplier to deal directly with the Engineer or with the Agency with regard to a submittal. These dealings shall be limited to contract interpretations to clarify and expedite the Work.

(c) Shop Drawings and Product Submittals

(1) Wherever called for in the Contract Documents or where required by the Engineer, the Contractor shall furnish to the Engineer for review, five (5) copies plus one reproducible copy or electronic file, of each Shop Drawing or Product submittal. Shop Drawings may include detail design calculations, shop-prepared drawings, fabrication and installation drawings, erection drawings, lists, graphs, catalog sheets, data sheets, and similar items. If a list, graph, catalog sheet, data sheet, etc. includes more than one item, clearly mark which item is the subject of the submittal. Shop Drawings shall bear the signature and seal of an engineer registered in the appropriate branch and in the state of Oregon, unless otherwise indicated. Whenever the Contractor is required to submit design calculations as part of a submittal, such calculations shall bear the signature and seal of an engineer registered in the appropriate branch and in the state of Oregon, unless otherwise indicated.

(2) Shop Drawing and Product submittals shall be accompanied by the Engineer's standard submittal transmittal form, a reproducible copy of which is available from the Engineer. A submittal without the form or where applicable items on the form are not completed will be returned for resubmittal.

(3) Organization

- A single submittal transmittal form shall be used for each technical specification section or item or class of material or equipment for which a submittal is required. A single submittal covering multiple sections will not be acceptable, unless the primary specification references other sections for components. Example: if a pump section references other sections for the motor, shop-applied protective coating, anchor bolts, local control panel, and variable frequency drive, a single submittal would be acceptable. A single submittal covering vertical turbine pumps and horizontal split case pumps would not be acceptable.

- On the transmittal form, index the components of the submittal and insert tabs in the submittal to match the components. Relate the submittal components to specification paragraph and subparagraph, Drawing number, detail number, schedule title, room number, or building name, as applicable.

- Unless indicated otherwise, terminology and equipment names and numbers used in submittals shall match those used in the Contract Documents.

(4) Format

- Minimum sheet size shall be 8.5 inches by 11 inches. Maximum sheet size shall be 22 inches by 34 inches. Every page in a submittal shall be numbered in sequence. Each copy of a submittal shall be collated and stapled or bound, as appropriate. The Engineer will not collate sheets or copies.

- Where product data from a manufacturer is submitted, clearly mark which model is proposed, with complete pertinent data capacities, dimensions, clearances, diagrams, controls, connections, anchorage, and supports. Sufficient level of detail shall be presented for assessment of compliance with the Contract Documents.

- Each submittal shall be assigned a unique number. Submittals shall be numbered sequentially, and the submittal numbers shall be clearly noted on the transmittal. Original submittals shall be assigned a numeric submittal number (e.g., 25). If submittal “25” requires a resubmittal, the first resubmittal will bear the designation "25.A" and the second resubmittal will bear the designation "25.B" and so on.

- If there is a follow-up submittal related to a previously submitted class of material or type of equipment (e.g., follow-up submittal to submittal “25”), it shall be assigned the number “25.1”. If submittal “25.1” requires a resubmittal, the first resubmittal will bear the designation "25.1.A" and the second resubmittal will bear the designation "25.1.B" and so on.

(5) Disorganized submittals that do not meet the requirements of the Contract Documents will be returned without review.

(6) Except as may otherwise be indicated, the Engineer will return prints of each submittal to the Contractor with comments noted thereon, within 21 Days following receipt by the Engineer. It is considered reasonable that the Contractor will make a complete and acceptable submittal to the Engineer by the first resubmittal on an item. The Owner reserves the right to withhold monies due to the Contractor to cover additional costs of the Engineer's review beyond the first resubmittal. The Engineer's maximum review period for each submittal or resubmittal will be 21 Days.

(7) If a submittal is returned to the Contractor marked "NO EXCEPTIONS TAKEN," formal revision and resubmission will not be required.

(8) If a submittal is returned marked "MAKE CORRECTIONS NOTED," Contractor shall make the corrections on the submittal, but formal revision and resubmission will not be required, except where specifically required by Engineer as indicated on the submittal review form.

(9) If a submittal is returned marked "AMEND-RESUBMIT," the Contractor shall revise it and shall resubmit the required number of copies to the Engineer for review. Resubmittal of portions of multi-page or multi-drawing submittals will not be allowed. For example, if a Shop Drawing submittal consisting of 10 drawings contains one drawing noted as "AMEND - RESUBMIT," the submittal as a whole is deemed "AMEND - RESUBMIT," and 10 drawings are required to be resubmitted.

(10) If a submittal is returned marked "REJECTED-RESUBMIT," it shall mean either that the proposed material or product does not satisfy the specification, the submittal is so incomplete that it cannot be reviewed, or is a substitution request not submitted in accordance with the General Conditions. In the first 2 cases, the Contractor shall prepare a new submittal and shall submit the required number of copies to the Engineer for review. In the latter case, the Contractor shall submit the substitution request according to the General Conditions.

(11) Resubmittal of rejected portions of a previous submittal will not be allowed. Every change from a submittal to a resubmittal or from a resubmittal to a subsequent resubmittal shall be identified and flagged on the resubmittal.

(12) Fabrication of an item may commence only after the Engineer has reviewed the pertinent submittals and returned copies to the Contractor marked either "NO EXCEPTIONS TAKEN" or "MAKE CORRECTIONS NOTED". Corrections indicated on submittals shall be considered as changes necessary to meet the requirements of the Contract Documents and shall not be taken as changes to the Contract requirements.

(13) Submittals shall be carefully reviewed by an authorized representative of the Contractor prior to submission to the Engineer. Each submittal shall be dated and signed by the Contractor as being correct and in strict conformance with the Contract Documents. In the case of Shop Drawings, each sheet shall be so dated and signed. Any deviations from the Contract Documents shall be noted by the Contractor on the transmittal form and such deviation shall be subject to approval in writing by the Engineer and Agency. The Engineer will only review submittals that have been so verified by the Contractor. Non-verified submittals will be returned to the Contractor without action taken by the Engineer, and any delays caused thereby shall be the total responsibility of the Contractor.

(14) Corrections or comments made on the Contractor's Shop Drawings during review do not relieve the Contractor from compliance with Contract Drawings and Specifications. Review is for conformance to the design concept and general compliance with the Contract Documents only. The Contractor is responsible for confirming and correlating quantities and dimensions, fabrication processes and techniques, coordinating Work with the trades, and satisfactory and safe performance of the Work.

(d) Quality Control (QC) Submittals

(1) Quality control submittals are defined as those required by the Specifications to present documentary evidence to the Engineer that the Contractor has satisfied certain requirements of the Contract Documents.

(2) Unless otherwise indicated, QC submittals shall be submitted:

- Before delivery and unloading, for the following types of submittals:
  - Manufacturers' installation instructions
  - Manufacturers' and Installers' experience qualifications
  - Ready mix concrete delivery tickets
  - Design calculations
  - Affidavits and manufacturers' certification of compliance with indicated product requirements
  - Laboratory analysis results
  - Factory test reports

- For the following types of submittals, the manufacturer's field representative shall submit a draft

certification prior to leaving the Project site and a final certification within 7 days of the event documented:

  - Manufacturers' field representative certification of proper installation

- Within 30 Days of the event documented for the following types of submittals:
  - Field measurement
  - Field test reports
  - Receipt of permit
  - Receipt of regulatory approval

(3) The Engineer will record the date that a QC submittal was received and review it for compliance with submittal requirements, but the review procedures above for Shop Drawings and samples will not apply.

(e) Deferred Submittals to Agency

(1) For the purposes of this section, Deferred Submittals are defined as those portions of the Project that are Contractor-designed and must be submitted to the Agency's building official for approval and to meet Building Permit plan review requirements.

(2) The Engineer will schedule a pre-submittal conference with the Contractor and Agency's building official to discuss proposed Deferred Submittal items, requirements, and review schedule.

(3) The Contractor shall list the Deferred Submittals on the title or cover sheet of the Drawings for submission to the Agency and shall state the design criteria/assumptions of the Deferred Submittal items on the plans. Deferred Submittals shall include details for connection of materials to the structure and calculations showing that the specified structural requirements are met.

(4) The Contractor shall submit Deferred Submittals to the Engineer for review for general conformance to the design of the structure. Neither the Agency nor the Engineer is responsible for coordination of Deferred Submittal components with Contract Documents. Review does not lessen nor shift burden or responsibility from Contractor or assigned subcontractor/supplier to the Agency or Engineer. The Engineer, upon confirming the Deferred Submittals are in general conformance with the design, shall forward the Deferred Submittals to the building official. Contractor is responsible, with no exceptions, to ensure that building official's Deferred Submittal review will not adversely affect Project's construction schedule. The Deferred Submittal items shall not be installed by the Contractor until the design and Deferred Submittals have been approved by the building official.

(f) Effect of Review of Contractor's Submittals

(1) Review of Contract drawings, methods of work, or information regarding materials or equipment the Contractor proposes to provide, shall not relieve the Contractor of its responsibility for errors therein and shall not be regarded as an assumption of risks or liability by the Engineer or the Agency, or by any officer or employee thereof, and the Contractor shall have no claim under the contract on account of the failure, or partial failure, of the method of work, material, or equipment so reviewed. An indication of "NO EXCEPTIONS TAKEN" or "MAKE CORRECTIONS NOTED" shall mean that the Agency or Engineer has no objection to the Contractor, upon its own responsibility, using the plan or method of Work proposed, or providing the materials or equipment proposed.

00150.37 Equipment Lists and Other Submittals - The Contractor shall submit Equipment lists, and other required submittals for approval by the Engineer. With each submittal, the Contractor shall clearly identify the applicable specification sub-section and the product make, model, size and proposed options.

00150.40 Cooperation and Superintendence by the Contractor:

The Contractor is responsible for full management of all aspects of the Work, including superintendence of all Work by Subcontractors, Suppliers, and other providers. The Contractor shall appoint a single Superintendent and may also appoint alternate Superintendents as necessary to control the Work. The form of appointment of the alternate shall state, in writing, the alternate's name, duration of appointment in the absence of the Superintendent, and scope of authority. The Contractor shall:

- Provide for the cooperation and superintendence on the Project by:
  - Furnishing the Engineer all data necessary to determine the actual cost of all or any part of the Work, added Work, or changed Work.

    - Allowing the Engineer reasonable access to the Contractor's books and records at all times. To the extent permitted by public records laws, the Engineer will make reasonable efforts to honor the Contractor's request for protection of confidential information.
    - Keeping one complete set of Contract Documents on the Project Site at all times, available for use by all the Contractor's own organization, and by the Engineer if necessary.
- Appoint a single Superintendent and any alternate Superintendent who shall meet the following qualifications:
    - Appointees shall be competent to manage all aspects of the Work.
    - Appointees shall be from the Contractor's own organization.
    - Appointees shall have performed similar duties on at least one previous project of the size, scope and complexity as the current Contract.
    - Appointees shall be experienced in the types of Work being performed.
    - Appointees shall be capable of reading and thoroughly understanding the Contract Documents.
- The appointed single Superintendent, or any alternate Superintendent shall:
    - Be present for all On-Site Work, regardless of the amount to be performed by the Contractor, Subcontractors, Suppliers, or other providers, unless the Engineer provides prior approval of the Superintendent's or alternate Superintendent's absence.
    - Be equipped with a two way radio or cell phone capable of communicating throughout the project during all the hours of Work on the Project Site and be available for communication with the Engineer.
    - Have full authority and responsibility to promptly execute orders or directions of the Engineer.
    - Have full authority and responsibility to promptly supply the Materials, Equipment, labor, and Incidentals required for performance of the Work.
    - Coordinate and control all Work performed under the Contract, including without limitation the Work performed by Subcontractors, Suppliers, and Owner Operators.
    - Diligently pursue progress of the Work according to the schedule requirements of Section 00180.
    - Cooperate in good faith with the Engineer, Inspectors, and other contractors in performance of the Work.
    - Provide all assistance reasonably required by the Engineer to obtain information regarding the nature, quantity, and quality of any part of the Work.
    - Provide access, facilities and assistance to the Engineer in establishing such lines, grades and points as the Engineer requires.
    - Carefully protect and preserve the Engineer's benchmarks and horizontal control locations.

Any Superintendent or alternate Superintendent who repeatedly fails to follow the Engineer's written or oral orders, directions, instructions, or determinations, shall be subject to removal from the project.

If the Contractor fails or neglects to provide a Superintendent, or an alternate Superintendent, and no prior approval has been granted, the Engineer has the authority to suspend the Work according to 00180.70. Any continued Work by the Contractor, Subcontractors, Suppliers, or other providers may be subject to rejection and removal. The Contractor's repeated failure or neglect to provide the superintendence required by these provisions constitutes a material breach of the Contract, and the Engineer may impose any remedies available under the Contract, including but not limited to Contract termination.

00150.50 Cooperation with Utilities:

(a) General - Unless otherwise specified in the Special Provisions or on the Plans, existing Utilities requiring adjustment may be adjusted by the Utility before, during, or after Project construction. "Adjustment of Utilities" shall mean the alteration, improvement, connection, disconnection, relocation, or removal of existing Utility lines, facilities, or systems in temporary or permanent manner.

(b) Contractor's Responsibilities - The Contractor shall:

- Follow applicable rules adopted by the Oregon Utility Notification Center;
- Contact Utility owners after the Contract is awarded to verify all Utilities' involvement on the Project Site;
- Coordinate Project construction with the Utilities' planned adjustments, take all precautions necessary to prevent disruption of Utility service, and perform its Work in the manner that results in the least inconvenience to the Utility owners;
- Include all Utility adjustment work, whether to be performed by the Contractor or the Utilities, on the Contractor's Project Work schedule submitted under 00180.41;
- Protect from damage or disturbance any Utility that remains within the area in which Work is being performed;
- Not disturb an existing Utility if it requires an unanticipated adjustment, but shall protect it from damage or disturbance and promptly notify the Engineer; and
- Report to the Engineer any Utility owner who fails to cooperate or fails to follow the planned Utility adjustment.

Subject to the Engineer's approval, the Contractor may propose adjustments to the Utilities by asking the Utility owners to move, remove, or alter their facilities in ways other than as shown on the Plans or in the Special Provisions. The Contractor shall conduct all negotiations, make all arrangements, and assume all costs that arise from such changes.

(c) Notification - If the Project is located within the area served by the Oregon Utility Notification Center, the Contractor shall notify owners of Utilities prior to the performance of Work in the vicinity of their facilities. The Utilities notification system telephone number is 1-800-332-2344.

The Contractor shall comply with the rules of the Oregon Utility Notification Center, OAR 952-001-0010 through OAR 952-001-0090, and ORS 757.993. The Contractor may contact the Oregon Utility Notification Center at 503-232-1987 about these rules.

00150.53 Utilities and Existing Improvements:

(a) General – Information shown on the plans as to the location of existing water courses and utilities has been compiled from available sources and may not be accurate. The Contractor shall determine the location and nature of affected water courses, utilities and underground improvements prior to commencing Work.

The Contractor shall provide for the flow of water courses and essential utilities that may be interrupted during the progress of the Work and shall restore such water courses or utilities after completion of the Work.

The plans will not normally show the new location of utilities that have been adjusted immediately prior to the project or will be adjusted as part of the project Work.

Except where the plans indicate, utilities have been field located during design or certain utility locations shall be exposed as part of the Work. The Contractor shall be responsible for exploratory excavations as it deems necessary to determine the exact locations and depths of utilities which may interfere with Work. All such exploratory excavations shall be performed as soon as practicable after Notice to Proceed and, in any event, a sufficient time in advance of construction to avoid possible delays to the Contractor's progress. When such exploratory excavations show the utility location as shown on the plans to be in error, the Contractor shall so notify the Engineer.

The number of exploratory excavations required shall be that number which is sufficient to determine the alignment and grade of the utility. Unless otherwise provided herein, all potholing and exploratory work shall be incidental to the Work and no separate payment shall be made therefore.

The Contractor shall coordinate project construction with the adjustment of utilities, take all necessary precautions to prevent disturbing the utilities, and perform work so that utility owners and users are caused a minimum of inconvenience.

The Contractor shall protect underground utilities and other improvements which may be impaired during construction operations, regardless of whether or the not the utilities are indicated on the plans. The Contractor shall take all possible precautions for the protection of unforeseen utility lines to provide for uninterrupted service and to provide such special protection as may be necessary.

To ease or streamline the work, the Contractor may desire to adjust the utilities by asking the utility owners to move, remove, or alter their equipment in ways other than those shown on the plans or in the Contract Documents. The Contractor shall conduct the negotiations, make the arrangements, and pay all costs that arise from such changes.

(b) Utilities to be Moved – In case it shall be necessary to move the property of any public utility or franchise holder, such utility company or franchise holder shall be notified by the Contractor to move such property within a specified reasonable time. When utility lines that are to be removed are encountered within the area of operations, the Contractor shall notify the utility company and the Engineer a sufficient time in advance for the necessary measures to be taken to prevent the interruption of service.

(c) Utilities to be Removed – Where the proper completion of the Work requires the temporary or permanent removal and/or relocation of an existing utility or other improvement which is indicated, the Contractor shall remove and, without unnecessary delay, temporarily replace or relocate such utility or improvement in manner satisfactory to the Engineer and the owner of the facility. In all cases of such temporary removal or relocation, restoration to the former location shall be accomplished by the Contractor in a manner that will restore or replace the utility or improvement

as nearly as possible to its former locations and to as good or better condition than found prior to removal.

(d) Underground Utilities and Improvements Indicated – Existing utility lines and underground improvements that are indicated or the locations of which are made known to the Contractor prior to excavation and that are to be retained, and all utility lines and underground improvements that are encountered during excavation operations shall be protected from damage during excavation and backfilling and, if damaged, shall be immediately repaired or replaced by the Contractor, unless otherwise repaired by the owner of damaged utility. If the owner of the damage facility performs its own repairs, the Contractor shall reimburse said owner for the costs of repair.

(e) Underground Utilities and Improvements Not Indicated – In the event that the Contractor damages existing utility lines or underground improvements that are not indicated in the plans or marked in the field, or are not indicated or marked with reasonable accuracy, or the locations of which are not made known to the Contractor prior to excavation, the Contractor shall immediately provide a verbal report of such damage to the Engineer, and provide a written report thereof promptly thereafter. The Contractor shall immediately notify the owner of the damaged utility. If directed by the Engineer, repairs shall be made by the Contractor under the provisions for changes and extra work contained in the General Conditions.

This subsection applies only to main line utilities. For service lines, see Subsection 00150.53(f).

For purposes of this section, "reasonable accuracy" is defined as within 4 feet horizontally from actual location. No representation shall be made concerning the accuracy of vertical elevations of existing utilities, even if indicated in the plans, and no additional payment will be made for damage to utilities encountered at depths differing from those indicated.

(f) Underground Services Indicated or Not – If service lines are encountered, whether shown, marked or not, the Contractor shall take precautions to carefully work around them and repair them if they are damaged by the Contractor, at no additional cost to the Agency.

(g) Approval of Repairs – All repairs to a damaged utility or improvement are subject to inspection and approval by an authorized representative of the utility or improvement owner before being concealed by backfill or other Work.

(h) Owner's Right of Access – The right reserved to the Owner and to the owners of public utilities and franchises to enter at any time upon any public street, alley, right-f-way, or easement for the purpose of making changes in their property made necessary by the Work of this Contract.

00150.55 Cooperation with Other Contractors - The Agency reserves the right to perform other work on or near the Project Site, including without limitation any Materials site, with forces other than those of the Contractor.

If such work takes place on or near the Project Site, the Contractor shall have the following obligations:

- The Contractor shall coordinate Work with other contractors or forces.

- The Contractor shall cooperate in good faith with all other contractors or forces.

- The Contractor shall perform the Work specified in the Contract in a way that will minimize interference and delay for all forces involved.

- The Contractor shall place and dispose of the Materials being used so as not to interfere with the operations of other forces.

- The Contractor shall join the Work with that of other forces in a manner acceptable to the Engineer or the Agency, and shall perform it in the accepted sequence with the work of the other force.

The Engineer will resolve any disagreements under this Subsection that may arise among the Contractor and other work forces, or between the Contractor and the Agency. The Engineer's decision in these matters is final, as provided in 00150.00.

When the schedules for Work of the Contractor and the work of other forces overlap, each contractor involved shall submit a current, realistic progress schedule to the Engineer. Before the Engineer accepts the schedule, each party shall have the opportunity to review all schedules. After this review and any necessary consultations, the Engineer will determine acceptable schedules.

The Contractor waives any right it may have to make claims against the Agency for any damages or claims that may arise because of inconvenience, delay, or loss due solely to the presence of other contractors working on or near the Project Site.

If the Contract gives notice of work to be performed by other forces that may affect the Contractor's Work under the Contract, the Contractor shall include any costs associated with coordination of the Work in the appropriate Pay Item or as a portion of a Pay Item.

In an emergency, the contractor most immediately able to respond may repair a facility or Utility of another contractor in order to prevent further damage to the facility, Utility, or other Structure as a result of the emergency.

00150.60 Construction Equipment Restrictions:

(a) Load and Speed Restrictions for Construction Vehicles and Equipment - The Contractor shall comply with legal weight and speed restrictions when moving Materials or Equipment beyond the limits of the Project Site.

The Contractor shall control vehicle and Equipment loads and speeds within the Project Site according to the following restrictions, unless the Special Provisions provide otherwise:

- The Contractor shall restrict loads and speeds as necessary to avoid displacement or loss of Materials on Subgrades and Aggregate Bases.

- The Contractor shall restrict weights to legal loads, and shall travel at speeds of no more than 45 mph or the posted construction speed, whichever is less, on treated Bases, Pavement, or wearing Courses.
- The Contractor shall not cross Bridges or other Structures with Equipment or vehicles exceeding the legal load limit without prior written permission of the Engineer. The Contractor shall make any such request in writing, describing the loading details and the arrangement, movement, and position of the Equipment on the Structure. The Contractor shall comply with any restrictions or conditions included in the Engineer's written permission.

(b) Protection of Buried Items - The Contractor shall use temporary fill or other methods to avoid overload of pipes, box culverts, and other items that are covered, or to be covered, by fill or backfill.

(c) Responsibility for Damages - The Contractor shall assume responsibility for damages caused by excessive Equipment speed or loads while performing the Work, both inside and outside the Project Site. The Engineer's permission to cross Bridges and other Structures, according to 00150.60(a) will not relieve the Contractor from responsibility for load-caused damages.

00150.70 Detrimental Operations - The Contractor shall avoid operations whose methods, conditions, or timing may injure people or damage property or the Work. Damage may include without limitation, staining surfaces with mud or asphalt. (also see 00150.60, 00150.75, and Section 00170)

When any such damage occurs, the Engineer will determine if it is to be corrected by repair, replacement, or compensatory payment by the Contractor. If compensatory payment is required, the Engineer will determine the amount. Compensatory payment may be deducted from monies due or to become due to the Contractor under the Contract.

00150.75 Protection and Maintenance of Work During Construction - The Contractor shall protect and maintain the Work during construction and until Third Notification has been issued, unless otherwise provided in the Contract. For the purposes of this Subsection, "maintenance" shall include measures to prevent deterioration of Roadway and Structures at the Project Site, and to keep them in good condition at all times during the prosecution of the Work. The Contractor shall continuously allocate sufficient Equipment and workers to achieve such maintenance.

If the Contract requires the placement of a Course upon a previously constructed Course or Subgrade, the Contractor shall maintain the previous Course or Subgrade during all construction operations.

The Contractor shall include costs of protecting and maintaining the Work during construction in the unit prices bid for the various Pay Items. The Contractor will not be paid an additional amount for this Work, unless otherwise specified.

The Engineer will timely notify the Contractor of Contractor's noncompliance with this Subsection. If the Contractor fails to remedy unsatisfactory protection or maintenance within 24 hours after receipt of such

notice, the Engineer may proceed to remedy the deficiency, and deduct the entire cost from monies due or to become due the Contractor under the Contract.

00150.80 Removal of Unacceptable and Unauthorized Work - The Contractor shall correct or remove unacceptable Work and remove unauthorized work, as directed by the Engineer in writing. The Contractor shall replace such work with Work and Materials conforming to the requirements of the Contract.

For the purposes of this Subsection, "unauthorized work" shall include without limitation the following:

- Work that extends beyond lines shown on the Plans or otherwise established by the Engineer;
- Work that is contrary to the Engineer's instructions; and
- Work that is conducted without the Engineer's written authorization.

The Agency will not pay the Contractor for unacceptable Work or unauthorized work. The Engineer may issue a written order for the correction or removal of such work at the Contractor's expense.

If, when ordered by the Engineer, the Contractor fails to correct or remove unacceptable Work or unauthorized work, the Engineer may have the correction, or removal and replacement, done by others and deduct the entire cost from monies due or to become due the Contractor under the Contract.

00150.90 Final Inspection:

(a) On-site Construction Work - The Engineer will inspect the Project at a time close to the completion of On-Site Work for Contractor's compliance with the Contract Documents.

When all On-Site Work on the Project is completed, including but not limited to Change Order Work and Extra Work, the Engineer will issue Second Notification as specified in 00180.50(g).

Within 15 Calendar Days after the Engineer receives the Contractor's written notification that all punch list items, final trimming and cleanup according to 00140.90 have been completed, the Engineer will review the Project and notify the Contractor that all Work is complete, or will give the Contractor written instruction regarding incomplete or unsatisfactory Work.

(b) All Contract Work - The Engineer will issue the Third Notification when the Contractor has satisfactorily accomplished all of the following:

- The Contractor has completed all On-Site Work required under the Contract, including the punch list items from (a) above;
- The Contractor has removed all Equipment; and
- The Contractor has submitted all required certifications, bills, forms, warranties and other documents.
- The Contractor has submitted complete and acceptable "As-Built" drawings as specified in 00140.95.

00150.91 Post-Construction Review - The Contractor or the Engineer may request a Post-Construction Review meeting, to be held at a time prior to issuance of Third Notification but not earlier than 15 Days following the date of Second Notification. The meeting may be held if agreed to by both parties. The party making the request will conduct the meeting, and will announce the time and place of the meeting at least 15 Days prior to the meeting date. The purpose of this meeting is to examine the Project for possible process improvements that may benefit future projects.

00150.95 Final Acceptance - After the Engineer completes Final Inspection of all Correction Period work and deems it satisfactorily completed, the Agency will acknowledge Final Acceptance. The Agency will notify the Contractor in writing of the date of Final Acceptance within 7 Calendar Days after Final Acceptance, or as soon thereafter as is practicable.

00150.96 Maintenance Warranties and Guarantees - Prior to Third Notification, the Contractor shall transfer to the Agency all unexpired manufacturer's, installer's or supplier's warranties and guarantees for Materials and Equipment installed on the Project. Such warranties and guarantees shall recite that they are enforceable by the Agency.

00150.97 Responsibility for Materials and Workmanship:

(a) The Contractor shall perform the Work according to the terms, conditions, and requirements of the Contract.

(b) Whether before or after the Agency's acceptance of the Work, the Contractor shall be responsible for:

- Correcting or repairing any defects in, or damage to, the Work which results from the use of improper or defective materials or workmanship; or
- Replacing, in its entirety, the Work affected by the use of improper or defective materials or workmanship to the extent provided by law; and
- Correcting or repairing any Work, Materials, Structures, Existing Surfacings, Pavement, Utilities, or sites, including without limitation Wetlands, damaged or disturbed in that correction, repair, or replacement. (see 00170.80 to 00170.85)

Section 00160 - Source of Materials

00160.00 Definitions - The following definitions apply to Section 00160:

(a) Prospective Source - Agency-furnished Materials source, use of which by the Contractor is optional. The Agency makes no guarantee or representation, by implication or otherwise, of the land use status, quantity, quality, or acceptability of Materials available from it, except as may be stated in the Special Provisions.

(b) Mandatory Source - Agency-furnished Materials source, use of which by the Contractor is required.

00160.01 Notification of Source of Supply and Materials:

(a) All Materials - The Contractor shall notify the Engineer in writing of all proposed Materials sources of supply, including without limitation any steel or other fabricators within the following time frames:

- At least 15 Calendar Days before using or fabricating Materials, if source is within the State; or
- At least 45 Calendar Days before using or fabricating Materials, if source is outside the State

(b) Prospective Source Materials - When given an option to use Prospective Sources of Materials to be incorporated into the Work, the Contractor shall notify the Engineer in writing of the option selected within 15 Calendar Days from date of Notice to Proceed. Otherwise, such Materials sources may become unavailable.

(c) Approval Required - Before allowing production or delivery of Materials to begin from any source, the Contractor must obtain the Engineer's approval. Approval to use any source does not imply that Materials from that source will be accepted. If approved sources do not provide Materials that meet Specifications, the Materials will be rejected. The Contractor will then be responsible for locating other sources and obtaining the Engineer's approval.

00160.05 Qualified Products List (QPL) - The QPL is a listing of manufactured products available on the market (shelf items) that ODOT has evaluated and found suitable for a specified use in construction. The QPL is published twice a year and is available from ODOT's Construction Section; 800 Airport Road SE; Salem, OR 97301-4798; phone 503-986-3000. It may also be viewed on ODOT's web site.

The current version of the QPL at the time of Bid Closing is the version in effect for the Project. The Engineer may approve for use a conditionally qualified product, or a product qualified for inclusion in a later edition of the QPL, if the Engineer finds the product acceptable for use on the Project.

Use of listed products shall be restricted to the category of use for which they are listed. The Contractor shall install all products as recommended by the manufacturer. The Contractor shall replace qualified products not conforming to Specifications or not properly handled or installed at the Contractor's expense.

00160.10 Ordering, Producing, and Furnishing Materials - The Contractor shall not place orders for or produce full quantities of Materials anticipated to be required to complete the Work until the Work has advanced to a stage that allows the quantities to be determined with reasonable accuracy.

(a) Contractor's Duties - In purchasing, producing, or delivering Materials, the Contractor shall take into account the following:

- Kind of work involved;
- Amount of work involved;
- Time required to obtain Materials; and
- Other relevant factors.

(b) Quantity of Materials - Materials quantities shown on the Plans, or indicated by quantities and Pay Items, are subject to change or elimination. The Contractor is responsible for payment for excess Materials delivered to the Project Site or storage sites. Unless otherwise specified in the Contract, the Agency will not be responsible for:

- Materials the Contractor may deliver or produce in excess of Contract requirements;
- Extra expense the Contractor may incur because Materials were not ordered or produced earlier; or
- The Contractor's expenses related to Materials ordered by the Contractor that are not subsequently approved for use.

Excess Materials, ordered or produced by the Contractor, without approval of the Engineer, may be purchased by the Agency at the sole discretion of the Agency. (see 00195.80)

00160.20 Preferences for Materials:

(a) Buy America - If federal highway funds are involved on the Project, the Contractor shall limit the quantity of foreign Materials incorporated into the Work as follows. Section 635.410 of Title 23, Code of Federal Regulations, and the Intermodal Surface Transportation Efficiency Act require that all iron or steel manufacturing processes, including without limitation the casting of ingots, for iron or steel Materials permanently incorporated into the Project shall occur in the United States, unless the cost of foreign-origin iron or steel Materials does not exceed one-tenth of one percent (0.1%) of the Contract Amount or $2,500, whichever is greater. The Contractor shall not incorporate foreign-origin iron or steel Materials in excess of this amount into the Project. All foreign-origin iron or steel Materials incorporated in the Project in excess of the amount indicated above shall be removed and replaced with domestic iron or steel Materials at the Contractor's expense. For purposes of this Specification, the cost of foreign-origin iron or steel Materials shall be the value of the iron or steel products as of the date they are delivered to the Project Site.

Manufacturing processes include without limitation the application of coatings to finished iron or steel products or components. Coatings include epoxy coating, galvanizing, painting, and any other coating that protects or enhances the value of the steel or iron product or component.

The Contractor shall provide the Engineer with a Certificate of Materials Origin, on a form furnished by the Engineer, before incorporating any iron or steel products into the Project. Unless a Certificate of Materials Origin has been provided to the Engineer, the Materials shall be considered of foreign origin.

The Contractor shall retain manufacturers' certificates verifying the origin of all domestic iron or steel Materials for 3 years after the date of final payment for the Project, and shall furnish copies to the Engineer upon request.

(b) Buy Oregon - According to ORS 279A.120, the Contractor shall give preference to goods or services produced in Oregon if price, fitness, availability, and quality are equal. This provision does not apply to Contracts financed wholly or in part by federal funds.

(c) Recycled Materials - According to ORS 279A.010, ORS 279A.125, ORS 279A.145, ORS 279A.150, and ORS 279A.155, and subject to the approval of the Engineer, the Contractor shall use recycled products to the maximum extent economically feasible.

00160.30 Agency-Furnished Materials - Unless otherwise specified in the Special Provisions, Materials listed as Agency-furnished will be available to the Contractor free of charge.

The Contractor shall be responsible for all Materials furnished by the Agency and shall pay all demurrage and storage charges. The Contractor shall replace at its expense Agency-furnished Materials lost or damaged due to any cause.

The locations at which Agency-furnished Materials are available will be specified in the Special Provisions. If the locations are not listed in the Special Provisions, the Agency-furnished Materials will be furnished to the Contractor at the Project Site. In either case, all costs of handling, hauling, unloading, and placing Agency-furnished Material shall be considered included in the price paid for the Pay Item involving such Material.

All Agency-furnished Materials not incorporated into the Work remains the property of the Agency. The Contractor shall deliver such Materials as directed by the Engineer.

00160.50 Agency-Controlled Land; Limitations and Requirements:

(a) General - The Contractor shall have no property rights in, or right of occupancy on, Agency-Controlled Land. Nor shall the Contractor have the right to sell, use, remove, or otherwise dispose of any material from Agency-Controlled Land, areas, or property, except as specified in the Special Provisions or by the written authorization of the Engineer.

Unless authorized in the Contract, the Contractor shall not disturb any material within Rights-of-Way without written authorization from the Engineer.

Unless otherwise specified in the Contract, the ownership of all materials originating on Agency-Controlled Lands will at all times vest in, and remain within the control of, the Agency.

(b) Waste, Excess, and By-Product Materials - All waste, excess, and by-product materials, collectively referred to in this Subsection as "By-Products", from the manufacture or production of Materials from Agency-Controlled Lands shall remain Agency property. Unless otherwise ordered by the Engineer in writing, By-Products shall be placed as required in the Special Provisions:

- In stockpiles at designated locations;
- At locations and in shapes that are readily accessible; and
- In such a manner as to avoid fouling areas containing useable materials, or interfering with future plant setups to use materials from the property.

The Agency will not compensate the Contractor for handling and stockpiling By-Products according to the Special Provisions requirements. If by written order the Engineer directs the Contractor to stockpile or place designated By-Products at alternate sites, the By-Products designated shall be loaded, hauled, and placed as directed, and this work will be paid for according to 00195.20.

00160.60 Contractor-Furnished Materials and Sources:

(a) General - The Contractor shall furnish, at its own expense, all products and Materials required for the Project from sources of its own choosing, unless such sources have been specified in the Special Provisions or Plans as Prospective or Mandatory Sources.

(b) Acquisition of Sources - The Contractor shall acquire, at its own expense, the rights of access to, and the use of, all sources the Contractor chooses which are not Agency-controlled and made available by the Agency to the Contractor.

(c) Additional Requirements - Except for continuously-operated commercial sources, Work shall not begin, nor will any Materials be accepted by the Engineer, until the Contractor has:

(1) Given to the Engineer a copy of permits from, or proof that permits are not required from:

- The Department of Geology and Mineral Industries, as required under ORS 517.790;
- The Department of State Lands, as required under ORS 196.815 (when removing material from the bed or banks of any waters or from any Wetland); and
- Local governmental authorities having jurisdiction over land use at the source location.

(2) Furnished to the Engineer written approval of the property owner, if other than the Contractor, for the Contractor's proposed plans of operation in, and reclamation of, the source. The Contractor shall include in the document containing the property owner's written approval a summary of the requirements of the permits described above, which shall be subject to the Engineer's approval.

00160.70 Requirements for Plant Operations - Before operating mixing plants, Rock crushers, or other Equipment, the Contractor shall provide the Engineer copies of all applicable discharge permits for noise, air contaminants, and water pollutants from DEQ or applicable local jurisdictions, or a letter from DEQ or the local jurisdiction stating that no permits are required for the use of the Equipment and sites.

00160.80 Requirements for Sources of Borrow and Aggregate - The Contractor shall conduct operations according to all applicable federal, State, and local laws (including without limitation ORS 517 and OAR 632-030) when developing, using, and reclaiming all sources of Borrow material and Aggregate. The Contractor shall provide erosion control at Borrow sources that are not within the Project Site. The Contractor shall not operate in Wetlands except as allowed by permit. The Contractor shall comply with all requirements for pollution and sediment control, including without limitation the National Pollutant Discharge Elimination System where applicable.

Except for continuously-operated commercial sources, the Contractor shall also conform to the following:

(a) If a natural growth of trees or shrubs is present, preserve a border of such to conceal land scars.

(b) Excavate Borrow sources and Aggregate sources, except for those in streams and rivers, to provide:

- Reasonably uniform depths and widths;
- Natural drainage so no water stands or collects in excavated areas, when practicable;
- Slopes trimmed to blend with the adjacent terrain upon completion of operations;
- Slopes covered with native soil, or acceptable plant rejects to support plant growth, if required by Specifications, Plans, or permits; and
- A vegetative cover that blends with the adjacent natural growth.

(c) Excavate in quarries so that:

- Faces will not be steeper than vertical (no overhang);
- Vertical faces conform to Oregon OSHA standards, Division 3, and as shown on an approved development plan;
- Floors or benches are excavated to a uniform Slope free of depressions and will drain and not interfere with the downland owner's property; and
- Upon completion, the quarry is left appearing neat and compatible with surrounding terrain.

(d) Obliterate haul roads specifically built for access to sources, and restore the areas disturbed by these roads as nearly as practicable to the conditions that existed before the roads were built, unless otherwise directed by the landowner or regulatory body.

Section 00165 - Quality of Materials

Description

00165.00 General - The Contractor shall incorporate into the Work only Materials conforming to the Specifications and approved by the Engineer. The Contractor shall incorporate into the Work only manufactured products made of new materials unless otherwise specified in the Contract. The Agency may require additional testing or retesting to determine whether the Materials or manufactured products meet Specifications.

Materials or manufactured products not meeting the Specifications at the time they are to be used are unacceptable and must be removed immediately from the Project Site, unless otherwise directed by the Engineer.

00165.01 Rejected Materials - The Engineer may reject any Materials that appear to be defective (00150.25) or that contain asbestos. The Contractor shall not incorporate any rejected Materials into the Work. Rejected Materials whose defects have been corrected may not be incorporated into the Work until the Engineer has approved their use. The Engineer may order the removal and replacement by the Contractor, at Contractor's expense, of any defective Materials. (refer also to 00150.20)

00165.02 Materials Conformance and Quality Compliance Documents - For purposes of this Section, "Materials Conformance Documents" means the Contractor's quality-control, the Agency's verification, and the independent assurance test results, and the identity of the testing facility, as specified in the ODOT Manual of Field Test Procedures (MFTP), unless otherwise specified in the Contract.

For purposes of this Section, "Quality Compliance Documents" means those documents specified in ODOT's Nonfield-Tested Materials Acceptance Guide, unless otherwise specified in the Contract.

00165.03 Testing by Agency - When testing Materials, the Agency will conduct the tests in its central laboratory, field laboratories, or other laboratories designated by the Engineer, even though certain AASHTO, ASTM, and other Materials specifications may require testing at the place of manufacture. Results of the Agency's tests will be made available to the Contractor.

00165.04 Costs of Testing - When the Contract requires that the Agency performs the testing, the testing will be at the Agency's expense. The Agency will pay the cost of Contractor-requested source-review tests on unprocessed Aggregates from no more than two sources for each Project, and on no more than three unprocessed samples from each source. Additional source-review tests performed at the Contractor's request shall be at the Contractor's expense.

Unless otherwise provided in the Contract, all testing required to be performed by the Contractor will be at the Contractor's expense.

Provisions and Requirements

00165.10 Materials Acceptance Guides - Unless otherwise specified elsewhere in the Contract, Materials will be accepted according to the following guides:

(a) Field-Tested Materials - Field-tested Materials will be accepted according to the ODOT Manual of Field Test Procedures (MFTP). The MFTP is published once per year and is available from the ODOT – Construction Section, 800 Airport Road SE; Salem, OR 97301-4798; phone 503-986-3000. The MFTP is also available on the ODOT Construction Section web site.

(b) Nonfield-Tested Materials - Nonfield-tested Materials will be accepted according to the ODOT Nonfield Tested Materials Acceptance Guide (NTMAG), unless otherwise specified in the Contract. The NTMAG is available on the ODOT Construction Section web site.

00165.20 Materials Specifications and Test Method References - References to Materials specifications and test methods of ODOT, WAQTC, AASHTO, ASTM, other governmental agencies, or other recognized organizations mean those officially adopted and in current use by the agency or organization on the date of Bid Opening.

If there are conflicting references, or if no reference is made to Materials specifications or test method, Materials must meet the Materials specifications or test methods required by the first applicable of the following agencies and organizations:

- Field-Tested Materials:
  - Special Provisions;
  - MFTP as modified by the Local Public Agency Quality Assurance Program; and
  - Standard Specifications.

- Nonfield Tested Materials:
  - ODOT;
  - WAQTC;
  - AASHTO;
  - ASTM;
  - Other recognized national organizations, such as ANSI, AWPA, IMSA, and UL; and
  - Industry standards in the location where the Work is being performed.

If there are conflicting references in the Contract or the Quality Assurance program, to required sampling and testing frequencies, the Contractor shall sample and test the Materials according to the first applicable of the following:

- Special Provisions;
- MFTP as modified by the Local Public Agency Quality Assurance Program; and
- Standard Specifications.

00165.30 Field-Tested Materials:

(a) Contractor's Duties - The Contractor shall:

- Furnish Materials of the quality specified in the Contract;
- Provide and administer a quality control program as described in the Quality Assurance Manual portion of the MFTP. Upon request, the Contractor shall provide to the Engineer the names, telephone numbers, and copies of certifications for all personnel performing field testing; and
- Perform other testing as required by the Contract.

(b) Types of Tests - The types of tests and testing methods generally required by the Agency are described in the MFTP.

(c) Acceptance of Field-Tested Materials The Contractor's test results for field-tested Materials will be verified by the Agency according to the Quality Assurance program outlined in the MFTP. Materials will be analyzed as determined by the Engineer for acceptance before the Engineer will accept them for incorporation into the Work. Incorporated Materials that do not meet Specifications will be evaluated according to 00165.01 and 00150.25.

If the Agency's verification testing reveals that the Contractor's data is incorrect, the Agency may require additional testing to determine whether the Materials meet Specifications. The Contractor shall perform additional quality control testing or provide split samples to the Agency for additional testing as directed. If the Materials do not meet Specifications, the Contractor shall reimburse the Agency for the cost of the additional testing, which may be deducted from monies due or to become due the Contractor under the Contract. Incorporated Materials that do not meet Specifications will be evaluated according to 00165.01 and 00150.25. If the Materials meet Specifications the Agency will pay the cost for the additional testing.

00165.35 Nonfield-Tested Materials - The Contractor shall furnish Materials meeting Specifications, along with all Materials Conformance and Quality Compliance Documents.

(a) Test Results Certificate - The Certificate shall:

- Be from the manufacturer verifying that the Material furnished has been sampled and tested and the test results meet the Specifications.
- Include, or be accompanied by, a copy of the specified test results (ODOT, AASHTO, ASTM, UL or other).
- Identify the testing agency and the representative responsible for the test results.
- Permit positive determination that Material delivered to the Project is the same Material covered by the test results.
- Be delivered to the Engineer with the shipment of the material.

(b) Quality Compliance Certificate - The Certificate from the manufacturer shall:

- Verify that the Material meets the Specifications, and identify by number the specified test methods used, (ODOT, AASHTO, ASTM, UL, or other)

- Permit positive determination that Material delivered to the Project is the same Material covered by the certificate,
- Be delivered to the Engineer with the shipment of the Material, or be an identification plate or mark, decal, sticker, label, or tag attached to the container or Material,

(c) Equipment List and Drawings - These consist of lists of proposed Equipment and Materials, such as:

- Shop drawings
- Material lists
- Equipment lists
- Catalog description sheets
- Manufacturer's brochures

Submit these lists to the Engineer for review of conformance with the Specifications.

(d) Certificate of Origin of Steel Materials - When specified, complete this document (ODOT Form 734-2126) as required by 00160.20 for Federal-aid projects.

Materials will be subject to acceptance testing if the Engineer so elects. The Engineer may reject damaged or non-Specification Materials regardless of the Materials Conformance Documents furnished.

00165.50 Acceptance Sampling and Testing -The Contractor shall sample and test Materials for acceptance, as required by the Contract. Materials will be analyzed as determined by the Engineer for acceptance before the Engineer will accept them for incorporation into the Work. When the Engineer determines the Materials or Work does not conform to the Specifications the Engineer may accept the Materials or Work with pay adjustments or reject the Materials or Work per 00150.25.

00165.70 Use of Materials without Acceptable Materials Conformance Documents:

(a) General - The Contractor shall not incorporate Materials into the Project prior to submittal of Materials Conformance Documents acceptable to the Engineer. The Engineer may waive this requirement temporarily if Materials are necessary for immediate traffic safety.

(b) Materials Incorporated for Immediate Traffic Safety - If Materials are incorporated into the Project for immediate traffic safety before acceptable Materials Conformance Documents are available, no payment will be made for the value of the Materials, or the costs of incorporating them, until Materials Conformance Documents have been submitted to and approved by the Engineer, or the Materials are otherwise found through testing to comply with Specifications.

(c) Contractor's Request for Testing Assistance - If acceptable Materials Conformance Documents are not available, the Contractor may either have the necessary tests performed at a private laboratory or request in writing that the Engineer:

- Determine if the Agency or its agents can sample and test;
- Estimate the cost to the Contractor for the testing service; and

- Estimate the time required to obtain the test results.

The Engineer will provide this information to the Contractor in writing. If the Contractor requests the Engineer, in writing, to proceed, the Engineer will arrange for the sampling and testing, at the Contractor's expense. If these tests determine the Material complies with the Specifications, the Materials may be incorporated into the Project, or for Materials previously incorporated according to (b) above, payment will be authorized.

00165.75 Storage and Handling of Materials - The Contractor shall store and handle Materials so as to preserve their quality and fitness for incorporation into the Work. The Contractor shall restore all storage sites to their original condition according to 00140.90, or to comply with any applicable permits, orders, or agreements, at the Contractor's expense.

Stored Materials:

- Shall be readily accessible for inspection;
- May be stored on approved parts of the Right-of-Way; and
- May be stored on private property if written permission of the owner or lessor is obtained.

Section 00170 - Legal Relations and Responsibilities

Description

00170.00 General - The Contractor shall comply with all laws, ordinances, codes, regulations and rules, (collectively referred to as "Laws" in this Section), that relate to the Work or to those engaged in the Work. Where the provisions of the Contract are inconsistent or in conflict, the Contractor shall comply with the more stringent standard.

The Contractor shall indemnify, defend, and hold harmless the Agency and its representatives from liability arising from or related to the violation of Laws by those engaged in any phase of the Work. This provision does not apply to Work performed by Agency employees.

In any litigation, the entire text of any order or permit issued by a governmental or regulatory authority, as well as any documents referenced or incorporated therein by reference, shall be admissible for the purpose of Contract interpretation.

The Contract shall not be construed against either party regardless of which party drafted it. Other than as modified by the Contract, the applicable rules of contract construction and evidence shall apply. This Contract shall be governed by and construed according to the laws of the State of Oregon without regard to principles of conflict of laws.

Any dispute between the Agency and the Contractor that arises from or relates to this Contract and that is not resolved under the provisions of Section 00199 shall be brought and conducted solely and exclusively within the Circuit Court for the State of Oregon in the county where the Agency's main office is located; provided, however, if a dispute must be brought in a federal forum, then it shall be brought and conducted solely and exclusively within the United States District Court for the District of Oregon. In no event shall this Subsection be construed as a waiver by the State of Oregon on any form of defense or immunity, whether sovereign immunity, governmental immunity, immunity based on the Eleventh Amendment to the Constitution of the United States or otherwise, from any claim or from the jurisdiction of any court. CONTRACTOR BY EXECUTION OF THE CONTRACT HEREBY CONSENTS TO THE IN PERSONAM JURISDICTION OF THE COURTS REFERENCED IN THIS SECTION.

Provisions and Requirements

00170.01 Other Agencies Affecting Agency Contracts - Representatives of regulatory bodies or units of government whose Laws may apply to the Work shall have access to the Work according to 00150.20(d). These may include but are not limited to those in the following (a), (b), (c), and (d).

(a) Federal Agencies:

Agriculture, Department of
- Forest Service
- Natural Resource Conservation Service

Army, Department of the
- Corps of Engineers

Commerce, Department of

National Marine Fisheries Service

Defense, Department of

Energy, Department of

Environmental Protection Agency (EPA)

Federal Energy Regulatory Commission

Geology Survey

Health and Human Services, Department of

Homeland Security, Department of
U.S. Coast Guard (USCG)

Housing and Urban Development, Department of

Interior, Department of
Heritage, Conservation, and Recreation Service
Bureau of Indian Affairs
Bureau of Land Management
Bureau of Mines
Bureau of Reclamation
Geological Survey
Minerals Management Service
Office of Surface Mining, Reclamation, and Enforcement

Minerals Management Service

Solar Energy and Energy Conservation Bank

U.S. Fish and Wildlife Service

Labor, Department of
Mine Safety and Health Administration
Occupational Safety and Health Administration (OSHA)

Transportation, Department of
Federal Highway Administration

Water Resources Council

(b) State of Oregon Agencies:

Administrative Services, Department of

Agriculture, Department of
Natural Resources Division
Soil and Water Conservation District

Columbia River Gorge Commission

Consumer and Business Services, Department of
Insurance Division
Oregon Occupational Safety and Health Division (OR-OSHA)

Energy, Office of

Environmental Quality, Department of (DEQ)

Fish and Wildlife, Department of
Forestry, Department of
Geology and Mineral Industries, Department of
Human Resources, Department of
Labor and Industries, Bureau of
Land Conservation and Development Department
Parks and Recreation, Department of
State Lands, Department of
Water Resources Department

(c) Local Agencies:

City Commissions
County Courts
County Commissioners, Boards of
Design Commissions
Historical Preservation Commissions
Lane Regional Air Pollution Authority (LRAPA)
Planning Commissions
Port Districts
Special Districts

(d) Oregon Federally Recognized Tribal Governments:

Burns Paiute Tribe
Confederated Tribes of Coos, Lower Umpqua and Siuslaw Indians
Confederated Tribes of Grand Ronde
Confederated Tribes of Siletz
Confederated Tribes of Umatilla Indian Reservation
Confederated Tribes of Warm Springs
Coquille Tribe
Cow Creek Band of Umpqua Indians
Klamath Tribe

00170.02 Permits, Licenses, and Taxes - As required to accomplish the Work, the Contractor shall do the following:

- Obtain all necessary permits and licenses, except for those noted in 00170.03;
- Pay all applicable charges, fees and taxes, except for those noted in 00170.03;

- Give all notices required by applicable Laws, or under the terms of the Contract;
- Comply with ORS 274.530 relating to lease of stream beds by Oregon Division of State Lands;
- License, in the State of Oregon, all vehicles subject to licensing;
- Comply with ORS 477.625 and ORS 527.670 relating to clearing and fire hazards on forest lands; and
- Comply with all orders and permits issued by a governmental authority, whether local, State, or federal.

00170.03 Furnishing Right-of-Way, Easements and Permits - Unless required to be obtained in the name of the Contractor, the Agency will obtain and pay for the following when they are required by the applicable Laws or by Plans or Specifications:

- All necessary Rights-of-Way and Easements;
- Permits required for crossing or encroaching upon navigable streams;
- Permits required for removing materials from or depositing materials in waterways;
- Permits required for operating in Agency-controlled source of Materials or disposal area;
- System development fees charged by local units of government;
- Building construction permits, not including specialty work such as heating, ventilation, air conditioning, or electrical;
- Cost of referencing and replacing endangered survey monuments; and
- Environmental permits, including erosion control permits.

If, after the Bid Closing date, the Agency obtains any Permits, Rights of Way or Easements which require changes to the Work and thereby causes an increase or decrease in the cost of, or the time required for the performance of the Work, the Contractor shall submit information sufficient for the Engineer to determine the extent of the effects on the cost and/or schedule. If the Engineer agrees the cost and/or schedule will be affected by such changes, such effects will be handled in accordance with the General Conditions. The Engineer will provide the Contractor with a copy of any such Permits, Rights-of-Way or easements.

00170.04 Patents, Copyrights, and Trademarks - Prior to use of designs, devices, materials, or processes protected by patent, copyright, or trademark, the Contractor shall obtain from the Entity entitled to enforce the patent, copyright, or trademark all necessary evidence of legal right.

The Contractor shall indemnify, defend and hold harmless the Agency and all third parties and political subdivisions having a possessory or ownership interest or regulatory authority over the Project or Project Site from claims of patent, copyright or trademark infringement, and from costs, expenses and damages the Contractor or Agency may be obligated to pay as a result of such infringement during or after completing the Work.

00170.05 Assignment of Antitrust Rights - The Contractor irrevocably assigns to the Agency any claim for relief or cause of action the Contractor acquires during the term of the Contract, or which may accrue thereafter, by reason of any violation of:

- Title 15 (Commerce and Trade), United States Code;
- ORS 646.725; and
- ORS 646.730.

In connection with this assignment, it is an express obligation of the Contractor to take no action that would in any way impair or diminish the value of the rights assigned to the Agency according to the provisions of this Subsection. Further, it is the express obligation of the Contractor to take all action necessary to preserve the rights assigned. It is an express obligation of the Contractor to advise the Agency's legal counsel:

- In advance, of its intention to commence any action involving such claims for relief or causes of action;
- Immediately upon becoming aware of the fact that an action involving such claims for relief or causes of action has been commenced by some other person or persons;
- The date on which it notified the obligor(s) of any such claims for relief or causes of action of the fact of the Contractor's assignment to the Agency according to the provisions of this Subsection; and
- Immediately upon the discovery of any such antitrust claim for relief or cause of action.

In the event any payment is made to the Contractor under any such claims for relief, the Contractor shall promptly pay the full sum over to the Agency. In the event the Contractor fails to make such payment, the Agency may deduct the amount from monies due or to become due the Contractor under the Contract.

00170.06 Taxes - The Contract unit or lump sum prices shall include full compensation for any payroll taxes which may be incurred under State and Federal Unemployment and Social Security Acts, and all Sales Taxes on materials furnished by Contractor. The Contractor shall promptly pay such taxes to the proper agency, and shall indemnify and save harmless the Agency from any liability which may or could arise therefrom.

00170.07 Record Requirements - For purposes of this Subsection the term "Contractor" includes the Contractor, all subcontractors, Material Suppliers, and providers of rented operated Equipment (except non-DBE truck drivers), at all tiers, for all subcontracts with first-tier Subcontractors, all subcontracts between the first-tier Subcontractors and their subcontractors and any other lower tier subcontracts, and "Related Entities" as that term is defined in OAR 731-005-0780. The Material Suppliers included in this definition are those for Aggregates, Asphalt Cement Concrete, Portland Cement Concrete and the supply and fabrication of structural steel items or Material Suppliers that provide quotes.

(a) Records Required - The Contractor shall maintain all records, whether created before or after execution of the Contract, or during Contract performance, or after Contract completion, to clearly document:

- The Contractor's performance of the Contract or a subcontract;

- The Contractor's ability to continue performance of the Contract or a subcontract; and
- All claims arising from or relating to performance under the Contract or a subcontract.

These records shall include all records, including fiscal records, regardless of when created for the Contractor's business. The records for the Contractor's business include without limitation the:

- Bidding estimates and records, worksheets, tabulations or similar documents.
- Job cost detail reports, including monthly totals.
- Payroll records (including without limitation the ledger or register, and tax forms) and all documents which establish the periods, individuals involved, the hours for the individuals, and the rates for the individuals.
- Records that identify the Equipment used by the Contractor and subcontractors in the performance of the Contract or subcontracts, including without limitation, Equipment lists, rental contracts and any records used in setting rental rates.
- Invoices from vendors, rental agencies, and subcontractors.
- Material quotes, invoices, purchase orders and requisitions.
- Contracts with subcontractors and contracts with Material Suppliers, Suppliers and providers of rented equipment.
- Contracts or documents of other arrangements with any Related Entity as defined in OAR 731-005-0780.
- General ledger.
- Trial Balance.
- Financial statements (including without limitation the balance sheet, income statement, statement of cash flows, and financial statement notes).
- Income tax returns.
- All worksheets used to prepare bids or claims, or to establish the cost components for the Pay Items, including without limitation, the labor, benefits and insurance, Materials, Equipment, and subcontractors.

The following are examples, but not an exhaustive list, of records that would be included, if generated by the Contractor. If the Contractor generates such records, or equivalent records, they are included among the records subject to 00170.07.

- Daily time sheets and supervisor's daily reports.
- Collective bargaining agreements.
- Earnings records.
- Journal entries and supporting schedules.
- Insurance, welfare, and benefits records.
- Material cost distribution worksheet.
- Subcontractors' and lower tier subcontractors' payment certificates.
- Payroll and vendor's cancelled checks.

- Cash disbursements journal.
- All documents related to each and every claim together with all documents that support the amount of damages as to each claim.
- Additional financial statements (including without limitation the balance sheet, income statement, statement of cash flows, and financial notes) preceding the execution of the Contract and following final payment of the Contract.
- Depreciation records on all business Equipment maintained by the business involved, its accountant, or other Entity. (If a source other than depreciation records is used to develop cost for the Contractor's internal purposes in establishing the actual cost of owning and operating Equipment, all such other source documents.)

The Contractor shall maintain all fiscal records in material compliance with generally accepted accounting principles, or other accounting principles that are accepted accounting principles and practices for the subject industry and adequate for the nature of the Contractor's business, and in such a manner that providing a complete copy is neither unreasonably time consuming nor unreasonably burdensome for the Contractor or the Agency. Failure to maintain the records in this manner shall not be an excuse for not providing the records.

The Contractor shall include in its subcontracts, purchase orders, and all other written agreements, a provision requiring all subcontractors, Material Suppliers and providers of rented operated Equipment, (except non-DBE truck drivers), at all tiers to comply with 00170.07. The Contractor shall also require all subcontractors, Material Suppliers, and providers of rented operated Equipment, (except non-DBE truck drivers), at all tiers and Related Entities to include in their contracts, purchase orders, and all other written agreements, a provision requiring all lower tier subcontractors, Material Suppliers and providers of rented operated Equipment (except non-DBE truck drivers) to comply with 00170.07. The Material Suppliers to which this applies are those for Aggregates, Asphalt Cement Concrete, Portland Cement Concrete and the supply and fabrication of structural steel items or Material Suppliers that provide Material quotes and Related Entities as defined in OAR 731-005-0780.

(b) Access to Records - The Contractor shall provide the Engineer access to or a copy of all Contractor records upon request. A Project Manager's authority to request or access records is subject to OAR 731-005-0780(9). During the record retention period the Engineer, employees of the Agency, representatives of the Agency, or representatives of regulatory bodies or units of government may:

- Inspect, examine and copy or be provided a copy of all Contractor records;
- Audit the records, a Contract or the performance of a Contract;
- Inspect, examine and audit the records when, in the Agency's sole discretion, the records may be helpful in the resolution of any claim, litigation, administrative proceeding or controversy arising out of or related to a Contract.

Reasons for access to audit, inspect, examine and copy records include without limitation, general auditing, reviewing claims, checking for collusive bidding, reviewing or checking payment of required wages, performance and contract compliance, workplace safety compliance, evaluating related Entities, environmental compliance, and qualifications for performance of the Contract, including the ability to perform and the integrity of the Contractor.

Where such records are stored in a computer or in other digital media, the Engineer may request, and the Contractor shall provide, a copy of the data files and such other information or access to software to allow the Engineer review of the records.

Nothing in 00170.07 is intended to operate as a waiver of the confidentiality of any communications privileged under the Oregon Evidence Code. Nothing in 00170.07 limits the records or documents that can be obtained by legal process.

(c) Record Retention Period - The Contractor shall maintain the records and keep the records accessible and available at reasonable times and places for at least 3 years from the date of final payment under the Contract, or until the conclusion of all audits, litigation, administrative proceedings, disputes and claims arising out of or related to the Contract, whichever date is later.

(d) Public Records Requests - If records provided under this section contain any information that may be considered exempt from disclosure as a trade secret under either ORS 192.501(2) or ORS 646.461(4), or under other grounds specified in Oregon Public Records Law, ORS 192.410 through ORS 192.505, the Contractor shall clearly designate on or with the records the portions which the Contractor claims are exempt from disclosure, along with a justification and citation to the authority relied upon. Entire records or documents should not be designated as a trade secret or otherwise exempt from disclosure. Only specific information within a record or document should be so designated.

To the extent allowed by the Oregon Public Records Law or other applicable law related to the disclosure of public records, Agency will not disclose records or portions of records the Contractor has designated as trade secrets to a third party, who is not a representative of the Agency, to the extent the records are exempt from disclosure as trade secrets under the Oregon Public Records Law or other applicable law, except to the extent Agency is ordered to disclose in accordance with the Oregon Public Records Law or by a court of competent jurisdiction. Application of the Oregon Public Records Law or other applicable law shall determine whether any record, document or information is actually exempt from disclosure.

In addition, in response to a public records request, the Agency will not produce or disclose records so identified as exempt by the Contractor to any person other than representatives of the Agency, and others with authorized access under 00170.07(b), without providing the Contractor a copy of the public records request, unless:

The Contractor consents to such disclosure; or

Agency is prohibited by applicable law or court order from providing a copy of the public records request to the Contractor.

00170.10 Required Payments by Contractors - The Contractor shall comply with ORS 279C.505 and ORS 279C.515 during the term of the Contract.

(a) Prompt Payment by Contractor for Labor and Materials - As required by ORS 279C.505, the Contractor shall:

- Make payment promptly, as due, to all Entities supplying labor or Materials under the Contract;
- Pay all contributions or amounts due the Industrial Accident Fund, whether from the Contractor or a subcontractor, incurred in the performance of the Contract;
- Not permit any lien or claim to be filed against the State or any political subdivision thereof, on account of any labor or Material furnished in performance of the Contract; and
- Pay to the Department of Revenue all sums withheld from employees according to ORS 316.167.

(b) Prompt Payment by Contractor to First-Tier Subcontractor(s) - According to ORS 279C.580(3)(a), after the Contractor has determined and certified to the Agency that one or more of its Subcontractors has satisfactorily performed subcontracted Work, the Contractor may request payment from the Agency for the Work, and shall pay the Subcontractor(s) within 10 Calendar Days out of such amounts as the Agency has paid to the Contractor for the subcontracted Work.

(c) Interest on Unpaid Amount - If the Contractor or a first-tier Subcontractor fails, neglects, or refuses to make payment to an Entity furnishing labor or Materials in connection with the Contract within 30 Days after the Contractor's receipt of payment, the Contractor or first-tier Subcontractor shall owe the Entity the amount due plus interest charges that begin at the end of the 10 day period within which payment is due under ORS 279C.580(3) and that end upon final payment, unless payment is subject to a good-faith dispute as defined in ORS 279C.580(5)(b). The rate of interest on the amount due shall be in accordance with ORS 279C.515(2). The amount of interest shall not be waived.

(d) Agency's Payment of the Contractor's Prompt Payment Obligations - If the Contractor fails, neglects or refuses to make prompt payment of any invoice or other demand for payment for labor or services furnished to the Contractor or a Subcontractor by any Entity in connection with the Contract as such payment becomes due, the Agency may pay the Entity furnishing the labor or services and charge the amount of the payment against monies due or to become due the Contractor under the Contract.

The payment of a claim by the Agency in the manner authorized in this Subsection shall not relieve the Contractor or the Contractor's Surety from obligations with respect to any such claims.

(e) Right to Complain to the Construction Contractors Board - If the Contractor or a subcontractor fails, neglects, or refuses to make payment to an Entity furnishing labor or Materials in connection with the Contract, the Entity may file a complaint with the Construction Contractors Board, unless payment is subject to a good-faith dispute as defined in ORS 279C.580(5)(b).

(f) Notice of Claim Against Bond - An Entity (which by definition includes a natural person) claiming not to have been paid in full for labor or Materials supplied for the prosecution of the Work may have a right of action on the Contractor's Payment Bond as provided in ORS 279C.600 and ORS 279C.605.

The Commissioner of the Bureau of Labor and Industries (BOLI) may have a right of action on the Contractor's and Subcontractors' public works bonds and Payment Bonds for workers who have not been paid in full, as provided in ORS 279C.600 and ORS 279C.605.

00170.20 Public Works Bond - Before starting Work, the Contractor and subcontractors shall each file with the Construction Contractors Board, and maintain in full force and effect, a separate public works bond, in the amount of $30,000 unless otherwise exempt, as required by ORS 279C.830(3) and ORS 279C.836. The Contractor shall verify subcontractors have filed a public works bond before the subcontractor begins Work.

00170.32 Protection of Navigable Waters - The Contractor shall comply with all applicable Laws, including without limitation the Federal River and Harbor Act of March 3, 1899 and its amendments.

The Contractor shall not interfere with waterway navigation or impair navigable depths or clearances, except as U.S. Coast Guard or Corps of Engineer permits allow.

00170.60 Safety, Health, and Sanitation Provisions - The Contractor shall comply with all Laws concerning safety, health, and sanitation standards. The Contractor shall not require workers to perform Work under conditions that are hazardous, dangerous, or unsanitary.

Workers exposed to traffic shall wear upper body garments or safety vests that are highly visible and meet the requirements of 00225.25.

Workers exposed to falling or flying objects or electrical shock shall wear hard hats.

Upon their presentation of proper credentials, the Contractor shall allow inspectors of the U.S. Occupational Safety and Health Administration (OSHA) and the Oregon Occupational Safety and Health Division (OR-OSHA) to inspect the Work and Project Site without delay and without an inspection warrant.

According to ORS 468A.715 and ORS 468A.720, the Contractor or a Subcontractor who performs Project Work involving asbestos abatement shall possess a valid DEQ asbestos abatement license.

00170.61 Industrial Accident Protection:

(a) Workers' Compensation - The Contractor shall provide workers' compensation coverage for on-the-job injuries as required by 00170.70(d).

(b) Longshoremen's and Harbor Workers' Compensation - If Work to be performed is over or adjacent to navigable waters, the Longshoremen's and Harbor Workers' Compensation Act, (Chapter 18, Title 33 of the USC) may apply, and the Contractor shall be responsible for complying with its provisions (which may include the provision of additional workers' compensation benefits to employees).

00170.62 Labor Nondiscrimination - The Contractor shall comply with all Laws concerning equal employment opportunity, including without limitation those prohibiting discrimination because of race, religion, color, sex, disability, or national origin.

00170.63 Payment for Medical Care - According to ORS 279C.530, the Contractor shall promptly, as due, make payment to any person, copartnership, association or corporation furnishing medical, surgical and hospital care services or other needed care and attention, incident to sickness or injury, to the employees of the Contractor, of all sums that the Contractor agrees to pay for the services and all moneys and sums that the Contractor collected or deducted from the wages of employees under any law, contract or agreement for the purpose of providing or paying for the services.

00170.65 Minimum Wage and Overtime Rates for Public Works Projects:

(a) General - The Contractor is responsible for investigating local labor conditions. The Agency does not imply that labor can be obtained at the minimum hourly wage rates specified in State or federal wage rate publications, and no increase in the Contract Amount will be made if wage rates paid are more than those listed.

(b) State Prevailing Wage Requirements - The Contractor shall comply with the prevailing wage provisions of ORS 279C.800 through ORS 279C.870.

(1) Minimum Wage Rates - The Bureau of Labor and Industries (BOLI) determines and publishes the existing State prevailing wage rates in the publication "Prevailing Wage Rates for Public Works Contracts in Oregon". The Contractor shall pay workers not less than the specified minimum hourly wage rate according to ORS 279C.838 and ORS 279C.840 and shall include this requirement in all subcontracts.

See the Project Wage Rates page included with the Special Provisions for additional information about which wage rates apply to the project and how to access the applicable wage rates.

(2) Payroll and Certified Statements - As required in ORS 279C.845, the Contractor and every subcontractor shall submit written certified statements to the Engineer on the form prescribed by the Commissioner of BOLI in OAR 839-025-0010 certifying compliance with wage payment requirements and accurately setting out the Contractor's or subcontractor's weekly payroll records for each worker employed upon the project.

The Contractor and subcontractors shall preserve the certified statements for a period of 6 years from the date of completion of the Contract.

(3) Additional Retainage:

a. Agency - As required in ORS 279C.845(7) the Agency will retain 25% of any amount earned by the Contractor on the project until the Contractor has filed the certified statements required in ORS 279C.845 and in FHWA Form 1273, if applicable. The Agency will pay to the Contractor the amount retained within 14 Days after the Contractor files the required certified statements, regardless of whether a subcontractor has failed to file certified statements.

b. Contractor - As required in ORS 279C.845(8) the Contractor shall retain 25% of any amount earned by a first tier subcontractor on the project until the first tier subcontractor has filed with the

Agency the certified statements required in ORS 279C.845 and in FHWA Form 1273, if applicable. Before paying any amount retained, the Contractor shall verify that the first tier subcontractor has filed the certified statement. Within 14 Days after the first tier subcontractor files the required certified statement the Contractor shall pay the first tier subcontractor any amount retained.

(4) Owner/Operator Data - For a project funded by the FHWA, the Contractor shall furnish data to the Engineer for each owner/operator providing trucking services. Furnish the data before the time the services are performed and include without limitation for each owner/operator:

- Drivers name;
- Copy of driver's license;
- Vehicle identification number;
- Copy of vehicle registration;
- Motor vehicle license plate number;
- Motor Carrier Plate Number;
- Copy of ODOT Motor Carrier 1A Permit; and Name of owner/operator from the side of the truck.

(c) State Overtime Requirements - As a condition of the Contract, the Contractor shall comply with the pertinent provisions of ORS 279C.540.

(1) Maximum Hours of Labor and Overtime Pay - According to ORS 279C.540, no person shall be employed to perform Work under this Contract for more than 10 hours in any 1 Day, or 40 hours in any 1 week, except in cases of necessity, emergency, or where public policy absolutely requires it. In such instances, the Contractor shall pay the employee at least time and a half pay:

- For all overtime in excess of 8 hours a day or 40 hours in any 1 week when the work week is 5 consecutive days, Monday through Friday; or
- For all overtime in excess of 10 hours a day or 40 hours in any 1 week when the work week is 4 consecutive days, Monday through Friday; and
- For all Work performed on Saturday and on any legal holiday specified in ORS 279C.540.

For additional information on requirements for overtime and establishing a work schedule see OAR 839-025-0050 and OAR 839-025-0034.

(2) Notice of Hours of Labor - The Contractor shall give written notice to employees of the number of hours per day and days per week the employees may be required to work. Provide the notice either at the time of hire or before commencement of work on this Contract, or by posting a notice in a location frequented by employees.

(3) Exception - The maximum hours of labor and overtime requirements under ORS 279C.540 will not apply to the Contractor's Work under this Contract if the Contractor is a party to a collective bargaining agreement in effect with any labor organization. For a collective bargaining agreement to be in effect it shall be enforceable within the geographic area of the project, and its terms shall extend to workers who are working on the project (see OAR 839-025-0054).

(d) State Time Limitation on Claim for Overtime - According to ORS 279C.545, any worker employed by the Contractor is foreclosed from the right to collect any overtime provided in ORS 279C.540 unless a claim for payment is filed with the Contractor within 90 Days from the completion of the contract, provided the Contractor posted and maintained a circular as specified in this provision. Accordingly, the Contractor shall:

(1) Cause a circular, clearly printed in boldfaced 12-point type containing a copy of ORS 279C.545, to be posted in a prominent place alongside the door of the timekeeper's office or in a similar place which is readily available and freely visible to any or all workers employed to perform Work; and

(2) Maintain such circular continuously posted from the inception to the completion of the Contract on which workers are or have been employed.

(e) Additional Requirements When Federal Funds are Involved - When federal funds are involved, the following requirements shall apply in addition to the requirements of 00170.65(a) through 00170.65(d). The Contractor shall include these provisions in all subcontracts as well as ensure that all Subcontractors include these provisions in their lower tier subcontracts.

(1) FHWA Requirements - For Federal-Aid projects, the Contractor shall comply with the provisions of FHWA Form 1273, "Required Contract Provisions Federal-Aid Construction Contracts".

(2) Minimum Wage Rates - The Contractor shall pay each worker in each trade or occupation employed to perform any work under the contract not less than the existing State (BOLI) prevailing wage rate or the applicable federal prevailing wage rate required under the Davis-Bacon Act (40 U.S.C. 3141 et seq.), whichever is higher. The Contractor shall include this provision in all subcontracts.

See the Project Wage Rates page included with the Special Provisions for additional information about which wage rates apply to the project and how to access the applicable wage rates.

(3) Payroll and Certified Statements - In addition to providing the payroll information and certified statements required under ORS 279C.845 (see 00170.65(b-2)), the Contractor and every subcontractor shall submit written certified statements that also meet the requirements in Section IV of FHWA Form 1273 except the Contractor and every subcontractor shall preserve the certified statements for a period of 6 years from the date of completion of the Contract.

(4) Overtime - With regard to overtime pay, the Contractor shall comply with the overtime provision affording the greatest compensation required under FHWA Form 1273 and ORS 279C.540.

00170.70 Insurance:

(a) Insurance Coverages - Prior to starting work hereunder, CONTRACTOR, at CONTRACTOR'S cost, shall secure and continue to carry during the term of this contract, with an insurance company acceptable to CITY, the following insurance, written on an occurrence basis, in amounts not less than the limitations on liability for local public bodies provided in ORS 30.272 and ORS 30.273:

Commercial General Liability - CONTRACTOR shall obtain, at CONTRACTOR'S expense and keep in effect during the term of this Contract, Commercial General Liability Insurance covering bodily injury and property damage. Coverage shall include CONTRACTORs, SUBCONTRACTORs and anyone directly or indirectly employed by either.

Pollution Liability - If indicated by Special Provisions, Pollution Liability Insurance covering the Contractor's liability, or the liability of an appropriate subcontractor, if the coverage is obtained by the subcontractor, for bodily injury and property damage, and environmental damage resulting from sudden and accidental pollution, gradual pollution, and related clean-up costs incurred by the Contractor, or by the subcontractor if the coverage is obtained by the subcontractor, while performing Work required by the Contract. If the coverage is obtained by the Contractor, the coverage may be written in combination with the Commercial General Liability Insurance with separate limits for Pollution Liability and Commercial General Liability. Combined single limit per occurrence shall not be less than the dollar amount indicated in the Special Provisions. The annual aggregate limit shall not be less than the dollar amount indicated in the Special Provisions. The policy shall be endorsed to state that the annual aggregate limit of liability shall apply separately to the Contract.

Asbestos Liability - If indicated by Special Provisions, the Contractor, or the subcontractor, if the coverage is obtained by the subcontractor, shall provide an Asbestos Liability endorsement to the pollution liability coverage. If an endorsement cannot be obtained, The Contractor or subcontractor shall provide separate Asbestos Liability Insurance at the same combined single limit per occurrence and annual aggregate limit as the Pollution Liability Insurance with the policy endorsed to state that the annual aggregate limit of liability shall apply separately to the Contract.

Lead Liability - If indicated by Special Provisions, the Contractor, or the subcontractor, if the coverage is obtained by the subcontractor, shall provide a Lead Liability endorsement to the pollution liability coverage. If an endorsement cannot be obtained, the Contractor or subcontractor shall provide separate Lead Liability Insurance at the same combined single limit per occurrence and annual aggregate limit as the Pollution Liability Insurance with the separate policy endorsed to state that the annual aggregate limit of liability shall apply separately to the Contract.

Commercial Automobile Liability - CONTRACTOR shall obtain, at CONTRACTOR'S expense and keep in effect during the term of the resulting contract, Commercial Business Automobile Liability Insurance covering all owned, non-owned, or hired vehicles. This coverage may be written in combination with the Commercial General Liability Insurance (with separate limits).

Commercial Automobile Liability with Pollution Coverage - If indicated by Special Provisions, the Contractor, or the subcontractor, if the coverage is obtained by the subcontractor, shall provide Commercial Automobile Liability Insurance with Pollution coverage covering the Contractor's liability, or the liability of an appropriate subcontractor, if the coverage is obtained by the subcontractor, for bodily injury and property damage, and environmental damage arising out of the use of all owned, non-owned, or hired vehicles while performing Work under the Contract. If the coverage is obtained by the Contractor, the coverage may be written in combination with the Commercial General Liability Insurance with separate limits for Commercial Automobile Liability with Pollution Coverage and Commercial General Liability. Combined single limit per occurrence shall not be less than the dollar amount indicated in the Special Provisions or the amount required by the U.S. Department of Transportation, whichever is greater. If this coverage is written in combination with the Commercial

General Liability, the policy shall be endorsed to state that the Commercial General Liability annual aggregate limit shall apply separately to the Contract.

Commercial Automobile Liability with Pollution Coverage is required for this Project because the Project includes pollution related Work. If the Contractor will be performing pollution related Work, this coverage covering the Contractor must be provided. If an appropriate subcontractor, but not the Contractor, will perform the pollution related Work, Commercial Automobile Liability with Pollution Coverage covering the subcontractor, but not the Contractor, must be provided, however, the Contractor shall provide Commercial Automobile Liability insurance coverage covering the Contractor as provided in the Commercial Automobile Liability bullet above. If both the Contractor and an appropriate subcontractor will be performing pollution related Work, Commercial Automobile Liability with Pollution Coverage covering both the Contractor and the subcontractor shall be provided, and the Contractor may provide the coverage covering both the Contractor and the subcontractor, or the Contractor and the subcontractor may provide their own, separate Commercial Automobile Liability with Pollution coverages.

(b) Tail Coverage - If any of the required liability insurance coverages of 00170.70(a) are on a "claims made" basis, "tail" coverage will be required at the completion of the Contract for a duration of 24 months, or the maximum time period reasonably available in the marketplace. The Contractor shall furnish certification of "tail" coverage as described, or continuous "claims made" liability coverage for 24 months following Contract completion. Continuous "claims made" coverage will be acceptable in lieu of "tail" coverage, provided its retroactive date is on or before the effective date of the Contract. If Continuous "claims made" coverage is used, the Contractor shall keep the coverage in effect for a duration of not less than 24 months from the end of the Contract. This will be a condition to the Engineer's issuance of a Third Notification.

(c) Additional Insured - The liability insurance coverage shall include CITY and its officers and employees as Additional Insured but only with respect to CONTRACTOR'S activities to be performed under this Contract. Coverage will be primary and non-contributory with any other insurance and self-insurance. Prior to starting work under this Contract, CONTRACTOR shall furnish a certificate to CITY from each insurance company providing insurance showing that the CITY is an additional insured, the required coverage is in force, stating policy numbers, dates of expiration and limits of liability, and further stating that such coverage is primary and not contributory.

(d) Professional Liability Insurance - Professional Liability Insurance. The CONTRACTOR shall have in force a policy of Professional Liability Insurance. The CONTRACTOR shall keep such policy in force and current during the term of this contract.

(e) Workers' Compensation - All employers, including the Contractor and its Subcontractors, if any, that employ subject workers who are performing Work or providing labor or Materials under the Contract in the State shall comply with ORS 656.017 and provide the required Workers' Compensation coverage, unless such employers are exempt under ORS 656.126. The Contractor shall ensure that each of its Subcontractors complies with these requirements.

The Contractor shall certify in the Contract that the Contractor is registered by the Oregon Workers' Compensation Division either as a carrier-insured employer, a self-insured employer, an exempt employer, or is an independent contractor who will perform the Work without the assistance of others.

The Contractor shall ensure that its insurance carrier files a guaranty contract with the Oregon Workers' Compensation Division before performing any Work.

(f) Notice of Cancellation or Change - There will be no cancellation, material change, potential exhaustion of aggregate limits or non-renewal of insurance coverage(s) without thirty (30) days written notice from CONTRACTOR or its insurer(s) to CITY. Any failure to comply with the reporting provisions of this clause will constitute a material breach of this Contract and will be grounds for immediate termination of this Agreement.

(g) Certificate(s) of Insurance - As evidence of the insurance coverages required by this Contract, the Contractor shall furnish Certificate(s) of Insurance to the Agency at the time(s) provided in 00130.50(a). As evidence of insurance coverages required by this Contract but permitted by the Agency under 00170.70(a) to be obtained by an appropriate subcontractor, the Contractor shall furnish Certificate(s) of Insurance to the Agency for such coverages together with the Contractor's request under 00180.21 for approval of the subcontract with that subcontractor. The Certificate(s) will specify all of the parties who are Additional Insureds. The Contractor shall obtain, or ensure that the appropriate subcontractors obtain, insurance coverages required under this Contract from insurance companies or entities acceptable to the Agency and authorized to issue insurance in the State. The Contractor, or the appropriate subcontractor, but not the Agency, shall be responsible for paying all deductibles, self-insured retentions and/or self-insurance included under these provisions.

(h) Builders' Risk - If indicated by Special Provision, the Contractor shall obtain, at its expense, and keep in effect during the term of the Contract, Builders' Risk insurance on an all risks of direct physical loss basis, including, without limitation, earthquake and flood damage, for an amount equal to at least the value indicated in the Special Provisions. Any deductible shall not exceed $50,000 for each loss, except that the earthquake and flood deductible shall not exceed 5% of each loss or $50,000, whichever is greater. The policy shall include the Agency as loss payee.

00170.71 Independent Contractor Status - The service or services to be rendered under this Contract are those of an independent contractor. The Contractor is not an officer, employee, or agent of the Agency as those terms are used in ORS 30.265.

00170.72 Indemnity/Hold Harmless - To the fullest extent permitted by law, and except to the extent otherwise void under ORS 30.140, the Contractor shall indemnify, defend (with counsel approved by the Agency) and hold harmless the Agency, Agency's Authorized Representative, Architect/Engineer, Architect/Engineer's consultants, and their respective officers, directors, agents, employees, partners, members, stockholders and affiliated companies, and when federal transportation funding is involved the State of Oregon, the Oregon Transportation Commission and the Oregon Department of Transportation and their respective officers and members and employees (collectively "Indemnitees") from and against all liabilities, damages, losses, claims, expenses (including reasonable attorney fees), demands and actions of any nature whatsoever which arise out of, result from or are related to the following:

- Any damage, injury, loss, expense, inconvenience or delay described in this Subsection.

- Any accident or occurrence which happens or is alleged to have happened in or about the Project Site or any place where the Work is being performed, or in the vicinity of either, at any time prior to the time the Work is fully completed in all respects.
- Any failure of the Contractor to observe or perform any duty or obligation under the Contract Documents which is to be observed or performed by the Contractor, or any breach of any agreement, representation or warranty of the Contractor contained in the Contract Documents or in any subcontract.
- The negligent acts or omissions of the Contractor, a subcontractor or anyone directly or indirectly employed by them or any one of them or anyone for whose acts they may be liable, regardless of whether or not such claim, damage, loss or expense is caused in part by a party indemnified hereunder.
- Any lien filed upon the project or bond claim in connection with the Work.

Such obligation shall not be construed to negate, abridge, or reduce other rights or obligations of indemnity which would otherwise exist as to a party or person described in this Subsection.

In claims against any person or entity indemnified under this Subsection by an employee of the Contractor, a subcontractor, anyone directly or indirectly employed by them or anyone for whose acts they may be liable, the indemnification obligation under this Subsection shall not be limited by a limitation on amount or type of damages, compensation or benefits payable by or for the Contractor or a subcontractor under workers' compensation acts, disability benefit acts or other employee benefit acts.

00170.74 Employee Drug Testing Program - As required by ORS 279C.505(2), the Contractor shall have in place, and maintain during the period of the Contract, an employee drug-testing program. The Agency retains the right to audit and/or monitor the program. On request by the Engineer, the Contractor shall furnish a copy of the employee drug-testing program.

00170.78 Conflict of Interest - The Contractor shall not give or offer any gift, loan, or other thing of value to any member of the Agency's governing body or employee of the Agency in connection with the award or performance of any Contract.

The Contractor shall not rent, lease, or purchase Materials, supplies, or Equipment, with or through any Agency employee or member of the Agency's governing body.

No ex-employee of the Agency who has worked for the Agency on any phase of the Project within the prior 2 years may be employed by the Contractor to perform Work on the Project.

00170.79 Third Party Beneficiary - There are no third-party beneficiaries of the Contract, unless federal transportation funding is involved then the State of Oregon, the Oregon Transportation Commission and the Oregon Department of Transportation and their respective officers and members and employees, are third-party beneficiaries of the Contract.

00170.80 Responsibility for Damage to Work:

(a) Responsibility for Damage in General - The Contractor shall perform Work, and furnish Materials and Equipment for incorporation into the Work, at the Contractor's own risk, until the entire Project has been completed and accepted by the Agency. The Contractor shall repair all damages to Work performed, Materials supplied, and Equipment incorporated into the Work, except as otherwise provided in this Section.

(b) Repair of Damage to Work - Until Final Acceptance, the Contractor shall promptly rebuild, repair, restore, and make good damages to all portions of the permanent or temporary Work. The Contractor shall perform all repairs of damage to Work at no additional cost to the Agency, except for repairs necessitated by damage caused by:

- Acts of God or Nature, as defined in Section 00110; or
- Actions of governmental authorities.

(c) Vandalism and Theft - Vandalism includes damage to or destruction of Work or portions of Work that remain on the Project Site resulting from vandalism, criminal mischief, arson, or other criminal or illegal behavior.

Theft includes the loss of Work or portions of Work that are lost or stolen or otherwise unaccounted for from the Project Site or from Materials or fabrication locations. The Contractor shall remain solely responsible for all losses caused by theft, including without limitation theft that occurs in conjunction with vandalism.

The Contractor shall provide protection of the Work from vandalism and theft until Third Notification.

00170.82 Responsibility for Damage to Property and Facilities:

(a) In General - As used in this Subsection, the term "Contractor" shall include the Contractor's agents, Subcontractors, and all workers performing Work under the Contract; and the term "damage" shall include without limitation soiling or staining surfaces by tracking or splashing mud, asphalt, and other materials, as well as damage of a more serious nature.

The Contractor shall be solely responsible for damages arising from:

- The Contractor's operations;
- The Contractor's negligence, gross negligence, or intentional wrongful acts; and
- The Contractor's failure to comply with any Contract provision.

The Agency may withhold funds due the Contractor or the Contractor's Surety until all lawsuits, actions, and claims for injuries or damages are resolved, and satisfactory evidence of resolution is furnished to the Agency.

(b) Protection and Restoration of Agency Property and Facilities - The following requirements apply to highways, highway Structures and other improvements that are existing, under construction, or completed. The Contractor shall:

- Provide adequate protection to avoid damaging Agency property and facilities;
- Be responsible for damage to Agency property and facilities caused by or resulting from the Contractor's operations; and
- Clean up and restore such damage by repair, rebuilding, replacement, or compensation, as determined by the Engineer.

(c) Protection and Restoration of Non-Agency Property and Facilities - The Contractor shall determine the location of properties and facilities that could be damaged by the Contractor's operations, and shall protect them from damage. The Contractor shall protect monuments and property marks until the Engineer has referenced their location and authorized their removal. The Contractor shall restore property or facilities damaged by its operations to the condition that existed before the damage, at no additional compensation.

The Contractor shall provide temporary facilities when needed, e.g., to maintain normal service or as directed by the Engineer, until the required repair, rebuilding, or replacement is accomplished.

The Contractor shall protect specific service signs, e.g., business logos, and tourist-oriented directional signs (TODS) from damage, whether the signs are to remain in place or be placed on temporary supports. The Contractor shall repair or replace damaged signs at no cost to the Agency. Liquidated damages will be assessed against the Contractor in the amount of $200 per day for each sign out of service for more than 5 Calendar Days because of the Contractor's operations.

00170.85 Responsibility for Defective Work - The Contractor shall make good any defective Work, Materials or Equipment incorporated into the Work, according to the provisions of Section 00150.

(a) Latent Defects - The Contractor shall remain liable for all latent defects resulting from causes other than fraud or gross mistakes that amount to fraud until the expiration of all applicable statutes of limitation and ultimate repose, the Performance Bond, Warranty Bond, or Correction Period, whichever expires last. The Contractor shall remain liable for all latent defects resulting from fraud or gross mistakes that amount to fraud regardless of when those latent defects may be discovered, and regardless of whether such discovery occurs outside any applicable statutes of limitation or ultimate repose or any applicable Performance Bond, Warranty Bond, or Correction Period.

(b) Correction Period Warranty for Agency Projects: - The Contractor shall warrant all Work and workmanship, including Changed Work, Additional Work, Incidental Work, On-Site Work, and Extra Work, and Materials and Equipment incorporated in the Work, for one year from the date of Second Notification (Correction Period), except that manufacturers' warranties and extended warranties according to 00170.85(c) shall not be abridged. The Correction Period warranty described herein shall include extension of the Performance Bond for a period of one year from the date of Second Notification.

The Contractor shall be responsible for meeting the technical and performance Specifications required, making good the Work, and for all repairs of damage to the Work and other improvements, natural and

artificial structures, systems, equipment, and vegetation caused by, or resulting in whole or in part from occurrences beginning during the Correction Period and are the result of defects in Materials, Equipment, and workmanship. The Contractor shall be responsible for all costs associated with completing the repair of the defects and for associated Work including but not limited to permitting, mobilization, traffic control, erosion control, surface restoration, site cleanup and remediation caused by, or resulting in whole or in part from, defects in Materials, Equipment, or workmanship, and other Work determined by the Engineer to be necessary to complete the repair of the defects.

Within 10 Calendar Days of the Agency's written notice of defects, the Contractor, or the Contractor's Surety, shall vigorously and continuously correct and repair the defects and all related damage. If the Contractor or the Contractor's Surety fails to correct and repair the defects, the Agency may have the correction and repair done by others. The Contractor or Contractor's Surety shall promptly reimburse the Agency for all expenses incurred to correct and repair the defects.

In the event of an emergency, where delay could result in serious loss or damage, the Agency may make emergency corrections and repairs, without written notice. The Contractor or Contractor's Surety shall promptly reimburse the Agency for all expenses incurred to correct and repair the defects.

Corrections, repairs, replacements or changes shall be warranted for an additional one year period beginning on the date of the Agency's acceptance of the corrections, repairs, replacements or changes.

Without limiting the general applicability of other survival clauses under the Contract, this warranty provision shall survive expiration or termination of the Contract.

(c) Manufacturer, Installer or Supplier Warranties and Guarantees:

(1) Manufacturer, Installer or Supplier Warranties - For those Specification Sections referencing this 00170.85(c-1) Subsection, the Contractor shall furnish Warranties from the Manufacturer, Installer or Supplier and signed by an authorized Representative.

The warranty period will be specified in the applicable Specification Section for which it applies.

The warranty period will begin on the date the Engineer issues Second Notification unless otherwise specified in the Contract.

Corrections, repairs, replacements or changes shall be warranted for an additional Warranty period beginning on the date of the Agency's acceptance of the corrections, repairs, replacements or changes.

When the Agency makes written notification to the Manufacturer of failure of an item covered by this warranty, the warranty period will stop for the effected item or the portion of the effected item that failed, as applicable, until the required repairs or replacements are made and accepted. All repaired or replaced items shall meet current specifications, unless otherwise specified in the Contract, and will be warranted for the remaining warranty period.

Warranty work shall be performed when weather permits. If, in the opinion of the Engineer, temporary repairs are necessary, the temporary repairs will be made by the Agency or an independent

contractor at the Manufacturer's expense. The Manufacturer shall replace all temporary repairs at no additional cost to the Agency.

The Manufacturer shall provide all required traffic control during repair or replacement of failed items at no additional cost to the Agency.

(2) Trade Practice Guarantees - For those Items installed on the Project that have customary trade practice guarantees, the Contractor shall furnish the guarantees to the Engineer at the completion of the Contract.

00170.89 Protection of Utility, Fire-control, and Railroad Property and Services; Repair; Roadway Restoration:

(a) Protection of Utility, Fire-Control, and Railroad Property and Services; Coordination - The Contractor shall avoid damaging the properties of Utilities, Railroads, railways, and fire-control authorities during performance of the Work. The Contractor shall cooperate with and facilitate the relocation or repair of all Utilities and Utility services, as required under 00150.50, and of Railroad and fire-control property and railways.

The Contractor shall conduct no activities of any kind around fire hydrants until the local fire-control authority has approved provisions for continued service.

The Contractor shall immediately notify any Utility, Railroad, or fire-control authority whose facilities have been damaged.

If an Entity has a valid permit from the proper authority to construct, reconstruct, or repair Utility, Railroad, or fire-control service in the Roadway, the Contractor shall allow the permit holder to perform the work.

(b) Restoration of Roadway after Repair Work - The Contractor shall restore the Roadway to a condition at least equal to that which existed before the repair work addressed under this Subsection was performed, as directed by the Engineer. All restoration work required as a result of Contractor’s failure to protect Utilities, Railroads, railways and fire-control facilities shall be at the Contractor’s expense. Restoration which constitutes Extra Work will be paid as Extra Work.

00170.92 Fencing, Protecting Stock, and Safeguarding Excavations - The Contractor shall be responsible for loss, injury, or damage that results from its failure to restrain stock and persons.

(a) At the Contractor's Expense - The Contractor shall restrain stock to lands on which they are confined using temporary fences or other adequate means. The Contractor shall provide adequate temporary fences or other protection around excavations to prevent animals and unauthorized persons from entering.

The Contractor shall repair, at Contractor's expense and to the Engineer's satisfaction, fences damaged by the Contractor's operations and the operations of the Contractor's agents, employees and Subcontractors.

(b) At the Agency's Expense - The Contractor shall construct fences, or move and reconstruct fences, as shown on the Contract Documents or as directed by the Engineer. The Contractor shall tear down and remove fencing within the Right-of-Way when no longer needed, as part of the removal Work described in and paid for according to Section 00310.

00170.93 Trespass - The Contractor shall be responsible for its own, its agents' and employees', and its Subcontractors' trespass or encroachment upon, or damage to, property during performance of the Contract.

00170.94 Use of Explosives - The Contractor shall comply with all Laws pertaining to the use of explosives. The Contractor shall notify anyone having facilities near the Contractor's operations of Contractor's intended use or storage of explosives. The Contractor shall be responsible for all damage resulting from its own, its agents' and employees', and its Subcontractors' use of explosives. (see 00330.41(e) and Section 00335)

00170.95 Unlawful Discrimination Policy - Agency – It is the policy of the City of Warrenton that no person shall be denied the benefits of or be subjected to discrimination in any City program, service, or activity on the grounds of age, disability, race, religion, color, national origin, sex, sexual orientation, gender identity and expression. The City of Warrenton also requires its contractors and grantees to comply with this policy.

Section 00180 - Prosecution and Progress

00180.00 Scope - This Section consists of requirements for assignment of the Contract, subcontracting, time for performance, Contract responsibility, suspensions, terminations, and related provisions.

00180.05 Assignment/Delegation of Contract - Unless the Agency gives prior written consent, the Contractor shall not assign, delegate, sell, or transfer to any Entity, or otherwise dispose of any Contract rights or obligations, including without limitation:

- The power to execute or perform the Contract; or
- Any of its right, title or interest in the Contract.

Any attempted assignment, delegation, or disposition without prior Agency consent shall be void.

Such Agency consent will not normally be given except for the assignment of funds due under the Contract, as provided in 00180.06.

If written Agency consent is given to assign, delegate, or otherwise dispose of any Contract rights or obligations, it shall not relieve the Contractor or its Surety of any part of their responsibility under the Contract.

00180.06 Assignment of Funds Due under the Contract - Assignment of funds due or to become due under the Contract to the Contractor will not be permitted unless:

- The assignment request is made on the form acceptable to the Agency;
- The Contractor secures the written consent of the Contractor's Surety to the assignment; and
- The Engineer approves the assignment.

00180.10 Responsibility for Contract - The Contractor shall direct and coordinate the operations of its employees, Subcontractors and agents performing Work, and see that the Engineer's orders are carried out promptly. The Contractor's failure to direct, supervise and control its employees, Subcontractors and agents performing Work will result in one or more of the following actions, or other actions as the Engineer deems appropriate:

- Suspension of the Work;
- Withholding of Contract payments, as necessary to protect the Agency;
- Ordering removal of individuals from the Project Site; or
- Termination of the Contract.

Action by the Agency under this provision will not prejudice any other remedy it may have.

00180.15 Agency's Right to Do Work at Contractor's Expense - Except as otherwise provided in 00150.75 and 00220.60, if the Contractor neglects to prosecute the Work properly or fails to perform any provision of the Contract, the Agency may, after 2 Calendar Days' written notice, correct the deficiencies at the Contractor's expense. In situations where the Engineer reasonably believes there is danger to life or property, the Agency may immediately and without notice correct the deficiencies at the Contractor's expense.

Action by the Agency under this provision will not prejudice any other remedy it may have.

00180.20 Subcontracting Limitations:

(a) General - The Contractor's own organization shall perform Work amounting to at least the percentage of the original Contract Amount as indicated in the Special Provisions. The value of subcontracted Work is the full compensation to be paid to the Subcontractor(s) for all pay items in the Subcontract(s).

(b) Own Organization - The term "own organization", as used in Section 00180, includes only employees of the Contractor, Equipment owned or rented by the Contractor, Incidental rental of operated Equipment, and Materials and Equipment to be incorporated into the Work purchased or produced by the Contractor.

(c) Rental of Operated Equipment - For projects funded by FWHA, the Agency will not allow a Disadvantaged Business Enterprise (DBE) firm to provide services without a subcontract covering all Work to be performed by the DBE firm. For non-DBE firms, the use of Equipment rented with operators will be allowed without a subcontract only when the following requirements are met:

(1) Written Request - The Contractor has submitted to the Engineer a written request describing the service to be provided, its estimated cost, and the estimated duration. The Engineer must approve the request before the service is provided.

(2) Limitations - The use of Equipment rented with operators is limited to the following services:

- Truck hauling of Materials (If the trucking is by an owner/operator, in addition to the requirements of 00170.65(e), each truck shall have the name of the owner/operator clearly displayed on the side of the truck); or
- Performing minor, Incidental, short-duration work under the direct supervision of the Contractor or Subcontractor, with Equipment not customarily owned, leased, or operated by a Contractor, or with Equipment that is temporarily unavailable to the Contractor.

(3) Submittals - The Contractor shall provide the Engineer with a copy of the rental agreement or purchase order covering the service to be provided. For owner/operator trucking, attach copies of the data required under 00170.65(e). The Contractor shall make certain that the provider of approved services submits payrolls required under Section 00170 and complies with applicable Contract provisions, including without limitation 00170.07. The service provider will not be considered a Subcontractor under the Contract, but will be considered an agent of the Contractor in the performance of Work.

(4) Revocation of Approval - The Engineer may revoke approval for the services provided through rented, operated Equipment at any time the Engineer determines that the work is outside that authorized under 00180.20(c-2). Unless the Contractor promptly submits to the Engineer a subcontract agreement for consent under 00180.21, the service provider shall be immediately removed from the Project Site.

00180.21 Subcontracting:

(a) Substitution of Disclosed Subcontractors - The Contractor may only substitute a previously disclosed first-tier Subcontractor according to the provisions of ORS 279C.585. The Contractor shall provide the Engineer with a written notification that identifies the name of the proposed new Subcontractor and the reason for the substitution. Authorized reasons for substitution are limited to the following circumstances (see ORS 279C.585(1) through ORS 279C.585(10)):

- The disclosed Subcontractor fails or refuses to execute a written contract that is reasonably based either upon the Project Plans and Specifications, or the terms of the Subcontractor's written Bid, after having had a reasonable opportunity to do so;
- The disclosed Subcontractor becomes bankrupt or insolvent;
- The disclosed Subcontractor fails or refuses to perform the contract;
- The disclosed Subcontractor fails or refuses to meet the bond requirements of the prime Contractor that had been identified prior to the Bid submittal;
- The Contractor demonstrates to the Agency that the Subcontractor was disclosed as the result of an inadvertent clerical error;
- The disclosed Subcontractor does not hold a license from the Construction Contractors Board and is required to be licensed by the board;
- The Contractor determines that the Work performed by the disclosed Subcontractor is not in substantial compliance with the Plans and Specifications, or that the Subcontractor is substantially delaying or disrupting the progress of the Work;
- The disclosed Subcontractor is ineligible to work on a public improvement according to the applicable statutory provisions;
- The substitution is for "good cause" as defined by State Construction Contractors Board rule; or
- The substitution is reasonably based on the Contract alternates chosen by the Agency.

(b) Terms of Subcontracts - Subcontracts shall provide that work performed under the subcontract shall be conducted and performed according to the terms of the Contract. Compliance with 00170.07 is required. All subcontracts, including Contractor's with the first-tier Subcontractors and those of the first-tier Subcontractors with their subcontractors, and any other lower tier subcontracts shall contain a clause or condition that if the Contractor or a subcontractor fails, neglects, or refuses to make payment to an Entity furnishing labor or Materials in connection with the Contract, the Entity may file a complaint with the Construction Contractors Board, unless payment is subject to a good-faith dispute as defined in ORS 279C.580. Additionally, according to the provisions of ORS 279C.580, subcontracts shall include:

(1) A payment clause that obligates the Contractor to pay the first-tier Subcontractor for satisfactory performance under the subcontract within 10 Calendar Days out of amounts the Agency pays to the Contractor under the Contract.

(2) A clause that requires the Contractor to provide the first-tier Subcontractor with a standard form that the first-tier Subcontractor may use as an application for payment or as another method by which the Subcontractor may claim a payment due from the Contractor.

(3) A clause that requires the Contractor, except as otherwise provided in this subsection, to use the same form and regular administrative procedures for processing payments during the entire term of the subcontract. The Contractor may change the form or the regular administrative procedures the Contractor uses for processing payments if the Contractor:

- Notifies the Subcontractor in writing at least 45 Calendar days before the date on which the Contractor makes the change; and
- Includes with the written notice a copy of the new or changed form or a description of the new or changed procedure.

(4) An interest penalty clause that obligates the Contractor, if the Contractor does not pay the first-tier Subcontractor within 30 Calendar Days after receiving payment from the Agency, to pay the first-tier Subcontractor an interest penalty on amounts due in each payment the Contractor does not make in accordance with the payment clause included in the subcontract under 00180.21(d-1). The Contractor or first-tier Subcontractor is not obligated to pay an interest penalty if the only reason that the Contractor or first-tier Subcontractor did not make payment when payment was due is that the Contractor or first-tier Subcontractor did not receive payment from the Agency or the Contractor when payment was due. The interest penalty applies to the period that begins on the day after the required payment date and ends on the date on which the amount due is paid; and shall be computed at the rate specified in 00170.10(c).

(5) A clause that requires the Contractor's first-tier Subcontractor to include a payment clause and an interest penalty clause that conform to the standards of ORS 279C.580 (see 00180.21(d-1) and 00180.21(d-4)) in each of the first-tier Subcontractor's subcontracts and to require each of the first-tier Subcontractor's subcontractors to include such clauses in their subcontracts with each lower-tier subcontractor or Material supplier.

These payment clauses shall require the Contractor to return all retainage withheld from the Subcontractor, whether held by the Contractor or the Agency, as specified in 00195.50(d).

As required by ORS 279C.800 through ORS 279C.870, subcontracts shall include:

- A provision requiring the subcontractor to have a public works bond filed with the Construction Contractors Board before starting Work on the Project, unless exempt.
- A provision requiring that the workers shall be paid not less than the specified minimum hourly rate of wage.

(c) Contractor's Responsibilities - The Contractor shall remain solely responsible for administration of the subcontract, including but not limited to:

- Performance of subcontracted Work;
- Progress of subcontracted Work;
- Payments for accepted subcontracted Work; and
- Disputes and claims for additional compensation regarding subcontracted Work.

It shall be the direct responsibility of the Contractor to ensure that each and every subcontractor will not only be issued a complete and current set of Plans and Specifications, but also that these Plans and Specifications are on the project site and in use by the subcontractor when it is performing its portion of the project.

Subcontracted Work shall not create a contract between the Agency and the Subcontractor, will not convey to the Subcontractor any rights against the Agency, and will not relieve the Contractor or the Contractor's Surety of any of their responsibilities under the Contract.

(f) Failure to Comply - Failure to comply with 00180.21 will be cause for the Engineer to take action reasonably necessary to obtain compliance. This action may include, but is not limited to:

- Suspension of the Work;
- Withholding of Contract payments as necessary to protect the Agency; and
- Termination of the Contract.

00180.22 Payments to Subcontractors and Agents of the Contractor - To the extent practicable, the Contractor shall pay in the same units and on the same basis of measurement as listed in the Schedule of Items for subcontracted Work or other Work not done by the Contractor's own organization. In making payment to Subcontractors and to its other agents performing Work and furnishing Materials and Equipment to be incorporated into the Work, the Contractor shall assume all losses resulting from overpayment.

If requested in writing by a first-tier Subcontractor, the Contractor shall send to the Subcontractor, within 10 Calendar Days of receiving the request, a copy of that portion of any invoice or request for payment submitted to the Agency, or pay document provided by the Agency to the Contractor, specifically related to any labor, Equipment, or Materials supplied by the first-tier Subcontractor.

00180.30 Materials, Equipment, and Work Force - The Contractor shall furnish suitable and sufficient Materials, Equipment, and personnel to properly prosecute and complete the Work. The Contractor shall use only Equipment of adequate size and condition to meet the requirements of the Work and Specifications, and to produce a satisfactory quality of Work. Upon receipt of the Engineer's written order, the Contractor shall immediately remove, and not use again on the Project without the Engineer's prior written approval, Equipment that, in the Engineer's opinion, fails to meet Specifications or produce a satisfactory product or result.

The work force shall be trained and experienced for the Work to be performed. Upon receipt of the Engineer's written order, the Contractor shall immediately remove from the Project Site, and shall not employ again on the Project without the Engineer's prior written approval, any supervisor or employee of

the Contractor or any subcontractor who, in the Engineer's opinion, does not perform satisfactory Work or whose conduct interferes with the progress of the Work.

If the Contractor fails to remove Equipment or persons as ordered, or fails to furnish suitable and sufficient Materials, Equipment and personnel for the proper prosecution of the Work, the Engineer may suspend the Work by written notice until such orders are complied with and such deficiencies are corrected, or the Engineer may terminate the Contract under the provisions of 00180.90(a).

00180.31 Required Materials, Equipment, and Methods - The Engineer's decisions under this Section are final.

(a) General - When the Equipment and methods to be used are not specified in the Contract, any Equipment or methods that accomplish the Work as required by the Contract will be permitted.

When the Contract specifies certain Equipment or methods, the Contractor shall use the Equipment or methods specified unless otherwise authorized by the Engineer in writing.

(b) Substitution of Materials and Equipment to be Incorporated into the Work - After execution of the Contract, the Engineer may approve substitution of Materials and Equipment to be incorporated into the Work as follows:

(1) Reasons for Substitution - The Engineer will consider substitution only if:

- In the judgement of the Engineer, the proposed Materials or Equipment are equal to or superior to the specified items in construction, efficiency and utility; or
- Due to reasons beyond the control of the Contractor, the specified Materials or Equipment cannot be delivered to the Project in sufficient time to complete the Work in proper sequence.

(2) Submittal of Request - The Contractor shall submit requests for substitution to the Engineer, including manufacturers' brochures and other information needed to verify equality of the proposed item(s).

(c) Substitution of Equipment Specified to Perform Work - The Agency encourages development of new or improved Equipment and innovative use of Equipment. When the Specifications require Equipment of a particular size or type to be used to perform certain portions of the Work, the Contractor may submit a request to the Engineer to use Equipment of a different size or type. The request will not be considered as a cost reduction proposal under 00140.70. The request shall:

- Be in writing and include a full description of the Equipment proposed and its intended use;
- Include the reasons for requesting the substitution; and
- Include evidence, obtained at the Contractor's expense and satisfactory to the Engineer, that the proposed Equipment is capable of functioning as well as or better than the specified Equipment.

The Engineer will consider the Contractor's request and will provide a written response to the Contractor, either permitting or denying use of the proposed Equipment.

Permission may be granted on a trial basis to test the quality of Work actually produced, subject to the following:

- There will be no cost to the Agency, either in Contract Amount or in Contract Time;
- The permission may be withdrawn by the Engineer at any time if, in the Engineer's opinion, the Equipment is not performing in all respects equivalent to the Equipment specified in the Contract;
- If permission is withdrawn, the Contractor shall perform the remaining Work with the originally-specified Equipment; and
- The Contractor shall remove and replace nonspecification Work resulting from the use of the Contractor's proposed Equipment, or otherwise correct it as the Engineer directs, at no additional compensation.

(d) Substitution of Methods - The Agency encourages development of new, improved, and innovative construction methods. When the Plans or Specifications require a certain construction method for a portion of the Work, the Contractor may submit a request for a change by following the provisions of 00140.70, "Cost Reduction Proposals".

00180.32 Alternative Materials, Equipment, and Methods - Whenever the Contract authorizes certain alternative Materials, Equipment, or methods of construction for the Contractor's use to perform portions of the Work, and leaves the selection to the Contractor, the Agency does not guarantee that all listed alternative Materials, Equipment, or methods of construction can be used successfully throughout all or any part of the Work.

The Contractor shall employ only those alternatives that can be used to satisfactorily perform the Work. No additional compensation will be paid for corrective work necessitated by the Contractor's use of an inappropriate alternative.

00180.40 Limitation of Operations:

(a) In General - The Contractor shall comply with all Contract provisions and shall:

- Conduct the Work at all times so as to cause the least interference with traffic, and
- Not begin Work that may allow damage to Work already started.

(b) On-Site Work - The Contractor shall not begin On-Site Work until the Contractor has:

- Received Notice to Proceed;

- Filed with the Construction Contractors Board the public works bond as required in 00170.20;
- An approved Project Work schedule;
- An approved Traffic Control Plan;
- An approved Spill Prevention Control and Countermeasure Plan, if required;
- An approved Pollution Control Plan;
- An approved Erosion and Sediment Control Plan;
- Met with the Engineer at the required preconstruction conference; and

Assembled all Materials, Equipment, and labor on the Project Site, or has reasonably assured that they will arrive on the Project Site, so the Work can proceed according to the Project Work schedule.

00180.41 Project Work Schedules - The Contractor shall submit a Project Work schedule meeting the requirements of this Subsection to the Engineer. The Project Work schedule is intended to identify the sequencing of activities and time required for prosecution of the Work. The schedule is used to plan, coordinate, and control the progress of construction. Therefore, the Project Work schedule shall provide for orderly, timely, and efficient prosecution of the Work, and shall contain sufficient detail to enable both the Contractor and the Engineer to plan, coordinate, analyze, document, and control their respective Contract responsibilities.

The Contractor shall submit a schedule or plan for each activity that is behind schedule showing, in sufficient detail, the proposed corrective action to complete Contract Work within the Contract Time. Sufficient detail shall include all required double shifts, overtime work, or combination of both.

Contractor's activity related to developing, furnishing, monitoring, and updating these required schedules is Incidental.

The Contractor shall submit a supplemental "look ahead" Project Work schedule to the Engineer prior to or at each Progress Meeting. The "look ahead" Project Work schedule is supplemental to the Type A, B, or C schedule specified below. The supplemental "look ahead" Project Work schedule shall:

- Identify the sequencing of activities and time required for prosecution of the Work.
- Provide for orderly, timely, and efficient prosecution of the Work.
- Contain sufficient detail to enable both the Contractor and the Engineer to plan, coordinate, analyze, document, and control their respective Contract responsibilities.

The supplemental "look ahead" Project Work schedule shall be written in common terminology and show the planned Work activities broken down into logical, separate activities by area, stage, and size and include the following information:

- The resources the Contractor, subcontractors, or services will use.
- The locations of each activity that will be done including the limits of the work by mile posts, stations, or other indicators.
- The time frames of each activity by Calendar Days, shifts, and hours.
- All anticipated shoulder, lane, and road closures.

At a minimum, the Contractor shall prepare a bar chart that:

- Shows at least 3 weeks of activity including the week the bar chart is issued.
- Uses a largest time scale unit of 1 Calendar Day. Smaller time scale units may be used if needed.
- Is appropriate to the activities.
- Identifies each Calendar Day by month and day.

Include the Contract name, Contract number, Contractor's name, and date of issue on each page of the bar chart.

The Contractor shall submit the supplemental "look ahead" Project Work schedule starting at First Notification and continuing each week until Second Notification has been issued and all punch list items and final trimming and clean-up has been completed. The Contractor shall meet with the Engineer each week to review the supplemental "look ahead" Project Work schedule. If the Engineer or the Contractor determines that the current supplemental "look ahead" Project Work schedule requires changes or additions, either notations can be made on the current schedule or the Engineer may require the submittal of a revised supplemental "look ahead" Project Work schedule. Review of the current and subsequent supplemental "look ahead" Project Work schedules does not relieve the Contractor of responsibility for timely and efficient execution of the Contract.

One of the following Type "A", "B", or "C" schedules will be required under the Contract. The type of schedule will be identified in the Special Provisions.

(a) Type "A" Schedule - When a Type "A" schedule is required, the Contractor shall do the following:

(1) Schedule -At the preconstruction conference, the Contractor shall provide to the Engineer four copies of a Project Work schedule, including a time-scaled bar chart and narrative, showing:

- Expected beginning and completion dates of each activity, including all staging; and
- Elements of the Traffic Control Plan as required under 00225.05.

The schedule shall show detailed Work activities as follows:

- Construction activities;
- The time needed for completion of the utility relocation work;
- Submittal and approval of Materials samples and shop drawings;
- Fabrication, installation, and testing of special Materials and Equipment; and
- Duration of Work, including completion times of all stages and their sub phases.

For each activity, the Project Work schedule shall list the following information:

- A description in common terminology;
- The quantity of Work, where appropriate, in common units of measure;
- The activity duration in Calendar Days; and
- Scheduled start, completion, and time frame shown graphically using a time-scaled bar chart.

The schedule shall show the Work broken down into logical, separate activities by area, stage, or size. The duration of each activity shall be verifiable by manpower and Equipment allocation, in common units of measure, or by delivery dates.

The bar chart shall be prepared as follows:

- The length of bar shall represent the number of workdays scheduled.
- The time scale shall be appropriate for the duration of the Contract.
- The time scale shall be in Calendar Days.
- The smallest unit shown shall be 1 Calendar Day.
- The first day and midpoint of each month shall be identified by date.
- Distinct symbols shall be used to denote multiple shift, holiday, and weekend Work.

Each page of the bar chart shall include a title block showing the Contract name and number, Contractor's name, date of original schedule, and all update dates; and a legend containing the symbols used, their definitions, and the time scale, shown graphically. To ensure readability the bar chart shall be drawn on a reasonable size of paper up to a maximum of 36 inch by 36 inch, using multiple sheets when needed.

Within 7 Calendar Days after the preconstruction conference, the Engineer and the Contractor shall meet to review the Project Work schedule as submitted. The Engineer will review the schedule for compliance with all Contract Time limitations and other restraints. Review of this and subsequent schedules by the Engineer shall not relieve the Contractor of responsibility for timely and efficient execution of the Contract. Within 10 Calendar Days of this meeting, the Contractor shall resubmit to the Engineer four copies of the Project Work schedule, including required revisions.

(2) Review by the Engineer - The Project Work schedule may need revision as the Work progresses. Therefore, the Contractor shall periodically review the Project Work schedule and progress of the Work with the Engineer. If the Engineer or the Contractor determines that the Project Work schedule no longer represents the Contractor's own plans or expected time for the Work, a meeting shall be held between the Engineer and the Contractor. At this meeting, the Contractor and the Engineer shall review Project events and any changes for their effect on the Project Work schedule.

The Contractor shall compile an updated Project Work schedule incorporating any changes to the Project completion time(s). The bar chart shall reflect the updated information. The Contractor shall submit four copies of the updated Project Work schedule to the Engineer within 7 Calendar Days after the meeting. The report shall include without limitation the following:

- Sufficient narrative to describe the past progress, anticipated activities, and stage Work;
- A description of any current and expected changes or delaying factors and their effect on the construction schedule; and
- Proposed corrective actions.

(b) Type "B" Schedule - When a Type "B Schedule is required, the Contractor shall do the following:

(1) Initial Schedule - 5 Calendar Days prior to the preconstruction conference, the Contractor shall provide to the Engineer four copies of a time-scaled bar chart Project Work schedule showing:

- Expected beginning and completion date of each activity, including all staging; and
- Elements of the Traffic Control Plan as required under 00225.05.

The initial schedule shall show all Work intended for the first 60 Days of the Contract to the level of detail described in (2) below, and shall show the priority and interdependence (sequencing and network logic) of all major segments of the remainder of the Work.

(2) Detailed Schedule - In addition to the above requirements, and within 30 Calendar Days after the Notice to Proceed, the Contractor shall provide the Engineer one digital copy and four paper copies of a detailed time-scaled bar chart Project Work schedule indicating the critical course of the Work. The digital copy shall be compatible with MS Project 2003, Primavera P3, SureTrak Project Manager 3.0, or another scheduling program approved by the Engineer.

Detailed work schedule activities shall include the following:

- Construction activities;
- The time needed for completion of the utility relocation work;
- Submittal and approval of Material samples and shop drawings;
- Procurement of critical Materials;
- Fabrication, installation, and testing of special Material and Equipment; and
- Duration of Work, including completion times of all stages and their sub phases.

For each activity, the Project Work schedule shall list the following information:

- A description in common terminology;
- The quantity of Work, where appropriate, in common units of measure;
- The activity duration in normal workdays; and
- Scheduled start, completion, and time frame shown graphically using a time-scaled bar chart.

The schedule shall show the Work broken down into logical, separate activities by area, stage, or size. The duration of each activity shall be verifiable by manpower and Equipment allocation, in common units of measure, or by delivery dates.

The bar chart shall be prepared as follows:

- The length of bar shall represent the number of normal workdays scheduled.
- The time scale shall be appropriate for the duration of the Contract.
- The time scale shall be in normal workdays (every day except Saturday, Sunday, and legal holidays).
- The smallest unit shown shall be 1 Calendar Day.

- The first day and midpoint of each month shall be identified by date.
- Distinct symbols shall be used to denote multiple shift, holiday, and weekend Work.

The bar chart drawing(s) shall include a title block showing the Contract name and number, Contractor's name, date of original schedule, and all update dates; and a legend containing the symbols used, their definitions, and the time scale, shown graphically. To ensure readability the bar chart shall be drawn on a reasonable size of paper up to a maximum of 36 inch x 36 inch, using multiple sheets when needed.

Within 10 Calendar Days after submission of the Project schedule the Engineer and the Contractor shall meet to review the Project schedule as submitted. Within 10 Days of the review meeting, the Contractor shall resubmit to the Engineer one digital and four paper copies of the Project schedule, including required revisions.

The accepted Project schedule shall represent all Work, as well as the planned sequence and time for the Work. Review of this and subsequent schedules by the Engineer shall not relieve the Contractor of responsibility for timely and efficient execution of the Contract.

(3) Review and Reporting - The Project Work schedule may require revision as the Work progresses. Therefore, the Contractor shall monitor and when necessary revise the Project Work schedule as follows:

a. Review with the Engineer - The Contractor shall perform ongoing review of the Project Work schedule and progress of the Work with the Engineer. If the Engineer or the Contractor determines that the Project Work schedule no longer represents the Contractor's own plans or expected time for the Work, a meeting shall be held between the Engineer and the Contractor. At this meeting, the Contractor and the Engineer shall review Project events and any changes for their effect on the Project Work schedule. After any necessary action has been agreed upon, the Contractor shall make required changes to the Project Work schedule.

The Contractor shall collect information on all activities worked on or scheduled to be worked on during the previous report period, including shop drawings, Material procurement, and Contract Change Orders that have been issued. Information shall include commencement and completion dates on activities started or completed, or if still in progress, the remaining time duration.

The Contractor shall develop detailed sub-networks to incorporate changes, Additional Work, and Extra Work into the Project Work schedule. Detailed sub-networks shall include all necessary activities and logic connectors to describe the Work and all restrictions on it. The restraints shall include those activities from the Project Work schedule that initiated the sub-network as well as those restrained by it.

The Contractor shall evaluate this information and compare it with the Contractor's project schedule. If necessary, the Contractor shall make an updated bar chart schedule to incorporate the effect changes may have on the Project completion time(s). For any activity that has started, the Contractor shall add a symbol to show the actual date the activity started and the number of normal workdays remaining until completion. For activities that are finished, a symbol shall be added to show the actual date. The Contractor shall submit one digital and four paper copies of the updated

bar chart to the Engineer within 7 Days after the progress meeting, along with a progress report as required by "b." below.

b. Progress Report - The Contractor shall submit a progress report to the Engineer each month. The report shall include the following:

- Sufficient narrative to describe the past progress, anticipated activities, and stage Work;
- A description of any current and expected changes or delaying factors and their effect on the construction schedule; and
- Proposed corrective actions.

(c) Type "C" Schedule - When a Type "C" Schedule is required, the Contractor shall do the following:

(1) Initial Schedule - 10 Calendar Days prior to the preconstruction conference, the Contractor shall provide to the Engineer one digital copy and four paper copies of a time-scaled bar chart Project Work schedule. The digital copy shall be compatible with MS Project 2003, Primavera P3, SureTrak Project Manager 3.0, or another scheduling program approved by the Engineer. The initial schedule shall show:

- The expected beginning and completion date of each activity, including all stages and phases;
- The time needed for completion of the utility relocation work; and
- The elements of the traffic control plan as required under 00225.05.

A logic diagram and a time-scaled bar chart will be acceptable in lieu of a time-scaled logic diagram.

The initial schedule shall show all Work intended for the first 60 Days of the Contract to the level of detail described in (2) below, and shall show the priority and interdependence (sequencing and network logic) of all major segments of the remainder of the Work.

(2) Detailed Project Work Schedule - In addition to the above requirements, and within 30 Calendar Days after First Notification, the Contractor shall provide the Engineer one digital copy and four paper copies of a detailed time-scaled critical path method (CPM) network Project Work schedule and computer analysis printout, both clearly indicating the critical path. The digital copy shall be compatible with MS Project 2003, Primavera P3, SureTrak Project Manager 3.0, or another scheduling program approved by the Engineer. The first submitted detailed time-scaled critical path method (CPM) network Project Work schedule shall also contain a listing of the quantity of Work for each activity, when appropriate, in common units of measure.

Detailed work schedule activities shall include the following:

- Construction activities;
- Any limitations of operation specified in 00180.40;
- The time needed for completion of the utility relocation work;
- Implementation of TCP for each stage and phase;
- Submittal and approval of Material samples, mix designs, and shop drawings;

- Agency timeframes to process and return Contractor submitted plans, working drawings, equipment lists and other submittals;
- Procurement of critical Materials;
- Fabrication, installation, and testing of special Material and Equipment;
- Duration of Work, including completion times of all stages and their sub-phases; and
- Specified cure times for all concrete elements.

The activities shall be separately identifiable by coding or use of sub-networks or both. The duration of each activity shall be verifiable and consistent with the description in the Project narrative required in (3) below.

Detailed sub-networks shall include all necessary activities and logic connectors to describe the Work and all restrictions on it. In the restraints, include those activities from any Project Work schedule that initiated the sub-network as well as those restrained by it.

The time scale used on the Contractor's detailed time-scaled critical path method (CPM) network Project Work schedule shall be appropriate for the duration of the activities and the Project duration. The time scale shall be in normal workdays, defined as every day except Saturday, Sunday and legal holidays, with calendar dates identified no less than the first and midpoint of each calendar month. The smallest unit shown shall be 1 Day. The network shall show the length of the activity or part scaled to accurately represent the number of normal workdays scheduled. Distinct symbols or graphics shall be used to show multiple shift, holiday, or weekend work.

The schedule network drawing(s) shall include a title block showing the Contract name and number, Contractor's name, date of original schedule, and all update dates; and a legend containing the symbols used, their definitions, and the time scale, shown graphically. To ensure readability the drawings shall be on a reasonable size of paper up to a maximum of 36 inch x 36 inch, using multiple sheets when needed.

The Contractor shall include a tabulation of each activity in the computer mathematical analysis of the network diagram. The following information represents the minimum required for each activity:

- Event (node) number(s) for each activity;
- Maintain event (node) numbers throughout the Project;
- Activity description;
- Original duration of activities (in normal workdays);
- Estimated remaining duration of activities (in normal workdays);
- Earliest start date and actual start date (by calendar date);
- Earliest finish date and actual finish date (by calendar date);
- Latest start date (by calendar date);
- Latest finish date (by calendar date); and
- Slack or float time (in workdays).

Computer print-outs shall consist of at least a node sort and an "early start/total-float" sort.

Within 14 Calendar Days after submission of the detailed time-scaled critical path method (CPM) network Project Work schedule, the Engineer and the Contractor shall meet to review the detailed time-scaled critical path method (CPM) network Project Work schedule as submitted. Within 7 Calendar Days of the meeting, the Contractor shall resubmit to the Engineer one digital and four paper copies of the detailed time-scaled critical path method (CPM) network Project Work schedule, including required revisions.

This first accepted detailed time-scaled critical path method (CPM) network Project Work schedule, also called the accepted Project Work schedule, shall represent all Work, as well as the planned sequence and time for the Work. Review and acceptance of any Project Work schedules and Project narratives by the Engineer shall not relieve the Contractor of responsibility for timely and efficient execution of the Contract.

(3) Project Narrative - In addition to the above requirements, and within 30 Calendar Days after First Notification, the Contractor shall provide to the Engineer a final written Project narrative that discusses the planning, coordinating, scheduling and resourcing of the Work. The Project narrative shall include the following written description:

- Plans for staging the project.
- All critical activities.
- All near critical activities defined as those with less than 30 Days of float.
- All subcontractor activities that are critical, near critical, and those that are greater than two weeks in duration.
- Labor resourcing, by stage and phase, to include the number of crews, average crew size and planned night/weekend shifts including that of subcontractors.
- Equipment allocation, by stage and phase to include mobilization, demobilization and planned activities including that of subcontractors.
- Notifications required under the Contract during each stage and phase which may include but is not limited to road closures, lanes closures, night work, cold plane pavement removal, and pile driving.
- Provide discussion on addressing reasonably predictable weather conditions and their impact on all weather sensitive activities. Also, provide discussion on other weather limitations that may affect the project schedule.
- Submittal and approval of material samples, mix designs, and shop drawings.
- Procurement of critical materials.
- Plans for dealing with "unique" construction items.
- Coordination of utilities and any immediate concerns for impacts/delays.
- Constructability issues.
- Cost Reduction Proposals and/or immediate requests for changes to the specifications.
- Concerns/issues that need to be addressed within the first 90 Days following First Notification.

The accepted Project narrative shall represent all critical and near critical Work, as well as the planned sequence and time for the Work.

(4) Review and Reporting - The Project Work schedule may require revision as the Work progresses. Therefore, the Contractor shall monitor and when necessary revise the Project Work schedule as follows:

a. Review with the Engineer - The Contractor shall perform ongoing review of the accepted Project Work schedule and progress of the Work with the Engineer. If the Engineer or the Contractor determines that the accepted Project Work schedule no longer represents the Contractor's own plans or expected time for the Work, a meeting shall be held between the Engineer and the Contractor. At this meeting, the Contractor and the Engineer shall review Project events and any changes for their effect on the accepted Project Work schedule. After any necessary action has been agreed upon, the Contractor shall make required changes to the accepted Project Work schedule and associated Project narrative. Upon acceptance by the Engineer, this will become the new accepted Project Work schedule and associated Project narrative.

The Contractor shall collect information on all activities worked on or scheduled to be worked on during the previous report period, including shop drawings, Material procurement, and Contract Change Orders that have been issued. Information shall include actual start and completion dates on activities started or completed, or if still in progress, the remaining time duration.

The Contractor shall develop detailed sub-networks to incorporate changes, Additional Work, and Extra Work into the Project Work schedule. Detailed sub-networks shall include all necessary activities and logic connectors to describe the Work and all restrictions on it. The restraints shall include those activities from the Project Work schedule that initiated the sub-network as well as those restrained by it. The procedure for acceptance of the revised or updated Project Work schedule as the new accepted Project Work schedule will be as provided above.

The Contractor shall evaluate this information each month and compare it with the accepted Project Work schedule. The Contractor shall make an updated bar chart schedule to incorporate the effect changes may have on the Project completion time(s). For any activity that has started, the Contractor shall add a symbol to show the actual date the activity started and the number of normal workdays remaining until completion. For activities that are finished, a symbol shall be added to show the actual date. The Contractor shall submit , digitally and in paper, copies of the updated bar chart to the Engineer within 7 Days after the progress meeting, along with a progress report as required by "b." below.

b. Progress Report - Each month the Contractor shall submit a progress report and an update of the Project Work schedule to the Engineer. The report and updated schedule shall be submitted both digitally and in paper copy and shall include the following:

- A sufficient description, in narrative form, to describe the past progress, anticipated activities, and stage Work;
- A description of any current and expected changes or delaying factors and their effect on the construction schedule;
- Proposed corrective actions;

- Proposals to keep the Project on schedule in the event of a delay; and
- Any changes to the logic as compared to the accepted Project Work schedule.

(d) Substitution of Schedules - When a Type "A" schedule is required, a Type "B" or Type "C" schedule may be substituted for the Type "A" schedule.

When a Type "B" schedule is required, a Type "C" schedule may be substituted for the Type "B" schedule.

(e) Specified Contract Time Not Superseded by Schedule Revisions - The completion dates in any Project Work schedule and any revised or updated Project Work schedules shall be within the Contract Time(s) specified for the Project, or within adjusted Contract Times approved according to 00180.80(c). Acceptance of any Project Work schedule or any revised or updated Project Work schedules shall not constitute approval of any completion dates that exceed such Contract Time(s). If the Contractor believes that additional Contract Time is due, the Contractor shall submit, with a revised Project Work schedule, a request for adjustment of Contract Time according to 00180.80(c). A request for an adjustment of Contract Time will be evaluated using the most recently accepted Project Work schedule.

(f) Float Time - Float time shown on the Project Work schedule, including any time between a Contractor's scheduled completion date and the specified Contract Time(s), does not exist for the exclusive use of either party to the Contract and belongs to the Project.

(g) Schedules Do Not Constitute Notice - Submittal of a Project Work schedule, with supporting Project narrative, does not constitute or substitute for any notice the Contractor is required under the terms of the Contract to give the Agency.

(h) Failure to Provide Schedule - The Project Work schedule is essential to the Agency. The Contractor's failure to provide the schedule, schedule information, progress reports, Project narratives, or schedule updates when required will be cause to suspend the Work, or to withhold Contract payments as necessary to protect the Agency, until the Contractor provides the required information to the Engineer.

00180.42 Preconstruction Conference - Unless otherwise approved in writing by the Engineer, before any Work is performed and within 7 Calendar Days of the Notice to Proceed, the Contractor shall meet with the Engineer for a preconstruction conference at a time mutually agreed upon.

00180.43 Commencement and Performance of Work - From the time of commencement of the Work to the time of Final Acceptance the Contractor shall:

- Provide adequate Materials, Equipment, labor, and supervision to perform and complete the Work;
- Perform the Work as vigorously and as continuously as conditions permit, and according to a Project Work schedule that ensures completion within the Contract Time or the adjusted Contract Time;
- Not voluntarily suspend or slow down operations without prior written approval from the Engineer; and
- Not resume suspended Work without the Engineer's written authorization.

00180.44 Project Meetings – The Contractor shall participate in conferences and meetings for the purposes of addressing issues related to the Work, reviewing and coordinating progress of the Work and other matters of common interest to the Contractor, Engineer and Agency.

(a) Meeting Participants - Representatives of entities participating in meetings shall be qualified and authorized to act on behalf of entity each represents.

(b) Meet in Agency's meeting room facility, or in a location otherwise agreed to by Agency and Contractor.

(c) Engineer will distribute to each anticipated participant written notice and agenda of each meeting at least 4 days before meeting.

(d) Require attendance of Contractor's superintendent and project manager, and subcontractors who are or are proximate to be actively involved in the Work, or who are necessary to agenda.

(e) Engineer will invite agencies, utility companies or others when the Work affects their interests, and others necessary to agenda.

(f) Engineer will record minutes of meeting and distribute copies of minutes within 7 days of meeting to participants and interested parties.

(g) Progress Meetings

(1) Purpose of Progress Meetings: To expedite work of subcontractors or other organizations that are not meeting scheduled progress, resolve conflicts, and coordinate and expedite execution of the Work.

(2) Attend regularly scheduled bi-weekly progress meetings conducted by Engineer.

(3) Review progress of the Work, Progress Schedule, 3-week look-ahead schedule, narrative report, Application for Payment, record documents, and additional items of current interest that are pertinent to execution of the Work.

(4) Verify:

- Actual start and finish dates of completed activities since last progress meeting.
- Durations and progress of activities not completed.
- Reason, time, and cost data for Change Order Work that will be incorporated into Progress Schedule and Application for Payment.
- Percentage completion of items on Application for Payment.
- Reasons for required revisions to Progress Schedule and their effect on Contract Time and Contract Amount.

(5) Review status of Requests for Clarification/Information and Submittals review.

(6) Discuss Project safety and security.

(7) Discuss traffic control.

(8) Discuss potential problems which may impede scheduled progress and corrective measures.

(h) Coordination Meetings

(1) Purpose of Coordination Meetings: To coordinate the Work of this Contract with the work of the Agency and with work of other contractors.

(i) Pre-Event Meetings

(1) Prior to start of critical activities, the Contractor shall schedule a meeting with Engineer review applicable specifications and drawings, coordination of inspection requirements and other key activities.

(j) Pre-Survey Conference

(1) The Contractor, applicable subcontractors, Contractor's surveyor, Agency and Agency's surveyor shall meet with the Engineer two weeks prior to beginning survey work. The purpose of the meeting is to discuss methods and practices of accomplishing the survey work.

(k) Other Meetings

(1) The Contractor shall prepare for and attend other meetings as identified elsewhere in the Contract Documents.

00180.50 Contract Time to Complete Work:

(a) General - The time allowed to complete the Work or Pay Item is stipulated in the Solicitation Documents, and will be known as the "Contract Time". (see 00110.20)

(b) Kinds of Contract Time - The Contract Time will be expressed in one or more of the following ways:

(1) Fixed Date Calculation - The calendar date on which the Work or Pay Item shall be completed; or

(2) Calendar Day Calculation - The number of Calendar Days from a specified beginning point in which the Work or Pay Item shall be completed.

(3) Work Day Calculation – The number of Work Days from a specified beginning point in which the Work or Pay item shall be completed.

(c) Beginning of Contract Time - When the Contract Time is stated in Calendar Days, counting of Contract Calendar Days will begin at the date of the Notice to Proceed. When the Contract Time is stated in Work Days, counting of Contract Work Days will begin at the date of the Notice to Proceed.

(d) Recording Contract Time - All Contract Time will be recorded and charged to the nearest one-half Day.

Contract Times may be extended because of delays in the completion of the Work due to abnormal weather conditions provided that the Contractor shall, within 10 days of the beginning of such delay, notify Engineer in writing of the cause of the delay and request an extension of time. Such requests shall be accompanied with supporting documentation referenced to the NOAA INDEX weather in the Project vicinity. Engineer will make recommendations to Agency to extend the Contract Times for completing the Work when, in Engineer's judgement, the findings of facts and extent of delay justify such an extension. Contractor shall not be entitled to any additional compensation of any kind arising out of or relating to abnormal weather conditions.

On Contracts with Calendar Day or Work Day counts, the Engineer will furnish the Contractor a weekly statement of Contract Time charges. The statement will show the number of Calendar Days counted for the preceding week and the number of Calendar Days remaining prior to the established completion date.

For Contracts with fixed completion dates, or fixed completion dates for Pay Items or fixed milestone dates, the Engineer will furnish the Contractor a weekly statement of Contract Time charges only after expiration of the Contract Time. The statement will show the number of Calendar Days of liquidated damages that have been assessed, if any.

These statements will include any exclusions from, or adjustments to, Contract Time.

(e) Exclusions from Contract Time - Regardless of the way Contract Time is expressed in the Contract, certain Calendar Days will not be charged against Contract Time. These exclusions will be allowed when the Contractor is prevented from performing Work due to one of the following reasons, resulting in delay:

- Acts of God or Nature;
- Court orders enjoining prosecution of the Work;
- Strikes, labor disputes or freight embargoes that, despite the Contractor's reasonable efforts to avoid them, cause a shutdown of the entire Project or one or more major operations. "Strike" and "labor dispute" may include union action against the Contractor, a Subcontractor, a Materials supplier, or the Agency; or
- Suspension of the Work by written order of the Engineer for reasons other than the Contractor's failure or neglect.

(f) Time Calculation Protest - In the event the Contractor disputes the accuracy of the statement of Contract Time charges, it shall immediately contact the Engineer and attempt to resolve the dispute. If the dispute cannot be resolved informally, the Contractor shall submit a formal written protest to the Engineer within 7 Calendar Days of the date the Engineer mailed or delivered the statement. Failure to submit a formal written protest within the 7 Calendar Day period constitutes the Contractor's approval of the time charges, or adjusted time charges, itemized in the statement.

(g) End of Contract Time - When the Engineer determines that the On-Site Work has been completed, except for the items listed below, the Engineer will issue a Second Notification.

The Second Notification will list:

- The date the time charges stopped;
- Final trimming and cleanup tasks (see 00140.90);
- Equipment to be removed from the Project Site;
- Minor corrective work not involving additional payment to be completed; and
- Submittals, including without limitation all required certifications, bills, forms, warranties, certificate of insurance coverage (00170.70(b)), and other documents, required to be provided to the Engineer before Third Notification will issue.

The Contractor shall complete all tasks listed in the Second Notification in an expeditious manner within the time frame proposed by the Contractor and accepted by the Engineer. Unless otherwise agreed by the Agency, failure of the Contractor to complete all tasks listed in the Second Notification within the time frame accepted, will result in the Agency rescinding the Second Notification. Counting of time charges will resume upon expiration of the accepted time frame.

00180.60 Notice of Delay - The Contractor shall notify the Engineer of any delay that will likely prevent completion of the Work or a Pay Item by the date specified in the Project Work schedule. The notice shall be in writing and shall be submitted within 7 Calendar Days of when the Contractor knew or should have known of the delay. The notice shall include, to the extent available, the following:

- The reasons or causes for the delay;
- The estimated duration of the delay and the estimated resulting cumulative delay in Contract completion;
- Except for 00180.50(e) and 00180.65 delays, whether or not the Contractor expects to request an adjustment of Contract Time due to the delay;
- Whether or not the Contractor expects to accelerate due to the delay; and
- Whether or not the Contractor expects to request additional compensation due to the delay. Except for 00180.50(e) and 00180.65 delays, failure to include this information will constitute waiver of the Contractor's right to later make such a request.
- If Contractor is delayed and has stopped Contract Item work for less than 60 minutes, neither additional Contract Time nor additional compensation will be considered.

00180.65 Right-of-Way and Access Delays - Right-of-Way and access delays will be taken into consideration in adjusting Contract Time, and in approving additional compensation if the performance of the Work is delayed because of the Agency's failure to make available to the Contractor:

- Necessary Rights-of-Way;
- Agency-owned or Agency-controlled Materials sources that are offered in the Contract for the Contractor's use; or
- Access to, or rights of occupancy of, buildings and other properties the Contractor is required to enter or to disturb according to Contract requirements.

If the ending date of an anticipated delay is stated in the Special Provisions, only the delay occurring after that date will be considered for adjusting Contract Time or providing additional compensation.

00180.70 Suspension of Work:

(a) General - The Engineer has authority to suspend the Work, or part of the Work, for any of the following causes:

- Failure of the Contractor to correct unsafe conditions;
- Failure of the Contractor to carry out any provision of the Contract;
- Failure of the Contractor to carry out orders issued by the Engineer, the Agency, or any regulatory authority;
- Existence of conditions unsuitable to proper or safe performance of the Work; or
- Any reason considered by the Agency to be in the public interest.

When Work has been suspended for any reason, the Contractor shall not resume Work without the Engineer's written authorization.

(b) Contractor's Responsibilities during and after Suspension - During periods of suspension of the Work, the Contractor shall continue to be responsible for protecting and repairing the Work according to 00170.80, and for ensuring that a single designated representative responsible for the Project remains available according to 00150.40(b).

When Work is resumed after suspension, unless otherwise specified in the Contract, the Contractor shall perform the following at no additional compensation:

- Replace or repair any Work, Materials, and Equipment to be incorporated into the Work that was lost or damaged because of the temporary use of the Project Site by the public; and
- Remove Materials, Equipment, and temporary construction necessitated by temporary maintenance during the suspension, as directed by the Engineer.

(c) Compensation and Allowances for Suspension - Compensation and allowance of additional Contract Time due to suspension of any portion of the Work will be authorized only for Agency-initiated suspensions for reasons other than the Contractor's failure or neglect. (refer to 00180.50(e), 00180.65, and 00195.40)

00180.80 Adjustment of Contract Time:

(a) General - Contract Time established for the Work will be subject to adjustment, either by increase or decrease, for causes beyond the control of the Contractor, according to the terms of this Subsection. After adjustment, the Contract Time will become, and be designated as, the "Adjusted Contract Time". Except as provided in 00180.65 and 00195.40, an adjustment of Contract Time shall be the Contractor's only remedy for any delay arising from causes beyond the control of the Contractor.

(b) Contractor's Request Not Required - The Engineer may increase or decrease the Contract Time or the Adjusted Contract Time if Change Orders or Extra Work orders issued actually increase or decrease the amount of time required to perform the Work. The Engineer may also increase Contract Time in the event of Right-of-Way and Access delays (see 00180.65), and those delays due to causes beyond the Contractor's control specified in 00180.50(e). The Engineer will promptly inform the Contractor of adjustments made to Contract Time according to this Subsection, and will include the reasons for adjustment.

If the Agency anticipates delay during performance of the Contract, and specifies its expected duration in the Special Provisions, the Engineer will only consider additional delay beyond the stipulated duration in determining whether to adjust Contract Time.

(c) Contractor's Request Required - In the event the Contractor believes that additional Contract Time is due, the Contractor shall submit to the Engineer a timely request for adjustment of Contract Time. The Engineer will not consider untimely requests. The Agency regards as timely only those requests for adjustment of Contract Time that:

- Accompany a proposed revised Project Work schedule submitted according to 00180.41, for comparison with the last revision of the Project Work schedule; or
- Are not otherwise deemed waived and are submitted within 15 Days after the date of Second Notification, if Second Notification has been issued.

The Engineer will not grant an adjustment of Contract Time for events that occurred prior to the date of the last revision of the Project Work schedule. The Engineer will not authorize, nor the Agency pay, acceleration costs incurred by the Contractor prior to its submittal of a request for adjustment of Contract Time to which the acceleration costs relate.

The Contractor's request for adjustment of Contract Time shall be submitted to the Engineer on a form provided by, or in a format acceptable to, the Engineer, and shall include a copy of the written notice required under 00180.60. The request shall include without limitation:

- Consent of the Contractor's Surety if the request totals more than 30 Calendar Days of additional Contract Time;
- Sufficient detail for the Engineer to evaluate the asserted justification for the amount of additional Contract Time requested;
- The cause of each delay for which additional Contract Time is requested, together with supporting analysis and data;
- Reference to the Contract provision allowing Contract Time adjustment for each cause of delay;
- The actual or expected duration of delay resulting from each cause of delay, expressed in Calendar Days; and
- A schedule analysis based on the current approved Project Work schedule for each cause of delay, indicating which activities are involved and their impact on Contract completion.

(d) Basis for Adjustment of Contract Time - In the adjustment of Contract Time, the Engineer will consider causes that include, but are not limited to:

- Failure of the Agency to submit the Contract and bond forms to the Contractor for execution within the time stated in 00130.50, or to submit the Notice to Proceed within the time stated in 00130.90;
- Errors, changes, or omissions in the Supplemental Drawings, quantities, or Specifications;
- Performance of Extra Work;
- Failure of the Agency or Entities acting for the Agency to act promptly in carrying out Contract duties and obligations;
- Acts or omissions of the Agency or Entities acting for the Agency that result in unreasonable delay referenced in 00195.40;
- Causes cited in 00180.50(e); and
- Right-of-way and access delays referenced in 00180.65.

The Engineer will not consider requests for adjustment of Contract Time based on any of the following:

- Contentions that insufficient Contract Time was originally specified in the Contract;
- Delays that do not affect the specified or Adjusted Contract Time;
- Delays that affect the Contractor's planned early completion, but that do not affect the specified or adjusted Contract Time;
- Shortage or inadequacy of Materials, Equipment or labor;
- Work stoppage required by the Engineer to determine the extent of Work defects
- Time for the Contractor to correct the Work defects from date of notification of the defects until the correction work is completed and has been approved by the Engineer.
- Late delivery of Materials and Equipment to be incorporated into the Work, except under those conditions referenced in 00180.50(e);
- Different area of Material source in 00160.40(a);
- Substitution of Equipment in 00180.31(c);
- Reasonably predictable weather conditions; or
- Other matters within the Contractor's control or Contract responsibility.

(e) Consideration and Response by Agency - The Engineer will only consider a Contractor's request for Contract Time adjustment submitted according to the requirements of 00180.80(c). The Engineer may elect not to consider claimed delays that do not affect the specified or adjusted Contract Time required to complete the Work.

The Engineer may adjust Contract Time for causes not specifically identified by the Contractor in its request.

The Engineer will review a properly submitted request for Contract Time adjustment, and within a reasonable time will advise the Contractor of the Engineer's findings. If the Contractor disagrees with the Engineer's findings, the Contractor may request review according to the procedure specified in 00199.40.

00180.85 Failure to Complete on Time; Liquidated Damages:

(a) Time is of the Essence - Time is of the essence in the Contractor's performance of the Contract. Delays in the Contractor's performance of the Work may inconvenience the traveling public, interfere with business and commerce, and increase cost to the Agency. It is essential and in the public interest that the Contractor prosecute the Work vigorously to Contract completion.

The Agency does not waive any rights under the Contract by permitting the Contractor to continue to perform the Contract, or any part of it, after the Contract Time or adjusted Contract Time has expired.

(b) Liquidated Damages - The Agency will sustain damage if the Work is not completed within the specified Contract Time. However, in certain Agency projects it may be unduly burdensome and difficult to demonstrate the exact dollar value of such damages. The Agency will identify such projects in the Special Provisions related to them. In these projects, the Contractor agrees to pay to the Agency, not as a penalty but as liquidated damages, the amount specified in the Special Provisions for each Calendar Day the Contractor expends performing the Contract in excess of the Contract Time or adjusted Contract Time.

Payment by the Contractor of liquidated damages does not release the Contractor from its obligation to fully and timely perform the Contract according to its terms. Nor does acceptance of liquidated damages by the Agency constitute a waiver of the Agency's right to collect any additional damages it may sustain by reason of the Contractor's failure to fully perform the Contract according to its terms. The liquidated damages shall constitute payment in full only of damages incurred by the Agency due to the Contractor's failure to complete the Work on time.

If the Contract is terminated according to 00180.90(a), and if the Work has not been completed by other means on or before the expiration of Contract Time or adjusted Contract Time, liquidated damages will be assessed against the Contractor for the duration of time reasonably required to complete the Work.

00180.90 Termination of Contract and Substituted Performance:

(a) Termination for Default - Termination of the Contract for default may result if the Contractor:

- Fails to comply with the requirements for records;
- Violates any material provision of the Contract;
- Disregards applicable laws and regulations or the Engineer's instructions;
- Refuses or fails to supply enough Materials, Equipment or skilled workers for prosecution of the Work in compliance with the Contract;
- Fails to make prompt payment to Subcontractors;
- Makes an unauthorized general assignment for the benefit of the Contractor's creditors;
- Has a receiver appointed because of the Contractor's insolvency;

- Is adjudged bankrupt and the court consents to the Contract termination; or
- Otherwise fails or refuses to faithfully perform the Contract according to its terms and conditions.

If the Contract is terminated by the Agency, upon demand the Contractor and the Contractor's Surety shall provide the Engineer with immediate and peaceful possession of the Project Site, and of all Materials and Equipment to be incorporated into the Work, whether located on and off the Project Site, for which the Contractor received progress payments under 00195.50.

If the Contract is terminated for default, neither the Contractor nor its Surety shall be:

- Relieved of liability for damages or losses suffered by the Agency because of the Contractor's breach of Contract; or

- Entitled to receive any further progress payments until the Work is completed. However, progress payments for completed Work that remain due and owing at the time of Contract termination may be made according to the terms of 00195.50, except that the Engineer will be entitled to withhold sufficient funds to cover costs incurred by the Agency as a result of the termination. Final payment to the Contractor will be made according to the provisions of Section 00195.

If a termination under this provision is determined by a court of competent jurisdiction to be unjustified, the termination shall be deemed a termination for public convenience.

(b) Substituted Performance - According to the Agency's procedures, and upon the Engineer's recommendation that sufficient cause exists, the Agency, without prejudice to any of its other rights or remedies and after giving the Contractor and the Contractor's Surety 10 Calendar Days' written notice, may:

- Terminate the Contract;
- Substitute the Contractor with another Entity to complete the Contract;
- Take possession of the Project Site;
- Take possession of Materials on the Project Site;
- Take possession of Materials not on the Project Site, for which the Contractor received progress payments under 00195.50;
- Take possession of Equipment on the Project Site that is to be incorporated into the Work;
- Take possession of Equipment not on the Project Site that is to be incorporated into the Work, and for which the Contractor received progress payments under 00195.50; and
- Finish the Work by whatever method the Agency deems expedient.

If, within the 10 Calendar Day notice period provided above, the Contractor and/or its Surety corrects the basis for declaration of default to the satisfaction of the Engineer, or if the Contractor's Surety submits a proposal for correction that is acceptable to the Engineer, the Contract will not be terminated.

(c) Termination for Public Convenience - The Engineer may terminate the Contract for convenience in whole or in part whenever the Engineer determines that termination of the Contract is in the best interest of the public.

The Engineer will provide the Contractor and the Contractor's Surety 7 Calendar Days' written notice of termination for public convenience. After such notice, the Contractor and the Contractor's Surety shall provide the Engineer with immediate and peaceful possession of the Project Site, and of Materials and Equipment to be incorporated into the Work, whether located on and off the Project Site, for which the Contractor received progress payments under 00195.50.

If the Contract is terminated for public convenience, neither the Contractor nor its Surety shall be relieved of liability for damages or losses suffered by the Agency as a result of defective, unacceptable or unauthorized Work completed or performed.

Compensation for Work terminated by the Engineer under this provision will be determined according to the provisions of 00195.70(b).

00180.95 Project Closeout

(a) Description of Requirements – Project Closeout is defined to include general requirements near the end of the Contract Time, in preparation for Substantial Completion, Final Completion, final payment, normal termination of Contract, occupancy by Agency and similar actions evidencing completion of the Work. Specific requirements for individual units of Work are specified in various technical specification sections.

(b) Prerequisites To Substantial Completion

(1) Prior to requesting Engineer's inspection for certification of Substantial Completion for the entire work, complete the following and list known exceptions in request:

- In progress payment request, coincide with or first following date claimed, show either 100% completion for portion of work claimed as "substantially complete", or list incomplete items, value of incompletion, and reasons for being incomplete. Include supporting documentation for completion as indicated in these Contract Documents.
- Submit specific warranties, workmanship/maintenance bonds, maintenance agreements, final certifications and similar documents.
- Obtain and submit releases enabling Agency's full and unrestricted use of the Work and access to services and utilities.
- Deliver tools, spare parts, extra stocks of materials, and similar physical items to Agency.
- Where applicable, make final change-over of locks and transmit keys to Agency and advise Agency's personnel of change-over in security provisions.

- Complete start-up testing of systems, and instructions of Agency's operating/maintenance personnel. Discontinue (or change-over) and remove from Project site temporary facilities and services, along with construction tools and facilities, mock-ups, and similar elements.

- Touch-up and otherwise repair and restore marred exposed finishes.

(2) Upon receipt of Contractor's request, Engineer will either proceed with inspection or advise Contractor of prerequisites not fulfilled. Following initial inspection, Engineer will either prepare Certificate of Substantial Completion, or advise Contractor of Work which must be performed prior to issuance of certificate; a repeat inspection will be performed when requested and assured by the Contractor that Work has been substantially completed. Results of completed inspection will form initial "punch-list" requirements for Final Completion. If more than two visits are required to complete the final inspection for Substantial Completion then the Contractor shall pay the Agency for the Engineer's time, for all categories of labor required to complete the inspection for Substantial Completion at the Engineer's standard billing rates at the time of inspection. This time shall include time for travel and time to prepare inspection reports. Contractor shall also pay the Engineer's expenses at cost plus 10% and $0.55 per mile for travel to and from the site.

(c) Prerequisites To Final Completion

(1) Prior to requesting Engineer's final inspection for final payment and acceptance, complete the following and list known exceptions (if any) in request:

- Submit final payment request with final releases and supporting documentation which have not previously been submitted and accepted. Include certificates of insurance for products and completed operations where required.

- Submit updated final statement, accounting for additional (final) changes to Contract Amount.

- Submit certified copy of Engineer's final punch-list of itemized work to be completed or corrected, stating that each item has been completed or otherwise resolved for acceptance, endorsed and dated by Engineer.

- Submit final meter readings for utilities, measured record of stored fuel, and similar data as of time of Substantial Completion or when Agency took possession of and responsibility for corresponding elements of the work.

- Submit consent of surety.

- Submit final liquidated damages settlement statement, acceptable to Agency.

- Submit record drawings, maintenance manuals, and similar final record information.

(2) Re-inspection Procedure: Upon receipt of Contractor's notice that the Work has been completed, including punch-list items resulting from earlier inspections, and accepting incomplete items delayed because of acceptable circumstances, Engineer will re-inspect the work. Upon completion of re-inspection, Engineer will either make recommendation for final payment and acceptance by the Agency or advise Contractor of work not completed or obligations not fulfilled as required for final payment. If necessary, procedure will be repeated. If more than two visits are required to complete the final inspection for final payment then the Contractor shall pay the Agency for the Engineer's time, for all categories of labor required to complete the inspection for final acceptance at the Engineer's standard billing rates at the time of inspection. This time shall include time to travel and time to prepare inspection reports. Contractor shall also pay the Engineer's expenses at cost plus 10% and $0.55 per mile for travel to and from the site.

(d) Closeout Documents

(1) Submit following Closeout Submittals after receipt of Second Notification and at least seven (7) days prior to Application for Final Payment:

- Evidence of Compliance with Requirements of Governing Authorities.
- Project Record Documents.
- Operation and Maintenance Manuals.
- Warranties and Bonds.
- Keys and Keying Schedule.
- Evidence of Payment and Release of Liens as outlined in Conditions of the Contract.
- City of Warrenton Certificate of Compliance provided at the end of this Section

"Making a difference through excellence of service"

CITY OF WARRENTON

CERTIFICATE OF COMPLIANCE

City of Warrenton
225 S Main Ave
Warrenton, OR 97146

ATTN: Public Works Director

PROJECT NAME: _____

PROJECT LOCATION: _____

I hereby certify that:

A. All work on the above referenced contract has been performed and materials supplied in accordance with the plans, specifications and contract documents for the above work;

B. There have been no substitutions of Subcontractors without prior notification to the City in accordance with ORS279C.585;

C. Contractor and subcontractors performing work under this contract were registered with the Construction Contractors Board in accordance with ORS 701.035 to 701.138 before commencing work under the contract;

D. All payments due to all persons supplying labor or material for the performance of the work provided for in this contract have been made;

E. All contributions or amounts due the Industrial Accident Fund from the contractor or subcontractors incurred in the performance of the contract have been paid;

F. All sums withheld from employees under ORS 316.167 have been paid to the Department of Revenue.

Authorized Signature_____ Date_____

Section 00190 - Measurement of Pay Quantities

Description

00190.00 Scope - The Engineer will measure pay quantities for accepted Work according to the United States standard measure unless otherwise provided in the Contract. Unless otherwise specified in the Contract, the Engineer will round off all quantity computations using the following convention:

- The final significant digit will not be changed when the succeeding digit is less than 5.
- The final significant digit will be increased by one when the succeeding digit is 5 or greater.

The measurement provisions contained in the Specifications for each Pay Item will supplement or modify the above convention by:

- Imposing measurement limitations
- Describing measurement or computation procedures
- Giving conversion factors or adjustment conditions
- Providing for determination of reasonably accurate and representative Pay Item quantities

Measurements required or allowed to be made by the Contractor will be subject to the Engineer's verification. The Engineer's decision about measurement is final.

00190.10 Measurement Guidelines - Measurement of quantities will be made on the following bases, unless otherwise specified in the Contract:

(a) Unit Basis - Unit will be each, unless otherwise specified in the Contract and will be determined by actual count of units in place.

(b) Length Basis - Length will be feet or mile, unless otherwise specified in the Contract and will be determined by measuring the length at least to the nearest 0.1 foot or at least to the nearest 0.1 mile, as applicable, unless otherwise specified in the Contract. Measurements will be limited to the dimensions shown or specified, or as directed by the Engineer.

(c) Area Basis - Area will be square foot, square yard, or acre, unless otherwise specified in the Contract and will be determined by measuring the width and the length (or height) at least to the nearest 0.1 foot and computed at least to the nearest 0.1 square foot, nearest 0.1 square yard, or nearest 0.1 acre, as applicable, unless otherwise specified in the Contract.

(d) Weight Basis - Weight will be pound or ton, unless otherwise specified in the Contract and will be determined as follows:

(1) Pound - Pound weight will be determined by the net weight identified on the manufacturer's packaged labels, subject to periodic check weighing. Weight by pound will be measured at least to the nearest 1.0 pound unless otherwise specified in the Contract.

Provide a certificate with each shipment together with a certified copy of the weight of each delivery. If the check weight is less than the manufacturer weight by more than 0.4%, the discrepancy will be resolved by the Engineer.

(2) Ton - Ton weight will be determined on Contractor-provided scales as required under 00190.20 unless otherwise allowed by the Specifications. Weight by ton will be measured at least to the nearest 0.01 ton unless otherwise specified in the Contract.

If bituminous materials, portland cement, lime, and similar bulk Materials are shipped by truck or rail, the supplier's shipping invoice with net scale weights, or volumes converted to weights, may be used for Pay Item quantity determination in place of weights determined on the Contractor-provided vehicle scales.

Shipping invoice weights of the supplier's truck or transport shall be subject to periodic check weighing on the Contractor's vehicle scales, or other scales designated, according to 00190.20. If the check weight is less than the supplier weight by more than 0.4%, the discrepancy will be resolved by the Engineer.

No payment will be made:

- For quantities in excess of the supplier weight
- When Materials have been lost, wasted, or otherwise not incorporated into the Work
- For additional hauling costs resulting from the check weighing

(e) Volume Basis - Volume will be cubic yard truck measure or in-place measure, gallons, foot board measure (FBM), or thousand foot board measure (MFBM), unless otherwise specified in the Contract and will be measured at least to the nearest 0.1 cubic yard, nearest 1.0 gallon, nearest 0.1 FBM, or nearest 0.1 MFBM, as applicable, unless otherwise specified in the Contract.

Truck measure will be the measured and calculated maximum "water level" capacity of the vehicle. Quantities will be determined at the point of delivery, with no allowance for settlement of Material during transit. When required to facilitate measurement, the vehicle load shall be leveled at the point of delivery. Payment will not be made for Material in excess of the maximum "water level" capacity. Deductions will be made for loads below the maximum "water level" capacity.

When bituminous materials are measured by volume, the volume will be measured at 60 °F or will be corrected to the volume at 60 °F using the correction factors found in the MFTP (ODOT TM 321).

(f) Time Basis - Time will be hour, Day, or year, unless otherwise specified in the Contract, and will be measured to at least the nearest 0.5 hour, nearest 1.0 Day, or nearest 1.0 year, as applicable, unless otherwise specified in the Contract.

(g) Standard Manufactured Items - If standard manufactured items, such as fence, wire, plates, rolled shapes, pipe, conduit and other similar items are specified in the Contract by properties such as gauge, unit weight, or section dimensions, the manufacturing tolerances established by the industry involved will be accepted unless more stringent tolerances are cited in the Contract.

(h) Lump Sum Basis - Lump sum, when used, means the Work described shall be completed and accepted without measurement unless changes are ordered in writing by the Engineer. If estimated quantities of the Work to be performed are listed in the Special Provisions, they provide only a basis for adjusting payment amounts. Estimated quantities are approximate only, and are made from a reasonable interpretation of the Contract Documents. Computations based on the details and dimensions shown on the Contract Documents are not guaranteed to equal estimated quantities.

If the Agency issues no Change Order, the Agency will make no pay adjustment for quantities based on the Contractor's computations that overrun or underrun the estimated quantities.

If the Agency issues Change Orders for changes in the Work, the Engineer will measure such changes according to the standards set by 00195.20 to determine adjustment of payment.

00190.20 Contractor to Provide Vehicle Weigh Scales:

(a) General - If the Specifications require measurement by weighing on vehicle weigh scales, the Contractor shall provide vehicle weigh scales and shall transport Materials to the scales. Subject to the Engineer's approval, weights may be determined by plant or hopper scales according to 00190.30.

Contractor-provided scales shall be furnished, installed and maintained by the Contractor or its supplier, or, subject to the Engineer's approval, may be commercial scales located in the vicinity of the Project.

Unless otherwise provided in the Contract, Pay Items to be measured by weight shall include all Contractor costs for providing, maintaining, inspecting, and testing scales; for furnishing appropriate weigh tickets; for self-printing scales; and for transporting Materials to the scales or to check weighing.

(b) Requirements - The scales shall conform to ORS 618, or the laws of the state in which they are located, and NIST Handbook 44, and shall be:

- Licensed by the Oregon Department of Agriculture, or by the analogous regulatory body for scales located outside the State;
- Technically suitable for weighing the Materials;
- Properly installed and maintained; and
- Accurate to the required tolerances.

The weight of any Materials weighed by anyone other than the Engineer will be subject to check weighing as the Engineer directs.

(c) Approaches - Vehicle scale approaches shall be:

- At each end of the scale platform;
- Straight and in line with the platform; and
- Long enough to accommodate combination vehicles longer than the scale platform so that they are level and allow release of brakes before weighing.

(d) Inspections - Contractor shall have all scales certified, that is inspected and their accuracy tested, by the Oregon Department of Agriculture, an analogous regulatory body for scales located outside the State, or a scale service company as follows:

- Before use if installed at a new site;
- 60 Calendar Days after initial inspection;
- Every 6 months thereafter; and
- When the Engineer directs additional inspections.

No Materials weighed on scales without current certifications according to this Subsection will be accepted. The Contractor shall provide a copy of all required certifications to the Engineer.

Testing by a scale service company within the State of Oregon shall comply with ORS 618.

If additional inspections directed by the Engineer confirm that the scale accuracy is within the required tolerances, the Agency will pay the cost for inspecting and testing the scales. If the scale accuracy is not within these tolerances, the Contractor shall pay the cost for inspecting and testing the scales.

(e) Inspection Results - If an inspection indicates the scales have been under-weighing (indicating less than the true weight), the Agency will make no additional payment to the Contractor for Materials previously weighed.

If an inspection indicates the scales have been over-weighing (indicating more than the true weight), the weights will be reduced for Materials received after the time the Engineer determines the overweighing began or, if that is not possible, after the last acceptable certification of the scales. The reduction will be the amount of error in excess of the 0.2% maintenance tolerance allowed in the Contract.

(f) Contractor-Provided Weigh Technician - The Contractor shall provide a technician to operate Contractor-provided vehicle weigh scales. The Agency may observe procedures and require check weighing according to the following:

(1) Scale with Automatic Printer - If the scales have an automatic weigh memo printer that does not require manual entry of gross weight information, the Agency may periodically have a representative at the scales to observe the weighing procedures. In addition, the Engineer may periodically check the weight for a load of Materials by directing the haul vehicle to reweigh on a different scale that has been inspected and certified according to 00190.20(b) and 00190.20(d).

If a different scale is not available within a 30 mile round trip from the regular haul route the Agency will allow check weighing on an approved alternate basis. Check weights within 0.4% of the Contractor-provided weight are acceptable.

The Engineer will resolve discrepancies found by check weighing. Agency employee costs will be paid by the Agency. The Contractor shall pay all other costs resulting from the check weighings, including without limitation the use of other scales.

If more than 50 tons per Day of all types of Materials are received from a scale, the Contractor shall make random check weighings at least every tenth Day on which more than 50 tons is received or at each interval that 10,000 tons has been weighed, whichever occurs first, or as directed by the Engineer. The Contractor shall make at least one check weighing on projects where more than 2,000 tons of all types of Materials are received from a scale. The Contractor shall provide the Engineer with the results of the check weighing.

(2) Scale Without Automatic Printer - If the scales require manual entry of gross weight information, the Agency may periodically have a representative weigh witness at the scales to observe the weighing procedures. The Contractor shall inform the Engineer of his intent to use a scale without an automatic printer at least 3 working Days before weighing begins or before the Contractor changes to a scale that does not have an automatic printer. The Contractor shall pay costs for the weigh witness. The hourly cost of the weigh witness will be as stated in the Special Provisions. In addition, the Engineer may periodically check the weight for a load of Materials by directing the haul vehicle to reweigh on a different scale that has been inspected and certified according to 00190.20(b) and 00190.20(d).

If a different scale is not available within a 30 mile round trip from the regular haul route the Agency will allow check weighing on an approved alternate basis. Check weights within 0.4% of the Contractor-provided weight are acceptable.

The Engineer will resolve discrepancies found by check weighing. Agency employee costs for check weighings will be paid by the Agency. The Contractor shall pay all other costs resulting from the check weighings, including without limitation the use of other scales.

If more than 50 tons per Day of all types of Materials are received from a scale, the Contractor shall make random check weighings at least every tenth day on which more than 50 tons is received or at each interval that 10,000 tons has been weighed, whichever occurs first, or as directed by the Engineer. The Contractor shall make at least one check weighing on all projects where materials are received from a scale without an automatic printer. The Contractor shall provide the Engineer with the results of the check weighing.

(3) Duties of Weigh Technician - The Contractor's weigh technician shall:

- Determine twice a Day, or as otherwise directed by the Engineer, the empty haul weights (tare weights) of hauling vehicles, unless vehicles are tared before each load;
- Furnish daily a listing of the tare weights if 10 or more loads are hauled during that Day;
- Furnish a note listing the net weight for each consecutive ten loads with the following load;
- Furnish a daily listing of the net weights and total weight for each type of Material hauled during that Day; and
- Furnish a legible, serially numbered weigh memo for each load of Materials to the Agency's Materials receiver at the point of delivery, or as directed by the Engineer. The memo shall identify the Project, the Materials, the date, net weight (gross and tare as appropriate), and identification of vehicle, driver and weigh technician.

(g) Agency-Provided Weigh Technician - If the Contractor provides vehicle weigh scales without a weigh technician meeting the requirements of this Subsection, the Agency will provide a weigh technician at

the Contractor's expense. The Contractor shall provide a weighhouse for the weigh technician according to Section 00205. The Agency's weigh technician will:

- Determine tare weights;
- Prepare weigh memos for each load;
- Compile the weigh records; and
- Not participate in the production of Materials or the loading of haul vehicles.

00190.30 Plant Scales - The Contractor, with the Engineer's written approval, may weigh plant-mixed Materials on scales that have either:

- An automatic weight batching and mixing control printer system; or
- A weigh hopper printer system.

Any additional costs resulting from the use of these scales shall be borne by the Contractor. Check weighing will be done according to 00190.20(f).

Except for 00190.20(c) regarding approaches, the Contractor's use of plant scales shall comply with all provisions of 00190.20.

The Engineer's approval for the Contractor's use of plant scales to determine pay weights will be rescinded if check weighing or scale inspections indicate the scales do not consistently determine weights within the tolerances allowed by state law.

Section 00195 - Payment

Description

00195.00 Scope and Limit:

(a) General - The Agency will pay only for measured Pay Item quantities incorporated into the Work or performed according to the terms of the Contract. The Contractor understands and agrees that Pay Item quantities listed in the Schedule of Items do not govern payment.

Payment constitutes full compensation to the Contractor for furnishing all Materials, Equipment, labor, and Incidentals necessary to complete the Work; and for risk, loss, damage, and expense arising from the nature or prosecution of the Work or from the action of the elements, subject to the provisions of 00170.80. The Contractor shall include the costs of bonds and insurance for the Project in the unit price for each Pay Item of Work to be performed.

(b) Essential or Incidental Materials or Work - When the Specifications state that the unit price for a Pay Item is compensation for certain Materials or Work essential or Incidental to the Pay Item, the same Materials or Work will not be measured or paid under any other Pay Item.

Provisions and Requirements

00195.10 Payment For Changes in Materials Costs - On certain projects, as identified in the Special Provisions, an escalation/de-escalation clause with respect to certain materials will be in effect during the life of the Contract.

00195.13 Asphalt Cement Material Price Escalation/De-Escalation Clause - Subsections 00195.13, 00195.13(a), 00195.13(b), 00195.13(c), and 00195.13(d) contain the price escalation/de-escalation clause relating to asphalt cement materials (as defined in 00195.13(d)).

(a) Monthly Asphalt Cement Material Price (MACMP) - The Monthly Asphalt Cement Material Price (MACMP) will be established by ODOT each month. For information regarding the calculation of the MACMP, and for the actual MACMP, go to the ODOT website at:

http://www.oregon.gov/ODOT/HWY/ESTIMATING/asphalt_fuel.shtm

If the ODOT selected index ceases to be available for any reason, the Agency in its discretion will select and begin using a substitute price source or index to establish the MACMP each month. The MACMP will apply to all asphalt cement including but not limited to paving grade, polymer modified, and emulsified asphalts, and recycling agents. The Agency does not guarantee that asphalt cement will be available at the MACMP

(b) **Base Asphalt Cement Material Price (Base) -** The Base price for this Project is the MACMP published on the ODOT website for the month immediately preceding the bid opening date.

(c) Monthly Asphalt Cement Adjustment Factor - The Monthly Asphalt Cement Adjustment Factor will be determined each month as follows:

- If the MACMP is within ± 5% of the Base, there will be no adjustment.
- If the MACMP is more than 105% of the Base, then:

  Adjustment Factor (%) = ((MACMP)/(Base)) x (100) – 5

- If the MACMP is less than 95% of the Base, then:

  Adjustment Factor (%) = ((MACMP)/(Base)) x (100) + 5

(d) Asphalt Cement Price Adjustment – If specified in the Special Provisions, an asphalt cement escalation/de-escalation clause will be in effect during the life of the Contract. A price adjustment will be made for each pay item in the bid schedule containing asphalt cement. The price adjustment as calculated in 00195.13(c) above will use the MACMP for the month the asphalt is incorporated into the Project. The price adjustment per a ton of HMAC incorporated that month will be the difference between the cost submitted by the Contractor in the bid schedule for "Asphalt Cement in HMAC Per Ton of HMAC Complete" and the adjusted cost found by multiplying the "Asphalt Cement in HMAC Per Ton Of HMAC Complete" by the Adjustment Factor. The Agency reserves all of its rights under the Contract, including, but not limited to, its rights for suspension of the Work under 00180.70 and its rights for termination of the Contract under 00180.90, and this escalation/de-escalation provision shall not limit those rights.

00195.20 Changes to Plans or Character of Work:

(a) Insignificant Changed Work - If the changes made under 00140.30 do not significantly change the character or unit cost of the Work to be performed under the Contract, the Agency will pay for such work at the Pay Item price.

If the Work involved in the change is measured on a lump sum basis and its character is not significantly changed, payment for the Changed Work will be determined:

- As described in the applicable Section of the Specifications;
- If not described there, on a theoretical unit price determined by dividing the Contractor's lump sum price by the estimated quantity of the Pay Item listed in the Special Provisions; or
- If neither of the above apply, the Engineer will make an equitable adjustment.

(b) Significant Changed Work - If the changes made under 00140.30 significantly alter the character, quantity, unit cost, or lump sum cost of the Work, the Agency will adjust the Contract. The Contractor shall not be entitled to compensation for any loss in profits resulting from elimination of, reduction of, or other change to, a part of the Work.

Any such adjustments may be less than, but will not be more than the amount justified by the Engineer on the basis of the established procedures set out in Section 00197 for determining rates for Extra Work, but those procedures shall account for the decrease or elimination of Work as well as for increases in the Work. This does not limit the application of Section 00199.

The term "Significant Changed Work" shall apply only to that circumstance in which the character of the Work, as changed, differs materially in kind, nature, or unit cost from that involved or included in the originally proposed construction.

For purposes of this Section, “Significant” is defined as:

a) An increase or decrease of more than 25 percent of the total cost of the Work calculated from the original proposal quantities and the unit contract prices; or,
b) An increase or decrease of more than 25 percent in the quantity of any one major contract item.

For condition b) above, a major item is defined as any item that amounts to 10 percent or more of the original total contract price.

00195.30 Differing Site Conditions - Upon written notification, as required in 00140.40, the Engineer will investigate the identified conditions. If the Engineer determines that the conditions are differing Project Site conditions under 00140.40 and cause an increase or decrease in the cost or time required to perform any Work under the Contract, an adjustment in the Contract Amount or Contract Time, excluding loss of anticipated profits, will be made, and the Contract modified accordingly, in writing. The Engineer will notify the Contractor as to whether or not an adjustment of the Contract is warranted.

No Contract adjustment which benefits the Contractor will be allowed unless the Contractor has provided the required written notice. Any such adjustments will be made according to 00195.20.

00195.40 Unreasonable Delay by the Agency - If the Contractor believes that performance of all or any portion of the Work is suspended, delayed, or interrupted for an unreasonable period of time in excess of that originally anticipated or customary in the construction industry, due to acts or omissions of the Agency, or persons acting for the Agency, and that additional compensation, Contract Time, or both, are due the Contractor because of the suspension, delay or interruption, the Contractor shall immediately file a written notice of delay according to 00180.60. The Contractor shall then promptly submit a properly supported request for any additional compensation, Contract Time, or both, according to the applicable provisions in 00180.60 through 00180.80 and Section 00199.

The Engineer will promptly evaluate a properly submitted request for additional compensation. If the Engineer determines that the delay was unreasonable, and that the cost required for the Contractor to perform the Contract has increased as a result of the unreasonable suspension, delay or interruption, the Engineer will make an equitable adjustment, excluding profit, and modify the Contract in writing accordingly. The Engineer will notify the Contractor of the determination and whether an adjustment to the Contract is warranted.

Under this provision, no Contract adjustment will be allowed:

- Unless the Contractor has provided the written notice required by 00180.60;
- For costs incurred more than 10 Calendar Days before the Engineer receives the Contractor's properly submitted written request;
- For any portion of a delay that the Engineer deems to be a reasonable delay, or for which an adjustment is provided for or excluded under other terms of the Contract; or
- To the extent that performance would nevertheless have been suspended, delayed or interrupted by causes other than those described in this Subsection.

00195.50 Progress Payments and Retained Amounts:

(a) **Progress Payments** - The Agency's payment of progress payments, or determination of satisfactory completion of Pay Items or Work or release of retainage under 00195.50(d), shall not be construed as Final Acceptance or approval of any part of the Work, and shall not relieve the Contractor of responsibility for defective Materials or workmanship or for latent defects and warranty obligations.

The estimates upon which progress payments are based are not represented to be accurate estimates. All estimated quantities are subject to correction in the final estimate. If the Contractor uses these estimates as a basis for making payments to Subcontractors, the Contractor assumes all risk and bears any losses that result.

(1) **Progress Estimates** - At the same time each month, the Engineer will make an estimate of the amount and value of Pay Item Work completed. The amount of Work completed will be the sum of the estimated number of units completed for unit price Pay Items plus the estimated percentage completed of lump sum Pay Items.

The estimated value of the Work completed will then be determined by using the Contract unit price for unit price Pay Items, and by using one of the following methods to determine the value of the lump sum Pay Items:

- The "theoretical unit price", when the Special Provisions contain an estimated number of units;
- A Contractor-submitted, Engineer-approved Schedule of Values, when there is no theoretical unit price available; or
- Engineer's determination, when there is neither an available theoretical unit price, nor an approved, Contractor-submitted Schedule of Values.

The amounts to be allowed for lump sum Pay Items in progress payments will not exceed the reasonable value of the Work performed, as determined by the Engineer.

Incidentals such as formwork, falsework, shoring, and cribbing shall be included in the unit prices for the various Pay Items requiring their use, unless specified as a separate Pay Item. No payment will be made for Pay Items that include Incidentals until units or portions of such Pay Item Work are in place and completed. The costs of Incidentals will be paid in proportion to the percentage of Pay Item Work completed.

(2) Value of Materials on Hand - The Engineer will also make an estimate of the amount and value of acceptable Materials on hand, i.e., already delivered and stored according to 00195.60(a), to be incorporated into the Work.

(3) Value of Work Accomplished - The sum of the values in (1) and (2) above will be collectively referred to in this Subsection as the "value of Work accomplished", subject to (4) below.

(4) Limitations on Value of Work Accomplished - In determining the "value of Work accomplished", the Engineer's estimate will be based on the unit prices for the various Pay Items. Any amounts not included in progress payments due to substantial mathematical unbalancing of Pay Item prices will be included in the final payment issued according to 00195.90(b).

(5) Reductions to Progress Payments - With each progress payment, the Contractor will receive a Contract payment voucher and summary setting forth the value of Work accomplished reduced by the following:

- Amounts previously paid;
- Amounts deductible or owed to the Agency for any cause specified in the Contract;
- Additional amounts retained to protect the Agency's interests according to Subsection (e) below.

(b) Retainage - The amount to be retained from progress payments will be 5% of the value of Work accomplished, and will be retained in one of the forms specified in Subsection (c) below.

As provided in 00170.65(a) additional retainage of 25% of amounts earned will be withheld and released according to ORS 279C.845 when the Contractor fails to file the certified statements required in ORS 279C.845, FHWA Form 1273, and 00170.65.

(c) Forms of Retainage - Moneys retained by the Agency under ORS 279C.570(7) shall be retained in a fund by the Agency and paid to the Contractor in accordance with ORS 279C.570. Upon written request from the Contractor, other forms of acceptable retainage are specified below in Subsections (1) and (2). "Cash, Alternate A" is the Agency-preferred form of retainage. If the Agency incurs additional costs as a result of the Contractor's election to use a form of retainage other than Cash, Alternate A, the Agency may recover such costs from the Contractor by a reduction of the final payment.

(1) Cash, Alternate A - Retainage will be deducted from progress payments and held by the Agency until final payment is made according to 00195.90, unless otherwise specified in the Contract.

The Agency will deposit the cash retainage withheld in an interest-bearing account in a bank, trust company, or savings association for the benefit of the Agency, as provided by ORS 279C.560(5). Interest earned on the account shall accrue to the Contractor. Amounts retained and interest earned will be included in the final payment made according to 00195.90.

Any retainage withheld on Work performed by a Subcontractor will be released to the Contractor according to 00195.50(d).

2) Bonds, Securities, and Other Instruments - In accordance with ORS 279C.560, unless the Agency finds in writing that accepting a bond, security or other instrument poses an extraordinary risk that is

not typically associated with the bond, security or other instrument, the Agency will approve the Contractor's written request to deposit bonds, securities or other instruments with the Agency or in a custodial account or other account satisfactory to the Agency with an approved bank or trust company, to be held instead of cash retainage for the benefit of the Agency. In such event, the Agency will reduce the cash retainage by an amount equal to the value of the bonds, securities and other instruments. Interest or earnings on the bonds, securities and other instruments shall accrue to the Contractor.

Bonds, securities and other instruments deposited instead of cash retainage shall be assigned to or made payable to the Agency and shall be of a kind approved by the Director of the Oregon Department of Administrative Services, including but not limited to:

- Bills, certificates, notes or bonds of the United States;
- Other obligations of the United States or agencies of the United States;
- Obligations of a corporation wholly owned by the federal government;
- Indebtedness of the Federal National Mortgage Association;
- General obligation bonds of the State of Oregon or a political subdivision of the State of Oregon;
- Irrevocable letters of credit issued by an insured institution, as defined in ORS 706.008.

The Contractor shall execute and provide such documentation and instructions respecting the bonds, securities and other instruments as the Agency may require to protect its interests. When the Engineer determines that all requirements for the protection of the Agency's interest have been fulfilled, the bonds and securities deposited instead of cash retainage will be released to the Contractor.

(d) Reduction of Retainage - As the Work progresses, the amounts to be retained under (b) of this Subsection are subject to reduction in the Engineer's sole discretion. Retainage reductions will be considered only as follows:

- When the Work is 97.5% or more completed, the Engineer may, without application by the Contractor, reduce the retained amount to 100% of the value of the Work remaining.

- For a project funded by the FHWA, when a subcontractor has satisfactorily completed all of its Work, it may request release of retainage for that Work from the Contractor. The Contractor shall request reduction of retainage in the amount withheld for the subcontractor's Work after certifying to the Agency that the subcontractor's Work is complete, and that all contractual requirements pertaining to the subcontractor's Work have been satisfied. Within 60 Calendar Days of the end of the month in which the Agency receives the Contractor's certification regarding the subcontractor's Work, the Agency will either notify the Contractor of any deficiencies which require completion before release of retainage, or verify that the subcontractor's Work complies with the Contract and release all retainage for that Work with the next scheduled progress payment. Within 10 Calendar Days of receipt of retainage, the Contractor shall pay to the subcontractor all such retainage released except for latent defects or warranty.

- The Agency will only release retainage for satisfactorily completed portions of the Work represented by Pay Items in the Schedule of Items, or by Pay Items added by Change Order. Work

not represented by a Pay Item, but which constitutes part of an uncompleted Pay Item, will not be regarded as satisfactorily completed Work for the purposes of this Subsection.

If retainage has been reduced or eliminated, the Agency reserves the right to protect its interests by retaining amounts from further progress payments at the rates provided in 00195.50(b).

(e) Withholding Payments - In addition to any other rights the Agency may have to withhold payments under other provisions of the Contract, the Engineer may withhold such amounts from progress payments or final payment as may reasonably protect the Agency's interests until the Contractor has:

- Complied with all orders issued by the Engineer according to the Specifications; and
- Satisfied all legal actions filed against the Agency, the Agency's governing body and its members, and Agency employees that the Contractor is obliged to defend. (see 00170.72)

Notwithstanding ORS 279C.555 or ORS 279C.570 or 00195.50(d), if a Contractor is required to file statements on the prevailing rate of wages, but fails to do so, the Agency will retain 25% of any amount earned as required in 00170.65.

(f) Prompt Payment Policy - Payments shall be made promptly according to ORS 279C.570.

00195.60 Advance Allowance for Materials on Hand:

(a) General - If the total value of Materials on hand is at least $1,000 or the total value of a single class of Materials on hand is at least $500, the Engineer may authorize an advance allowance for the Materials in the progress payments. The Agency will not make advance allowances on the Materials unless the following three conditions are satisfied:

(1) Request for Advance Allowance - If Materials on hand meet the requirement of (2) below, an advance allowance will be made if:

- A written request for advance allowance for Materials on hand has been received by the Engineer at least 5 Calendar Days before the pay period cutoff date; and
- The request is accompanied by written consent of the Contractor's Surety, if required by the Agency.

(2) Stored or Stockpiled Conditions - The Materials shall have been delivered and/or acceptably stored or stockpiled according to the Specifications and as follows:

- At the Project Site;
- On Agency-owned property;
- On property in the State of Oregon on which the property owner has authorized storage in writing. The written authorization must allow the Agency to enter upon the property and remove Materials for at least 6 months after completion of the Project. The Contractor shall furnish a copy of the written permission to the Agency; or
- On property outside the State of Oregon on which the property owner has authorized storage in writing, provided that such storage location is allowed by the Special Provisions or authorized in

writing by the Engineer. The permit must allow the Agency to enter upon the property and remove Materials for at least 6 months after completion of the Project. The Contractor shall furnish a copy of the written permission to the Agency.

To be eligible for advance allowance, the Materials shall:

- Meet Specification requirements;
- Have the required Materials conformance and quality compliance documents on file with the Engineer (see Section 00165);
- Be in a form ready for incorporation into the Work; and
- Be clearly marked and identified as being specifically fabricated, or produced, and reserved for use on the Project.

(3) Responsibility for Protection - The Contractor has full control and responsibility for the protection of Materials on hand from the elements and against damage, loss, theft, or other impairment until the entire Project has been completed and accepted by the Agency.

If Materials are damaged, lost, stolen, or otherwise impaired while stored, the monetary value advanced for them, if any, will be deducted from the next progress payment.

If these conditions in 00195.60(a-1) through 00195.60(a-3) have been satisfied, the amount of advance allowance, less the retainage described in 00195.50, will be determined by one of the following methods as elected by the Engineer:

- Net cost to the Contractor of the Materials, f.o.b. the Project Site or other approved site; or
- Price (or portion of it attributable to the Materials), less the cost of incorporating the Materials into the Project, as estimated by the Engineer.

(b) Proof of Payment - The Contractor shall provide the Engineer with proof of payment to the Materials suppliers for purchased Materials within 30 Calendar Days of the date of the progress payment that includes the advance allowance.

If proof of payment is not provided, sums advanced will be deducted from future progress payments, and the Engineer will not approve further prepayment advance allowance requests.

(c) Terminated Contract - If the Contract is terminated, the Contractor shall provide the Agency immediate possession of all Materials for which advance allowances have been received, as provided above. If, for any reason, immediate possession of the Materials cannot be provided, the Contractor shall immediately refund to the Agency the total amount advanced for the Materials. The Agency may deduct any amount not so refunded from final payment.

00195.70 Payment under Terminated Contract - Payment for Work performed under a Contract that is terminated according to the provisions of 00180.90 will be determined under (a) or (b) of this Subsection.

(a) Termination for Default - Upon termination of the Contract for the Contractor's default, the Agency will make no further payment until the Project has been completed. The Agency will make progress payments to the party to whom the Contract is assigned, but may withhold an amount sufficient to cover anticipated Agency costs, as determined by the Engineer, to complete the Project.

Upon completion of the Project, the Engineer will determine the total amount that the defaulting Contractor would have been entitled to receive for the Work, under the terms of the Contract, had the Contractor completed the Work (the "cost of the Work").

If the cost of the Work, less the sum of all amounts previously paid to the Contractor, exceeds the expense incurred by the Agency in completing the Work, including without limitation expense for additional managerial and administrative services, the Agency will pay the excess to the Contractor, subject to the consent of the Contractor's Surety.

If the expense incurred by the Agency in completing the Work exceeds the Contract Amount, the Contractor or the Contractor's Surety shall pay to the Agency the amount of the excess expense.

The Engineer will determine the expense incurred by the Agency and the total amount of Agency damage resulting from the Contractor's default. That determination will be final as provided in 00150.00.

If a termination for default is determined by a court of competent jurisdiction to be unjustified, it shall be deemed a termination for public convenience, and payment to the Contractor will be made as provided in Subsection (b) below.

(b) Termination for Public Convenience:

(1) General - Full or partial termination of the Contract shall not relieve the Contractor of responsibility for completed or performed Work, or relieve the Contractor's Surety of the obligation for any just claims arising from the completed or performed Work.

(2) Mobilization - If mobilization is not a separate Pay Item, and payment is not otherwise provided for under the Contract, the Agency may pay the Contractor for mobilization expenses, including moving Equipment to and from the Project Site. If allowed, payment of mobilization expenses will be based on cost documentation submitted by the Contractor to the Engineer.

(3) All Other Work - The Agency shall pay the Contractor at the unit price for the number of Pay Item units of completed, accepted Work. For units of Pay Items partially completed, payment will be as mutually agreed, or, if not agreed, as the Engineer determines to be fair and equitable. No claim for loss of anticipated profits will be allowed. The Agency will purchase Materials left on hand according to 00195.80.

00195.80 Allowance for Materials Left on Hand:

(a) Purchase of Unused Materials - If Materials are delivered to the Project Site, or otherwise acceptably stored at the order of the Engineer, but not incorporated into the Work due to complete or partial elimination of Pay Items, changes in Plans, or termination of the Contract for public convenience according to 00180.90, and it is not commercially feasible for the Contractor to return them for credit or

otherwise dispose of them on the open market; the Agency will purchase them according to the formula and conditions specified in Subsection (b) below.

(b) Purchase Formula and Conditions:

(1) Formula - The Agency will apply the following formula in determining the Contractor's allowance for Materials left on hand:

Contractor's Actual Cost, plus 5% Overhead Allowance, minus Advance Allowances under 00195.60, but no markup or profit.

(2) Conditions - The Agency will not purchase the Contractor's Materials left on hand unless the Contractor satisfies the following conditions:

- Requests the Agency's purchase of unused Materials;
- Shows acquisition of the Materials according to 00160.10;
- Shows that the Materials meet Specifications;
- Provides receipts, bills and other records of actual cost of Materials delivered to the designated delivery points; and
- Demonstrates to the satisfaction of the Engineer that the materials cannot be returned for credit or otherwise disposed of on the open market.

00195.90 Final Payment:

(a) Final Estimate - As soon as practicable after Final Inspection of the Project, as provided in 00150.90, the Engineer will prepare a final estimate of the quantities of the Pay Items completed. With this estimate of quantities as a base, the total amount due the Contractor will be determined according to the terms of the Contract including without limitation any amounts due for Extra Work performed.

(b) Final Payment - The amount of final payment will be the difference between the total amount due the Contractor and the sum of all payments previously made. All prior partial estimates and payments shall be subject to correction in the final estimate and payment.

After computation of the final amount due, and after the Engineer's issuance of Third Notification, final payment will be mailed to the Contractor's last known address as shown in the records of the Agency.

(c) No Waiver of Right to Make Adjustment - The fact that the Agency has made any measurement, estimate, determination or certification either before or after completion of the Project, Final Acceptance, Agency assumption of possession of the Project Site, determination of satisfactory completion of Pay Items or Work or release of retainage under 00195.50(d) or payment for any part of the Work, shall not prevent either party from:

- Showing the true amount and character of the Work;

- Showing that any measurement, estimate, determination or certification is incorrect;
- Recovering from the other party damages that may have been suffered because the other party failed to comply with the Contract.

00195.95 Error in Final Quantities and Amounts:

(a) Request for Correction of Compensation - If the Contractor believes the quantities and amounts detailed in the final Contract payment voucher, prepared by the Engineer according to 00195.90, to be incorrect, the Contractor shall submit an itemized statement to the Engineer detailing all proposed corrections.

This statement must be submitted to the Engineer within 90 Calendar Days from the date the voucher was mailed to the Contractor, according to 00195.90(b). Any request for compensation not submitted and supported by an itemized statement within the 90 Calendar Day period will not be paid by the Agency. This does not limit the application of Section 00199.

(b) Acceptance or Rejection of Request:

(1) Consideration of Request - The Engineer will consider and investigate the Contractor's request for correction of compensation submitted according to 00195.95(a), and will promptly advise the Contractor of acceptance or rejection of the request in full or in part.

(2) Acceptance of Request - If the Engineer accepts the Contractor's request(s) in full or in part, the Engineer will prepare a post-final Contract payment voucher, including all accepted corrections, and will forward it to the Contractor.

(3) Rejection of Request - If the Engineer rejects the request(s) in full, the Engineer will issue a written notice of rejection and mail it to the Contractor.

(4) Contractor Objection to Revised Voucher or Notice of Rejection - If the Contractor disagrees with the revised voucher or notice of rejection, the Contractor may seek review and resolution according to the procedure specified in 00199.40. If the Contractor fails to submit a request for 00199.40 review within 30 Calendar Days after the Engineer mails a post-final Contract payment voucher or notice of rejection, the Contractor waives all rights to a claim based on errors in quantities and amounts.

Section 00196 - Payment for Extra Work

Description

00196.00 General - Only work not included in the Contract as awarded but deemed by the Engineer to be necessary to complete the Project (see 00140.60) will be paid as Extra Work. Regardless of alterations and changes, any item of Work provided for in the Contract will not constitute Extra Work. Payment for alterations and changes to Work will be made according to 00195.20.

Compensation for Extra Work will be paid only for Work authorized in writing by the Engineer and performed as specified. Work performed before issuance of the Engineer's written authorization shall be at the Contractor's risk. Extra Work will be paid as determined by the Engineer, according to 00196.10 and 00196.20.

Provisions and Requirements

00196.10 Negotiated Price - If the Engineer can reasonably determine a price estimate for Extra Work, the Engineer may then give written authorization to the Contractor to begin the Extra Work. As soon as practicable, but within 10 Calendar Days after that authorization, the Contractor shall respond in writing to the Engineer's Extra Work price estimate by submitting to the Engineer an Extra Work price quote. The price quote shall detail the following items related to the Extra Work:

- Types and amounts of Materials
- Hours of Equipment use and hours of labor
- Travel
- Overhead and profit
- Other costs associated with the proposed Extra Work

Pending approval of the price quote, the Engineer will maintain force account records of the Extra Work. As soon as practicable, but within 10 Calendar Days of receipt of a properly supported price quote, the Engineer will review the price quote and advise the Contractor if it is accepted or rejected. The Engineer will not accept a price quote that cannot be justified on a Force Account basis. If the Contractor's price is accepted, the Engineer will issue a Change Order, and the Extra Work will be paid at the accepted price.

00196.20 Force Account - If the Engineer and the Contractor cannot agree on a price for the Extra Work, the Engineer may issue a Force Account Work order requiring the Extra Work to be paid as Force Account Work. Force Account Work records and payment will be made according to Section 00197.

Section 00197 - Payment for Force Account Work

00197.00 Scope - The Materials, Equipment and labor rates and procedures established in this Section apply only to Extra Work ordered by the Engineer to be performed as Force Account Work.

00197.01 General - Before ordering Force Account Work, the Engineer will discuss the proposed work with the Contractor, and will seek the Contractor's comments and advice concerning the formulation of Force Account Work specifications. The Engineer is not bound by the Contractor's comments and advice, and has final authority to:

- Determine and direct the Materials, Equipment and Labor to be used on the approved Force Account Work; and
- Determine the time of the Contractor's performance of the ordered Force Account Work.

Force account work performed by subcontractors will be measured and paid for on the same basis and in the same manner as force account work performed directly by the Contractor.

If the Engineer orders the performance of Extra Work as Force Account Work, the Engineer will record, on a daily basis, the Materials, Equipment and Labor used for the Force Account Work during that day. Engineer and the Contractor shall sign the record daily to indicate agreement on the Materials, Equipment and Labor used for the Force Account Work performed on that day.

The following shall be reflected on the daily record:

- Materials used in the Force Account Work as directed by the Engineer, except those furnished and paid under rental rates for use of Equipment;
- Equipment which the Engineer considers necessary to perform the Force Account Work. Equipment hours will be recorded to the nearest quarter hour;
- Labor costs, including that of Equipment operators and supervisors in direct charge of the specific operations while engaged in the Force Account Work; and
- The Engineer's and Contractor's signatures confirming its accuracy.

00197.10 Materials:

(a) General - The Contractor will be paid for Materials actually used in the Force Account Work as directed by the Engineer, except for those furnished and paid for under rental rates included with the use of Equipment. Payments will be at actual cost, including transportation costs to the specified location, from the supplier to the purchaser, whether the purchaser is the Contractor, a Subcontractor, or other forces. All costs are subject to the provisions of this Subsection.

(b) Trade Discount - If a commercial trade discount is offered or available to the purchaser, it shall be credited to the Agency, even though the discount may not have actually been taken. The Agency will not take any discounts for prompt or early payment, whether or not offered or taken.

(c) Not Directly Purchased From Supplier - If Materials cannot be obtained by direct purchase from and direct billing by the supplier, the cost shall be considered to be the price billed to the purchaser less commercial trade discounts, as determined by the Engineer, but not more than the purchaser paid for the Materials. No markup other than actual handling costs will be permitted.

(d) Purchaser-Owned Source - If Materials are obtained from a supply or source wholly or partly owned by the purchaser, the cost shall not exceed the price paid by the purchaser for similar Materials furnished from that source on Pay Items, or the current wholesale price for the Materials delivered to the Project Site, whichever is lower.

00197.20 Equipment:

(a) General - Equipment approved by the Engineer to perform the Force Account Work will be eligible for payment at the established rates only during the hours it is operated or on standby if so ordered by the Engineer. Equipment hours will be recorded on the daily record to the nearest quarter hour.

Except as modified by these provisions, Equipment use approved by the Engineer will be paid at the rental rates given in the most current edition of the Rental Rate Blue Books for Construction Equipment ("Blue Book"), Volumes 1, 2, and 3, published by Penton Media, Inc., and available from EquipmentWatch (phone 1-800-669-3282).

(b) Equipment Description - On the billing form for Equipment costs, the Contractor shall submit to the Engineer sufficient information for each piece of Equipment and its attachments to enable the Engineer to determine the proper rental rate from the Blue Book.

(c) Rental Rates (without Operator):

(1) Rental Rate Formula - Rental rates for Equipment will be paid on an hourly basis for Equipment and for attachments according to the following formula:

$$\text{Hourly Rate} = \frac{\text{Monthly Base Rate x Rate Adjustment Factor}}{\text{176 hours/month}} + \text{Hourly Operating Rate}$$

Some attachments are considered "standard Equipment" and are already included in the monthly base rate for the Equipment. That information can be obtained from EquipmentWatch.

(2) Monthly Base Rate - The monthly base rate used above for the machinery and for attachments represents the major costs of Equipment ownership, such as depreciation, interest, taxes, insurance, storage, and major repairs.

(3) Rate Adjustment Factor - The rate adjustment factor used above will be determined as per page iii of each section of the Blue Book.

(4) Hourly Operating Rate - The hourly operating rate used above for the machinery and for attachments represents the major costs of Equipment operations, such as fuel and oil, lubrications, field repairs, tires or ground engaging components, and expendable parts.

(5) Limitations - The Blue Book "Regional Adjustment Factor" shall not apply.

If multiple attachments are included with the rental Equipment, and are not considered "standard Equipment", only the attachment having the higher rental rate will be eligible for payment, provided the attachment has been approved by the Engineer as necessary to the Force Account Work.

Rental will not be allowed for small tools that have a daily rental rate of less than $5, or for unlisted Equipment that has a fair market value of $400 or less.

The above rates apply to approved Equipment in good working condition. Equipment not in good working condition, or larger than required to efficiently perform the work, may be rejected by the Engineer or accepted and paid for at reduced rates.

(d) Moving Equipment - If it is necessary to transport Equipment located beyond the Project Site exclusively for Force Account Work, the actual cost to transport the Equipment to, and return it from, its On-Site Work location will be allowed as an additional item of expense. However, the return cost will not exceed the original delivery cost. These costs will not be allowed for Equipment that is brought to the Project Site for Force Account Work if the Equipment is also used on Pay Item or related Work.

If transportation of such Equipment is by common carrier, payment will be made in the amount paid for the freight. No markups will be allowed on common carrier transportation costs. If the Equipment is hauled with the Contractor's own forces, transportation costs will include the rental rate of the hauling unit and the hauling unit operator's wage. If Equipment is transferred under its own power, the rental rate allowed for transportation time will be 75% of the appropriate hourly rate for the Equipment, without attachments, plus the Equipment operator's wage.

(e) Standby Time - If ordered by the Engineer, standby time will be paid at 40% of the hourly rental rate calculated according to this Subsection, excluding the hourly operating rate. Rates for standby time that are calculated at less than $1 per hour will not be paid. Payment will be limited to not more than 8 hours in a 24-hour period or 40 hours in a 1 week period.

(f) Blue Book Omissions - If a rental rate has not been established in the Blue Book, the Contractor may:

- If approved by the Engineer, use the rate of the most similar model found in the Blue Book, considering such characteristics as manufacturer, capacity, horsepower, age and fuel type;
- Request EquipmentWatch to furnish a written response for a rental rate on the Equipment, which shall be presented to the Engineer for approval; or
- Request that the Engineer establish a rental rate.

(g) Outside Rental Equipment - If Contractor-owned or Subcontractor-owned Equipment is not available, and Equipment is rented from outside sources, payment will be based on the actual paid invoice. Approval of the Engineer to rent from outside sources must be obtained prior to renting the equipment.

If the invoice specifies that rental rate does not include fuel, lubricants, field repairs, and servicing, an amount equal to the Blue Book hourly operating cost may be added for those items that were excluded.

The Agency may reduce the payment when the invoice amount plus allowance is higher than the amount authorized under (c) through (f) of this Subsection.

The provisions of 00180.20(c) apply to owner-operated Equipment.

00197.30 Labor - The Contractor will be paid for all labor engaged directly on Force Account Work, including Equipment operators and supervisors in direct charge of the specific force account operations, as follows:

(a) Wages - The actual wages paid to laborers and supervisors, if those wages are paid at rates not more than those for comparable labor currently employed on the Project, or at the recognized, current, prevailing rates in the locality of the Project.

(b) Required Contributions - The actual cost of industrial accident insurance, unemployment compensation contributions, payroll transit district taxes, and social security for old age assistance contributions incurred or required under statutory law and these Specifications. The actual cost of industrial accident insurance is the National Council on Compensation Insurance (NCCI) rate for the assigned risk pool for the appropriate work class multiplied by the experience modification factor for the Contractor.

(c) Required Benefits - The actual amount paid to, or on behalf of, workers as per diem and travel allowances, health and welfare benefits, pension fund benefits, or other benefits when such other benefits are required by a collective bargaining agreement or other employment contract generally applicable to the classes of labor employed on the Project.

No overtime will be compensated unless authorized in advance of performing the work by the Engineer.

00197.80 Percentage Allowances - To the Contractor's actual costs incurred, as limited in this Section 00197, amounts equal to a percentage markup of such costs will be allowed and paid to the Contractor as follows:

Subsection	Percent
00197.10 Materials	17
00197.20 Equipment	17
00197.30 Labor	22

When a Subcontractor performs ordered Force Account Work, the Contractor will be allowed a supplemental markup of 8% on each Force Account Work order.

These allowances made to the Contractor will constitute complete compensation for bonds, insurance, overhead, general and administrative expense, profit, and all other Force Account Work costs that were incurred by the Contractor, or by other forces that the Contractor furnished. No other reimbursement, compensation, or payment will be made.

00197.90 Billings - Billings for Force Account Work by the Contractor shall be submitted for the Engineer's approval on forms provided by the Agency or approved by the Engineer. Billings for Materials (other than Incidental items out of the inventory of the Contractor or Subcontractors), rental Equipment from sources other than the Contractor or Subcontractors, and Special Services, shall be accompanied by copies of invoices for the goods and services. The invoices shall be fully itemized showing dates, quantities, unit prices, and complete descriptions of goods and services provided. Invoices for amounts of $10 or less per invoice are not required, unless requested by the Engineer.

Costs included on the billings shall comply with 00197.01(a) and 00197.10 through 00197.40.

When a billing for Force Account Work has been paid at the Project level, no further corrections will be made because of further review if those corrections amount to less than $10.

Section 00199 - Disagreements, Protests, and Claims

Description

00199.00 General - This Section details the process through which the parties agree to resolve any disagreement concerning additional compensation or concerning a combination of additional compensation and Contract Time. (See 00180.80 for disagreements and claims concerning additional Contract Time only, and 00195.95 for disagreements and claims concerning correction of final compensation.) The Agency will not consider direct disagreements, protests, or claims from subcontractors, Suppliers, or any other Entity not a party to the Contract.

Provisions and Requirements

00199.10 Procedure for Resolving Disagreements - When disagreements occur concerning additional compensation or a combination of additional compensation and Contract Time, the Contractor shall first pursue resolution through the Engineer of all issues in the dispute, including without limitation the items to be included in the written notice in 00199.20. If the discussion fails to provide satisfactory resolution of the disagreement, the Contractor shall follow the protest procedures outlined in 00199.20. If the Engineer denies all or part of the Contractor's protest, and the Contractor desires to further pursue the issues, the Contractor shall submit a claim for processing according to 00199.30.

00199.15 Inappropriate Protest or Claim - It shall be presumed that the Contractor submits a protest or claim for additional compensation in good faith, based upon facts which reasonably support the Contractor's position and with full knowledge and understanding of the injury done to the Agency when notice of differing Project Site conditions or claims for additional compensation are not submitted in a timely manner as required under the Contract. Accordingly, the submission of a protest or claim without the concurrent submission of evidence that reasonably supports the protest or claim, or the submission of a protest or claim in an untimely manner will constitute a waiver of the protest or claim.

00199.20 Protest Procedure - If the Contractor disagrees with anything required in a Change Order or other written or oral order from the Engineer, including any direction, instruction, interpretation, or determination, or if the Contractor asserts a disagreement or dispute on any other basis, except 0195.95, that, in the Contractor's opinion, entitles or would entitle the Contractor to additional compensation or a combination of compensation and Contract Time, the Contractor shall do all of the following in order to pursue a protest and preserve its claim:

(a) Oral Notice - Give oral notice of protest to the Engineer and outline the areas of disagreement before starting or continuing the protested Work.

(b) Written Confirmation of Oral Notice – Not later than the end of the next business day following the day that oral notice of protest is given, deliver written documentation to the Engineer of the oral notice that includes the notice of protest and the areas of disagreement.

(c) Written Notice - File a proper written notice of protest with the Engineer within 7 Calendar Days after receiving the protested order. In the notice the Contractor shall:

- Describe the acts or omissions of the Agency or its agents that allegedly caused or may cause damage to the Contractor or to the Project, citing specific facts, persons, dates and Work involved;
- Describe the Contractor's proposed alternative to the Work ordered, if any, which will avoid damage to Contractor or to the Project;
- Describe the nature of the damages;
- Cite the specific Contract provision(s), if any, that support the protest;
- Include the estimated dollar cost, if any, of the protested Work, and furnish a list of estimated Materials, Equipment and labor for which the Contractor might request additional compensation; and
- If additional compensation is estimated to be due, include the estimated amount of additional time required, if any.

FAILURE TO COMPLY WITH THIS NOTICE REQUIREMENT RENDERS THE NOTICE IMPROPER AND SHALL CONSTITUTE A WAIVER OF ANY CLAIM FOR ADDITIONAL COMPENSATION OR A COMBINATION OF ADDITIONAL COMPENSATION AND CONTRACT TIME FOR ANY PART OF THE PROTESTED WORK.

(d) Engineer's Record and Response – The Engineer will file a copy of each written notice of protest in the Project records and will issue a written response to the protest within seven (7) work days of receipt of a timely filed written notice of protest. The Engineer has no responsibility to evaluate the protest unless the Contractor has timely filed a proper notice submitting all of the above information.

(e) Final Documentation of Claim - Within 60 Calendar Days following completion of the protested work, Contractor shall provide the Engineer with complete documentation of protested work, listing exact materials, equipment and labor used for the work and the dollar amount requested for each. If the claim is accepted, no additional compensation will be awarded based on documentation submitted after this deadline. If the claim is denied or if the Contractor is not satisfied with the decision by the Engineer, the amount claimed by the Contractor in any subsequent Step or proceeding may not exceed the dollar amount requested under this subsection.

(f) Records - Keep complete records of all costs and time incurred throughout the protested Work, and allow the Engineer access to those and other supporting records. Provide daily records of protested Work, on a weekly basis, on a schedule to be set by agreement with the Engineer.

(g) Comparison of Records - Provide the Engineer adequate facilities for keeping cost and time records of the protested Work. The Contractor and the Engineer will compare records and either bring them into agreement at the end of each day, or record and attempt to explain any differences.

(h) Work to Proceed - In spite of any protest, proceed promptly with the Work ordered by the Engineer.

(i) Evaluation of Protest - The Engineer has no responsibility for evaluating a protest that is not timely filed, or for which adequate supporting documentation has not been made available to the Engineer. Provided the procedures above are followed, the Engineer will promptly evaluate all protests, after the Contractor has fully complied with the requirements described in 00199.20(c), Written Notice. If the protest is denied, the Engineer will notify the Contractor in writing of the reasons for full or partial denial.

If a protest is found to be valid, the Engineer will, within a reasonable time, make an equitable adjustment of the Contract. Adjustment of time will be evaluated according to 00180.80.

The Engineer has no responsibility for evaluating and may reject a protest that does not comply with 00199.20(b). If the protest is rejected, the Engineer will notify the Contractor in writing of the reasons for rejection.

(j) Protest Evaluation by Third Party Neutral - If the Engineer agrees that the Contractor has fully complied with the requirements described in 00199.20(b), and if the Engineer fully or partially denies, in writing, the Contractor's protest according to 00199.20(f), the Contractor may request that a mutually selected Third Party Neutral review the protest. Procedures for selecting, using, and paying for the cost of the Third Party Neutral will be specified by Change Order.

If the Contractor does not accept the Engineer's evaluation of the protest, or either the Contractor or Engineer disagrees with the resolution recommended by the Third Party Neutral, the Contractor may pursue a claim as described in 00199.30.

00199.30 Claims Procedure:

(a) General - If the Contractor believes that additional compensation is due, or a combination of additional compensation and Contract Time, and has pursued and exhausted all the procedures provided in 00199.10 and 00199.20 to resolve a disagreement and protest, the Contractor may file a claim.

The Agency's Contract is with the Contractor. There is no contractual relationship between the Agency and any subcontractors, Suppliers or any Entity other than the Contractor. It is the Contractor's responsibility to fully evaluate any claim before presenting it to the Agency. In addition, when a claim includes Work done or costs incurred by any subcontractors, Suppliers, or any Entity other than the Contractor, the Contractor remains solely responsible for presenting the claim to the Agency.

Claims that include Work done or costs incurred by subcontractors, Suppliers, or any Entity other than the Contractor will not be considered by the Agency unless the Contractor has:

- Completed and provided its own written evaluation of the claim;
- Verified by its own independent review and evaluation of the amount of compensation sought; and
- Certified the claim in accordance with 00199.30(b) (Part 10).

(b) Claims Requirements - At any time during the progress of the Work, but not later than 45 Calendar Days following the date of the Second Notification, the Contractor shall submit to the Engineer in writing, claims for additional compensation or a combination of additional compensation and Contract Time additional to that specified in the Contract. For a claim not submitted within the 45 day limit, that has not met the requirements of 00199.20, or is not filed as provided in 00199.30, the Contractor waives any claim for additional compensation or for additional compensation and Contract Time, and the Agency may reject the claim.

Written claims to the Engineer or the Agency by the Contractor shall be delivered to the Agency address shown in the Special Provisions, unless a different address is agreed to by the Engineer, and shall be delivered:

- By U.S. Postal Service first class mail or priority mail (which at the sender's option may include certified or registered mail return receipt requested); or
- By overnight delivery service of a private industry courier.

Claims will be considered as having been received by the Agency:

- At the time of actual receipt or 7 Calendar Days after the postmarked date when deposited for delivery by first class or priority mail, whichever is earlier; or
- At the time of actual receipt or 3 Calendar Days after deposit with a private industry courier for overnight delivery service, whichever is earlier.

The Agency reserves the right at any time and at any step in the claim decision or review process to request additional information, records or documentation related to the claim or the Contract either directly or through agents working toward resolution of the disputed or claimed events and issues.

Claims shall be made in writing, and shall include all information, records and documentation necessary for the Agency to properly and completely evaluate the claim.

To be considered, claims for additional compensation, or for additional compensation and Contract Time, shall be completed according to 00199.30 and shall be submitted with the required information and in the format below and labeled as required below for each claimed issue:

(Part 1) Summary (label page 1.1 through page 1.X) - In the summary, include a detailed, factual statement of the claim for additional compensation and Contract Time, if any, with necessary dates and locations of Work involved in the claim and the dates of when the event arose. Also include detailed facts supporting the Contractor's position relative to the Engineer's decision (see 00199.20(f));

(Part 2) Proof of notice (label page 2.1 through page 2.X) - Submit a copy of the written notice, with all attachments, that was given to the Agency. Include the date when that written notice and the date when oral notice was given:

(Part 3) Copies of the Contract Specifications that support the Contractor's claim (label page 3.1 through page 3.X);

(Part 4) Theory of entitlement supporting the claim (label page 4.1 through page 4.X) - Include a narrative of how or why the specific Contract Specifications support the claim and a statement of the reasons why such Specifications support the claim;

(Part 5) Itemized list of claimed amounts (label page 5.1 through page 5.X) - Claimed damages that resulted from the event with a narrative of the theories and records and documents used to arrive at the value of the damages;

(Part 6) Additional Contract Time requests (label page 6.1 through page 6.X) - If the claim is for a combination of additional compensation and Contract Time, submit a copy of the schedule that was

in effect when the event occurred and a detailed narrative which explains how the event impacted Contract Time. In addition, if an Agency-caused delay is claimed:

- Include the specific days and dates under claim;
- Provide detailed facts about the specific acts or omissions of the Agency that allegedly caused the delay, and the specific reasons why the resulting delay was unreasonable; and
- Provide a schedule evaluation that accurately describes the impacts of the claimed delay.
- Also see 00180.80 for additional requirements regarding claims for Contract Time and causes that are eligible and ineligible for consideration;

(Part 7) Copies of actual expense records (label page 7.1 through page 7.X) - Include documents that contain the detailed records and which support and total to the exact amount of additional compensation sought. Include the information and calculations necessary to support that amount. That amount may be calculated on the basis of Section 00197, if applicable, or may be calculated using direct and indirect costs presented in the following categories:

- Direct Materials;
- Direct Equipment. The rate claimed for each piece of Equipment shall not exceed the actual cost. In the absence of actual Equipment costs, the Equipment rates shall not exceed 75 percent of those calculated under the provisions of 00197.20. For each piece of Equipment, the Contractor shall include a detailed description of the Equipment and attachments, specific days and dates of use or standby, and specific hours of use or standby;
- Direct labor;
- Job overhead;
- General and administrative overhead; and
- Other categories as specified by the Contractor or the Agency;

(Part 8) Supporting records and documents (label page 8.1 through page 8.X) - Include copies of, or excerpts from the following:

- Any documents that support the claim, such as manuals standard to the industry and used by the Contractor; and
- Any daily reports or diaries related to the event, photographs or media that help explain the issue or event (optional), or all other information the Contractor chooses to provide (optional);

(Part 9) Certification (label page 9.1 through 9.X) - A certified statement, signed by a person authorized to execute Change Orders, by the Contractor, subcontractor, Supplier, or Entity, originating the claim, as to the validity of facts and costs with the following certification:

Under penalty of law for perjury or falsification, the undersigned, (Name), (Title), (Company) certifies that this claim for additional compensation for Work on the Contract is a true statement of the actual costs incurred (in the amount of $_____, exclusive of interest) and is fully documented and supported under the Contract between the parties.

(Part 10) Contractor evaluation of a lower tier claim (label page 10.1 through 10.X) - If the claim includes Work done or costs incurred by any subcontractors, Suppliers, or any Entity other than the Contractor, the following are required:

- Data required by the other Subsections of 00199.30(b);
- Copies of the Contractor's, subcontractor's, Supplier's and Entity's, at all tiers above the level of which the claim originates, separate evaluation of entitlement;
- Copies of the Contractor's, subcontractor's, Supplier's and Entity's, at all tiers above the level of which the claim originates, independent verification and evaluation of the amount of damages sought; and
- A person authorized to execute Change Orders on behalf of the Contractor, subcontractor, Supplier and Entity, at all tiers above the level of which the claim originates, must sign a statement with the following certification:

  Under penalty of law for perjury or falsification, the undersigned, (Name) (Title), (Company) certifies that this claim originating from the subcontractor, Supplier or Entity (Company) for additional compensation for Work on the Contract is a reasonable statement, independently verified, of the costs incurred (in the amount of $_____, exclusive of interest) and is fully documented and supported under the Contract between the parties.

  My commission expires _____.

If the Engineer determines that additional information, records or documentation is needed to allow proper evaluation of the claim submittal, the Engineer will request the information, records or documentation. The Contractor shall submit to the Engineer within 14 Calendar Days, or as otherwise agreed by the parties, the required additional information, records and documentation.

If the Engineer determines that the claim submittal with the additional information, records and documentation submitted is incomplete and not accepted as a claim, the Engineer will notify the Contractor in writing and the submittal will be rejected and will not be considered under 00199.40.

(c) Records Requirements - The Contractor shall comply with 00170.07.

(d) Compliance Required - Full compliance by the Contractor with the provisions of this Section is a condition precedent to the commencement of any lawsuit by the Contractor to enforce any claim.

00199.40 Claim Decision; Review; Exhaustion of Administrative Remedies - The Agency intends to resolve all claims at the lowest possible administrative level. The Engineer will also determine whether multiple claims should be advanced separately or together.

If the Engineer denies the claim for additional compensation or a combination of additional compensation and Contract Time, in full or in part, according to 00199.40(a), the Contractor may request review of the denial. The disputed claim for additional compensation or a combination of additional compensation and Contract Time may then be resolved, in full or in part, at any of the progressive steps of claim review procedure as specified in (b) through (c) of this Subsection.

If the Engineer has denied a claim, in full or in part, for Contract Time only according to 00180.80, or has denied a claim, in full or in part, for correction of final compensation according to 00195.95, those disputed claims may then be resolved, in full or in part, at either of the two progressive steps of claim review procedure as specified in (b) through (c) of this Subsection.

A person authorized by the Contractor to execute Change Orders on behalf of the Contractor must be present and attend all claim hearings. For all claims, all of the actions and review under each step of the review process shall occur before the review can be advanced to the next higher step.

If, at any step in the claim decision or review process, the Contractor fails to promptly submit requested information or documentation that the Agency deems necessary to analyze the claim, the Contractor is deemed to have waived its right to further review, and the claim will not be considered properly filed and preserved.

(a) Decision by the Engineer - The Engineer will, as soon as practicable, consider, investigate, and evaluate a Contractor's claim for additional compensation, or for a combination of additional compensation and Contract Time, if submitted as required by 00199.30.

Once the Engineer determines the Agency is in receipt of a properly submitted claim, the Engineer will arrange a meeting, within 21 Calendar Days or as otherwise agreed by the parties, with the Contractor in order to present the claim for formal review and discussion.

If the Engineer determines that the Contractor must furnish additional information, records or documentation to allow proper evaluation of the claim, the Engineer will schedule a second meeting, to be held within 14 Calendar Days or as otherwise agreed by the parties, at which the Contractor shall present the requested information, records and documentation.

The Engineer will provide a written decision to the Contractor within 30 Calendar Days of the last Engineer-level meeting.

If the Contractor does not accept the Engineer's decision, the Contractor may, within 10 Calendar Days of receipt of the written decision, request in writing that the Engineer arrange a review at Step 1 (see (b) below).

(b) Step 1: Public Works Director Level Review - The Contractor shall request that the Engineer arrange a meeting with the Public Works Director or the Public Works Director's designee, as determined by the Public Works Director, in order to present the denied or partially denied claim for formal review and discussion. The meeting will take place within 21 Calendar Days of the Agency's receipt of the request, or as otherwise agreed by the parties.

If the Public Works Director (or designee) determines that the Contractor must furnish additional information, records or documentation to allow proper evaluation of the claim, the Public Works Director (or designee) will schedule a second meeting, to be held within 14 Calendar Days, or as otherwise agreed by the parties, at which the Contractor shall present the requested information, records and documentation.

The Public Works Director (or designee) will provide a written decision to the Contractor within 30 Calendar Days of the last meeting with the Public Works Director (or designee).

The claim is subject to 00199.60, if not all of the records requested by the Public Works Director (or designee) were furnished. If applicable, advancement of the claim is subject to the provisions of 00199.60 regarding waiver and dismissal of the claim or portions of the claim.

If the Contractor does not accept the decision, the Contractor may, within 180 Calendar Days from the date of receipt of the Public Works Director (or designee) written decision or within 90 Calendar Days of the date of Second Notification, whichever is later, initiate Step 2 as set forth in subsection (c) below.

(c) Step 2: Arbitration and Litigation - The Contractor must follow each step in order, and exhaust all available administrative remedies before resort to arbitration and litigation. Litigation of a claim that cannot be resolved in Step 1 shall be initiated by filing a complaint in the Circuit Court for the State of Oregon in the county where the Agency's main office is located that contains a stipulation to arbitration under ORS 36.410. The claim and all cross and counter-claims filed in response to the complaint shall be submitted to the Court Arbitration Program set forth in ORS 36.400 to 36.425, Chapter 13 of the Oregon Uniform Trial Court Rules and the Circuit Court supplemental local rules concerning arbitration. Either party may seek, and shall be entitled to, an order directing the other party to submit to arbitration as provided herein and to judgment for its costs, expenses and attorney fees in obtaining and enforcing the order

In no event shall this Subsection be construed as a waiver by the Agency or by the State of Oregon on any form of defense or immunity, whether sovereign immunity, governmental immunity, immunity based on the Eleventh Amendment to the Constitution of the United States or otherwise, from any claim or from the jurisdiction of any court.

(d) Payment of Costs, Expenses and Attorney's Fees – The prevailing party shall be entitled to an award for reasonable costs and expenses incurred after the initiation of Step 2, including costs and expenses incurred for arbitration, trial de novo and on appeal. Costs and Expenses shall include, but shall not be limited to, reasonable attorney fees and expenses, arbitrator fees and expenses, and costs of discovery

As used in this subsection 00199.40(d), "prevailing party" for an arbitration award means (1) a Contractor who has received an arbitration award, exclusive of interest, costs and expenses, that is more than the dollar amount claimed by the Contractor in its Final Documentation of Claim under 00199.20(d) or (2) the Agency if there is no arbitration award to the Contractor or if the arbitration award to the Contractor, exclusive of interest, costs and expenses, is less than the dollar amount of the award in the Step 1 decision. For all other arbitration awards, there shall not be a "prevailing party."

The award of costs and expenses after trial de novo shall be made as provided for in ORS 36.425. The award of costs and expenses after appeal from a judgment entered after trial de novo shall be to the prevailing party designated as such by the appeals court.

The Contractor shall comply with 00170.00.

00199.50 Mediation - Notwithstanding the formal claims procedure specified above, the parties may enter into nonbinding mediation by mutual agreement at any time, in which case the parties may also agree to suspend the time requirements in Section 00199 pending the outcome of the mediation process. The rules, time and place for mediation, as well as selection of the mediator, shall be established by mutual agreement. Costs shall be divided equally between the Contractor and the Agency. Either party may terminate mediation at any time upon 5 Calendar Days notice to the other, after which the time requirements of Section 00199 shall be automatically reinstated and shall resume from the point at which the time requirements were suspended.

00199.60 Review of Determination Regarding Records - If not all of the records requested by the Agency under 00199.40(c) Step 2 were provided, then the Agency will determine:

- If the records are of the type described in 00170.07; and
- If the records have not been maintained or the records, or access to the records, has not been provided to the Agency as required by 00170.07 and this Section; and
- If the records are material and necessary for proper evaluation of part or all of the claim; and
- The portions of the claim for which the records are material and necessary for proper evaluation.

If the Agency makes the foregoing determinations, then subject to the review process described below, all portions of the claim for which the Agency determined the records are material and necessary for proper evaluation are immediately waived and irrevocably dismissed.

Even if the records have not been maintained or the records, or access to the records, have not been provided to the Agency in a given instance, the Agency may determine that sufficient records have been provided for the Agency to properly evaluate the claim in that instance. If the Agency makes this determination, the claim or portions of the claim will not be waived or dismissed under this provision.

If the Contractor does not accept the Agency written determination that the records are material and necessary for proper evaluation of part or all of the claim, and the portions of the claim for which the records are material and necessary, the Contractor may, within 14 Calendar Days of receipt of the Agency determination, request, in writing, a review of such determination by the Public Works Director (or designee). If the Contractor does not request a review of the Agency determination, the Agency

determination shall then become the Agency's final determination as of the expiration of the time limit to request review.

If the Contractor requests the review, the Public Works Director (or designee) will schedule a review meeting within 14 Calendar Days, or as otherwise agreed by the parties, of when the Public Works Director (or designee) receives the written review request. The Agency and the Contractor will each have an opportunity to explain their respective positions at the review meeting in a manner determined by the Public Works Director (or designee).

Within 10 Calendar Days of the review meeting, the Public Works Director (or designee) will issue a written proposed finding of whether the records not maintained or not provided to the Agency, or for which access was not provided to the Agency, are material and necessary for proper evaluation of part or all of the claim. If the Public Works Director (or designee) makes that finding, then the Public Works Director (or designee) will also make a proposed written finding as to what portions of the claim the records are material and necessary and, therefore, waived and irrevocably dismissed.

Even if the records have not been maintained or the records, or access to the records, have not been provided to the Agency in a given instance, the Public Works Director (or designee) may determine that sufficient records have been provided for the Agency to properly evaluate the claim in that instance. If the Public Works Director (or designee) makes this determination, then the claim or portions of the claim will not be waived or dismissed under this provision.

The Public Works Director's (or designee) findings will be submitted to the Contractor. The Public Works Director's (or designee) findings are the Agency's final determination.

If the Agency's final determination is that the records are material and necessary for proper evaluation of part or all of the claim, then the claim or that portion of the claim for which the records are material and necessary is waived and irrevocably dismissed, unless the Contractor provides the records, or access to the records, to the Agency within 5 Calendar Days of the Agency's final determination. If the Contractor provides the records, or access to the records, within this time limit, the Agency will schedule a meeting with the Contractor within 14 Calendar Days or as otherwise agreed by the parties, to discuss the records.

The Agency's final determination that records are material and necessary for proper evaluation of part or all of the claim, and the Agency's final determination of the portions of the claim for which the records are material and necessary, shall be final and binding.

If the entire claim is waived and irrevocably dismissed pursuant to the Agency's final determination there will be no further decision by the Agency on the claim or further review of the claim under 00199.40 and the claim will not be eligible for mediation under 00199.50. If only portions of the claim are waived and irrevocably dismissed pursuant to the Agency's final determination, the Agency will provide a written decision to the Contractor regarding the remaining portions of the claim within 30 Calendar Days of the final Step 2 meeting, or the Agency's final determination regarding the records, whichever is later. There will be no further decision by the Agency on or further review under 00199.40 of the portions of the claim waived and irrevocably dismissed pursuant to Agency's final determination and those portions will not be eligible for mediation under 00199.50.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 00 73 00 – SPECIAL PROVISIONS

PART 00100 – GENERAL CONDITIONS

Section 00110 – Organization, Conventions, Abbreviations, and Definitions

00110.10 Organization of Specifications – Modify the third bullet as follows:

- The Special Provisions, which include the Technical Specifications, Divisions 01 through 48.

00110.20 Definitions – The definition of "ENGINEER" is modified as follows:
ENGINEER – Consor North America, Inc. is designated ENGINEER and is to act as AGENCY's representative, assume duties and responsibilities, and have the rights and authority assigned to ENGINEER in the Contract Documents in connection with completion of the Work in accordance with the Contract Documents.

Section 00120 – Bidding Requirements and Procedures

00120.01 Receipt of Bids; Opening - Add the following:
Bids must be delivered to Kevin Gorman, Public Works Director, at the front desk of Warrenton City Hall, 225 South Main Street, Warrenton, OR 97146, by 2:00 PM local time on MONTH DAY, YEAR. Bids will be publicly opened and read by the Public Works Director at 2:00 PM, local time on MONTH DAY, YEAR in the Warrenton Fire Training Room. Bids may not be submitted by fax or electronic means.

00120.02 Prequalification of Bidders – No prequalification is required.

00120.03 Request for Solicitation Documents – Add the following:
Solicitation Documents may be obtained via email request to Twyla Vittetoe, Engineering Technician, tvittetoe@warrentonoregon.us. Documents are available at no charge in electronic file format (PDF).

00120.04 Pre-Bid Meeting – Add the following:
A voluntary pre-bid meeting will be held on MONTH DAY, YEAR, at 10:00 AM, local time, at Warrenton City Hall, P.O. Box 250, 225 South Main Street, Warrenton, OR 97146. A project site tour will follow the pre-bid meeting.

00120.17 Use of Agency-Owned Land for Staging and Storage Areas – Add the following:
CONTRACTOR may use the following lands for staging or storage areas: as delineated in the Drawings. CONTRACTOR shall comply with all Restrictions on Use as defined in the General Conditions, Technical Specifications and Drawings.

Section 00150 – Control of Work

00150.30 Deliver of Notices – CONTRACTOR written notice to ENGINEER or AGENCY shall be delivered to:

Kevin Gorman, Public Works Director
P.O. Box 250
Warrenton, OR 97146

Section 00160 – Source of Materials

00160.20(a) Buy America – Federal highway funds are not involved on the project.

Add the following Sections:
00160.20(d) American Iron and Steel – The Project is being funded by the Drinking Water State Revolving Fund which has federal statutory requirements commonly known as "American Iron and Steel." See Solicitation Documents, Section 00 73 30.01, SDWRLF/EPA Grant Construction Contract Requirements.

00160.20(e) Build America Buy America Act Requirements – The Project is being funded by the Build America Buy America Act which has federal statutory requirements commonly known as "BABA." See Solicitation Documents, Section 00 73 30.01, SDWRLF/EPA Grant Construction Contract Requirements.

Section 00165 – Quality of Materials

00165.03 Testing by AGENCY - Replace with the following:
Reference the Technical Specifications, Section 01 45 00 Quality Control, for responsibilities and costs of testing.

00165.04 Costs of Testing – Replace with the following:
Reference the Technical Specifications, Section 01 45 00 Quality Control, for responsibilities and costs of testing.

Section 00170 – Legal Relations and Responsibilities

00170.02 Permits, Licenses, and Taxes – Add the following:

- Obtain business license from CITY of Warrenton.

00170.03 Furnishing Rights of Way and Permits – Add the following:
The AGENCY will apply and pay for the following Permits:

- CITY of Warrenton Public Works Construction Permit
- Oregon DOT Permit to Occupy or Perform Operations on a State Highway

CONTRACTOR is required to comply with all terms and conditions of Permits.

Prior to commencement of respective work, the CONTRACTOR shall confirm that required permits have been issued and obtain copies of such permits. CONTRACTOR shall provide such CONTRACTOR information to the respective permitting authority as is necessary for issuance of permits in accordance with the procedures required by the permitting authority.

The CONTRACTOR shall be responsible for coordinating and scheduling all inspections required by applicable permits with the respective permitting authorities, including those for permits issued by the AGENCY.

The CONTRACTOR shall be responsible for paying all permit reinspection fees, investigation fees, penalties, and other permit fees arising from the CONTRACTOR's failure to properly request, coordinate, schedule, and obtain required inspections; CONTRACTOR's failure to properly prepare the work for inspection; CONTRACTOR's commencement of work prior to issuance of required permits; or

CONTRACTOR's failure to comply with the provisions of any permit. The CONTRACTOR shall pay such fees or penalties promptly to the respective permitting authority, and no separate payment, reimbursement, or other compensation will be paid to the CONTRACTOR by the AGENCY for such penalties or fees. If any such penalties or fees are levied against the AGENCY and the permitting authority requires the AGENCY to pay them directly to the permitting authority, the CONTRACTOR shall reimburse the AGENCY, which may include deducting such amounts from payments due to the CONTRACTOR.

Any delays in the Work arising from the CONTRACTOR's failure to properly request, coordinate, schedule, and obtain required inspections; CONTRACTOR's failure to properly prepare the work for inspection; CONTRACTOR's commencement of work prior to issuance of required permits; or CONTRACTOR's failure to comply with the provisions of any permit; or CONTRACTOR's failure to remit payment to the permitting authority any reinspection fees, investigation fees, penalties, or other fees or penalties as provided in this section, shall be counted against the Contract Time. No additional Contract Time will be provided for such delays.

00170.65(b)(1) Minimum Wage Rates – BOLI Prevailing Wage Rates (Effective January 1, 2025) title page is included at the end of these Special Provisions.

00170.70(a) Insurance Coverages

Required minimum Insurance coverage levels are as follows:

Commercial General Liability	$2,000,000 Combined Single Limit Per Occurrence
Pollution Liability Coverage	$2,000,000
Asbestos Liability Endorsement	Not Required
Lead Liability Endorsement	Not Required
Commercial Automobile Liability	$2,000,000 Combined Single Limit Per Occurrence
with Pollution Coverage	Required
Builder's Risk	Contract Value

00170.70(c) Additional Insured - The liability insurance coverages of 00170.70(a) shall include the AGENCY, the AGENCY's governing body, board, or Commission and its members, and the AGENCY's officers and employees as Additional Insureds, but only with respect to the CONTRACTOR's activities to be performed under the Contract. When federal transportation funding is involved, the liability coverages of 00170.70(a) shall also include the State of Oregon, the Oregon Transportation Commission and the Oregon Department of Transportation and their respective officers, members and employees as additional insureds, but only with respect to the CONTRACTOR's activities to be performed under the Contract. Coverage shall be primary and non-contributory with any other insurance and self-insurance. The liability coverages of 00170.70(a) that are permitted by the AGENCY to be obtained by an appropriate SUBCONTRACTOR shall include all of the foregoing as Additional Insureds and shall also include CONTRACTOR and its officers and employees as Additional Insureds.

Section 00180 – Prosecution and Progress

00180.20(a) Subcontracting Limitations; General – The CONTRACTOR's own organization shall perform work amounting to at least 50% of the original Contract Amount.

00180.40(a) Limitation of Operations; In General – Add the following to subsection:

- As further detailed in the Technical Specifications, Section 01 10 00 Summary of Work.

00180.40(b) Limitation of Operations; On-Site Work – Add the following item to the bulleted list:

- An approved ODOT Permit to Occupy or Perform Operations on a State Highway

00180.41 Project Work Schedules – A Type "A" Schedule shall be required for the Project.

00180.85(b) Liquidated Damages – Add the following:
CONTRACTOR shall pay to the Agency, not as a penalty but as liquidated damages, one thousand two dollars ($1,200) per calendar day for each Calendar Day the CONTRACTOR expends performing the Contract in excess of the Contract Time or adjusted Contract Time.

Section 00190 – Measurement of Pay Quantities

00190.00 Scope – This section is supplemented by the Technical Specifications, Section 01 22 20 Unit Price Measurement and Payment.

Section 00199 – Disagreements, Protests, and Claims

00199.30(b) Claims Requirements – CONTRACTOR written claims to ENGINEER or AGENCY shall be delivered to:

Kevin Gorman, Public Works Director
P.O. Box 250
Warrenton, OR 97146

PREVAILING WAGE RATES

This Contract is for a project that is subject to ORS 279C.800 to 279C.870. All persons working under this contract and all associated subcontracts must be paid not less than the applicable state prevailing rate of wage. ***"Prevailing Wage Rates for Public Works Contracts in Oregon" (effective January 1, 2025)*** are the appropriate prevailing wage rate publications for this contract. These documents are published by the Oregon Bureau of Labor and Industries (BOLI) and are available on-line at:

http://www.oregon.gov/BOLI/WHD/PWR/Pages/pwr_state.aspx

BOLI Office Locations

Bend	1645 NE Forbes Rd, Suite 106 Bend, OR 97701	541-322-2435
Eugene	1400 Executive Pkwy., Suite 200 Eugene, OR 97401	541-686-7623
Medford	119 N Oakdale Ave. Medford, OR 97501	541-776-6270
Portland	800 NE Oregon St., Suite 1045 Portland, OR 97232	971-673-0761
Salem	3865 Wolverine Ave. NE Building E, Suite 1 Salem, OR 97305	503-378-3292

The successful Bidder and all subsequent subcontracts shall comply with ORS 279C.845 wage rate requirements and produce appropriate certificates that they have compiled.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 00 73 30.01 – SDWRLF/EPA GRANT CONSTRUCTION CONTRACT REQUIREMENTS

The following clauses shall be incorporated into construction contracts receiving financial assistance from the Safe Drinking Water Revolving Loan Fund (SDWRLF) and the EPA Community Grant. In the event of conflict within the contract these clauses shall take precedence.

Required Bid Submittals

The following submittals are required to be submitted with the bid proposal:

- Certification Regarding Lobbying (Section 00 45 46.02)
- DBE Proposed Utilization: Documentation of good faith efforts for solicitation and proposed utilization/contracting with Disadvantaged Business Enterprises ("DBE")

SAM Registration

SAM Registration is required for all entities that enter into direct contracts with the recipients of SDWRLF. SAM Registration Link: https://www.sam.gov/SAM/ *(NOTE: The SAM registration expires annually and must be kept active until the SDWRLF project is closed.)*

Termination for Cause and for Convenience & Breach of Contract

Contractor shall address termination for cause and for convenience, including the manner by which it will be effected and the basis for settlement. In addition, contractor shall address administrative, contractual, or legal remedies in instances where contractors violate or breach contract terms, and provide for such sanctions and penalties as appropriate.

Equal Employment Opportunity

Contractor shall comply with Executive Order 11246 of September 24, 1965, entitled ''Equal Employment Opportunity,'' as amended by Executive Order 11375 of October 13, 1967, and as supplemented in Department of Labor regulations (41 CFR chapter 60).

Procurement of Recovered Materials

Contractor must comply with section 6002 of the Solid Waste Disposal Act, as amended by the Resource Conservation and Recovery Act, including procurement of recovered materials in a manner designated in guidelines of the Environmental Protection Agency (EPA) at 40 CFR part 247.

Whistleblower

Contractor receiving SDWRLF funds shall under or through this contract to, post notice of the rights and remedies provided to whistleblowers under No Fear Act Pub. L. 107-174. 29 CFR § 1614.703 (d).

Source of Funds

Work under this contract is funded by the federal Safe Drinking Water Revolving Loan Fund through Business Oregon and a partnership of Local and/or Private Funds.

Suspension and Debarment

Contractor certifies that it is not debarred or suspended or is otherwise excluded from or ineligible for participation in federal assistance programs under Executive Order 12549, ‘‘Debarment and Suspension”, and shall not contract or permit any subcontract at any level with any party similarly excluded or ineligible. A list of excluded parties is available in the System for Award Management (SAM) at www.sam.gov, under “search records”.

Copeland “Anti-Kickback” Act

Contractor shall comply with the Copeland “Anti-Kickback” Act (18 U.S.C. 847) as supplemented in Department of Labor regulations (29 CFR part 3).

Intellectual Property

Contractor hereby grants to the U.S. E.P.A. a royalty-free, nonexclusive, and irrevocable license to reproduce, publish or otherwise use, and to authorize others to use, for federal government purposes, any intellectual property developed under this contract. Contractor shall secure from third parties the same license in the name of the U.S. E.P.A. regarding any intellectual property developed by third parties as subcontractors under this contract, or developed under contract with the Contractor specifically to fulfill Contractor’s obligations related to this contract.

Inspections; Information

Contractor shall permit, and cause its subcontractors to allow City of Warrenton, the State of Oregon, the federal government and any party designated by them to:

- Examine, visit and inspect, at any and all reasonable times, the property, if any, constituting the Project.
- Inspect and make copies of any accounts, books and records, including, without limitation, its records regarding receipts, disbursement, contracts, and any other matters relating to the Project, and to its financial standing, and shall supply such reports and information as reasonably requested.
- Interview any officer or employee of the Contractor, or its subcontractors, regarding the Project.

Contractor shall retain all records related to the Project for three years after final payments are made and any pending matters are closed.

Disadvantaged Business Enterprises

Recipient will implement the good faith efforts for solicitation and contracting with Disadvantaged Business Enterprises (“DBE”) described in Section 4.1 of the Safe Drinking Water Handbook. This applies to all solicitation and contracting for construction, equipment, supplies, engineering or other services that constitute the Project financed by this Contract. Recipient will maintain documentation in a Project file on Disadvantaged Business Enterprises. Recipient will maintain documentation in a Project file and submit required forms, as described in Section 4.1 of the Safe Drinking Water Handbook. Recipient will ensure that all prime contractors and subcontractors implement the good faith efforts for solicitation and contracting, and comply with all DBE procurement forms, statements, and reporting requirements. Recipient will ensure

that each procurement contract (prime plus all subcontractor contracts) includes the following term and condition:

> "The contractor shall not discriminate on the basis of race, color, national origin or sex in the performance of this contract. The contractor shall carry out applicable requirements of 40 CFR part 33 in the award and administration of contracts awarded under EPA financial assistance agreements. Failure by the contractor to carry out these requirements is a material breach of this contract which may result in the termination of this contract or other legally available remedies."

Recipient will ensure that all prime contractors and subcontractors implement the good faith efforts for solicitation and contracting, and comply with all DBE procurement forms, statements, and reporting requirements.

The DBE Six Good Faith Efforts and Forms and included at the end of this document.

Prohibition on Certain Telecommunication and Video Surveillance Services or Equipment

As required by 2 CFR 200.216, federal grant or loan recipients and subrecipients are prohibited from obligating or expending loan or grant funds to procure or obtain; extend or renew a contract to procure or obtain; or enter into a contract (or extend or renew a contract) to procure or obtain equipment, services, or systems that use covered telecommunications equipment, video surveillance services or services as a substantial or essential component of any system, or as critical technology as part of any system. As described in Public Law 115-232, section 889, covered telecommunications equipment is telecommunications equipment produced by Huawei Technologies Company or ZTE Corporation (or any subsidiary or affiliate of such entities).

Prohibitions extend to the use of Federal funds by recipients and subrecipients to enter into a contract with an entity that "uses any equipment, system, or service that uses covered telecommunications equipment or services" as a substantial or essential component of any system, or as critical technology as part of any system. Certain equipment, systems, or services, including equipment, systems, or services produced or provided by entities subject to the prohibition are recorded in the System for Award Management exclusion list.

American Iron and Steel

The Contractor acknowledges to and for the benefit of the City of Warrenton ("Purchaser") and the State of Oregon (the "State") that it understands the goods and services under this Agreement are being funded with monies made available by the Drinking Water State Revolving Fund that have statutory requirements commonly known as "American Iron and Steel;" that requires all of the iron and steel products used in the project to be produced in the United States ("American Iron and Steel Requirement") including iron and steel products provided by the Contactor pursuant to this Agreement. The Contractor hereby represents and warrants to and for the benefit of the Purchaser and the State that (a) the Contractor has reviewed and understands the American Iron and Steel Requirement, (b) all of the iron and steel products used in the project will be and/or have been produced in the United States in a manner that complies with the American Iron and Steel Requirement, unless a waiver of the requirement is approved, and (c) the Contractor will provide any further verified information, certification or assurance of compliance with this paragraph, or information necessary to support a waiver of the American Iron and Steel Requirement, as may be requested by the Purchaser or the State. Notwithstanding any other provision of this Agreement,

any failure to comply with this paragraph by the Contractor shall permit the Purchaser or State to recover as damages against the

Contractor any loss, expense, or cost (including without limitation attorney's fees) incurred by the Purchaser or State resulting from any such failure (including without limitation any impairment or loss of funding, whether in whole or in part, from the State or any damages owed to the State by the Purchaser). While the Contractor has no direct contractual privity with the State, as a lender to the Purchaser for the funding of its project, the Purchaser and the Contractor agree that the State is a third-party beneficiary and neither this paragraph (nor any other provision of this Agreement necessary to give this paragraph force or effect) shall be amended or waived without the prior written consent of the State.

Federal Labor Standards

Oregon Bureau of Labor and Industries (BOLI) prevailing wage requirements apply to public entities for projects over $50,000 and private entities for projects that utilize more than $750,000 of public funds.

Prevailing Wage Requirements

Construction projects assisted in whole or in part with the Safe Drinking Water Revolving Loan Fund Program (SDWRLF) must be carried out in compliance with Federal Davis Bacon and Related Acts and the Oregon Bureau of Labor and Industries (BOLI) requirements. Contractor shall pay each worker employed in the performance of this contract not less than the higher of the wage rate for the type of work being performed as set forth in either the Oregon Prevailing Wage "Prevailing Wage Rate for Public Works Contracts in Oregon" (if applicable) or the applicable federal Davis-Bacon Wage Decision. Contractor shall download a U.S. Department of Labor Employee Fair Compensation Notice and post it at the work site along with a list of locally prevailing wage rates. Contractor shall prepare and submit weekly Certified Payroll Reports on forms to be supplied by Business Oregon. Contractor shall permit access to construction site in order to conduct on-site interviews with workers during working hours."

(1) Minimum wages.

(i) All laborers and mechanics employed or working upon the site of the work will be paid unconditionally and not less often than once a week, and without subsequent deduction or rebate on any account (except such payroll deductions as are permitted by regulations issued by the Secretary of Labor under the Copeland Act (29 CFR part 3)), the full amount of wages and bona fide fringe benefits (or cash equivalents thereof) due at time of payment computed at rates not less than those contained in the wage determination of the Secretary of Labor which is attached hereto and made a part hereof, regardless of any contractual relationship which may be alleged to exist between the contractor and such laborers and mechanics.

Contributions made or costs reasonably anticipated for bona fide fringe benefits under section 1(b)(2) of the Davis-Bacon Act on behalf of laborers or mechanics are considered wages paid to such laborers or mechanics, subject to the provisions of paragraph (a)(1)(iv) of this section; also, regular contributions made or costs incurred for more than a weekly period (but not less often than quarterly) under plans, funds, or programs which cover the particular weekly period, are deemed to be constructively made or incurred during such weekly period. Such laborers and mechanics shall be paid the appropriate wage rate and fringe benefits on the wage determination for the classification of work actually performed, without regard to skill, except as provided in § 5.5(a)(4). Laborers or mechanics performing work in more than one classification may be compensated at the rate specified for each classification for the time actually worked therein: Provided that the employer's payroll records accurately set forth the time spent in each

classification in which work is performed. The wage determination (including any additional classification and wage rates conformed under paragraph (a)(1)(ii) of this section) and the Davis-Bacon poster (WH-1321) shall be posted at all times by the contractor and its subcontractors at the site of the work in a prominent and accessible place where it can be easily seen by the workers.

Sub recipients may obtain wage determinations from the U.S. Department of Labor's web site, www.dol.gov.

(ii)(A) The sub recipient(s), on behalf of EPA, shall require that any class of laborers or mechanics, including helpers, which is not listed in the wage determination and which is to be employed under the contract shall be classified in conformance with the wage determination. The State award official shall approve a request for an additional classification and wage rate and fringe benefits therefore only when the following criteria have been met:

(1) The work to be performed by the classification requested is not performed by a classification in the wage determination; and

(2) The classification is utilized in the area by the construction industry; and

(3) The proposed wage rate, including any bona fide fringe benefits, bears a reasonable relationship to the wage rates contained in the wage determination.

(B) If the contractor and the laborers and mechanics to be employed in the classification (if known), or their representatives, and the sub recipient(s) agree on the classification and wage rate (including the amount designated for fringe benefits where appropriate), documentation of the action taken and the request, including the local wage determination shall be sent by the sub recipient (s) to the State award official. The State award official will transmit the request, to the Administrator of the Wage and Hour Division, Employment Standards Administration, U.S. Department of Labor, Washington, DC 20210 and to the EPA DB Regional Coordinator concurrently. The Administrator, or an authorized representative, will approve, modify, or disapprove every additional classification request within 30 days of receipt and so advise the State award official or will notify the State award official within the 30-day period that additional time is necessary.

(C) In the event the contractor, the laborers or mechanics to be employed in the classification or their representatives, and the sub recipient(s) do not agree on the proposed classification and wage rate (including the amount designated for fringe benefits, where appropriate), the award official shall refer the request and the local wage determination, including the views of all interested parties and the recommendation of the State award official, to the Administrator for determination. The request shall be sent to the EPA DB Regional Coordinator concurrently. The Administrator, or an authorized representative, will issue a determination within 30 days of receipt of the request and so advise the contracting officer or will notify the contracting officer within the 30-day period that additional time is necessary.

(D) The wage rate (including fringe benefits where appropriate) determined pursuant to paragraphs (a)(1)(ii)(B) or (C) of this section, shall be paid to all workers performing work in the classification under this contract from the first day on which work is performed in the classification.

(iii) Whenever the minimum wage rate prescribed in the contract for a class of laborers or mechanics includes a fringe benefit which is not expressed as an hourly rate, the contractor shall either pay the benefit as stated in the wage determination or shall pay another bona fide fringe benefit or an hourly cash equivalent thereof.

(iv) If the contractor does not make payments to a trustee or other third person, the contractor may consider as part of the wages of any laborer or mechanic the amount of any costs reasonably anticipated in providing bona fide fringe benefits under a plan or program, Provided, That the Secretary of Labor has found, upon the written request of the contractor, that the applicable standards of the Davis-Bacon Act have been met. The Secretary of Labor may require the contractor to set aside in a separate account assets for the meeting of obligations under the plan or program.

(2) Withholding. The sub recipient(s), shall upon written request of the EPA Award Official or an authorized representative of the Department of Labor, withhold or cause to be withheld from the contractor under this contract or any other Federal contract with the same prime contractor, or any other federally-assisted contract subject to Davis-Bacon prevailing wage requirements, which is held by the same prime contractor, so much of the accrued payments or advances as may be considered necessary to pay laborers and mechanics, including apprentices, trainees, and helpers, employed by the contractor or any subcontractor the full amount of wages required by the contract. In the event of failure to pay any laborer or mechanic, including any apprentice, trainee, or helper, employed or working on the site of the work, all or part of the wages required by the contract, the (Agency) may, after written notice to the contractor, sponsor, applicant, or owner, take such action as may be necessary to cause the suspension of any further payment, advance, or guarantee of funds until such violations have ceased.

(3) Payrolls and basic records.

(i) Payrolls and basic records relating thereto shall be maintained by the contractor during the course of the work and preserved for a period of three years thereafter for all laborers and mechanics working at the site of the work. Such records shall contain the name, address, and social security number of each such worker, his or her correct classification, hourly rates of wages paid (including rates of contributions or costs anticipated for bona fide fringe benefits or cash equivalents thereof of the types described in section 1(b)(2)(B) of the Davis-Bacon Act), daily and weekly number of hours worked, deductions made and actual wages paid. Whenever the Secretary of Labor has found under 29 CFR 5.5(a)(1)(iv) that the wages of any laborer or mechanic include the amount of any costs reasonably anticipated in providing benefits under a plan or program described in section 1(b)(2)(B) of the Davis-Bacon Act, the contractor shall maintain records which show that the commitment to provide such benefits is enforceable, that the plan or program is financially responsible, and that the plan or program has been communicated in writing to the laborers or mechanics affected, and records which show the costs anticipated or the actual cost incurred in providing such benefits. Contractors employing apprentices or trainees under approved programs shall maintain written evidence of the registration of apprenticeship programs and certification of trainee programs, the registration of the apprentices and trainees, and the ratios and wage rates prescribed in the applicable programs.

(ii)(A) The contractor shall submit weekly, for each week in which any contract work is performed, a copy of all payrolls to the sub recipient, that is, the entity that receives the sub-grant or loan from the State capitalization grant recipient. Such documentation shall be available on request of the State recipient or EPA. As to each payroll copy received, the sub recipient shall provide written confirmation in a form satisfactory to the State indicating whether or not the project is in compliance with the requirements of 29 CFR 5.5(a)(1) based on the most recent payroll copies for the specified week. The payrolls shall set out accurately and completely all of the information required to be maintained under 29 CFR 5.5(a)(3)(i), except that full social security numbers and home addresses shall not be included on the weekly payrolls. Instead the payrolls shall only need to include an individually identifying number for each employee (e.g., the last four digits of the employee's social security number). The required weekly payroll information may be submitted in any form desired. Optional Form WH-347 is available for this purpose from the Wage and

Hour Division Web site at http://www.dol.gov/whd/forms/wh347instr.htm or its successor site. The prime contractor is responsible for the submission of copies of payrolls by all subcontractors. Contractors and subcontractors shall maintain the full social security number and current address of each covered worker, and shall provide them upon request to the sub recipient(s) for transmission to the State or EPA if requested by EPA, the State, the contractor, or the Wage and Hour Division of the Department of Labor for purposes of an investigation or audit of compliance with prevailing wage requirements. It is not a violation of this section for a prime contractor to require a subcontractor to provide addresses and social security numbers to the prime contractor for its own records, without weekly submission to the sub recipient(s).

(B) Each payroll submitted shall be accompanied by a "Statement of Compliance," signed by the contractor or subcontractor or his or her agent who pays or supervises the payment of the persons employed under the contract and shall certify the following:

(1) That the payroll for the payroll period contains the information required to be provided under § 5.5 (a)(3)(ii) of Regulations, 29 CFR part 5, the appropriate information is being maintained under § 5.5 (a)(3)(i) of Regulations, 29 CFR part 5, and that such information is correct and complete;

(2) That each laborer or mechanic (including each helper, apprentice, and trainee) employed on the contract during the payroll period has been paid the full weekly wages earned, without rebate, either directly or indirectly, and that no deductions have been made either directly or indirectly from the full wages earned, other than permissible deductions as set forth in Regulations, 29 CFR part 3;

(3) That each laborer or mechanic has been paid not less than the applicable wage rates and fringe benefits or cash equivalents for the classification of work performed, as specified in the applicable wage determination incorporated into the contract.

(C) The weekly submission of a properly executed certification set forth on the reverse side of Optional Form WH-347 shall satisfy the requirement for submission of the "Statement of Compliance" required by paragraph (a)(3)(ii)(B) of this section.

(D) The falsification of any of the above certifications may subject the contractor or subcontractor to civil or criminal prosecution under section 1001 of title 18 and section 231 of title 31 of the United States Code.

(iii) The contractor or subcontractor shall make the records required under paragraph (a)(3)(i) of this section available for inspection, copying, or transcription by authorized representatives of the State, EPA or the Department of Labor, and shall permit such representatives to interview employees during working hours on the job. If the contractor or subcontractor fails to submit the required records or to make them available, the Federal agency or State may, after written notice to the contractor, sponsor, applicant, or owner, take such action as may be necessary to cause the suspension of any further payment, advance, or guarantee of funds. Furthermore, failure to submit the required records upon request or to make such records available may be grounds for debarment action pursuant to 29 CFR 5.12.

(4) Apprentices and trainees

(i) Apprentices. Apprentices will be permitted to work at less than the predetermined rate for the work they performed when they are employed pursuant to and individually registered in a bona fide apprenticeship program registered with the U.S. Department of Labor, Employment and Training Administration, Office of Apprenticeship Training, Employer and Labor Services, or with a State Apprenticeship Agency recognized by the Office, or if a person is employed in his or her first 90 days of probationary employment as an apprentice in such an apprenticeship program, who is not individually

registered in the program, but who has been certified by the Office of Apprenticeship Training, Employer and Labor Services or a State Apprenticeship Agency (where appropriate) to be eligible for probationary employment as an apprentice. The allowable ratio of apprentices to journeymen on the job site in any craft classification shall not be greater than the ratio permitted to the contractor as to the entire work force under the registered program. Any worker listed on a payroll at an apprentice wage rate, who is not registered or otherwise employed as stated above, shall be paid not less than the applicable wage rate on the wage determination for the classification of work actually performed. In addition, any apprentice performing work on the job site in excess of the ratio permitted under the registered program shall be paid not less than the applicable wage rate on the wage determination for the work actually performed. Where a contractor is performing construction on a project in a locality other than that in which its program is registered, the ratios and wage rates (expressed in percentages of the journeyman's hourly rate) specified in the contractor's or subcontractor's registered program shall be observed. Every apprentice must be paid at not less than the rate specified in the registered program for the apprentice's level of progress, expressed as a percentage of the journeymen hourly rate specified in the applicable wage determination. Apprentices shall be paid fringe benefits in accordance with the provisions of the apprenticeship program. If the apprenticeship program does not specify fringe benefits, apprentices must be paid the full amount of fringe benefits listed on the wage determination for the applicable classification. If the Administrator determines that a different practice prevails for the applicable apprentice classification, fringes shall be paid in accordance with that determination. In the event the Office of Apprenticeship Training, Employer and Labor Services, or a State Apprenticeship Agency recognized by the Office, withdraws approval of an apprenticeship program, the contractor will no longer be permitted to utilize apprentices at less than the applicable predetermined rate for the work performed until an acceptable program is approved.

(ii) Trainees. Except as provided in 29 CFR 5.16, trainees will not be permitted to work at less than the predetermined rate for the work performed unless they are employed pursuant to and individually registered in a program which has received prior approval, evidenced by formal certification by the U.S. Department of Labor, Employment and Training Administration. The ratio of trainees to journeymen on the job site shall not be greater than permitted under the plan approved by the Employment and Training Administration. Every trainee must be paid at not less than the rate specified in the approved program for the trainee's level of progress, expressed as a percentage of the journeyman hourly rate specified in the applicable wage determination. Trainees shall be paid fringe benefits in accordance with the provisions of the trainee program. If the trainee program does not mention fringe benefits, trainees shall be paid the full amount of fringe benefits listed on the wage determination unless the Administrator of the Wage and Hour Division determines that there is an apprenticeship program associated with the corresponding journeyman wage rate on the wage determination which provides for less than full fringe benefits for apprentices. Any employee listed on the payroll at a trainee rate who is not registered and participating in a training plan approved by the Employment and Training Administration shall be paid not less than the applicable wage rate on the wage determination for the classification of work actually performed. In addition, any trainee performing work on the job site in excess of the ratio permitted under the registered program shall be paid not less than the applicable wage rate on the wage determination for the work actually performed. In the event the Employment and Training Administration withdraws approval of a training program, the contractor will no longer be permitted to utilize trainees at less than the applicable predetermined rate for the work performed until an acceptable program is approved.

(iii) Equal employment opportunity. The utilization of apprentices, trainees and journeymen under this part shall be in conformity with the equal employment opportunity requirements of Executive Order 11246, as amended and 29 CFR part 30.

(5) Compliance with Copeland Act requirements. The contractor shall comply with the requirements of 29 CFR part 3, which are incorporated by reference in this contract.

(6) Subcontracts. The contractor or subcontractor shall insert in any subcontracts the clauses contained in 29 CFR 5.5(a)(1) through (10) and such other clauses as the EPA determines may by appropriate, and also a clause requiring the subcontractors to include these clauses in any lower tier subcontracts. The prime contractor shall be responsible for the compliance by any subcontractor or lower tier subcontractor with all the contract clauses in 29 CFR 5.5.

(7) Contract termination; debarment. A breach of the contract clauses in 29 CFR 5.5 may be grounds for termination of the contract, and for debarment as a contractor and a subcontractor as provided in 29 CFR 5.12.

(8) Compliance with Davis-Bacon and Related Act requirements. All rulings and interpretations of the Davis-Bacon and Related Acts contained in 29 CFR parts 1, 3, and 5 are herein incorporated by reference in this contract.

(9) Disputes concerning labor standards. Disputes arising out of the labor standards provisions of this contract shall not be subject to the general disputes clause of this contract. Such disputes shall be resolved in accordance with the procedures of the Department of Labor set forth in 29 CFR parts 5, 6, and 7. Disputes within the meaning of this clause include disputes between the contractor (or any of its subcontractors) and sub recipient(s), State, EPA, the U.S. Department of Labor, or the employees or their representatives.

(10) Certification of eligibility.

(i) By entering into this contract, the contractor certifies that neither it (nor he or she) nor any person or firm who has an interest in the contractor's firm is a person or firm ineligible to be awarded Government contracts by virtue of section 3(a) of the Davis-Bacon Act or 29 CFR 5.12(a)(1).

(ii) No part of this contract shall be subcontracted to any person or firm ineligible for award of a Government contract by virtue of section 3(a) of the Davis-Bacon Act or 29 CFR 5.12(a)(1).

(iii) The penalty for making false statements is prescribed in the U.S. Criminal Code, 18 U.S.C. 1001.

Contract Provisions for Contracts in Excess of $100,000

(a) Contract Work Hours and Safety Standards Act. The sub recipient shall insert the following clauses set forth in paragraphs (a)(1), (2), (3), and (4) of this section in full in any contract in an amount in excess of $100,000 and subject to the overtime provisions of the Contract Work Hours and Safety Standards Act. These clauses shall be inserted in addition to the clauses required by Item 3, above or 29 CFR 4.6. As used in this paragraph, the terms laborers and mechanics include watchmen and guards.

(1) Overtime requirements. No contractor or subcontractor contracting for any part of the contract work which may require or involve the employment of laborers or mechanics shall require or permit any such laborer or mechanic in any workweek in which he or she is employed on such work to work in excess of forty hours in such workweek unless such laborer or mechanic receives compensation at a rate not less than one and one-half times the basic rate of pay for all hours worked in excess of forty hours in such workweek.

(2) Violation; liability for unpaid wages; liquidated damages. In the event of any violation of the clause set forth in paragraph (a)(1) of this section the contractor and any subcontractor responsible therefore shall

be liable for the unpaid wages. In addition, such contractor and subcontractor shall be liable to the United States (in the case of work done under contract for the District of Columbia or a territory, to such District or to such territory), for liquidated damages. Such liquidated damages shall be computed with respect to each individual laborer or mechanic, including watchmen and guards, employed in violation of the clause set forth in paragraph (a)(1) of this section, in the sum of $10 for each calendar day on which such individual was required or permitted to work in excess of the standard workweek of forty hours without payment of the overtime wages required by the clause set forth in paragraph (a)(1) of this section.

(3) Withholding for unpaid wages and liquidated damages. The sub recipient, upon written request of the EPA Award Official or an authorized representative of the Department of Labor, shall withhold or cause to be withheld, from any moneys payable on account of work performed by the contractor or subcontractor under any such contract or any other Federal contract with the same prime contractor, or any other federally-assisted contract subject to the Contract Work Hours and Safety Standards Act, which is held by the same prime contractor, such sums as may be determined to be necessary to satisfy any liabilities of such contractor or subcontractor for unpaid wages and liquidated damages as provided in the clause set forth in paragraph (b)(2) of this section.

(4) Subcontracts. The contractor or subcontractor shall insert in any subcontracts the clauses set forth in paragraph (a)(1) through (4) of this section and also a clause requiring the subcontractors to include these clauses in any lower tier subcontracts. The prime contractor shall be responsible for compliance by any subcontractor or lower tier subcontractor with the clauses set forth in paragraphs (a)(1) through (4) of this section.

(b) In addition to the clauses contained in Item 3, above, in any contract subject only to the Contract Work Hours and Safety Standards Act and not to any of the other statutes cited in 29 CFR 5.1, the Sub recipient shall insert a clause requiring that the contractor or subcontractor shall maintain payrolls and basic payroll records during the course of the work and shall preserve them for a period of three years from the completion of the contract for all laborers and mechanics, including guards and watchmen, working on the contract. Such records shall contain the name and address of each such employee, social security number, correct classifications, hourly rates of wages paid, daily and weekly number of hours worked, deductions made, and actual wages paid. Further, the Sub recipient shall insert in any such contract a clause providing hat the records to be maintained under this paragraph shall be made available by the contractor or subcontractor for inspection, copying, or transcription by authorized representatives of the (write the name of agency) and the Department of Labor, and the contractor or subcontractor will permit such representatives to interview employees during working hours on the job.

5. Compliance Verification

(a) The sub recipient shall periodically interview a sufficient number of employees entitled to DB prevailing wages (covered employees) to verify that contractors or subcontractors are paying the appropriate wage rates. As provided in 29 CFR 5.6(a)(6), all interviews must be conducted in confidence. The sub recipient must use Standard Form 1445 (SF 1445) or equivalent documentation to memorialize the interviews. Copies of the SF 1445 are available from EPA on request.

(b) The sub recipient shall establish and follow an interview schedule based on its assessment of the risks of noncompliance with DB posed by contractors or subcontractors and the duration of the contract or subcontract. Sub recipients must conduct more frequent interviews if the initial interviews or other information indicated that there is a risk that the contractor or subcontractor is not complying with DB.

Sub recipients shall immediately conduct interviews in response to an alleged violation of the prevailing wage requirements. All interviews shall be conducted in confidence."

(c) The sub recipient shall periodically conduct spot checks of a representative sample of weekly payroll data to verify that contractors or subcontractors are paying the appropriate wage rates. The sub recipient shall establish and follow a spot check schedule based on its assessment of the risks of noncompliance with DB posed by contractors or subcontractors and the duration of the contract or subcontract. At a minimum, if practicable, the sub recipient should spot check payroll data within two weeks of each contractor or subcontractor's submission of its initial payroll data and two weeks prior to the completion date the contract or subcontract. Sub recipients must conduct more frequent spot checks if the initial spot check or other information indicates that there is a risk that the contractor or subcontractor is not complying with DB. In addition, during the examinations the sub recipient shall verify evidence of fringe benefit plans and payments there under by contractors and subcontractors who claim credit for fringe benefit contributions.

(d) The sub recipient shall periodically review contractors and subcontractor's use of apprentices and trainees to verify registration and certification with respect to apprenticeship and training programs approved by either the U.S Department of Labor or a state, as appropriate, and that contractors and subcontractors are not using disproportionate numbers of, laborers, trainees and apprentices. These reviews shall be conducted in accordance with the schedules for spot checks and interviews described in Item 5(b) and (c) above.

(e) Sub recipients must immediately report potential violations of the DB prevailing wage requirements to the EPA DB contact listed above and to the appropriate DOL Wage and Hour District Office listed at http://www.dol.gov/whd/america2.htm.

Environmental and Natural Resource Laws

Contractor shall comply with all applicable standards, orders, or requirements issued under section 306 of the Clean Air Act (42 U.S.C. 1857(h)), section 508 of the Clean Water Act (33 U.S.C. 1368), Executive Order 11738, and Environmental Protection Agency regulations (40 CFR part 15).

Build America Buy America (BABA) Act Requirements

The Contractor acknowledges to and for the benefit of the City of Warrenton ("Owner") and the Environmental Protection Agency (the "Funding Authority") that it understands the goods and services under this Agreement are being funded with federal monies and have statutory requirements commonly known as "Build America, Buy America;" that requires all of the iron and steel, manufactured products, and construction materials used in the project to be produced in the United States ("Build America, Buy America Requirements") including iron and steel, manufactured products, and construction materials provided by the Contactor pursuant to this Agreement. The Contractor hereby represents and warrants to and for the benefit of the Owner and Funding Authority (a) the Contractor has reviewed and understands the Build America, Buy America Requirements, (b) all of the iron and steel, manufactured products, and construction materials used in the project will be and/or have been produced in the United States in a manner that complies with the Build America, Buy America Requirements, unless a waiver of the requirements is approved, and (c) the Contractor will provide any further verified information, certification or assurance of compliance with this paragraph, or information necessary to support a waiver of the Build America, Buy America Requirements, as may be requested by the Owner or the Funding Authority. Notwithstanding any other provision of this Agreement, any failure to comply with this paragraph by the Contractor shall permit the Owner or Funding Authority to recover as damages against the Contractor any loss, expense, or cost (including without limitation attorney's fees) incurred by the Owner or Funding Authority resulting from

any such failure (including without limitation any impairment or loss of funding, whether in whole or in part, from the Funding Authority or any damages owed to the Funding Authority by the Owner). If the Contractor has no direct contractual privity with the Funding Authority, as a lender or awardee to the Owner for the funding of its project, the Owner and the Contractor agree that the Funding Authority is a third-party beneficiary and neither this paragraph (nor any other provision of this Agreement necessary to give this paragraph force or effect) shall be amended or waived without the prior written consent of the Funding Authority.

END OF SECTION

Six Good-Faith Efforts

Any public water system receiving an award from the Safe Drinking Water Revolving Loan Fund and the Drinking Water Source Protection Fund must ensure implementation of the six good-faith efforts comprising the federal "Fair Share Program," for the solicitation of all contractors providing construction, equipment, supplies, engineering or other services that constitute the project financed by the award.

Documentation demonstrating that these six good-faith efforts have been taken must be included and maintained in the water system's project files. Likewise, once a **contractor** has been selected by the water system, that contractor must adhere to the following six good-faith efforts in soliciting its subcontractor:

1. Ensure Disadvantaged Business Enterprises (DBEs) are made aware of contracting opportunities to the fullest extent practicable through outreach and recruitment activities. For Indian Tribal, state and local government recipients, this will include placing DBEs on solicitation lists and soliciting them whenever they are potential sources. (Note: The acronym DBE used throughout this document is a global term for Minority Business Enterprises (MBEs) and Women's Business Enterprises (WBEs).
2. Make information on forthcoming opportunities available to DBEs and arrange time frames for contracts and establish delivery schedules, where the requirements permit, in a way that encourages and facilitates participation by DBEs in the competitive process. This includes, whenever possible, posting solicitations for bids or proposals for a minimum of 30 calendar days before the bid or proposal closing date.
3. Consider in the contracting process whether firms competing for large contracts could subcontract with DBEs. For Indian Tribal, state and local government recipients, this will include dividing total requirements, when economically feasible, into smaller tasks or quantities to permit maximum participation by DBEs in the competitive process.
4. Encourage contracting with a consortium of DBEs when a contract is too large for one of these firms to handle individually.
5. Utilize the services of the Small Business Administration (SBA) and the Minority Business Development Agency of the Department of Commerce.
6. If the prime contractor awards subcontracts, require the prime contractor to take these six good-faith efforts in subcontracting with Disadvantaged Business Enterprises for any subcontract that they let.

Locating Disadvantaged Business Enterprises for Outreach

Applicable MBE/WBEs are certified by the Oregon Certification Office of Business Inclusion and Diversity, Small Business Administration, or by another federal agency.

The following sites may be of assistance for locating Minority or Women Owned business firms and others may exist too:

- Oregon directory of certified firms at Certification Office of Business Inclusion and Diversity
- http://www.oregon4biz.com/How-We-Can-Help/OMWESB/
- Federal System for Award Management at www.sam.gov/
- Minority Business Development Agency, US Dept. of Commerce at http://www.mbda.gov/
- EPA's Office of Small Business Programs at ~~www.epa.gov/osbp/~~
- U.S. Department of Transportation at https://www.transportation.gov/civil-rights/disadvantaged-business-enterprise

Prevention of Unfair Practices

Finally, there are a number of provisions designed to prevent unfair practices that may adversely affect DBEs that are now required of the prime contractor for every SDWRLF funded project:

- A SWRLF loan recipient must require its prime contractor to pay its subcontractor for satisfactory performance no more than 30 days from the prime contractor's receipt of payment.
- A SWRLF loan recipient must be notified in writing by its prime contractor prior to any termination of a DBE subcontractor for convenience by the prime contractor.
- If a DBE subcontractor fails to complete work under the subcontract for any reason, the SDWRLF loan recipient must require the prime contractor to employ the Six Good-Faith Efforts if soliciting a replacement subcontractor.
- A SDWRLF loan recipient must require its prime contractor to employ the Six Good-Faith Efforts even if the prime contractor has achieved its fair share objectives.

Project File Documentation of Good-Faith Efforts

In addition to narrative summaries of actions and decisions taken to fulfill each of the above affirmative steps, project file documentation must include any relevant information. The following are some examples, with the above step numbers in parentheses (#):

- Copies of solicitation lists including identified certified MBE/WBEs and small businesses (1 & 2)
- Printed lists of certified MBE/WBE businesses that may be qualified contractors, as obtained from web sites or other official sources (1 & 5)
- Options for dividing up or adjusting the pace of contracts in excess of $500,000 (3 & 4)
- Copies of advertisements, web postings, etc., for bid calls in relevant media (1 & 2)
- Correspondences with/information from relevant federal/state agencies, contractor clearinghouses and the like (2 & 5)
- Correspondences/bids from any disadvantaged business enterprise (2)
- Copies of any bid documentation and instructions to any general/prime contractor for purposes of that contractor's fulfillment of the six good faith efforts (6)**.**

State or federal officials overseeing the SDWRLF may ascertain the existence of such project file documentation at any time, including but not limited to audits.

Each procurement contract (prime plus all subcontractor contracts) must include the following term and condition:

> "The contractor shall not discriminate on the basis of race, color, national origin or sex in the performance of this contract. The contractor shall carry out applicable requirements of 40 CFR part 33 in the award and administration of contracts awarded under EPA financial assistance agreements. Failure by the contractor to carry out these requirements is a material breach of this contract which may result in the termination of this contract or other legally available remedies."

Data Reporting

FORM: Procurement of Disadvantaged Business Enterprises by Quarter The form on the next page must be submitted at the end of any quarter, in which the water system receiving an SDWRLF award, a prime contractor for the system or a subcontractor to the prime procures/contracts for construction, equipment, supplies or services from an applicable business in conjunction with the award. The system must submit this form to Business Oregon, Regional Project Manager. Without these reports Business Oregon may not be able to process subsequent requests for cash to pay for procurements.

FORM: Disbursements Attributable to Certified Disadvantaged Business Enterprises Included here is a second form, which is **required each time** that the water system requests cash draw down of its award. The draw-down request must include this sheet in order for the request to be processed.

Safe Drinking Water Revolving Loan Fund

Procurement of Disadvantaged Business Enterprises by Quarter

Submit to Business Oregon Regional Project Manager within 30 days following any quarter in which applicable procurements have been made or modified

Letter of Interest Year _____ **Quarter** _____

Project Number _____

Loan Recipient _____

Procurement Made by (check one)			Business Enterprise (check one or both)		Value of Procurement ($)	Date of Contract (MM/DD/YY)	Type of Product or Service (Enter Code No.)*	Name & Address and Certification Number of MBE/WBE Contractor or Vendor

Name of Solicitor: _____ Name of Company Selected: _____

#	Six Good-Faith Efforts	Did you pursue this effort?	**If yes**, please explain what you did and attach the supporting document. **If no**, please explain why this effort is not being pursued.
1	Ensure DBEs are made aware of contracting opportunities to the fullest extent practicable through outreach and recruitment activities. For Indian Tribal, state and local government recipients, this will include placing DBEs on solicitation lists and soliciting them whenever they are potential sources.	Yes No	
2	Make information on forthcoming opportunities available to DBEs and arrange time frames for contracts and establish delivery schedules, where the requirements permit, in a way that encourages and facilitates participation by DBEs in the competitive process. This includes, whenever possible, posting solicitations for bids or proposals for a minimum of 30 calendar days before the bid or proposal closing date.	Yes No	
3	Consider in the contracting process whether firms competing for large contracts could subcontract with DBEs. For Indian Tribal, state and local government recipients, this will include dividing total requirements, when economically feasible, into smaller tasks or quantities to permit maximum participation by DBEs in the competitive process.	Yes No	
4	Encourage contracting with a consortium of DBEs when a contract is too large for one of these firms to handle individually.	Yes No	
5	Utilize the services of the Small Business Administration (SBA) and the Minority Business Development Agency of the Department of Commerce.	Yes No	
6	If the prime **contractor** awards subcontracts, require the prime contractor to take these six good-faith efforts in subcontracting with Disadvantaged Business Enterprises for any subcontract that they let.	Yes No	

TECHNICAL SPECIFICATIONS

DIVISION 01 – GENERAL REQUIREMENTS

SECTION 01 10 00 – SUMMARY OF WORK

PART 1 GENERAL

1.1 SUMMARY

A. Section Includes:

1. Work covered by Contract Documents.
2. Contractor's use of Site.
3. Permits.
4. Specification conventions.
5. Prevailing wage rates for public works contracts in Oregon
6. Oregon products.
7. Use of explosives.
8. Contaminated material.
9. Extended warranty provisions for paving in Clatsop County and ODOT rights-of-way.
10. Work with existing asbestos water pipelines.
11. Inadvertent Discovery Plan for cultural resources.

1.2 WORK COVERED BY CONTRACT DOCUMENTS

A. Work of the Project includes furnishing all permits, labor, materials, and equipment necessary for the construction of the following:

1. Installation of approximately 4,500 linear feet (LF) of buried 18-inch diameter PVC C900 DR 18 water transmission pipe, isolation valves and other water system appurtenances, and connections to existing watermains and services. The water transmission main will be installed along Ft Stevens Highway (OR-104) and NW 13th Street.

B. The defined Work elements are a general outline of principal features of the Work and do not in any way limit the responsibility of the Contractor(s) to perform all Work and furnish all equipment, labor and materials required by the Contract Documents.

C. Work of each separate Contract Bid Schedule is identified in the following and on Drawings:

1. Phase 1: Work includes the installation of approximately 4,500 LF of 18-in diameter water transmission pipe, isolation valves and related system appurtenances. The Work begins at the existing 18-in water main terminus near the intersection of NW 13th Street and ends at a location near the intersection of Ft Stevens Hwy (OR-104) and 7th Avenue. The new 18-in water main will connect to the existing 10-in waterline. A stub-out of 18-in pipe with blind flange will be installed for the future Phase 2 Work.

1.3 NOT USED

1.4 NOT USED

1.5 NOT USED

1.6 CONTRACTOR'S USE OF SITE

A. The Work included in the Contract Documents is to be performed within public rights-of-way along State and City highways. Contractor shall have use of Project site for construction operations as indicated on Drawings, requirements of this Section, and terms and conditions of ODOT Permit to Occupy or Perform Operations on a State Highway.

B. Maintain all ODOT and City rights-of-way clear and available to the public in accordance with terms and conditions of respective rights-of-way use permits or other written permission from authorities having jurisdiction.

C. Noisy and Disruptive Operations (such as Use of Jack Hammers and Other Noisy Equipment): Not allowed in close proximity to existing buildings during regular hours of operation. Coordinate and schedule such operations with Owner to minimize disruptions.

D. Time Restrictions for Performing Work: All work shall be conducted between the hours of 7:00 a.m. and 6:00 p.m. on non-holiday weekdays only. Weekend work will only be allowed with prior approval. Requests for variations in work hours shall be made in writing for consideration by the Owner. No work shall be conducted outside of the above-described days and hours without prior approval of the Owner.

E. Utility Outages and Shutdown:

1. Coordinate and schedule electrical and other utility outages with Owner.

2. Outages: Allowed only at previously agreed upon times.

3. At least one week before scheduled outage, submit Outage Request Plan to Owner itemizing the dates, times, and duration of each requested outage.

F. Sound Level Restrictions: Shall comply with local Noise Ordinance.

G. Construction Plan: Before start of construction, submit three copies of construction plan regarding access to Work, use of Site, and utility outages for acceptance by Owner. After acceptance of plan, construction operations shall comply with accepted plan unless deviations are accepted by Owner in writing.

1.7 NOT USED

1.8 NOT USED

1.9 PERMITS

A. Responsibilities for permits, licenses and fees shall be in accordance with Section 00 73 00, Special Provisions, 00170.02 and 00170.03.

1.10 SPECIFICATION CONVENTIONS

A. These Specifications are written in imperative mood and streamlined form. This imperative language is directed at the Contractor unless specifically noted otherwise. The words "shall be" are included by inference where a colon (:) is used within sentences or phrases.

1.11 PREVAILING WAGE RATES FOR PUBLIC WORKS CONTRACTS IN OREGON

The Contractor shall abide by ORS 279C.800 through 279C.870 which relate to the prevailing wage rates for the building and construction trades in the State of Oregon. These prevailing wage rates are shown in the Bureau of Labor and Industries document which is included elsewhere in these contract documents.

1.12 OREGON PRODUCTS

Contractor's attention is directed to the provisions of Oregon Law, ORS 279A.120 regarding the preference for products that have been manufactured or produced in Oregon. Contractor shall use Oregon-produced or manufactured materials with respect to common building materials such as cement, sand, crushed rock, gravel, plaster, etc., and Oregon-manufactured products in all cases where price, fitness, availability, and quality are otherwise equal.

1.13 USE OF EXPLOSIVES

The use of explosives shall not be allowed on this Project. Alternative methods of excavation shall be utilized.

1.14 CONTAMINATED MATERIAL

A. General

It is possible that the Contractor may encounter contaminated material (soil and/or water) during excavation activities. This specification identifies requirements for handling and disposing contaminated media.

B. Definitions

1. “Contaminated material” is defined as soil, water, free product, Underground Storage Tanks (UST), buried abandoned utility lines containing residual or free product, solid waste, treated wood waste, chemical containers, or other solid, liquid, or gas substances with contamination levels above background levels.

2. “Hazardous substances” shall mean those substances or materials defined in the ORS 465.200, as amended.

3. “Release” shall have the meaning as defined in ORS 465.200, as amended.

4. “Environmental laws” shall mean any applicable statute, law, ordinance, order, consent decree, judgment, permit, license, code, covenant, deed, common law, treaty, convention, or other requirement pertaining to protection of the environment, health or safety, natural resources, conservation, wildlife, waste management or disposal, hazardous substances, or pollution, including but not limited to regulation of releases to air, land, water, and groundwater.

C. Execution

1. Discovery of Contaminated Material

In the event that the Contractor, during the course of construction or during any other activities authorized under this contract, should encounter suspected contaminated material or any other materials suspected of posing a threat to human health and the environment, the Contractor shall notify the Engineer immediately and manage according to requirements identified below.

2. Discovery of Contaminated Soil

Contractor shall note evidence of contamination (odor, visual staining of soil, free liquid product seeping from soil, sheen on groundwater, etc.) and note location of evidence on a sketch of the excavation and provide to the Engineer.

Contractor shall report the discovery to the Engineer immediately. Contractor shall stop all excavation activities and secure the site to prevent entry by the public. The excavation shall not be backfilled. Protect all open excavations with berms, plates, and fencing. Contractor may continue with work in other non-contaminated areas.

Contractor shall assist Engineer in collecting sample(s) of suspected contaminated media for testing and characterization. Contractor shall allow 21 days, at no cost to Owner, for testing, results, and instructions as to how to proceed with contaminated materials.

The Contractor shall obtain a copy of an approved soil disposal/acceptance permit (Disposal/Treatment Facility requires transporter to have a copy of the permit.)

Contractor will transport and dispose of contaminated material at an approved disposal/treatment facility.

Contractor shall provide the Engineer with a copy of the contaminated soil disposal receipt.

3. Handling of Contaminated Soil

After approval from the Engineer, excavate the soil in a manner that prevents commingling of contaminated and non-contaminated soil. Engineer will make determination (based on soil saturation) if contaminated soil can be directly transported to a treatment or disposal facility, or if soil needs to be stockpiled to reduce water content. Engineer will determine when stockpiled soil can be transported off-site.

Contractor will be responsible for stockpiling contaminated soil in containers or on impervious surface to prevent the spread of contamination. Any water runoff from the contaminated soil stockpile area(s) must be contained by Contractor and handled as contaminated water.

Minimize movement of excavation equipment over or through contaminated soil to prevent movement of contaminated soil into areas where no contaminated soil exists.

Stockpiles will be created on an approved site and shall be surrounded by a fence to limit access. The stockpiles must be covered and bermed during periods of rainfall to prevent

run-on and run-off. The stockpiles shall be covered with a minimum 10-mil high density polyethylene (HDPE) plastic during periods of strong winds, nightfall, over the weekends, or during extended work stoppages. If dust is observed coming from the stockpiles, the stockpiles shall be either covered or the dust controlled with water.

Maintain excavation equipment in good working order. Prevent spillage of oil, fuel, or hazardous substances from equipment. In particular, promptly repair oil leaks from equipment and clean up any contaminated soil.

4. Transport of Contaminated Materials

Contractor shall comply with all applicable Federal, State, or local laws, codes, and ordinances that govern or regulate contaminated substance transportation. Contaminated soils placed in stockpiles shall be loaded into trucks in a manner that prevents the spilling or tracking of contaminated soil into areas of the site with uncontaminated soil. Loose material falling onto the exterior of the truck during loading shall be removed before the truck leaves the loading area. Any material collected in the loading area shall either be placed back into the truck or back into the stockpile. If loading areas are unpaved, the surface soil shall be sampled at the conclusion of the loading activities to confirm that contaminated soil is not present. If loading areas are paved, any loose soil shall be cleaned from the pavement at the conclusion of the loading activities.

Specific truck haul routes shall be established before beginning off-site contaminated media transport. On-site truck routes shall be established to minimize or prevent movement of trucks over contaminated soils. Off-site truck routes shall be established to reduce the risk of releases of contaminated soils and impact on local traffic. The Contractor shall be responsible for ensuring that loaded truck weights are within acceptable limits. All trucks shall be covered before they leave the loading area.

The Contractor shall ensure that all drivers of vehicles transporting contaminated substances have in their possession during transport all applicable Oregon State and local vehicle insurance requirements, valid driver's license, and vehicle registration and license. The Contractor shall be responsible for informing all drivers of transport vehicle about:

a. The nature of the material transported.

b. Required routes to and from the off-site thermal treatment or disposal facility.

c. Applicable City/County Street regulations and requirements, and State of Oregon Department of Transportation codes, regulations, and requirements.

d. The City/County's requirement for proper handling and transportation of the substances.

The Contractor shall not allow contaminated substances to be spilled or tracked off-site at any time during the Project. Trucks used for the transportation of contaminated substances off-site shall be watertight, substance compatible, licensed, insured, and permitted pursuant to federal, state, and local statutes, rules, regulations, and ordinances.

If contaminated media is discarded prior to removal of contaminated material, the price per cubic yard of soil materials and price per 100 gallons of contaminated water will be negotiated with Owner.

1.15 NOT USED

1.16 EXTENDED WARRANTY PROVISIONS FOR PAVING IN CLATSOP COUNTY AND ODOT RIGHTS-OF-WAY

The Contractor shall provide an extended warranty for all paving work performed in Clatsop County and ODOT rights-of-way. The warranty for this work shall extend an additional one year beyond that provided for the overall project.

1.17 NOT USED

1.18 WORK WITH EXISTING ASBESTOS WATER PIPELINES

The Contractor shall comply with all requirements of the State of Oregon, Department of Environmental Quality (DEQ) with respect to the safe handling, removal, and disposal of asbestos cement pipe, including all reporting requirements.

1.19 INADVERTENT DISCOVERY PLAN FOR ARCHAEOLOGICAL AND HUMAN REMAINS

The Contractor shall follow the Inadvertent Discovery Plan (IDP) if cultural material including archaeological and human remains are encountered during construction. The IDP is found in the Supplementary Information section.

PART 2 PRODUCTS - Not Used

PART 3 EXECUTION - Not Used

END OF SECTION

SECTION 01 12 16 - WORK SEQUENCE

PART 1 GENERAL

1.1 SUMMARY

A. This Section includes general sequencing, project phasing and coordination requirements for the Work.

B. Contract Requirements:

1. Water Distribution Facilities

a. The existing water distribution facilities within the Project provide drinking water service to residential and commercial customers. Plan and prosecute the Work such that water service is not interrupted, expect as specified herein.

b. The Project is delineated into two phases which is summarized as follows and on the Drawings:

1) Phase 1: Installation of approximately 4,500 linear feet (LF) of buried 18-inch diameter PVC C900 DR 18 water transmission pipe, isolation valves and other water system appurtenances, and connections to existing watermains and services. The water transmission main will be installed along Ft Stevens Highway (OR-104) and NW 13th Street.

2) Phase 2: Installation of approximately 5,500 LF of buried 18-inch diameter PVC C900 DR 18 water transmission pipe, isolation valves and other water system appurtenances, and connections to existing watermains and services. The water transmission main will be installed along Ft Stevens Highway (OR-104) and NW 13th Street.

c. The Work involves the installation, testing, disinfection, and acceptance of Phase 1 water system improvements.

1) STEP 1: The water system improvements between STA A52+93± to A54+89± shall be installed as the initial Work activity. This segment of the Work requires archaeologist monitoring of excavation and trenching activities. This segment of Work shall be installed, tested and disinfected. The cut-off valves will be closed to isolate it from the existing 10-inch water main, the water shall be drained from the pipe and a temporary cap installed.

2) STEP 2: Upon completion of the previous Work segment, the waterline installation shall resume beginning at STA A10+00 and proceeding west/north in Station ascending order. The water system improvements shall be installed, tested, disinfected and accepted in logical sequence.

3) STEP 3: Upon reaching the temporary cap installed in STEP 1, the temporary cap shall be removed, waterline connected, and the pipe segment shall be tested, disinfected, and accepted.

d. Phase 2 is not included in the Work but will be implemented in the future.

e. The water main Work may involve adjustment of existing sanitary sewer service laterals to provide required separation with the installed water main. The sewer lateral adjustments must be coordinated with the water main installation to allow logical construction sequencing that could potentially result in utility service disruptions, water leakage, sewage spillage or other adverse effects.

2. Sanitary Sewer Service Facilities

a. The existing sanitary sewer facilities within the Project provide sewer collection service to residential and commercial customers. Plan and prosecute the Work such that sewer service is not interrupted, expect as specified herein.

b. Spillage or discharge of raw sewage to surface waters or drainage courses is prohibited during construction. Penalties imposed on Owner as a result of any sewage bypass of this type caused by Contractor, its employees or Subcontractors, and legal fees and other expenses to Owner resulting directly or indirectly from the bypass shall be borne in full by Contractor.

c. Control any and all leakage resulting from or integral to making all temporary and permanent piping connections. Provide any and all devices required to control, stop, divert, or dispose of any and all leakage.

d. Plan and prosecute the Work such that temporary sewage control activities are provided in accordance with Section 01 57 19.11, Temporary Sewage Control and Bypass Pumping.

C. Related Sections:

1. Section 01 10 00, Summary of Work.

2. Section 01 57 19.11, Temporary Sewage Control and Bypass Pumping.

1.2 SUBMITTALS

A. Section 01 33 00, Submittal Procedures: Requirements for submittals.

B. Work Sequencing Plan: At a minimum, to include the following:

1. Complete sequence of construction for all activities contained herein.

1.3 NOT USED

1.4 GENERAL WORK CONSTRAINTS

A. Constraints primarily relate to interfacing with and tying into existing pipelines, water and sanitary sewer services, and other aspects of Owner enterprise utilities.

B. Make every effort to give proper attention to each of these items so as to minimize interruptions of the existing facilities and avoid delays that may result if the constraints are not observed.

C. Constraints listed below involve limits on activities during construction. These limits relate to the critical nature of the existing water distribution and sanitary sewer facilities.

1. Coordinate construction schedule with Owner.

2. Owner recognizes portions of the water distribution and sanitary sewer facilities may have to be interrupted, shut down, or interfered with in order to accommodate construction activities. Owner will, through its personnel, attempt to accommodate Work, provided that proper notification is given. Owner reserves the right to deny permission for interruption or shutdown on any day.

3. Do operate any of the Owner utility facilities. Contractor is liable for any loss or damage caused to property, equipment or any personal injury resulting from or related to this unauthorized operation or use.

D. Extended Working Hours: If it is desired to perform any Work outside the specified working hours, obtain written permission from Owner and all necessary permitting agencies, and make all necessary arrangements prior to commencing.

1.5 TEMPORARY SHUTDOWNS

A. Provide 14-day minimum advance notice to request approval of a temporary shutdown of a facility.

B. Each Notice of Request for Approval of a Temporary Shutdown submitted to Owner shall include the following:

1. Dates, times, and duration of proposed shutdown.

2. Work activities to be performed during the shutdown.

3. Assistance required of Owner's personnel before, during, and after shutdown.

4. Personnel to be on Site during shutdown.

5. Contingency plan if work during shutdown is not completed during allotted time or critical equipment fails.

C. Upon receipt of such request, Owner will decide what action(s) is required by Owner and if the requested shutdown is acceptable. The request from Contractor will be returned to Contractor with the Owner's written decision noted. If Owner deems that the requested shutdown is unacceptable, Owner will state such reasons, and Contractor shall reschedule the shutdown as required.

D. It is hereby agreed between the Contractor and Owner that disapproval by Owner of the Contractor's shutdown request does not entitle Contractor to any time extension unless Contractor can demonstrate to the satisfaction of Owner, through an updated CPM schedule, that the overall project completion date will not be met as a result of this disapproval.

E. Owner may postpone a planned and approved shutdown at any time for critical water or sanitary sewer service demands or safety reasons.

1.6 INTERRUPTION OF UTILITY SERVICE

A. Indicate required shutdowns of existing utilities or interruptions of existing operations on Progress Schedule. Interruptions to utility service will be allowed to the extent that customer service will not be adversely compromised.

B. Submit requests for interruptions to utility service not less than 14-days in advance of the date scheduled for the interruption.

C. Following receipt of the request, Engineer will notify Contractor if the requested date will be permitted. Evaluation of the request will be based upon the availability of the utility owner's personnel to assist and monitor utilities during the shutdown period and impact to customer service.

D. Minimize the period of interruption by thorough advance planning. Procure and provide all required materials, equipment, and labor on site during the shutdown.

E. Do not begin interruption until written authorization is received from Engineer.

PART 2 PRODUCTS - NOT USED

PART 3 EXECUTION – NOT USED

END OF SECTION

SECTION 01 22 20 - UNIT PRICE MEASUREMENT AND PAYMENT

PART 1 GENERAL

Measurement and payment will be on a unit price basis in accordance with the prices set forth in the proposal for individual work items. Where work is required but does not appear as a separate item in the proposal, the cost for that work shall be included and absorbed in the unit prices named in the proposal. Contractor shall make a careful assessment when preparing the bid.

A. Mobilization, Bonds, Insurance and Demobilization: Payment for mobilization, bonds, insurance, and demobilization will be on a lump sum basis. The amounts paid for mobilization in the contract progress payment will be based on the percent of the original contract amount that is earned from other contract items, as follows:

1. When 5 percent is earned, either 100 percent of the amount for mobilization or 5 percent of the original contract amount, whichever is the least.

2. When all work is completed, amount of mobilization exceeding 5 percent of the original contract amount.

This schedule of mobilization progress payments will not limit or preclude progress payments otherwise provided by the contract.

B. Record Drawings: Payment for record drawings will be on a lump sum basis. Payment will include all labor and materials necessary to prepare and maintain a set of construction drawing markups at the project site to document work completed including any approved changes.

C. Temporary Work Zone Traffic Control: No measurement of quantities will be made. Payment will be on a lump sum basis and shall include furnishing, installing, moving, operating, maintaining, inspecting, and removing materials and traffic control devices, and for furnishing all equipment, labor, and incidentals necessary to complete the work as specified. The CONTRACTOR shall provide a breakdown of contract price as required by Section 01 33 00, Submittal Procedures.

D. Temporary Erosion & Sediment Control: No measurement of quantities will be made. Payment for temporary erosion and sedimentation control will be on a lump sum basis. The lump sum price shall include compensation for all labor, equipment, materials, planning and design for temporary erosion and sedimentation control measures, upkeep and maintenance of all measures, removal of erosion and sedimentation control measures at the completion of the Project and after vegetation is fully established, and all other materials and work necessary.

E. Construction Survey & Staking: No measurement of quantities will be made. Payment for construction survey and staking will be on a lump sum basis and shall include all labor, materials, and equipment necessary to complete the work.

F. Trench Safety System: No measurement of quantities will be made. Payment for trench safety system shall be made on lump sum basis. Payment shall include all labor, equipment, and materials necessary for selection, design, installation, maintenance, protection, and removal of excavation support systems as required in Section 31 50 00, Excavation and Support Protection.

G. Temporary Dewatering System: No measurement of quantities will be made. Payment for all temporary dewatering work that is not included in other bid items shall be made on a lump sum basis. Payment shall include all labor, equipment and materials to design, construct, test, operate, maintain, and decommission the temporary dewatering system as required by Section 31 23 19, Dewatering. The CONTRACTOR shall provide a breakdown of contract price as required by Section 01 33 00, Submittal Procedures.

H. Rock Excavation: Payment for rock excavation, as defined in Section 31 23 18, Rock Removal and approved by the Engineer, will be made at the unit price per cubic yard of rock excavated and rock excavation will be paid for in addition to the linear foot price for pipe, trench excavation and backfill. Measurement for rock excavation in pipe trench shall be for the length and depth of rock encountered to 6-inches below the pipe invert and the pay width shall be the nominal pipe diameter plus 12-inches on each side of the pipe for all pipe sizes. Measurement for rock excavation for vaults and other structures shall be for the depth of rock encountered to the depth necessary to install the structure and to a maximum of 18-inches beyond the outside walls of the vault or structure. No payment will be made for rock excavation beyond these limits.

I. Trench Foundation Material: Payment for trench foundation material, where its installation is directed by written direction from Engineer, shall include the excavation, removal and disposal of unsuitable material and furnishing, placing, and compacting the trench foundation material. No payment will be made for trench foundation material required because the Contractor excavates below the grade required by the Drawings in suitable material or in unsuitable material without the Engineer's written approval. Measurement for trench foundation material shall be in cubic yards of foundation material determined from weight receipts corrected to 0% moisture from each truck delivering material for installation.

J. Trench Rock Drainage Layer: Payment for trench rock drainage layer, where its installation is directed by written direction from Engineer, shall include the excavation, removal and disposal of native material and furnishing, placing, and compacting the trench rock drainage layer. No payment will be made for trench foundation material required because the Contractor excavates below the grade required by the Drawings in suitable material or in unsuitable material without the Engineer's written approval. Measurement for trench rock drainage layer shall be in cubic yards of rock drainage material determined from weight receipts corrected to 0% moisture from each truck delivering material for installation.

K. General Surfacing Restoration: No measurement of quantities will be made. Payment will be made on a lump sum basis for general surface restoration, including stripping and stockpiling topsoil, regrading to original contours, bark mulching planting areas, resurfacing gravel surfaces, and cleanup following construction as required. Measurement and payment for surface restoration of asphaltic concrete pavement and concrete surfaces such as streets, sidewalks, and curbs, will be paid under separate bid items.

L. Cold Plane Pavement Removal (4-in Depth): Measurement and payment for cold plane pavement removal to a depth of 4-inches including all work and materials, testing, inspection, and acceptance will be made on a square yard basis. Payment will include but not limited to milling, grinding, and removal of existing asphalt as shown and specified in the Drawings. Measurement will be based on total area in square yards of completed cold plane pavement removal to depth of 4-inches.

M. AC Pavement Restoration (Level 3, ½-in HMA Mixture): Measurement and payment for AC pavement restoration including all work and materials, testing, inspection, and acceptance will be made on a weight (tons) basis. Payment will include but not limited to placement of Level 3, ½-in hot mix asphalt mixture to the depth and locations indicated in the Drawings. Measurement will be based on the total weight in tons of completed and in place hot mix asphalt supporting the utility trench surfacing restoration.

N. Water Pipe, C905 DR14 PVC, 18-in w/ 30" Steel Casing: Measurement and payment for furnishing and installing C905 DR14 PVC, 18-in diameter water carrier pipe within 30-in diameter steel casing pipe, including all work and materials, testing, inspection, and acceptance, will be made on a linear foot basis. Payment will include but not limited to excavation and disposal of waste material, jacking/receiving trench shoring, furnishing and installing casing pipe by auger/jack-and-bore, installing carrier pipe with spacer supports, end seals, exterior casing grouting, filling the casing pipe with sand, backfill and compaction of jacking/receiving trenches, and all other items of the Work required by the Drawings and ODOT Utility Permit. Measurement will be based on the total horizontal length of piping constructed as indicated on the plans.

O. Water Pipe, C900/905 DR14 PVC: Measurement and payment for furnishing and installing C900/905 DR14 PVC water pipe, at all depths as shown on the plans, including all work and materials, testing, inspection, and acceptance, will be made on a linear foot basis for the pipe diameters and the trench backfill specified. Payment will include but not limited to excavation, loading, hauling, disposal, pipe and trench zone materials (including aggregate base course[s] for surface restoration), pipe installation, and the placement, compaction, and testing of the Class of trench backfill shown and specified. Measurement will be based on the total horizontal length of piping constructed as indicated on the plans without deduction for fittings and valves. Polyethylene encasement of pipe, fitting and other appurtenances are considered incidental to the installation and no separate measurement or payment will be made. Measurement and payment for surface restoration, trench foundation material and trench rock drainage layer will be paid under separate bid items.

P. Water Pipe, C900/905 DR14 PVC, Restrained: Measurement and payment for furnishing and installing C900/905 PVC restrained water pipe, at all depths as shown on the plans, including all work and materials, testing, inspection, and acceptance, will be made on a linear foot basis for the pipe diameters and the trench backfill specified. Payment will include but not limited to excavation, loading, hauling, disposal, pipe and trench zone materials (including aggregate base course[s] for surface restoration), pipe installation, and the placement, compaction, and testing of the Class of trench backfill shown and specified. Measurement will be based on the total horizontal length of piping constructed as indicated on the plans without deduction for fittings and valves. Polyethylene encasement of pipe, fitting and other appurtenances are considered incidental to the installation and no separate measurement or payment will be made. Measurement and payment for surface restoration, trench foundation material and trench rock drainage layer will be paid under separate bid items.

Q. Water Valves: Measurement and payment for furnishing and installing water valves, at all depths shown on the plans, including all work and materials, testing, inspection, and acceptance, will be made on a per each basis for the valve types and sizes specified. Valve accessories, including valve boxes, covers, risers, and extensions, are considered incidental to the installation of the valves and no separate measurement or payment will be made.

Measurement and payment for surface restoration, trench foundation material and trench rock drainage layer will be paid under separate bid items.

R. Water Pipe Fittings, DI: Measurement and payment for furnishing and installing water pipe Ductile Iron (DI) fittings, at all depths shown on the plans, including all work and materials, testing, inspection, and acceptance, will be made on a per each basis for the fitting types and sizes specified. Fitting accessories, including glands, bolts, and gaskets, restraints, thrust blocks, and polyethylene encasement are considered incidental to the installation of the fittings and no separate measurement or payment will be made. Measurement and payment for surface restoration, trench foundation material and trench rock drainage layer will be paid under separate bid items.

S. Air Release Valve Assembly: Measurement and payment for air release valve assemblies will be on a per each basis for the assembly type and size specified. Payment will include but not limited to excavation, loading, hauling, disposal, pipe and trench zone materials (including aggregate base course[s] for surface restoration), pipe, valves, fittings, boxes and covers, risers and extensions if required; installation, testing, and acceptance of water system materials as shown in the plans and specifications. Measurement and payment for surface restoration, trench foundation material and trench rock drainage layer will be paid under separate bid items.

T. Blow-Off Assembly: Measurement and payment for blow off assemblies will be on a per each basis for the assembly type and size specified. Payment will include but not limited to excavation, loading, hauling, disposal, pipe and trench zone materials (including aggregate base course[s] for surface restoration), pipe, valves, fittings, boxes and covers, risers and extensions if required; installation, testing, and acceptance of water system materials as shown in the plans and specifications. Measurement and payment for surface restoration, trench foundation material and trench rock drainage layer will be paid under separate bid items.

U. Fire Hydrant Assembly: Measurement and payment for fire hydrant assemblies will be on a per each basis. Payment will include but not limited to excavation, loading, hauling, disposal, pipe and trench zone materials (including aggregate base course[s] for surface restoration), shackles, tie rods, pier blocks, gravel, painting, and all other items for the complete installation of the hydrant including the pipe connecting the hydrant to the main; installation, testing, and acceptance of water system materials as shown in the plans and specifications. Measurement and payment for surface restoration, trench foundation material and trench rock drainage layer will be paid under separate bid items.

V. Adjustment to Existing Services – Water, Gas: Payment for adjustments to existing water and natural gas services will be made at the unit price for each utility service indicated in the Drawings. Payment will include all labor, equipment and materials to adjust the existing service piping above/under the proposed water pipping, providing required minimum clearances as indicted in the Drawings and in accordance with utility service provider requirements. Measurement and payment for surface restoration, trench foundation material and trench rock drainage layer will be paid under separate bid items.

W. Abandonment of Existing Services – Water: No measurement of quantities will be made. Payment will be made on a lump sum basis for the completion of all work for abandoning the existing water services as shown on the plans. Lump sum payment under this item shall cover

all particular elements of the project, whether or not specifically or specially identified, as specified herein, in the contract documents and as shown on the plans, except for work included separately under separate bid items. Payment shall be full and complete compensation for all work shown in the drawings and other work required for abandonment of the existing water pipe in place, including materials, equipment, and labor for construction. The CONTRACTOR shall provide a breakdown of contract price as required by Section 01 33 00, Submittal Procedures. Measurement and payment for surface restoration will be paid under separate bid items.

X. Conc Encasement of Existing Sanitary Sewer: Measurement and payment for furnishing and installing concrete encasement of existing sanitary sewer pipes, including all work and materials, testing, inspection, and acceptance, will be made on a linear foot basis. Payment will include but not limited to excavation, installation of formwork, steel reinforcement, concrete, removal of formwork, backfill and compaction as shown on the Drawings. Measurement will be based on the total horizontal length of sanitary sewer pipe encased in concrete as constructed.

Y. Water Main Connections: No measurement of quantities will be made. Payment will be made on a lump sum basis for the completion of each water main connection as indicated on the Bid Form and in the Drawings. Lump sum payment under this item shall include but not limited to excavation, loading, hauling, disposal, pipe and trench zone materials (including aggregate base course[s] for surface restoration), pipe, fittings, restraints, valves; installation, testing and acceptance of water system materials within the pay limits as shown in the plans and specifications. Polyethylene encasement of pipe, fitting and other appurtenances are considered incidental to the installation and no separate measurement or payment will be made. The CONTRACTOR shall provide a breakdown of contract price as required by Section 01 33 00, Submittal Procedures. Measurement and payment for surface restoration, trench foundation material and trench rock drainage layer will be paid under separate bid items.

Z. Testing, Flushing, and Disinfection of Water Mains: Payment for testing, flushing and disinfection of water mains will be on a lump sum basis and shall include furnishing, installing, and removing temporary blowoff piping including miscellaneous piping, valves, fittings, and thrust restraint. The Owner shall provide off-site laboratory analysis. Payment for any retesting shall be paid by the Contractor.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 01 33 00 - SUBMITTAL PROCEDURES

PART 1 GENERAL

1.1 SUMMARY

A. This Section contains administrative and procedural requirements for submittals for review, information, and for Project closeout.

B. Section includes:

1. Schedule of Submittals.
2. Submittal requirements.
3. Submittal procedures.
4. ENGINEER review.
5. Resubmittal procedures.
6. Product data.
7. Shop Drawings.
8. Samples.
9. Design data.
10. Test reports.
11. Certificates.
12. Manufacturer's instructions.
13. Manufacturer's field reports.
14. Construction progress schedules.
15. Breakdown of contract price.
16. Construction photographs.
17. Other Submittals.

1.2 DEFINITIONS

A. Action Submittals: Written and graphic information and physical samples that require ENGINEER's responsive action.

B. Informational Submittals: Written and graphic information and physical Samples that do not require ENGINEER's responsive action. Submittals may be rejected for not complying with requirements.

1.3 SCHEDULE OF SUBMITTALS

A. Within 10 days after the Effective Date of the Contract, CONTRACTOR shall submit to ENGINEER a preliminary Schedule of Submittals, including proposed list of major products proposed for use, with specification section reference, name of Manufacturer, supplier, trade name, SUBCONTRACTOR, and model number of each

product. Provide a schedule of specific target dates for the submission and return of submittals and shop drawings required by the Contract Documents.

B. For products specified only by reference standards, indicate Manufacturer, trade name, model or catalog designation, and reference standards.

C. The list and schedule shall be updated and resubmitted when requested by the ENGINEER.

D. CONTRACTOR's Schedule of Submittals will be acceptable to the ENGINEER if it provides a workable arrangement for reviewing and processing the required submittals.

1.4 SHOP DRAWING AND SAMPLE SUBMITTAL REQUIREMENTS

A. Before submitting a Shop Drawing or Sample, CONTRACTOR shall have:

1. reviewed and coordinated the Shop Drawing or Sample with other Shop Drawings and Samples and with the requirements of the Work and the Contract Documents;

2. determined and verified all field measurements, quantities, dimensions, specified performance and design criteria, installation requirements, materials, catalog numbers, and similar information with respect thereto;

3. determined and verified the suitability of all materials and equipment offered with respect to the indicated application, fabrication, shipping, handling, storage, assembly, and installation pertaining to the performance of the Work; and

4. determined and verified all information relative to CONTRACTOR's responsibilities for means, methods, techniques, sequences, and procedures of construction, and safety precautions and programs incident thereto.

B. Each submittal shall bear a stamp or specific written certification that CONTRACTOR has satisfied CONTRACTOR's obligations under the Contract Documents with respect to CONTRACTOR's review of that submittal, and that CONTRACTOR approves the submittal.

C. With each submittal, CONTRACTOR shall give ENGINEER specific written notice of any variations that the Shop Drawing or Sample may have from the requirements of the Contract Documents. This notice shall be set forth in a written communication separate from the Shop Drawings or Sample submittal; and, in addition, in the case of Shop Drawings by a specific notation made on each Shop Drawing submitted to ENGINEER for review of each such variation.

1.5 SUBMITTAL PROCEDURES

A. CONTRACTOR shall submit Shop Drawings and Samples to ENGINEER for review in accordance with the accepted Schedule of Submittals.

B. Transmit each submittal with ENGINEER-accepted transmittal form certifying compliance with requirements of Contract Documents.

C. Sequentially number transmittal forms. Mark transmittal forms for resubmittals with original number and sequential alphabetic suffix.

D. Show each Submittal with the following numbering and tracking system:

1. Submittals shall be numbered according to specification section. For example, the first product submittal for Section 05 50 00 would be “05 50 00-1”. Resubmittals of that submittal would be “05 50 00-1.1”, followed by “05 50 00-1.2”, and so on. The second product submittal for that Section would be “05 50 00-2”.

2. Submittals containing product information from multiple sections of the specifications will not be reviewed. CONTRACTOR and/or their supplier shall divide submittals in a manner that meets the numbering and tracking system requirements stated herein.

3. Alternative method of numbering may be used if acceptable to ENGINEER.

E. Identify: Project, CONTRACTOR, SUBCONTRACTOR and supplier, pertinent drawing and detail number, and specification Section number appropriate to submittal.

F. Apply CONTRACTOR's stamp, signed or initialed, certifying that review, approval, verification of products required, field dimensions, adjacent construction Work, and coordination of information is according to requirements of the Work and Contract Documents.

G. Coordinate submission of related items.

1. All shop drawings for interrelated items shall be scheduled for submission at the same time.

2. The ENGINEER may hold shop drawings in cases where partial submission cannot be reviewed until the complete submission has been received or where shop drawings cannot be reviewed until correlated items affected by them have been received. When such shop drawings are held, the ENGINEER will advise the CONTRACTOR in writing that the shop drawing submitted will not be reviewed until shop drawings for all related items have been received.

H. When hard copies of submittals are provided by the CONTRACTOR, six copies of all materials shall be provided to the ENGINEER. Two copies of reviewed submittals will

be kept by the ENGINEER, two copies of reviewed submittals will be transmitted to the OWNER, and two copies of reviewed submittals will be returned to the CONTRACTOR. If the CONTRACTOR requests that more than two copies of the reviewed submittal be returned, then the CONTRACTOR shall submit the appropriate quantity of submittals.

I. When electronic transmittals of submittals are provided by the CONTRACTOR under established protocols described elsewhere in the Contract Documents or as jointly developed by the OWNER, ENGINEER and CONTRACTOR, provide electronic submittals in portable document format (PDF) in addition to the source document format (Word, Excel, AutoCAD, etc.). Reviewed submittals will be returned to the CONTRACTOR as PDF electronic files.

J. For each submittal for review, allow not less than 14 days for ENGINEER review, excluding delivery time to and from CONTRACTOR.

K. Identify variations in Contract Documents and product or system limitations that may be detrimental to successful performance of completed Work.

L. Allow space on submittals for CONTRACTOR and ENGINEER review stamps or comments.

M. When revised for resubmission, the CONTRACTOR shall identify changes made since previous submission. A narrative of changes shall be provided, and shop drawings or calculations shall indicate that a revision was made.

N. Distribute copies of reviewed submittals as appropriate. Instruct parties to promptly report inability to comply with review comments.

O. Submittals not requested will not be recognized nor processed.

P. Incomplete Submittals: ENGINEER will not review. Complete submittals for each item are required. Delays resulting from incomplete submittals are not the responsibility of ENGINEER.

1.6 ENGINEER REVIEW

A. Informational submittals and other similar data are for ENGINEER's information, do not require ENGINEER's responsive action, and will not be reviewed or returned with comment.

B. The ENGINEER’s review of submittals and shop drawings is not a check of any dimension or quantity and will not relieve the CONTRACTOR from responsibility for errors of any sort in the submittals and shop drawings.

C. Submittals made by CONTRACTOR that are not required by Contract Documents may be returned without action.

D. The ENGINEER will review the submitted data and shop drawings and return to the CONTRACTOR with notations thereon indicating "No Exception Taken", "Make Corrections Noted", "Rejected", "Revise and Resubmit", or "Submit Specified Item".

E. If more than two submissions of an item are required to meet the Project specifications, CONTRACTOR shall be responsible for ENGINEER's charges to OWNER for its review time, and OWNER may impose a set-off against payments due to CONTRACTOR to secure reimbursement for such charges, unless the need for such change is beyond the control of CONTRACTOR.

F. ENGINEER will provide timely review of Shop Drawings and Samples in accordance with the Schedule of Submittals acceptable to ENGINEER. ENGINEER's review will be only to determine if the items covered by the submittals will, after installation or incorporation in the Work, conform to the information given in the Contract Documents and be compatible with the design concept of the completed Project as a functioning whole as indicated by the Contract Documents.

G. ENGINEER's review will not extend to means, methods, techniques, sequences, or procedures of construction or to safety precautions or programs incident thereto.

H. ENGINEER's review of a separate item as such will not indicate approval of the assembly in which the item functions.

I. ENGINEER's review of a Shop Drawing or Sample shall not relieve CONTRACTOR from responsibility for any variation from the requirements of the Contract Documents unless CONTRACTOR has complied with the requirements of Paragraph 1.4.C and ENGINEER has given written acceptance of each such variation by specific written notation thereof incorporated in or accompanying the Shop Drawing or Sample. ENGINEER will document any such accepted variation from the requirements of the Contract Documents in a Field Order.

J. ENGINEER's review of a Shop Drawing or Sample shall not relieve CONTRACTOR from responsibility for complying with the requirements of Paragraph 1.4 A. and B.

K. ENGINEER's review of a Shop Drawing or Sample, or of a variation from the requirements of the Contract Documents, shall not, under any circumstances, change the Contract Times or Contract Price, unless such changes are included in a Change Order.

L. Neither ENGINEER's receipt, review, return of a Shop Drawing, Sample, or other submittal shall result in such item becoming a Contract Document.

M. CONTRACTOR shall perform the Work in compliance with the requirements and commitments set forth in returned Shop Drawings and Samples, subject to the provisions of Paragraph 1.6.I.

1.7 RESUBMITTAL PROCEDURES

A. CONTRACTOR shall make corrections required by ENGINEER and shall return the required number of corrected copies of Shop Drawings and submit, as required, new Samples for review. CONTRACTOR shall direct specific attention in writing to revisions other than the corrections called for by ENGINEER on previous submittals.

B. CONTRACTOR shall furnish required submittals with sufficient information and accuracy to obtain required review of an item with no more than two submittals. ENGINEER will record ENGINEER's time for reviewing a third or subsequent submittal of a Shop Drawings, sample, or other item requiring review, and CONTRACTOR shall be responsible for ENGINEER's charges to OWNER for such time. OWNER may impose a set-off against payments due to CONTRACTOR to secure reimbursement for such charges.

C. If CONTRACTOR requests a change of a previously reviewed submittal item, CONTRACTOR shall be responsible for ENGINEER's charges to OWNER for its review time, and OWNER may impose a set-off against payments due to CONTRACTOR to secure reimbursement for such charges, unless the need for such change is beyond the control of CONTRACTOR.

PART 2 PRODUCTS

2.1 CONSTRUCTION PROGRESS SCHEDULES

A. Within 10 days after the Effective Date of the Contract, prepare and submit to the ENGINEER a practicable schedule showing the order in which the CONTRACTOR proposes to carry out the Work, the dates on which the important features of the work will start, and the contemplated dates for completing same. A time-scaled bar chart schedule shall include the following:

- Construction activities
- Submittal and review of critical material samples and shop drawings
- Procurement and delivery of critical materials
- Duration of work, including completion times of all stages and their sub-phases

B. Attention is drawn to typical local climatic weather patterns and Work shall be coordinated accordingly.

C. Complete Project schedule shall be revised and resubmitted to the ENGINEER at a minimum occurrence of every three (3) weeks for review.

D. Three Week Lookahead Schedules: Provide each week at the weekly construction meeting. The previous week's completed work shall be shown on the schedule for a total of 4 weeks shown.

2.2 BREAKDOWN OF CONTRACT PRICE

A. Within 10 days after the Effective Date of the Contract, submit a complete breakdown of all lump sum bid items showing the value assigned to each part of the work, including an allowance for profit and overhead adding up to the total lump sum contract price.

B. Breakdown of lump sum bids shall be coordinated with the items in the schedule and shall be in sufficient detail to serve as the basis for progress payments during construction.

C. ENGINEER will review the contract price breakdown and may request items to be further broken down or for more items be added in order to facilitate tracking of work progress for payment.

D. Preparatory work, bonds, and insurance required in setting up the job will be allowed as a separate entry on the cost breakdown but shall not exceed 5 percent of the total base bid.

E. Upon acceptance of the breakdown of the contract price by the ENGINEER, it shall be used as the basis for all requests for payment.

2.3 PRODUCT DATA

A. Product Data: Action Submittal: Submit to ENGINEER for review for assessing conformance with information given and design concept expressed in Contract Documents. Submitted data shall be sufficient in detail for determination of compliance with the Contract Documents.

B. Mark each copy to identify applicable products, models, options, and other data. Supplement Manufacturers' standard data to provide information specific to this Project.

1. Note submittal will be returned to CONTRACTOR without review of submittal if products, models, options, and other data are not clearly marked or identified.

C. Indicate product utility and electrical characteristics, utility connection requirements, and location of utility outlets for service for functional equipment and appliances.

D. After review, produce copies and distribute according to Paragraph 1.5.M and for record documents.

2.4 SHOP DRAWINGS

A. Shop Drawings: Action Submittal: Submit to ENGINEER for assessing conformance with information given and design concept expressed in Contract Documents.

B. Indicate special utility and electrical characteristics, utility connection requirements, and location of utility outlets for service for functional equipment and appliances.

C. When required by individual Specification Sections, provide Shop Drawings signed and sealed by a professional ENGINEER licensed in the state of Project, responsible for designing components shown on Shop Drawings.

1. Include signed and sealed calculations to support design.

2. Submit Shop Drawings and calculations in form suitable for submission to and approval by authorities having jurisdiction.

3. Make revisions and provide additional information when required by authorities having jurisdiction.

D. All dimensioned shop drawings shall be scalable and provided as full-sized (22-inch x 34-inch) sheets. PDF electronic files shall print as scalable full-sized sheets.

E. After review, produce copies and distribute according to Paragraph 1.5.M and for record documents.

2.5 SAMPLES

A. Samples: Action Submittal: Submit to ENGINEER for assessing conformance with information given and design concept expressed in Contract Documents.

B. Samples for Selection as Specified in Product Sections:

1. Submit to ENGINEER for aesthetic, color, and finish selection.

2. Submit Samples of finishes, textures, and patterns for OWNER selection.

C. Submit Samples to illustrate functional and aesthetic characteristics of products, with integral parts and attachment devices. Coordinate Sample submittals for interfacing work.

D. Include identification on each Sample, with full Project information.

E. Submit number of Samples specified in individual Specification Sections; ENGINEER will retain one Sample.

F. Reviewed Samples that may be used in the Work are indicated in individual Specification Sections.

G. After review, produce copies and distribute according to Paragraph 1.5.M and for record documents.

2.6 DESIGN DATA

A. Informational Submittal: Submit data for ENGINEER's knowledge as Contract administrator or for OWNER.

B. Submit information for assessing conformance with information given and design concept expressed in Contract Documents.

2.7 TEST REPORTS

A. Informational Submittal: Submit reports for ENGINEER's knowledge and records as Contract administrator or for OWNER.

B. Submit test reports for information for assessing conformance with information given and design concept expressed in Contract Documents.

2.8 CERTIFICATES

A. Informational Submittal: Submit certification by Manufacturer, installation/application SUBCONTRACTOR, or CONTRACTOR to ENGINEER, in quantities specified for Product Data.

B. Indicate material or product conforms to or exceeds specified requirements. Submit supporting reference data, affidavits, and certifications as appropriate.

C. Certificates may be recent or previous test results on material or product but must be acceptable to ENGINEER.

2.9 MANUFACTURER'S INSTRUCTIONS

A. Informational Submittal: Submit Manufacturer's installation instructions for ENGINEER's knowledge as Contract administrator or for OWNER.

B. Submit printed instructions for delivery, storage, assembly, installation, startup, adjusting, and finishing, to ENGINEER in quantities specified for Product Data.

C. Indicate special procedures, perimeter conditions requiring special attention, and special environmental criteria required for application or installation.

2.10 MANUFACTURER'S FIELD REPORTS

A. Informational Submittal: Submit reports for ENGINEER's knowledge and records as Contract administrator or for OWNER.

B. Submit report within 48 hours of observation to ENGINEER for information.

C. Submit reports for information for assessing conformance with information given and design concept expressed in Contract Documents.

2.11 ERECTION DRAWINGS – NOT USED

2.12 PROJECT HEALTH AND SAFETY PROGRAM – NOT USED

2.13 CONSTRUCTION PHOTOGRAPHS

A. Provide photographs of Site and construction throughout progress of Work.

B. Submit photographs with Application for Payment.

C. Photographs: Electronic, PDF, or JPEG format.

D. Take photographs of key construction elements: lateral connections, valve connections, creek crossings, and connections to existing piping. Take photographs with different angles and with varying zoomed in/out perspective to provide details of work and relative reference of the trench and Site.

E. Identify each photo in the electronic file name. Identify name of Project, pipe stationing, orientation of view, and date photo is taken.

2.14 OPERATION AND MAINTENANCE (O&M) INSTRUCTIONS – NOT USED

2.15 OTHER REQUIRED SUBMITTALS

A. Other required submittals include the items listed below. This list is provided for CONTRACTOR's convenience only and may not be complete in all respects. CONTRACTOR shall provide all submittals specified or required, whether or not listed here.

1. CONTRACTOR Emergency Contact List.
2. Erosion and Sediment Control Plan.
3. Traffic Control and Protection Plan.
4. Work Sequencing Plan.
5. Dewatering Plan.
6. Record Drawings.

PART 3 EXECUTION - Not Used

END OF SECTION

SECTION 01 45 00 - QUALITY CONTROL

PART 1 GENERAL

1.1 DESCRIPTION

A. This Section covers quality control requirements supplementary to those of the General Conditions and Technical Specifications.

1.2 PROVISIONS

A. CONTRACTOR's Responsibility for Testing

The CONTRACTOR shall be responsible for the cost of all testing as specified in this section. Additional information has been provided regarding the payment responsibility for the OWNER with regards to the Project.

B. OWNER's Right to Perform Additional Tests

The OWNER or ENGINEER reserves the right to complete additional testing. In such cases, the CONTRACTOR shall provide safe access for the OWNER or ENGINEER and their inspectors to adequately inspect the quality of work and the conformance with Project specifications.

1.3 QUALITY ASSURANCE

A. Testing Requirements

An independently owned and operated laboratory approved by the ENGINEER shall perform all testing as specified herein.

B. Testing

1. General

a. All required testing of work and/or materials shall be conducted in the presence of the ENGINEER. The CONTRACTOR shall provide 48-hour notification to the OWNER and OWNER's Representative prior to conducting any and all quality assurance testing. Where applicable, work and materials shall only be buried with the consent of the ENGINEER.

b. Where such inspection and testing are to be conducted by an independent laboratory or agency, the sample, or samples of material to be tested shall be selected by such laboratory or agency or by the ENGINEER. The CONTRACTOR shall furnish such samples of all materials without charge to OWNER.

c. The results from any and all tests are made for the information of the OWNER. Regardless of any test results, the CONTRACTOR is solely responsible for the quality of workmanship and materials and for compliance with the requirements of the Drawings and Specifications.

2. Costs of Testing

a. The CONTRACTOR shall be responsible for and shall pay for all tests as specified in Part 3 of this Section. Additional information has been provided regarding the payment responsibility for the OWNER with regards to the Project.

b. With regards to all materials to be tested, where test results demonstrate that the material or workmanship does not meet the minimum requirements of the Contract Documents, additional testing shall be completed and shall be paid for by the CONTRACTOR with no reimbursement by the OWNER.

1.4 SPECIAL INSPECTIONS – NOT USED

1.5 SUBMITTALS

A. Laboratory Test or Inspection Reports

Each report shall be signed and certified by the independently owned and operated testing laboratory. Unless otherwise specified, submit three copies of each report to the OWNER or OWNER's Representative.

PART 2 PRODUCTS - NOT USED

PART 3 EXECUTION

3.1 FIELD TESTING SCHEDULE

A. The CONTRACTOR shall complete field testing in accordance with the following schedule. Additional source material testing shall be completed as necessary to establish the basis of field tests. The frequency of testing listed in this schedule lists the minimum number of tests per quantity of work completed by the CONTRACTOR. Testing locations to be determined by the ENGINEER.

Material to be Tested	Payment Responsibility for Initial Testing	Minimum Testing Frequency
Trench Backfill	CONTRACTOR	In-place compaction testing (w/ nuclear compaction gauge) performed at the surface and on each lift of backfill for every 200 lineal feet of pipeline trench as measured along pipe centerline. ENGINEER may reduce frequency to one test per lift for every 1,500 lineal feet of pipeline trench when satisfied with CONTRACTOR's method of compaction. See Article 3.16, Field Quality Control of Section 31 23 17, Trenching for further details.
Asphalt Concrete	CONTRACTOR	As required when placed. See detailed requirements in Article 3.3, Field Quality Control of Section 32 12 16, Asphalt Paving.
Concrete	CONTRACTOR	As required when placed. See Section 03 11 00, Concrete Work.
Sanitary Sewer Pipes	CONTRACTOR	As required. See Sections 33 30 00.13, Sewer and Manhole Testing and 33 30 10.16, TV Inspection of Sewer Pipelines.
Waterline – Hydrostatic testing and disinfection	CONTRACTOR	As required. See Section 33 13 00, Testing and Disinfection of Water Utility Piping.
Waterline – Bacteriological testing	OWNER	As required. See Section 33 13 00, Testing and Disinfection of Water Utility Piping.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 01 50 00 - TEMPORARY FACILITIES AND CONTROLS

PART 1 GENERAL

1.1 SUMMARY

A. Temporary construction facilities and control requirements for the Work include the following. CONTRACTOR is responsible for providing all temporary facilities and controls necessary to complete the Work as described in the Contract Documents.

1. Utilities including lighting, electricity and water.
2. Water truck and backflow device for connection to water system.
3. Sanitary facilities.
4. Fire protection.
5. Security fencing.
6. Enclosures.
7. Parking area.
8. Traffic Control.
9. OWNER's access to facilities.
10. Secured storage for materials.

B. Maintain temporary facilities in proper and safe condition throughout progress of Work.

C. Comply with federal, state, and local codes and regulations, and utility company requirements.

1.2 LAYOUT OF TEMPORARY FACILITIES

A. Before starting Work, submit to OWNER, for approval, proposed layout of temporary facilities.

B. Should CONTRACTOR require space in addition to that shown on Drawings, CONTRACTOR shall make arrangements for storage of materials and equipment in locations off Site.

1.3 UTILITY PROPERTIES AND SERVICE

A. In areas where the CONTRACTOR's operations are adjacent to or near a utility and such operations may cause damage which might result in significant expense, loss and inconvenience, the operations shall be suspended until all arrangements necessary for the protection thereof have been made by the CONTRACTOR.

B. The CONTRACTOR shall notify all utility offices which may be affected by the construction operation at least 48 hours in advance. Before exposing any utility, the utility having jurisdiction shall grant permission and may oversee the operation. Should service of any utility be interrupted due to the CONTRACTOR's operation, the proper authority shall be notified immediately. It is of the utmost importance that the CONTRACTOR cooperates with the said authority in restoring the service as promptly as possible. Any costs shall be borne by the CONTRACTOR.

C. CONTRACTOR to contact one-number locator service (811) at least 48 hours in advance in advance of all excavations or other activities that may disturb and/or damage existing utilities. Existing utilities which may be impacted include the following:

UTILITY	UTILITY PROVIDER
Potable Water	City of Warrenton
Storm Water	ODOT, City of Warrenton
Sanitary Sewer	City of Warrenton
Natural Gas	Northwest Natural
Telephone/Data	
Power	Pacific Power (PacifiCorp)

1.4 TEMPORARY LIGHTING AND ELECTRICITY

A. General:

1. Temporary lighting shall be sufficient to enable CONTRACTOR and SUBCONTRACTORs to complete Work and enable OWNER to observe Work. Illumination shall meet or exceed state code requirements.

B. Temporary Electric Power:

1. Provide portable generator(s) as needed.

1.5 TEMPORARY HEAT – NOT USED

1.6 TEMPORARY COMMUNICATIONS – NOT USED

1.7 PROJECT IDENTIFICATION – NOT USED

1.8 WATER FOR CONSTRUCTION AND TESTING

A. CONTRACTOR is responsible for making all arrangements necessary for temporary water for construction.

1. Non-potable water for construction purposes will be purchased from the OWNER through an approved hydrant meter permit application and payment of necessary fees.

2. The CONTRACTOR shall furnish all valves, hoses, connections, and other devices as necessary to obtain sufficient water for construction and for filling and testing of water lines as required. Fire hydrant use is allowed only by permission of the utility OWNER.

3. Backflow protection is required on all connections to potable water systems.

1.9 SANITARY FACILITIES

A. Provide temporary sanitary facilities conforming to state and local regulations, in sufficient numbers for use of CONTRACTOR's and SUBCONTRACTOR's employees.

B. Maintain in sanitary condition and properly supply with toilet paper.

C. Use of OWNER's existing sanitary facilities is not allowed.

1.10 TEMPORARY FIRE PROTECTION

A. Provide and maintain fire extinguishers and other fire protection equipment and devices as would be reasonably effective in extinguishing fires during early stages by personnel at Site.

1.11 TEMPORARY SITE AND OTHER ROADS

A. Maintain existing roads used during construction free from accumulation of dirt, mud, and construction debris.

B. CONTRACTOR shall repair or replace existing roads that remain to original or better condition prior to Final Completion. Survey and record condition of existing roads prior to construction.

1.12 CONTRACTOR'S WORK AREA

A. Work Area:

1. Limit construction operations and storage of equipment and materials to areas shown on Drawings and as determined by OWNER.

2. Except as provided herein, no private property, or other area adjacent to Site shall be used for storage of CONTRACTOR's equipment and materials unless prior written approval is obtained from legal OWNER of the respective locations.

3. CONTRACTOR shall maintain staging areas during construction in a manner that will not obstruct operations of existing facilities. Work shall proceed in an orderly manner, maintaining construction Site and staging area free of debris and unnecessary equipment or materials.

B. Storage and Protection of Equipment and Materials:

1. The CONTRACTOR shall be solely responsible for the protection and security of all equipment and materials stored on the site. Equipment and materials stored at the site shall be placed neatly on the job site in an area and environment that will provide protection and security. Materials that are not adequately protected or stored in

conformance with the Manufacturer's recommendations will be rejected. Unusable materials (i.e., rejected, or damaged liner material, old concrete chunks, metal scraps, etc.) shall be expeditiously removed from the job site.

2. Provide appropriate barricades, signs, and traffic control devices in like-new condition where necessary to protect the public and OWNER employees from any hazards associated with the storage of materials and equipment used for this Project.

3. No equipment and/or materials shall be stored outside the immediate work area, in the following locations, or in the following manner:

   a. In any maintained landscape or lawn area.

   b. In a manner that would totally eliminate an individual residents' street parking, or parking for the OWNER's existing buildings.

   c. In front of any business.

   The "immediate work area" is the area where work is taking place or will be taking place within one calendar day. The CONTRACTOR shall immediately move stored material or equipment which causes a nuisance or creates complaints.

1.13 SECURITY

A. CONTRACTOR shall be responsible for loss or injury to persons or property where Work is involved and shall provide security and take precautionary measures to protect CONTRACTOR's and OWNER's interests.

B. Provide and maintain temporary fencing of design and type needed to prevent entry into active construction areas.

1.14 ENCLOSURES

A. Provide and maintain all enclosures, scaffolds, tarpaulins, canopies, warning signs, steps, platforms, bridges, and other temporary construction necessary for proper completion of Work.

1.15 PARKING

A. Staging area and designated areas within construction limits may be used for parking of construction personnel's private vehicles and CONTRACTOR's lightweight vehicles. Parking shall not impede access or traffic on adjacent roadways.

B. Make arrangements for additional parking off site as required.

C. No overnight parking, camping, or storage of personal vehicles, trailers or other items will be authorized.

1.16 TRAFFIC CONTROL AND PROTECTION

A. The Contractor shall maintain traffic control and protection in the work areas 24 hours per day. Traffic control shall conform to the requirements set forth by the ODOT as well as the standards set forth in the Manual on Uniform Traffic Control Devices (MUTCD) and local jurisdiction.

B. The Contractor shall conduct its operations so as to keep one lane of traffic open for public and private access at all times on City, County and Public streets, roads and highways. Permits obtained for the Project may have more stringent requirements than noted in this section.

C. Prior to beginning construction and as necessary or required by local or state agencies, the Contractor shall submit a detailed street closure and traffic control plan to the OWNER and ODOT for approval, which meets the requirements of the of ODOT. As construction proceeds, the Contractor shall notify the OWNER and ODOT as to the status of street closures and detours, if required.

D. All work shall be carried on with due regard for safety to the public. Open trenches shall be backfilled or covered with steel plates at the end of each day.

1.17 CONTRACTOR'S FIELD OFFICES AND BUILDINGS – NOT USED

1.18 ENGINEER'S FIELD OFFICE AND EQUIPMENT – NOT USED

PART 2 PRODUCTS - NOT USED

PART 3 EXECUTION

3.1 GENERAL

A. Maintain and operate systems to ensure continuous service for duration of construction.

B. Modify and extend systems, as Work progress requires.

3.2 REMOVAL

A. Completely remove temporary materials, equipment, signs, and structures when no longer required.

B. In unfinished areas, clean and repair damaged caused by temporary installations or use of temporary facilities, restore drainage, and evenly grade, seed, or plant as necessary to provide appearance equal to or better than original.

C. In finished areas, restore existing or permanent facilities used for temporary services to specified, or original condition.

3.3 DAMAGE TO EXISTING PROPERTY

A. CONTRACTOR is responsible for replacing or repairing damage to existing buildings, structures, sidewalks, roads, parking areas, and other existing assets.

B. CONTRACTOR shall have option of having OWNER contract for such Work and have cost deducted from Contract Price.

3.4 OWNER'S USE – NOT USED

END OF SECTION

SECTION 01 55 00 - SITE ACCESS, STAGING, AND STORAGE

PART 1 GENERAL

1.1 CONTRACTOR'S WORK AND STORAGE AREAS

A. Portions of the Site and off-Site areas for CONTRACTOR's use during the term of the Contract as a stockpiling, storage, staging and shop area for construction operations for the WORK are identified on the Drawings as those areas enclosed by erosion control methods and as identified in Article 3.2 below. At completion of the WORK, the CONTRACTOR shall restore these areas to their original condition, including grading, surfacing and landscaping, unless otherwise indicated in this Section, on the Drawings, or by the ENGINEER.

B. Other lands to be furnished by the OWNER for storage, staging, construction operation, roads and other purposes are indicated on the Drawings. Should the CONTRACTOR find it necessary to use any additional land for its operations or for other purposes during the construction of the WORK, it shall arrange for the use of such lands at its own expense.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.1 PUBLIC ACCESS

A. Continuous, unobstructed, safe, and adequate pedestrian and vehicular access shall be provided to fire hydrants, commercial and industrial establishments, private residences, churches, schools, parking lots, service stations, motels, fire and police stations, and hospitals. Continuous emergency vehicle access shall be provided through work areas in public roadways. The CONTRACTOR shall cooperate with parties involved in the delivery of mail and removal of trash and garbage so as to maintain existing schedules for such services. Vehicular access to residential driveways shall be maintained to the property line except when necessary construction precludes such access for reasonable periods of time, as approved by the ENGINEER.

1. If exceptions are necessary, notify OWNER so that OWNER can secure written consent of individuals or authorities concerned to permit such temporary construction associated with access points.

2. Plan and perform the construction work so that all adjacent businesses have access at all times. Maintain clear communication and scheduling with the business owners and residents at all times.

3. Access to the WORK shall be provided as may be required by the OWNER or its representatives, and all authorized representatives of the state and federal governments and any other agencies having jurisdiction over any phase of the work, for inspection of the progress of the work, the methods of construction or any other required purposes.

3.2 STAGING AND STORAGE AREAS

A. Staging areas for CONTRACTOR personnel, materials, and equipment may occur at the following sites. Staging area use shall only be allowed with the following limitations stated in this specification and as noted on the Drawings. CONTRACTOR will inspect and become familiar with the existing conditions at each site prior to Mobilization. CONTRACTOR shall not be required to use or develop all sites. The following conditions apply to the sites if they are used by the CONTRACTOR:

Location	Allowed Activities
As Delineated in the Drawings	CONTRACTOR may utilize delineated area as shown in the Drawings for staging and material storage. Contractor shall prepare a detailed staging plan for approval which incorporates all OWNER requirements including but not limited to temporary chain-link security fencing and erosion control.

3.3 TEMPORARY CONSTRUCTION ACCESS AND PARKING AREAS

A. Locate any temporary construction roads, drives, walks, and parking facilities to provide uninterrupted access to construction offices, mobilization, work and storage areas, and other areas required and approved by the OWNER.

B. Traffic and parking areas shall be maintained in a sound condition, free of excavated material, construction equipment, mud, and construction materials.

3.4 WORK AND STORAGE AREA

A. Make arrangements for any additional off-site storage or shop areas necessary for the proper execution of the WORK at no additional cost to the OWNER.

3.5 ROADWAY LIMITATIONS

A. The CONTRACTOR shall make its own investigation of the condition of available public and private roads and of clearances, restrictions, bridge load limits, and other limitations affecting transportation and ingress and egress to the site of the WORK. It shall be the CONTRACTOR's responsibility to construct and maintain any temporary haul roads required for its construction operations.

END OF SECTION

SECTION 01 56 39 - TEMPORARY TREE AND PLANT PROTECTION

PART 1 GENERAL

1.1 SUMMARY

A. This Section includes provisions for temporary protection of trees and other plant life in preparation for trenching, site or building excavation Work.

B. This specification shall be applied concurrently and in conjunction with other plant material protection measures herein described and specified.

C. Related Sections:

1. Section 31 10 00 - Site Clearing
2. Section 31 22 13 - Rough Grading
3. Section 31 23 16 - Excavation
4. Section 31 23 17 - Trenching

PART 2 MATERIALS - Not Used

PART 3 EXECUTION

3.1 INSPECTION

A. Inspect all trees specified on the Drawings for protection prior to construction.

1. Document with written memorandum and photographs any unusual conditions.
2. Submit copies of documentation to Engineer prior to beginning work.

B. Verify all conditions on the Drawings with actual conditions at Site regarding tree protection prior to any site disturbance.

C. The Engineer must be present during demolition of existing conditions occurring within the drip line of trees designated to remain.

D. Notify Engineer 24 hours prior to inspections and/or tagging of protected trees.

3.2 PROTECTION

A. Install barricades specified in the Drawings at drip lines of trees designated to remain prior to the commencement of construction.

B. Clearly designate protected trees and clear of any material storage, personnel, or vehicular movement.

C. Provide temporary fencing, barricades, and guards as necessary or required to protect trees designated on the Drawings to remain, from damage above and below grade.

D. Protect root systems of trees and plant life to remain.

1. Protect from damage due to noxious materials in solution caused by runoff or spillage during mixing and placement of construction materials.

2. Protect from flooding, erosion, or excessive wetting resulting from dewatering operations and compaction.

3. Protect against unauthorized cutting, breaking, skinning roots and branches, or bruising bark.

4. Protect from smothering and compaction.

a. Do not store construction materials or permit vehicles to drive or park within the drip line area of any tree to remain.

5. Protect from dumping of refuse in close proximity.

E. Where cutting is necessary, review conditions with the Engineer before proceeding, and comply with directives of Engineer.

3.3 EXCAVATION AROUND TREES

A. Excavate within drip lines of trees only where indicated on the Drawings or as directed by Engineer.

B. Where trenching for utilities is required within drip lines, tunnel under or around roots by hand excavating.

1. Where possible trench toward trunk of tree and tunnel under central root mass to avoid severing all lateral roots on side of trench.

2. Do not cut main lateral roots or tap roots over 1-inch in diameter.

3. Temporarily support and protect trees from damage until permanently covered with approved backfill.

C. Do not allow exposed roots to dry out before backfill is placed.

1. Provide temporary earth or burlap cover.

2. Water roots daily when exposed and maintain in a moist condition.

D. Backfill roots only upon inspection approval from the Engineer.

1. Backfill around root excavations only with clean imported topsoil free from materials deleterious to root growth.

2. Backfill to eliminate voids and compact only by means of manual tamping at root areas.

3. Water sufficiently to settle topsoil and eliminate voids or air pockets around roots.

4. Allow for natural settlement of soil surface and furnish and apply topsoil sufficient to bring to original finish grade after backfill settlement.

E. If during excavation, any condition arises that threatens the survivability of the protected tree, or an unknown condition arises that affects the stability or integrity of the root system, notify the Engineer immediately.

3.4 REPAIR AND REPLACEMENT OF DAMAGED TREES

A. In the event of damage to existing trees:

1. Immediately prune limbs smaller than 3-inch caliper or roots smaller than 2-inch caliper to repair trees damaged by construction operations.

2. Make repairs promptly after damage occurs to prevent progressive deterioration of damaged trees.

3. Any such pruning and/or repairs shall be approved in advance and at completion by Engineer.

4. The Engineer shall reserve the right, at cost to the Contractor, to obtain the services of a Certified Consulting Arborist with current membership in the American Society of Consulting Arborists to determine the severity of damage.

5. The Contractor is responsible for the cost of repairs caused by their actions or by the actions of subcontractors engaged by the Contractor.

B. Remove and replace dead or damaged trees which are determined by the Engineer to be incapable of restoration to normal growth patterns at no additional cost to Owner.

1. Provide new trees of the same species as those removed or damaged, with size and/or quantity to be determined by Engineer.

2. Furnish replacement trees and plant life to the Site and plant, maintain, and warranty as directed by the Engineer.

3. If trees are not replaceable with the same species, and size, compensate the Owner for the replacement cost of the trees based on the evaluation of a Certified Consulting Arborist.

4. The Contractor is responsible for additional costs of removing damaged trees and labor for planting new specimens.

3.5 DESIGNATED TREE REMOVAL PROCEDURES

A. If designated tree removal is specified by Engineer, furnish labor, material, and equipment necessary for removing and/or salvaging existing trees, if necessary, as designated on the Drawings for removal.

1. Verify location and species with Engineer prior to removal.

B. Salable logs or timber may be sold to Contractor's benefit upon notification and prior approval of Owner. Upon approval, remove salable logs or timber promptly from site.

3.6 DESIGNATED TREE TRANSPLANTING PROCEDURES

A. If designated tree transplanting is specified by Engineer, verify, and identify existing trees to be transplanted.

B. All work shall be in accordance with the standards and practices outlined in the following: Tree and Shrub Transplanting Manual, E.B. Himelick, 1981 Ed., International Society of Arboriculture.

C. Prior to commencement of Work, submit a coordination schedule, method of transplanting, traffic control, routing, etc., to Engineer, for review and approval.

D. Warranty for transplanted trees shall be determined and directed on a case-by-case basis by the Engineer, upon contracting of specified transplanting work.

E. Review and verify location of utilities in area of operation. Obtain location and jurisdictional approval from utilities prior to transplanting activities. Protect utilities and the public at all times.

F. Prior to transplanting, spray trees with an anti-desiccant emulsion-type film forming agent, "Dowax" by Dow Chemical Company, "Wilt-Pruf" by Nursery Specialty Products Inc., "D-Wax", by Plant Products Inc., or equal, prior to digging with two separate applications allowing 48 hours apart. Use a power sprayer to provide an adequate film over trunks, branches, stems, twigs, and foliage. Anti-desiccant must be dry prior to relocation.

G. Dig, ball, and burlap, and move designated trees for relocation to the new planting location shown on the Drawings. In the event the new planting area is not prepared, place tree in a storage area approved by the Engineer solely designated for healing-in of plant materials until final planting may occur. Brace in a vertical position, provide shade, wind protection, and irrigation at plant storage area. Utilize all horticulturally proper methods for plant storage. Plants shall be maintained by Contractor while in storage.

3.7 GRADING AND FILLING AROUND TREES

A. Maintain existing grade within drip line of trees unless otherwise indicated on the Drawings or directed by the Engineer.

3.8 MAINTENANCE OF PROTECTIVE MEASURES

A. Maintain protective measures throughout the construction process. Immediately repair any alteration to protection measures throughout construction process. Repair or reinstall protective measures immediately upon alteration. Monitor protective measures daily.

B. Remove and clear area of debris and fencing, barricades, etc., upon final written approval of Engineer.

END OF SECTION

DIVISION 02 – EXISTING CONDITIONS

SECTION 02 30 00 - SUBSURFACE INVESTIGATION

PART 1 GENERAL

1.1 SUMMARY

A. Subsurface investigations and reporting have been performed for the purpose of obtaining data for the planning and design of this Project. Copies of such reporting are attached to the Contract Documents as Supplementary Information.

1.2 LIMITATIONS

A. The subsurface investigations and reporting are being made available solely for the convenience of the Bidder and shall not relieve the Bidder or the Contractor of any risk, duty to make examinations and investigations as required by Article 4 of the Instructions to Bidders, or any other responsibility under the Contract Documents.

B. It is mutually agreed to by all parties:

1. Written reports are reference documents and are not part of the Contract Documents.

2. Subsurface investigations are for the purpose of obtaining data for planning and design of the Project.

3. Data concerning borings and test pits is intended to represent with reasonable accuracy conditions and material found in specific borings and test pits at the time the borings and test pits were made.

C. It is expressly understood and agreed the Owner and Engineer assume no responsibility whatsoever in respect to the sufficiency or accuracy of the investigation thus made, the records thereof, or of the interpretations set forth therein, or made by the Owner in the Owner's use thereof; and there is no warranty or guarantee, either expressed or implied, that the conditions indicated by such investigations, or records thereof, are representative of those existing throughout such areas, or any part, or that unforeseen developments may not occur.

D. The Owner's subsurface investigations and reporting are made available to Bidder or Contractor only on the basis of the understandings and agreement herein stated.

PART 2 PRODUCTS - Not Used

PART 3 EXECUTION - Not Used

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 02 41 00 - DEMOLITION

PART 1 GENERAL

1.1 SUMMARY

A. Section Includes:

1. Demolition and removal of existing facilities.

2. Abandoning and removing utilities.

B. Related Sections:

1. Section 31 05 16 - Aggregates for Earthwork

2. Section 31 10 00 - Site Clearing

3. Section 31 22 13 - Rough Grading

4. Section 31 23 16 - Excavation

5. Section 33 05 50 - Existing Pipe Abandonment

1.2 SUBMITTALS

A. Section 01 33 00 - Submittal Procedures: Requirements for submittals.

B. Submit to Engineer a copy of written permission of private property owners, with copy of fill permit for said private property, as may be required for disposal of materials.

1.3 QUALITY ASSURANCE

A. Existing Conditions: Determine the extent of work required and limitations before proceeding with Work.

B. Conform to applicable local, state, and federal codes for environmental requirements in relation to disposal of debris.

1. Burning at the Site for the disposal of refuse, debris, and waste materials resulting from demolition and site clearing operations shall not be permitted.

C. Permits: The Contractor is responsible for obtaining all necessary permits required for completion of the Work described in this Section.

D. Protection of Persons and Property: Meet all federal, state, and local safety requirements for the protection of workmen, other persons, and property in the vicinity of the Work and requirements of the General Provisions.

E. If the existing material to be demolished and removed contains any hazardous materials which will require special handling upon removal, such as asbestos or lead, it is the responsibility of

the Contractor to remove and dispose of the material in accordance with all applicable federal, state, and local regulations.

PART 2 PRODUCTS

2.1 MATERIALS

A. Existing Materials: All materials, equipment, miscellaneous items, and debris involved, occurring, or resulting from demolition, clearing, and grubbing work shall become the property of the Contractor at the place of origin, except as otherwise indicated in the Drawings or Specifications.

B. Crushed Rock: As specified in Section 31 05 16-2.1, Aggregates for Earthwork. Of the size shown in the Drawings or specified herein.

C. Sand: As specified in Section 31 05 16-2.2, Aggregates for Earthwork.

PART 3 EXECUTION

3.1 EXAMINATION

A. The Owner assumes no responsibility for the actual condition of the facilities to be demolished. The Contractor shall visit the site, inspect all facilities and be familiar with all existing conditions and utilities.

B. Demolition drawings identify major equipment and structures to be demolished only. Auxiliary utilities such as water, air, chemicals, drainage, lubrication oil, hydraulic power fluid, electrical wiring, controls, and instrumentation are not necessarily shown shall be considered incidental to all demolition work.

C. Identify waste and salvage areas for placing removed materials.

3.2 PREPARATION

A. Carefully coordinate the work of this Section with all other work and construction.

B. Call Local Utility Line Information service at 1-800-332-2344, not less than three working days before performing Work.

1. Request underground utilities to be located and marked within and surrounding construction areas.

2. Disconnect or arrange for disconnection of utilities (if any) affected by required work.

3. Keep all active utilities intact and in continuous operations.

3.3 PROTECTION

A. Utilities: Locate, identify, and protect utilities located by utilities and indicated in the Drawings to remain from damage.

B. Survey control: Protect benchmarks, survey control points, and existing structures from damage or displacement.

C. Preservation and Trimming of Trees, Shrubs and Other Vegetation: As specified in Section 31 10 00-3.4.C, Site Clearing.

D. Landscaped Areas: Protect existing landscaped areas as specified in Section 31 10 00-3.4.D, Site Clearing.

E. Miscellaneous Site Features: Protect all existing miscellaneous site features from damage by excavating equipment and vehicular traffic, including but not limited to existing structures, fences, mailboxes, sidewalks, paving, guy wires, utility poles, and curbs.

F. Repair and Replacement:

1. Damaged items, including but not restricted to those noted above, shall be repaired, or replaced with new materials as required to restore damaged items or surfaces to a condition equal to and matching that existing prior to damage or start of Work of this contract.

2. Any damage to existing facilities or utilities to remain as caused by the Contractor's operations shall be repaired at the Contractor's expense.

3.4 DEMOLITIONS

A. Areas which are to be excavated for the purpose of demolition shall be cleared and stripped in accordance with Section 31 10 00-3.6, Site Clearing.

B. Carefully consider all bearing loads and capacities for placement of equipment and material on site. In the event of any questions as to whether an area to be loaded has adequate bearing capacity, consult with Engineer prior to the placement of such equipment or material.

C. Demolition of Existing Structures:

1. Excavate around existing structures as required to perform demolition operations and to plug associated existing pipelines where shown in the Drawing.

2. Provide shoring, bracing, and supports, as required, to ensure adjacent structures are not damaged and structural elements of existing structures are not overloaded during demolition activities.

a. Increase structural supports or adding new supports as may be required as a result of any cutting, removal, or demolition work performed under any part of this Contract.

b. Remove all temporary protection when the Work is complete or when so authorized by the Engineer.

3. Any floors that are to remain in place shall be completely cracked through to allow for drainage. Cracking shall be accomplished by dropping a demolition ball or by other methods approved by the Engineer.

4. Remove and dispose of all exposed and/or protruding metalwork, piping, plumbing, and conduits resulting from demolition activities, and all woodwork, roofing, and electrical and mechanical equipment removed from demolished structures.

    a. Reinforcing bars shall be cut flush with final wall elevations as shown in the Drawings.

    b. No detached metalwork, excluding concrete reinforcing bars, shall be buried with the concrete and masonry rubble.

D. Backfill at Demolished Structures:

1. For structures designated to be abandoned and/or demolished in place, concrete and/or masonry rubble and excavated soils resulting from demolition activities shall be used for backfill or placed in the bottoms of said structures only as directed by the Engineer.

2. Concrete and masonry rubble used for backfilling shall be broken into pieces no larger than 12 inches on any one side.

3. Materials resulting from abandonment/demolition activities approved for backfill shall be combined with imported filler sand to create a dense, compacted backfill.

4. Backfilling or placement of the excavated material in the structures shall meet the following requirements.

    a. Furnish, place and compact filler sand along with the concrete and masonry rubble so that all voids are filled and a dense, compacted backfill is obtained.

    b. Filler sand shall be placed in horizontal layers completely filling all voids between pieces of rubble and not exceeding 12 inches in thickness.

    c. Each layer of filler sand shall be compacted to obtain at least 90 percent of maximum density as determined by ASTM Method D-698-78 (AASHTO T-99).

    d. Water shall be furnished by the Contractor and added to each layer as required to maintain optimum moisture content.

    e. The amount of filler sand used shall only be the amount needed to fill all voids created by placement of the concrete and asphalt rubble, as directed by the Engineer.

    f. At locations where concrete and masonry rubble are used for backfill, they shall be placed such that a minimum of 3 feet of compacted non-rubble backfill material (crushed rock) exists between any rubble and finished grade. Protruding reinforcing bars shall be cut to lengths that allow granular backfill to be placed and compacted to required levels in and above the rubble.

5. Disposal of all materials not used for backfill shall be performed off-site and in compliance with applicable local, state, and federal codes and requirements.

6. In areas where new construction will take place, no trace of these structures shall remain prior to placing of backfill.

E. Backfilling within the footprint of new structures with rubble material resulting from demolition activities will not be allowed.

F. All existing improvements designated in the Drawings or specified to be removed, including but not limited to structures, pipelines, walls, footings, foundations, slabs, pavements, curbs, fencing, and similar structures occurring above, at, or below existing ground surface shall be included in the demolition work.

G. Unless otherwise specified, any resulting voids shall be backfilled with suitable excavated or imported material compacted to the density of the adjacent soil.

3.5 EXISTING WATER UTILITY PIPING ABANDONMENT

A. As specified in Section 33 05 50, Existing Pipe Abandonment.

3.6 NOT USED

3.7 NOT USED

3.8 ASPHALTIC CONCRETE DEMOLITION

A. Asphalt pavement shall be removed to the limits shown in the Drawings.

B. The limits of the removal shall be saw cut.

C. Asphalt pavement may not be used as rubble fill.

3.9 REMOVAL

A. Remove debris, rock, excavated materials, rubble, abandoned piping, and extracted plant life resulting from abandonment and/or demolition activities from site.

B. Continuously clean-up and remove waste materials from site. Do not allow materials to accumulate on site.

C. Removal: All material resulting from demolition, clearing, grubbing, and trimming operations shall be removed from the Project Site and disposed of in a lawful manner. Materials placed on property of private property owners shall be by written permission only.

3.10 GRADING

A. All grading work shall be completed in accordance with Section 31 22 13, Rough Grading.

3.11 CLEANUP

A. During and upon completion of work, promptly remove all unused tools and equipment, surplus materials, debris, and dust and shall leave all areas affected by the work in a clean condition, as may be subject to Engineer approval.

B. Adjacent structures shall be cleaned of dust, dirt, and debris resulting from demolition.

C. Adjacent areas shall be returned to their existing condition prior to the start of work.

3.12 NOT USED

END OF SECTION

DIVISION 03 - CONCRETE

SECTION 03 11 00 - CONCRETE WORK

PART 1 GENERAL

1.1 SUMMARY

A. The extent of concrete work is shown on the Drawings.

B. Work includes providing formwork and shoring for cast-in-place concrete and installation into formwork of items such as reinforcing steel bar (rebar), anchor bolts, setting plates, bearing plates, anchorages, inserts, reveals, frames, nosings, sleeves and other items to be embedded in concrete.

1.2 QUALITY ASSURANCE

A. Codes and Standards

Comply with the provisions of the following codes, specifications, and standards, except as otherwise shown or specified here:

ACI 301 "Specifications for Structural Concrete for Buildings"

ACI 311 "Recommended Practice for Concrete Inspection"

ACI 318 "Building Code Requirements for Reinforced Concrete"

ACI 347 "Recommended Practice for Concrete Formwork"

ACI 304 "Recommended Practice for Measuring, Mixing, Transporting and Placing Concrete"

Concrete Reinforcing Steel Institute, "Manual of Standard Practice"

Comply with building code requirements which are more stringent than the above and all Occupational Safety and Health Administration (OSHA) requirements.

B. ASTM International (ASTM)

1. C31, Making and Curing Concrete Test Specimens in the Field
2. C33, Specification for Concrete Aggregate
3. C39, Compressive Strength of Cylindrical Concrete Specimens
4. C40, Organic Impurities in Fine Aggregate for Concrete
5. C85, Cement Content of Hardened Portland Cement Concrete
6. C88, Soundness of Aggregates by use of Sodium Sulfate or Magnesium Sulfate
7. C94, Standard Specifications for Ready-Mixed Concrete

8. C131, Resistance to Degradation of Small Size Coarse Aggregate by Abrasion and Impact in the Los Angeles Machine

9. C136, Method for Sieve Analysis to Fine and Coarse Aggregate

10. C143, Slump of Portland Cement Concrete

11. C150, Standard Specification for Portland Cement

12. C156, Water Retention by Concrete Curing Materials

13. C173, Air Content of Freshly Mixed Concrete by the Volumetric Method

14. C231, Air Content of Freshly Mixed Concrete by the Pressure Method

15. C233, Standard Method of Testing Air-Entraining Admixtures for Concrete

16. C260, Standard Specifications for Air-Entraining Admixtures for Concrete

17. C289, Standard Test Method for Potential Reactivity of Aggregates (Chemical Method)

18. C441, Standard Test Method for Effectiveness of Mineral Admixtures in Preventing Excessive Expansion of Concrete Due to the Alkali-Aggregate Reaction

19. C457, Microscopical Determination of Air-Void Content and Parameters of the Air-Void System in Hardened Concrete

20. C494, Standard Specifications for Chemical Admixtures for Concrete

21. C670, Preparing Precision Statements for Test Methods for Construction Materials

22. C803, Penetration Resistance of Hardened Concrete

C. Workmanship

The Contractor is responsible for correction of concrete work that does not conform to the specified requirements, including strength, tolerances, and finishes. Correct deficient concrete as directed by the Engineer. The Contractor shall also be responsible for the cost of corrections to any other work affected by or resulting from corrections to the concrete work.

D. Concrete Testing Service

The Contractor will engage a special inspector/testing laboratory to perform material evaluation tests and to design concrete mixes. See detailed requirements in Part 3.14 “Quality Control Testing during Construction”. Per the Owner or Engineer’s requirements the Contractor shall notify the designated representative to schedule the special inspections and materials testing required by the Project documents.

E. Testing Requirements

Materials and installed work may require testing and retesting, as directed by the Engineer, at any time during the progress of the work. Allow free access to material stockpiles and facilities

at all times. All testing, including the retesting of rejected materials and installed work shall be done at the Contractor's expense.

F. Tests for Concrete Materials

1. Test aggregates by the methods of sampling and testing of ASTM C33.

2. For Portland cement, sample the cement and determine the properties by the methods of test of ASTM C150.

3. Submit written reports to the Engineer, for each material sampled and tested prior to the start of work. Provide the Project identification name and number, date of report, name of Contractor, name of concrete testing service, source of concrete aggregates, Material Manufacturer and brand name for manufactured materials, values specified in the referenced specification for each material, and test results. Indicate whether or not material is acceptable for intended use.

4. Certificates of material properties and compliance with specified requirements may be submitted in lieu of testing. The materials producer and the Contractor must sign certificates of compliance.

G. Allowable Tolerances:

1. Construct formwork to provide completed cast-in-place concrete surfaces complying with the tolerances specified in ACI 347, and as follows:

a. Variation from plumb in lines and surfaces of columns, piers, walls and rises; 1/4-inch per 10 feet, but not more than 1-inch. For exposed corner columns, control joint grooves, and other conspicuous lines, 1/4-inch in any bay or 20 feet maximum; 1/2-inch maximum in 40 feet or more.

b. Variation from level or grade in slab soffits, ceilings, beam soffits, and rises 1/4-inch in 10 feet, 3/8-inch in any bay or 20 feet maximum, and 3/4-inch in 40 feet or more. For exposed lintels, sills, parapets, horizontal grooves and other conspicuous lines, 1/4-inch in any bay or 20 feet maximum and 1/2-inch in 40 feet or more.

c. Variation from position of the linear lines and related columns, walls, and partitions, 1/2-inch in any bay or 20 feet maximum, and 1-inch in 40 feet or more.

d. Variation in sizes and locations of sleeves, floor openings, and wall openings, 1/4-inch.

e. Variation in cross-sectional dimensions of columns and beams and thickness of slabs and walls, minus 1/4-inch and plus 1/2-inch.

f. Variations in footing plan dimensions, minus 1/2-inch and plus 2 inches; misplacement or eccentricity, 2 percent of the footing width in direction of misplacement but not more than 2 inches; thickness reduction, minus 5 percent.

g. Variation in steps - In a flight of stairs, 1/8-inch for rise and 1/4-inch for treads; in consecutive steps, 1/16-inch for rise and 1/8-inch for treads.

h. Circular structures shall be constructed in a true circular form, with maximum variation of 1/4-inch from the dimensions shown on the plans.

2. Before concrete placement check the lines and levels of erected formwork. Make corrections and adjustments to ensure proper size and location of concrete members and stability of forming systems.

3. During concrete placement check formwork and related supports to ensure that forms are not displaced, and that completed work will be within specified tolerances.

H. Quality Control Testing During Construction

See Section 3 - Execution.

1.3 SUBMITTALS

A. For information only, submit six copies of Manufacturer's data with application and installation instructions for proprietary materials and items, including reinforcement and forming accessories, admixtures, patching compounds, water stops, joint systems, chemical floor hardeners, dry-shake finish materials, and others. Bind and submit in one submittal.

B. Submit shop drawings for fabrication, bending and placement of concrete reinforcement. Comply with the ACE 315 "Manual of Standard Practice for Detailing Reinforced Concrete Structures" showing bar schedules, stirrup spacing, diagrams of bent bars, and arrangements of concrete reinforcement. Include special reinforcement required at openings through concrete structures.

C. Submit shop drawings for fabrication and erection of specific finished concrete surfaces as shown or specified. Show the general construction of forms including jointing, special formed joints or reveals, location and pattern of form tie placement, and other items which affect the exposed concrete visually. Submit form drawings for building columns, walls, fascias, and intersections, and concrete pan and joist system. Submit for typical sections only. Engineer's review is for general architectural applications and features only. Design of formwork for structural stability and efficiency is the Contractor's responsibility.

D. Submit six copies of laboratory test reports for concrete materials and mix design tests as specified.

E. Material Certificates may be provided in lieu of materials laboratory test reports. The Material Manufacturer and the Contractor, certifying that each material item complies with, or exceeds, the specified requirements shall sign material certificates.

1.4 CONCRETE MIX DESIGNS

A. All concrete materials shall be proportioned so as to produce a workable mixture in which the water content will not exceed the maximum specified.

B. If the concrete mix designs specified herein have not been used previously by the ready-mix supplier or if directed by the Engineer, mix proportions and concrete strength curves for regular cylinder tests, based on the relationship of 7-, 14- and 28-day strengths versus slump values of 2, 4, and 6 inches, all conforming to these Specifications, shall be established by an

approved ready-mix supplier or an independent testing laboratory. A laboratory, independent of the ready-mix supplier, shall be required to prepare and test all concrete cylinders. The costs for preparation of mix designs and testing of concrete and materials shall be borne by the Contractor.

C. The exact proportions by weight of all materials entering into the concrete delivered to the jobsite shall conform to the approved mix design unless specifically so directed by the Engineer or Laboratory for improved specified strength or desired density, uniformity and workability.

D. The proportions of such mix design shall be based on a full cubic yard of hardened concrete.

E. Ready-mix companies or jobsite batch plants shall furnish delivery tickets, signed by a Certified Weighmaster, on which each shall state the weight of aggregates, sand, cement, admixtures and water, and the number of cubic yards of concrete furnished, which will be compared against the approved mix design.

F. There shall be no variation in the weights and proportions of materials from the approved mix design.

G. There shall be no variation in the quality and source of materials once they have been approved for the specific mix design.

1.5 READY-MIXED CONCRETE

Ready-mixed concrete shall conform to the requirements of ACI 301 and ASTM C 94. In case of conflict, ACI 301 shall govern.

1.6 SAMPLE

Contractor shall pour and finish one 2-foot square exposed aggregate concrete sample for Engineer's approval prior to construction if exposed aggregate is included on job.

1.7 JOB CONDITIONS

Maintain continuous traffic control and access for vehicular and pedestrian traffic as required for other construction activities as well as to adjoining facilities for regular operation. Utilize flagmen, barricades, warning signs and warning lights as required, to maintain a safe entrance and passage on all roads or drives abutting the Project.

PART 2 PRODUCTS

2.1 WALL FORMS

A. Full Height Pours: The wall form design shall be such that wall sections can be poured full height without creating horizontal cold joints and without causing snapping of form ties which shall be of sufficient strength and number to prevent spreading of the forms during the placement of concrete and which shall permit ready removal of the forms without spalling or damaging the concrete.

B. Wall Form Ties

1. Form ties which remain in the wall of a subgrade water-retaining structure shall have waterstops and a 1-inch minimum break back or cone depth.

2. Snap ties, if used, shall not be broken until the concrete has reached the design concrete strength. Snap ties, designed so that the ends must be broken off before the forms can be removed, shall not be used. The use of tie wires as form ties will not be permitted. Fully threaded stub bolts may be used in lieu of smooth ties with waterstops.

3. Taper ties with plastic or rubber plugs of an approved and proven design may also be used. The plugs must be driven into the hole with a steel rod, placed in a cylindrical recess made therefore in the plug. At no time shall plugs be driven on the flat area outside the cylindrical recess. Plugs shall be A-58 SURE PLUG as manufactured by DAYTON SUPERIOR, Santa Fe Springs, CA; phone: (714) 522-3442.

4. Ties shall positively secure the wall to the required dimension and hold the wall to that dimension prior to and during concrete placement.

C. Wall Form Stiffeners

1. Horizontal walers shall consist of structural steel channels, angles, or tubing of adequate size to retain the concrete without deflecting.

2. The walers shall be rolled or welded to the proper radii or offset brackets shall be used for shaping the wall to the dimensions shown on the Drawings and shall be used both for inside and outside wall forms in direct contact with the wall panels and at vertical spacings of no more than 96 inches on center.

3. There shall be at least one such waler within 24 inches of the top and bottom of the wall.

4. The largest dimension of the steel waler shall be in the radial direction.

5. Vertical structural steel or wood members shall be used at a minimum horizontal spacing of 74 inches and shall have sufficient rigidity and strength to insure the proper vertical alignments with the aid of braces under all predictable stress conditions.

6. In lieu of the above, a different system and spacings may be used if it is satisfactorily demonstrated to the Engineer that it will be equally effective.

2.2 FORMS FOR EXPOSED FINISH CONCRETE

Unless otherwise shown or specified, construct all formwork for exposed concrete surfaces with plywood, metal, metal-framed plywood-faced or other acceptable panel-type materials, to provide continuous, straight, smooth, exposed surfaces. Finish in largest practicable sizes to minimize number of joints and to conform to joint system shown on drawings. Provide form material with sufficient thickness to withstand pressure of newly placed concrete without bow or deflection. Use overlaid plywood complying with U.S. Product Standard PS-1 “B-B High Density Overlaid Concrete Form”, Class I. Use flexible spring steel forms or laminated boards free of distortion and defects to form radius bends as required.

2.3 FORMS FOR UNEXPOSED FINISH CONCRETE

A. Form concrete surfaces which will be unexposed in finished structure with plywood, lumber, metal, or other acceptable material. Provide lumber dressed on at least two edges and one side for tight fit.

2.4 FORM MATERIALS

A. Form Coatings

Provide commercial formulation form-coating compounds that will not bond with, stain nor adversely affect concrete surfaces, and will not impair subsequent treatments of concrete surfaces requiring bond or adhesion, nor impede wetting of surfaces to be cured with water or curing compound. Petroleum based coatings shall not be used for structures in creeks and waterways. Biodegradable coatings shall be used which will not contaminate the creeks/waterways or an alternate method for stripping the form shall be proposed.

B. Chamfers, Reveals, Drips

Provide preformed PVC or shaped wood or metal of size and profile as shown on drawings.

C. Cylindrical Columns and Supports

Form round-section members with paper or fiber tubes, constructed of laminated plies using water-resistant type adhesive with wax-impregnated exterior for weather and moisture protection. Provide units with sufficient wall thickness to resist loads imposed by wet concrete without deformation. Provide units having “seamless” interior to minimize spiral gaps or seams.

D. Pan Forms

Provide forms for concrete pan-type construction complete with covers and end enclosures to form a true, clean, smooth concrete surface. Design units for easy removal without damaging placed concrete. Block adjoining pan units if required to avoid lateral deflection of formwork during concrete placement and compaction. Provide standard or tapered end forms, as shown.

If required, factory-fabricate pan form units to required sizes and shapes of the following:

1. Steel – 16-gauge minimum, free of dents, irregularities, sag, and rust, or

2. Glass-Fiber Reinforced Plastic - Molded under pressure with matched dies, 0.11 inches minimum wall thickness.

E. Inserts

Provide metal inserts for anchorage of materials or equipment to concrete construction, not supplied by other trades and as required for the work. Provide “Parabolt” by the Molly Company, “Phillips Red-Head”, or “Burke” products. The Contractor is responsible for ensuring that all required anchorage not specified in the Project documents is installed per current building code and applicable ICC report requirements.

2.5 REINFORCING MATERIALS

A. Reinforcing Bar (rebar): ASTM A615 and as follows below>

Stirrups and Ties Grade 60 (Grade 40 may be used for #3 and smaller)

All other Uses Grade 60

B. Steel Wire: ASTM A82, plain, cold-drawn, steel.

C. Welded Wire Fabric (WWF): ASTM A185, welded steel wire fabric.

D. Supports for Reinforcement

Provide supports for reinforcement including bolsters, chairs, spacers, and other devices for spacing, supporting and fastening reinforcing bars, and welded wire fabric in place. Use wire bar type supports complying with CRSI recommendations, unless otherwise specified. Wood, brick, concrete blocks, and other devices will not be acceptable. For slabs-on-grade, use supports with sand plates or horizontal runners where wetted base materials will not support chair legs. For exposed-to-view concrete surfaces, where legs of supports are in contact with forms, provide supports with legs that are hot-dip galvanized, after fabrication, or plastic protected or stainless steel protected.

E. Fiber Reinforcement – Collated polypropylene fiber, 3/4-inch, manufactured from 100 percent virgin homopolymer polypropylene, hydrophobic, in compliance with ASTM C116.

2.6 CONCRETE MATERIALS

A. Portland Cement

ASTM C150, Type II, unless otherwise acceptable to Engineer. Use only one brand of cement throughout the Project, unless otherwise acceptable to the Engineer. The use of ground granulated blast furnace slag is not allowed.

B. Aggregates

ASTM C33 and as herein specified. Provide aggregates from a single source for all exposed concrete.

Local aggregates not complying with ASTM C33, but which have shown by special test or actual service to produce concrete of adequate strength and durability, may be used when acceptable to the Engineer.

1. Fine Aggregate - Clean, sharp, natural sand free from loam, clay, lumps, or other deleterious substances. Dune sand, bank-run sand and manufactured sand are not acceptable.

2. Coarse Aggregate - Clean, uncoated, processed aggregate containing no clay, mud, loam, or foreign matter, as follows:

a. Crushed stone processed from natural rock or stone.

b. Washed gravel, either natural or crushed. Use of pit or bank run gravel is not permitted.

c. Maximum Aggregate Size - Not larger than one-fifth of the narrowest dimensions between sides of forms, one-third of the depth of slabs, nor three-fourths of the minimum clear space between individual reinforcing bars or bundles of bars.

3. These limitations may be waived if, in the judgment of the Engineer, workability and methods of consolidation are such that concrete can be placed without honeycomb or voids.

4. In general, it is desired that normal commercial mixes using 1-1/2-inch or 3/4-inch maximum aggregate size be used.

5. Aggregate for exposed aggregate concrete shall consist of selected aggregate of washed clean river gravel in color range of medium to dark in browns and grays; material uniformly sized 5/8-inch to 3/4-inch.

C. Water: Clean, fresh, drinkable.

D. Air Entraining Admixture: ASTM C260.

E. Water-Reducing Admixture: ASTM C494, Type A.

F. Set-Control Admixtures: ASTM C494, as follows:

1. Type B, Retarding

2. Type C, Accelerating

3. Type D, Water-reducing and Retarding

4. Type E, Water-reducing and Accelerating

Calcium chloride will not be permitted in concrete, unless otherwise authorized in writing by the Engineer.

2.7 RELATED MATERIALS

A. Waterstops

Provide flat, dumbbell type, or centerbulb type waterstops at construction joints and other joints as shown. Size to suit joints or as shown. Provide PVC waterstops complying with Corps of Engineer's CRD-C 572. Waterstops to be Greenstreak 701 or equal. Split face waterstops will not be acceptable under any circumstances.

B. Bituminous and Fiber Joint Filler

Provide resilient and non-extruding type pre-molded bituminous impregnated fiberboard units complying with ASTM D1751, FS HH-F-341, Type 1 and AASHTO M 213. Provide one of the following products:

1. Elastite; Philip Carey/Celotex

2. Flexcell; Celotex Corp.

3. Crane Fiber 1390; W.R. Grace & Co.

4. Fibre; W.R. Meadows, Inc.

5. Tex-Lite; J & P Petroleum Prod. Inc.

6. Sonoflex; Sonneborn/Contech, Inc.

C. Joint Sealing Compound: See Section 07 92 00, Sealants and Caulking

D. Moisture Barrier

Provide moisture barrier cover over all prepared base material. Use only materials that are resistant to decay when tested in accordance with ASTM E154. The moisture barrier consists of heavy Kraft papers laminated together with glass fiber reinforcement and overcoated with black polyethylene on each side. Provide Moistop, St. Regis, or equal.

E. Form Ties (for forms other than wall forms)

Factory-fabricated, adjustable-length, removable or snap off metal form ties, designed to prevent form deflection, and to prevent spalling concrete surfaces upon removal. Unless otherwise shown, provide ties so portion remaining within concrete after removal is at least 1-1/2 inches inside concrete. Unless otherwise shown, provide form ties, which will not leave holes larger than 1-inch in diameter in concrete surface.

F. Concrete Curing Materials

Acrylic curing and sealing compound - Water emulsion acrylic curing and sealing compound formulated of acrylic polymers of water-based carrier. W.R. Meadows, Inc. VOCOMP-20 or equal.

G. Epoxy Adhesive

Provide Sikadur-31 Hi-Mod Gel or Sikadur-32 Hi-Mod for application to wire-brushed and prepared existing concrete to be mated to new concrete. Apply per Manufacturer's recommendations.

H. Chemical-Hardener Finish: Provide Hornolith from Tamms Industries or equal.

I. Non-slip Aggregate Finish

Provide fused aluminum oxide grits, or crushed emery, as abrasive aggregate for non-slip finish with emery aggregate containing not less than 40 percent aluminum oxide and not less than 25 percent ferric oxide. Use material that is factory-graded, packaged, rustproof and non-glazing, and is unaffected by freezing, moisture and cleaning materials.

J. Non-shrink Grout: See Section 03 60 00, Grouting.

2.8 PROPORTIONING NORMAL CONCRETE

A. Proportion mixes by either laboratory trial batch or field experience methods, using materials to be employed on the Project for each class of concrete required, complying with ACI 211.1. All measurements shall be by weight. All concrete admixtures will either be by the same supplier to insure compatibility. If different suppliers are used, a memorandum from EACH admixture supplier will be provided stating the compatibility of their product with the other supplier's products.

B. The slump shall be between 2 inches and 4 inches when tested in accordance with ASTM Specifications C 143. Variations in the slump range may be allowed by the Engineer if admixtures, such as water reducers or superplasticizers, are utilized in the concrete mix. Regardless of the measured slump, the maximum allowable water-cement ratios as specified here-in, shall be strictly adhered to.

C. Compressive Strength, Water and Cement Content

Notwithstanding what has been stated here-before, and unless shown otherwise on the Drawings, the concrete shall meet the following requirements. All concrete except as noted otherwise on the drawings shall have 4,000 pounds per square inch (psi) 28-day compressive strength. The maximum water content per 94-pound sack of cement is 4.5 gallons. The minimum cement content for the 4,000-psi mix is 6.0 sacks (94-pound sack of cement per cubic yard of concrete). Up to a maximum of 15 percent of cementatious material may be fly ash in accordance with ASTM C618. The use ground granulated blast furnace slag is not allowed.

D. Retarding Densifiers

1. All concrete (as defined in 2.9 below) used for wall construction shall also contain DARATARD-17, as manufactured by Grace Const. Products, Cambridge, MA or MBL-82, as manufactured by Master Builders, Cleveland, OH in the amounts recommended by the Additive Manufacturer whenever the air temperature during the pour exceeds 85 degrees Fahrenheit (F).

2. To be considered as equal, any alternate product offered for consideration shall contain no calcium chloride and shall be compatible with air-entrained cements and air-entraining admixtures conforming to the applicable ASTM, AASHTO, ANSI and Federal specifications.

3. Contractor shall certify that admixtures do not contain calcium chlorides or other corrosive materials.

E. Air-Entraining Agents

1. All concrete that that is specified to be air entrained or that may be exposed to freeze/thaw action either during construction or the service life of the structure must be air entrained. Sufficient air-entraining agent shall be used to provide total air content of 5 percent, +/- 1 percent.

2. Air-entraining agents shall meet ASTM C 260, ASTM C 233 and ASTM C 457.

3. The maximum total volumetric air content of the concrete before placement shall be 6 percent plus or minus one percent as determined by ASTM C 173 or ASTM 231.

4. Subject to these Specifications, consideration will be given to the following products: PROTEX “AES,” GRACE “DAREX AEA,” MASTER BUILDERS “MB-AE10,” or SIKA CHEMICAL “AER.”

F. Water Reducing Admixtures

1. In addition to air-entrainment, approved water reducing additives, which do not affect the ultimate performance of any steel in any way, may be added to maintain the maximum water content below that specified herein. Water reducing additives shall conform to ASTM C 494, Type A or D.

2. The use of water reducing additives shall not permit a reduction in the minimum specified cement content or in the specified amount of air-entrainment.

3. Admixtures shall contain no calcium chloride, tri-ethanolamine or fly ash. All admixtures shall be from the same manufacturer.

4. Superplasticizers, if allowed by the Engineer, shall conform to ASTM C 494, Type F or G, batch plant added using second or third generation only.

5. Set control admixtures if allowed by the Engineer, shall conform to ASTM C 494, Type B (retarding) or Type C (accelerating).

G. Fiber reinforcement admixture shall be included in the ready-mix concrete design used for filling and channeling the wet well chambers. Fibers shall be used in strict accordance with the Manufacturer’s directions.

2.9 CONCRETE MIXING

Ready-Mix Concrete - Comply with the requirements of ASTM C94, and as herein specified. During hot weather, or under conditions contributing to rapid setting of concrete, a shorter mixing time than specified in ASTM C94 may be required. When the air temperature is between 85 degrees F and 90 degrees F, reduce the mixing and delivery time from 1-1/2 hours to 75 minutes, and when the air temperature is above 90 degrees F, reduce the mixing and delivery time to 60 minutes.

PART 3 EXECUTION

3.1 FORMS

A. Design, erect, support, brace, and maintain formwork to support vertical and lateral loads that might be applied until such loads can be supported by the concrete structure. Construct formworks so concrete members and structures are of correct size, shape, alignment, elevation, and position.

B. Design formworks to be readily removable without impact shock, or damage to cast-in-place concrete surfaces and adjacent materials.

C. Construct forms complying with ACI 347, to sizes, shapes, lines and dimensions shown, and to obtain accurate alignment, location, grades, level, and plumb work in finished structures. Provide for openings, offsets, sinkages, keyways, recesses, moldings, rustications, reglets, chamfers, blocking, screeds, bulkheads, anchorages and inserts, and other features required

in work. Use selected materials to obtain required finishes. Solidly butt joints and provide backup at joints to prevent leakage of cement paste.

D. Fabricate forms for easy removal without hammering or prying against the concrete surfaces. Provide crush plates or wrecking plates where stripping may damage cast concrete surfaces. Provide top forms for inclined surfaces where slope is too steep to place concrete with bottom forms only. Kerf wood inserts for forming keyways, reglets, recesses, and the like, to prevent swelling and for easy removal.

E. Erect falsework and support; brace and maintain it to safely support vertical, lateral, and asymmetrical loads applied until such loads can be supported by in-place concrete structures.

Provide shores and struts with positive means of adjustment capable of taking up formwork settlement during concrete placing operations, using wedges or jacks or a combination thereof. Provide trussed supports when adequate foundations for shores and struts cannot be secured.

Support form facing materials by structural members spaced sufficiently close to prevent deflection. Fit forms placed in successive units for continuous surfaces to accurate alignment, free from irregularities and within allowable tolerances.

F. Forms for Exposed Concrete

Drill forms to suit ties used and to prevent leakage of concrete mortar around tie holes. Do not splinter forms by driving ties through improperly prepared holes. Do not use metal cover plates for patching holes or defects in forms. Provide sharp, clean corners at intersecting planes, without visible edges or offsets. Back joints with extra studs or girts to maintain true, square intersections. Use extra studs, walers, and bracing to prevent bowing of forms between studs and to avoid bowed appearance in concrete. Do not use narrow strips of form material, which will produce bow. Assemble forms so they may be readily removed without damage to exposed concrete surfaces. Form molding shapes, recesses and projections with smooth-finish materials, and install in forms with sealed joints to prevent displacement.

Corner Treatment - Form exposed corners of beams and columns to produce square, smooth, solid, unbroken lines, except as otherwise indicated.

G. Provide temporary openings where interior area of formwork is inaccessible for cleanout, for inspection before concrete placement, and for placement of concrete. Securely brace temporary openings and set tightly to forms to prevent loss of concrete mortar. Locate temporary openings of forms at inconspicuous locations.

H. Chamfer exposed corners and edges, reveals and drips as shown using wood, metal, PVC or rubber strips fabricated to produce uniform smooth lines and tight edge joints.

I. Provisions for Other Trades - Provide openings in concrete formwork to accommodate work of other trades. Determine size and location of openings, recesses and chases from trades providing such ties. Accurately place and securely support items built into forms.

J. Cleaning and Tightening - Thoroughly clean forms and adjacent surfaces to receive concrete. Remove chips, wood, sawdust, dirt, or other debris just before concrete is placed. Retighten forms after concrete placement if required to eliminate mortar leaks.

3.2 PLACING REINFORCEMENT

Detail and place according to ACI Manual SP-66. Unless otherwise noted, minimum cover shall be 1-1/2 inches for No. 5 and smaller bars, 2 inches for No. 6 and larger bars and 3 inches when poured against earth. Unless otherwise noted, bend all horizontals reinforcing a minimum of 2 feet at corners and wall intersections.

A. Clean reinforcement of loose rust and mill scale, earth, ice and other materials which reduce or destroy bond with concrete.

B. Accurately position, support and secure reinforcement against displacement by formwork, construction, or concrete placement operations. Locate and support reinforcing by metal chairs, runners, bolsters, spacers, and hangers, as required.

C. Place reinforcement to obtain at least the minimum coverages for concrete protection. Arrange, space and securely tie bars and bar supports to hold reinforcement in position during concrete placement operations. Set wire ties so ends are directed into concrete, not toward exposed concrete surfaces. Do not place reinforcing bars more than 2 inches beyond the last leg of continuous bar support. Do not use supports as bases for runways for concrete conveying equipment and similar construction loads.

D. Install welded wire fabric in as long lengths as practicable. Lap adjoining pieces at least one full mesh plus 2 inches, and lace splices with wire. Offset end laps in adjacent widths to prevent continuous laps in either direction.

3.3 JOINTS

A. Construction Joints - Locate and install construction joints, which are not shown on the drawings, so as not to impair the strength and appearance of the structure, as acceptable to the Engineer.

B. Place construction joints perpendicular to the main reinforcement. Continue all reinforcement across construction joints. Unless otherwise specified, reinforcement shall be lapped in accordance with ACI Standards.

C. Waterstops - Provide waterstops in construction joints as shown on the drawings. Install waterstops to form a continuous diaphragm in each joint. Make provisions to support and protect waterstops during the progress of the work. Fabricate field joints in waterstops in accordance with Manufacturer's printed instructions. Protect waterstop material from damage where it protrudes from any joint.

D. Isolation Joints in Slabs-on-Ground - Construct isolation joints in slabs-on-ground at all points of contact between slabs on ground and vertical surfaces, such as column pedestals, foundation walls, grade beams, and elsewhere as indicated.

E. Control Joints in Slabs-on-Ground - Construct control joints in slabs-on-ground to form panels of patterns as shown. Use inserts 1/4-inch wide by one-fifth to one-fourth of the slab depth, unless otherwise shown.

1. Form control joints by inserting a pre-molded hardboard or fiberboard strip into the fresh concrete until the top surface of the strip is flush with the slab surface. After the concrete has cured, remove inserts and clean groove of loose debris.

2. Joint sealant material shall be as specified above.

3.4 INSTALLATION OF EMBEDDED ITEMS

A. General - Set and build into the work anchorage devices and other embedded items required for other work that is attached to, or supported by, cast-in-place concrete. Use setting drawings, diagrams, instructions, and directions provided by suppliers of the items to be attached thereto.

B. Edge Forms and Screed Strips for Slabs - Set edge forms or bulkheads and intermediate screed strips for slabs to obtain the required elevations and contours in the finished slab surface. Provide and secure units sufficiently strong to support the types of screed strips by the use of strike-off templates or accepted compacting type screeds.

C. Cast in Place Reglets - Place in straight and continuous lines as detailed to enable flashing to be applied continuously without deviation at reglet joints more than 1/8-inch. Miter corners for continuous reglet joint where outside corners occur. At inside corners extend one section 1-inch past corner. Adequately anchor or secure reglets per Manufacturer's instructions prior to pouring and during construction to insure dimensional tolerances and alignment. Vibrate concrete to insure concrete cover adjacent to and around reglet. Visually inspect after pour and patch as required.

3.5 PREPARATION OF FORM SURFACES

Coat the contact surfaces of forms with a form-coating compound before reinforcement is placed. Thin formcoating compounds only with thinning agent of type, and in amount, and under conditions of the Form-coating Compound Manufacturer's directions. Use dissipating-type form oil at surfaces to receive cement plaster finish. Do not allow excess form-coating material to accumulate in the forms or to come into contact with concrete surfaces against which fresh concrete will be placed. Apply in compliance with Manufacturer's instructions. Coat steel forms with a non-staining, rust-preventative form oil or otherwise protect against rusting. Rust-stained steel formwork is not acceptable.

3.6 CONCRETE PLACEMENT

A. Pre-Placement Inspection

1. Before placing concrete, inspect and complete the formwork installation, reinforcing steel, and items to be embedded or cast in. Notify other crafts involved in ample time to permit the installation of their work; cooperate with other trades in setting such work as required. Notify Engineer in time for inspection prior to pouring.

2. Thoroughly wet wood forms immediately before placing concrete, as required where form coatings are not used.

3. Coordinate the installation of joint materials and moisture barriers with placement of forms and reinforcing steel.

4. Concrete Curbs and Paving - Do not place concrete until subbase is completed and approved by the Engineer as required to provide uniform dampened condition at the time concrete is placed. Moisten subbase as required to provide uniform dampened condition at the time concrete is placed.

B. Place concrete in compliance with the practices and recommendations of ACI 304 and as herein specified.

1. Deposit concrete continuously or in layers of such thickness that no concrete will be placed on concrete which has hardened sufficiently to cause the formation of seams or planes of weakness within the section. If a section cannot be placed continuously, provide construction joints as herein specified. Perform concrete placing at such a rate that concrete, which is being integrated, with fresh concrete is still plastic. Deposit concrete as nearly as practicable to its final location to avoid segregation due to re-handling or flowing. Do not subject concrete to any procedure, which will cause segregation.

2. Screed concrete which is to receive other construction to the proper level to avoid excessive skimming or grouting.

3. Do not use concrete which becomes non-plastic and unworkable or does not meet the required quality control limits or which has been contaminated by foreign materials. Do not use re-tempered concrete. Remove rejected concrete from the Project Site and dispose of in an acceptable location. Do not use concrete whose allowable mixing time has been exceeded.

C. Concrete Conveying

1. Handle concrete from the point of delivery and transfer to the concrete conveying equipment and to the locations of final deposit as rapidly as practicable by methods, which will prevent segregation and loss of concrete mix materials.

2. Provide mechanical equipment for conveying concrete to ensure a continuous flow of concrete at the delivery end. Provide runways for wheeled concrete conveying equipment from the concrete delivery point to the locations of final deposit. Keep interior surfaces of conveying equipment, including chutes, free of hardened concrete, debris, water, snow, ice, and other deleterious materials.

3. The Contractor shall provide traffic control on the narrow access roads to the work sites.

4. The Contractor shall not wash concrete trucks/chutes/equipment off at the Project Site unless plastic tarps and hay bales are employed to contain the concrete. The Contractor will be required to haul off-site all concrete contaminated soil.

D. Placing Concrete into Forms

1. Deposit concrete in forms in horizontal layers not deeper than 24 inches and in a manner to avoid inclined construction joints. Where placement consists of several layers, place each layer while preceding layer is still plastic to avoid cold joints.

2. Do not interrupt successive placement; do not permit cold joints to occur.

3. Remove temporary spreaders in forms when concrete placing has reached the elevation of such spreaders.

4. Consolidate concrete placed in forms by mechanical vibrating equipment supplemented by hand spading, rodding, or tamping. Use equipment and procedures for consolidation of concrete in accordance with the recommended practices of ACI 309, to suit the type of concrete and Project conditions. Vibration of forms and reinforcing will not be permitted.

5. Do not use vibrators to transport concrete inside of forms. Insert and withdraw vibrators vertically at uniformly spaced locations not farther than the visible effectiveness of the machine. Place vibrators to rapidly penetrate the layer of concrete at least 6 inches into the preceding layer. Do not insert vibrators into lower layers of concrete that have begun to set. At each insertion, limit the duration of vibration to the time necessary to consolidate the concrete and complete embedment of reinforcement and other embedded items without causing segregation of the mix.

6. Do not place concrete in supporting elements until the concrete previously placed in columns and walls is no longer plastic.

E. Placing Concrete Slabs

1. Deposit and consolidate concrete slabs in a continuous operation, within the limits of construction joints, until the placing of a panel or section is completed.

2. Consolidate concrete during placing operations using mechanical vibrating equipment so the concrete is thoroughly worked around reinforcement and other embedded items and into corners.

3. Consolidate concrete placed in beams and girders of supported slabs and against bulkheads of slabs on ground, as specified for formed concrete structures. Consolidate concrete in the remainder of slabs by vibrating bridge screeds, roller pipe screeds, or other acceptable methods. Limit the time of vibrating consolidation to prevent bringing an excess of fine aggregate to the surface.

4. Bring slab surfaces to the correct level with a straight edge and strike off. Use bull floats or darbies to smooth the surface, leaving it free of humps or hollows. Do not sprinkle water on the plastic surface. Do not disturb the slab surfaces prior to beginning finishing operations.

5. Maintain reinforcing steel in the proper position continuously during concrete placement operations.

F. Bonding

1. Roughen surfaces of set concrete at all joints except where bonding is obtained by use of concrete bonding agent, and clean surfaces of laitance, coatings, loose particles and foreign matter. Roughen surfaces in a manner to expose bonded aggregate uniformly and not to leave laitance, loose particles of aggregate or damaged concrete at the surface.

2. Prepare for bonding of fresh concrete to new concrete that has set but is not fully cured, as follows:

a. At joints between footings and walls or columns, and between walls or columns and beams or slabs they support, and elsewhere unless otherwise specified herein, dampen, but do not saturate, the roughened and cleaned surface of set concrete immediately before placing fresh concrete.

b. At joints in exposed work; at vertical joints in walls; at joints in girders, beams, supported slabs and other structural members; and at joints designed to contain liquids; dampen, but do not saturate the roughened and cleaned surface of set concrete and apply a liberal coating of neat cement grout.

c. Use neat cement grout consisting of equal parts Portland cement and fine aggregate by weight and not more than 6 gallons of water per sack of cement. Apply with a stiff broom or brush to a minimum thickness of 1/16-inch. Deposit fresh concrete before cement grout has attained its initial set.

d. In lieu of neat cement grout, bonding grout may be a commercial bonding agent. Apply to cleaned concrete surfaces in accordance with the printed instructions of the Bonding Material Manufacturer.

3. Prepare for bonding of fresh concrete to fully cured hardened concrete or existing concrete by using an epoxy-resin-bonding agent as follows:

a. Handle and store epoxy-resin adhesive binder in compliance with the Manufacturer's printed instructions, including safety precautions.

b. Mix the epoxy-resin adhesive binder in the proportions recommended by the Manufacturer, carefully following directions for safety of personnel.

c. Before depositing fresh concrete, thoroughly roughen and clean hardened concrete surfaces and coat with epoxy-resin grout not less than 1/16-inch thick. Place fresh concrete while the epoxy-resin material is still tacky, without removing the in-place grout coat, and as directed by the Epoxy-resin Manufacturer.

G. Cold Weather Placing

1. Protect all concrete work from physical damage or reduced strength which could be caused by frost, freezing actions, or low temperatures, in compliance with the requirements of ACI 306 and as herein specified.

2. When the air temperature has fallen to or is expected to fall below 40 degrees F, provide adequate means to maintain the temperature in the area where concrete is being placed at either 70 degrees F for 3 days or 50 degrees F for 5 days after placing. Provide temporary housing or coverings including tarpaulins or plastic film. Keep protections in place and intact at least 24 hours after artificial heat is discontinued. Keep concrete moist. Avoid rapid dry-out of concrete due to over-heating and avoid thermal shock due to sudden cooling or heating.

3. When air temperature has fallen to or is expected to fall below 40 degrees F, uniformly heat all water and aggregates before mixing as required to obtain a concrete mixture temperature of not less than 50 degrees F, and not more than 80 degrees F, at point of placement.

4. Do not use frozen materials containing ice or snow. Do not place concrete on frozen subgrade or on subgrade containing frozen materials. Ascertain that forms, reinforcing steel and adjacent concrete surfaces are entirely free of frost, snow and ice before placing concrete.

5. Do not use calcium chloride, salt and other materials containing antifreeze agents or chemical accelerators unless otherwise accepted in mix designs.

H. Hot Weather Placing

1. When hot weather conditions exist that would seriously impair the quality and strength of concrete, place concrete in compliance with ACI 305 and as herein specified.

2. Cool ingredients before mixing to maintain concrete temperature at time of placement below 90 degrees F. Mixing water may be chilled or chopped ice may be used to control the concrete temperature provided the water equivalent of the ice is calculated to the total amount of mixing water.

3. Cover reinforcing steel with water-soaked burlap if it becomes too hot so that the steel temperature will not exceed the ambient air temperature immediately before embedment in concrete.

4. Wet forms thoroughly before placing concrete.

5. Do not use retarding admixtures unless otherwise accepted in mix designs.

3.7 FINISH OF FORMED SURFACES

A. Rough Form Finish

For formed concrete surfaces not exposed to view in the finish work or covered by other construction, unless otherwise shown or specified. This is the concrete surface having the texture imparted by the form facing material used, with tie holes and defective areas repaired and patched and fins and other projections exceeding 1/4-inch in height rubbed down or chipped off.

B. Smooth Form Finish

Provide as-cast smooth form finish for formed concrete surfaces that are to be exposed to view. Or that are to be covered with a coating material applied directly to the concrete, or a covering material bonded to the concrete such as waterproofing, damp proofing, painting or other similar system.

Produce smooth form finish by selecting form material to impart a smooth, hard, uniform texture and arranging them orderly and symmetrically with a minimum of seams. Repair and patch defective areas with all fins or other projections completely removed and smoothed.

C. Curb Finishes

Curbs shall be screeded off accurately to true lines and planes or warped surfaces as indicated or directed. Finish smooth. Arises shall be true and straight or properly eased where curved

and neatly rounded with approved tool. Smooth trowel finish with corners rounded to 3/4-inch radius.

D. Grout Cleaned Finish (Sacked)

Provide grout cleaned finish to scheduled concrete surfaces which have received smooth form finish treatment, and to all exposed to view interior and exterior building surfaces, typical.

Combine one part Portland cement to 1-1/2 parts fine sand by volume and mix with water to the consistency of thick paint. Blend standard Portland cement and white Portland cement, amounts determined by trial patches, so that final color of dry grout will closely match adjacent surfaces.

Thoroughly wet concrete surfaces and apply grout immediately to coat surfaces and fill small holes. Remove excess grout by scraping and rubbing with clean burlap. Keep damp by fog spray for at least 36 hours after rubbing.

E. Related Unformed Surfaces

At tops of walls, horizontal offsets and similar unformed surfaces occurring adjacent to formed surfaces, strike off smooth and finish with a texture matching the adjacent formed surfaces. Continue the final surface treatment of formed surfaces uniformly across the adjacent unformed surfaces, unless otherwise shown.

3.8 MONOLITHIC SLAB FINISHES

A. Float Finish

1. Apply float finish to monolithic slab surfaces that are to receive trowel finish and other finishes as hereinafter specified, and slab surfaces which are to be covered with membrane or elastic waterproofing, membrane or elastic roofing or sand bed terrazzo, and as otherwise shown on drawings or in schedules.

2. After placing concrete slabs, do not work the surface further until ready for floating. Begin floating when the surface water has disappeared or when the concrete has stiffened sufficiently to permit the operation of a power-driven float, or both. Consolidate the surface with power-driven floats, or by hand floating if area is small or inaccessible to power units. Check and level the surface plane to a tolerance not exceeding 1/4-inch in 10 feet when tested with a 10-foot straightedge placed on the surface at not less than two different angles. Cut down high spots and fill at low spots. Uniformly slope surfaces to drains. Immediately after leveling, refloat the surface to a uniform, smooth, granular texture.

B. Trowel Finish

1. Apply trowel finish to monolithic slab surfaces that are to be exposed to view, unless otherwise shown, and slab surfaces that are to be covered with resilient flooring, paint, or other thin-film finish coating system.

2. After floating, begin the first trowel finish operation using a power-driven trowel. Begin final troweling when the surface produces a ringing sound as the trowel is moved over the surface.

3. Consolidate the concrete surface by the final hand troweling operation, free of trowel marks, uniform in texture and appearance, and with a surface plane tolerance not exceeding 1/8-inch in 10 feet when tested with a 10-foot straightedge. Grind smooth surface defects which would telegraph through applied floor covering system.

C. Exposed Aggregate Finish

1. Screed to true plane, bullfloat surfaces, provide uniform double troweled finish. After troweling, let set until hard enough to wash without disturbing coarse aggregates. Simultaneously brush and spray with water to expose large aggregate and produce texture to match approved sample. Water cure or keep wet for 25 hours.

2. Scrub surface after 24 hours with a 1-part muriatic acid to 10-part water solution. Rinse thoroughly.

D. Broom Finish (Non-Slip)

1. Apply non-slip, broom finish to exterior concrete platforms, steps and ramps and elsewhere as shown on the drawings or in schedules.

2. Immediately after trowel finish, slightly roughen the concrete surface by brooming in the direction perpendicular to the main traffic route or in the direction of water flow. Use fiber-bristle broom unless otherwise directed. Coordinate the required final finish with the Engineer before application.

E. Chemical-Hardener Finish

1. Apply chemical curing-hardening compound or chemical-hardener to all interior concrete floors which will not receive applied finish materials. Mask adjacent work and surfaces to avoid over spray. Apply liquid chemical-hardener after complete curing and drying of the concrete surface.

2. Dilute the liquid hardener with water and apply in accordance with the Manufacturer's printed directions. Evenly apply each coat and allow for drying between coats in accordance with Manufacturer's printed directions.

3. After the final coat of chemical-hardener solution is applied and dried, remove surplus hardener by scrubbing and mopping with water.

F. Non-slip Aggregate Finish

Apply non-slip aggregate finish to concrete stair treads, platforms, ramps, and elsewhere as shown on the drawings or in schedules.

After completion of float finishing and before starting trowel finish, uniformly spread 25 pounds of dampened non-slip aggregate per 100 square feet of surface. Tamp aggregate flush with surface using steel trowel, but do not force the non-slip aggregate particles below surface.

After broadcasting and tamping, apply trowel finish as herein specified. After curing, lightly work the surface with a steel wire brush, or an abrasive stone, and water to expose the non-slip aggregate.

3.9 SCHEDULE OF CONCRETE SURFACE FINISHES

Also see Section 09 90 00, Painting and Coating for protective coating requirements.

	Surface Description	Type	Finish Requirement
A.	Interior Horizontal Slabs	Slab	Trowel Finish
B.	Exterior Horizontal Slabs	Slab	Broom Finish (Non-Slip)
C.	Stair Treads, Platforms and Ramps	Slab	Non-Slip Aggregate
D.	Interior Vertical Surfaces (including Wet Well)	Formed	Smooth Form
E.	Exterior Vertical Surfaces Exposed to View	Formed	Smooth Form

3.10 CONCRETE CURING AND PROTECTION

A. General

1. Protect freshly placed concrete from premature drying and excessive cold or hot temperature and maintain without drying at a relatively constant temperature for the period of time necessary for hydration of the cement and proper hardening of the concrete.

2. Start initial curing as soon as free moisture has disappeared from the concrete surface after placing and finishing. Weather permitting, keep continuously moist for not less than 72 hours.

3. Begin final curing procedures immediately following initial curing and before the concrete has dried. Continue final curing for at least 7 days and in accordance with ACI 301 procedures. Avoid rapid drying at the end of the final curing period.

B. Curing Methods

Perform curing of concrete by moist curing, by moisture-retaining cover curing, by membrane curing, or by combinations thereof, as herein specified. Provide the curing methods indicated as follows:

1. For concrete floor slabs provide moisture curing, moisture cover curing, or liquid membrane/chemical curing-hardening curing. If liquid membrane curing is used, it must be compatible with concrete hardening compounds to be applied later.

2. For other concrete work, provide moisture curing or moisture cover curing. Do not use liquid membrane or chemical curing-hardening curing on any concrete work to receive any applied finishes.

3. For curing, use only water that is free of impurities, which could etch or discolor exposed, natural concrete surfaces.

4. Provide moisture curing by any of the following methods:

    a. Keeping the surface of the concrete continuously wet by covering with water.

    b. Continuous water-fog spray.

    c. Covering the concrete surface with the specified absorptive cover thoroughly saturated with water and keeping the absorptive cover continuously wet. Place absorptive cover so as to provide coverage of the concrete surfaces and edges with a 4-inch lap over adjacent absorptive covers.

5. Provide moisture-cover curing as follows - Cover the concrete surfaces with the specified moisture-retaining cover for curing concrete placed in the widest practicable width with sides and ends lapped at least 3 inches and sealed by waterproof tape or adhesive. Immediately repair any holes or tears during the curing period using cover material and waterproof tape.

6. Provide liquid membrane curing as follows:

    a. Apply the specified membrane-forming curing compound to damp concrete surfaces as soon as the water film has disappeared. Apply uniformly in a coat continuous operation by power spray equipment in accordance with the Manufacturer's directions. Recoat areas, which are subjected to heavy rainfall within 3 hours after initial application. Maintain the continuity of the coating and repair damage to the coat during the entire curing period.

    b. Do not use membrane-curing compounds on surfaces, which are to be covered with a coating material applied directly to the concrete or with a covering material bonded to the concrete. Such as other concrete, liquid floor hardener, waterproofing, dampproofing, membrane roofing, flooring, painting, and other coatings and finish materials, unless otherwise acceptable to the Engineer.

7. Curing Formed Surfaces - Cure formed concrete surfaces, including the undersides of girders, beams, supported slabs, and other similar surfaces by moist curing with the forms in place for the full curing period or until forms are removed. If forms are removed, continue curing by methods specified above, as applicable.

8. Curing Unformed Surfaces

    a. Initially cure unformed surfaces, such as slabs, floor topping, and other flat surfaces by moist curing, whenever possible.

    b. Final cure unformed surfaces, unless otherwise specified, by any of the methods specified above, as applicable.

    c. Final cure concrete surfaces to receive liquid floor hardener or finish flooring by use of moisture-retaining cover, unless otherwise acceptable to the Engineer.

9. Provide liquid curing-hardening compound as follows:

    a. Apply to horizontal surfaces when concrete is dry to touch by means of power spray, hand spray or hair broom in accordance with Manufacturer's directions.

C. Temperature of Concrete during Curing

1. When the atmospheric temperature is 40 degrees F and below, maintain the concrete temperature between 50 degrees F and 70 degrees F continuously throughout the curing period. When necessary, make arrangements before concrete placing for heating, covering, insulation, or housing as required to maintain the specified temperature and moisture conditions continuously for the concrete curing period. Provide cold weather protections complying with the requirements of ACI 306.

2. When the atmospheric temperature is 80 degrees F, and above, or during other climatic conditions which will cause too rapid drying of the concrete, make arrangements before the start of concrete placing for the installation wind breaks or shading, and for fog spraying, wet sprinkling, or moisture-retaining covering. Protect the concrete continuously for the concrete curing period. Provide hot weather protections complying with the requirements of ACI 305.

3. Maintain concrete temperature as uniformly as possible and protect from rapid atmospheric temperature changes. Avoid temperature changes in concrete, which exceed 5 degrees F in any 1-hour and 50 degrees Ft in any 24-hour period.

D. Protection from Mechanical Injury - During the curing period, protect concrete from damaging mechanical disturbances including load stresses, heavy shock, excessive vibration, and from damage caused by rain or flowing water. Protect all finished concrete surfaces from damage by subsequent construction operations.

3.11 MISCELLANEOUS CONCRETE ITEMS

A. Filling-In - Fill-in holes and openings in concrete structures for the passage of work by other trades, unless otherwise shown or directed, after the work of other trades is in place. Mix, place, and cure concrete as herein specified, to blend with in-place construction. Provide all other miscellaneous concrete filling shown or required to complete the work.

B. Curbs - Provide monolithic finish to interior curbs by stripping forms while concrete is still green and steel-troweling surfaces to a hard, dense finish with corners, intersections, and terminations slightly rounded.

C. Equipment Bases and Foundations - Provide machine and equipment bases and foundations as shown on the drawings. Set anchor bolts for machines and equipment to template at correct elevations, complying with certified diagrams or templates of the Manufacturer furnishing the machines and equipment.

3.12 REMOVAL OF SHORES AND FORMS

A. Remove shores and re-shore in a planned sequence to avoid damage to partially cured concrete. Locate and provide adequate re-shoring to safely support the work without excessive stress or deflection.

Keep re-shores in place a minimum of 15 days after placing upper tier, and longer if required, until the concrete has attained its required 28-day strength and heavy loads due to construction operations have been removed.

B. Formwork not supporting weight of concrete, such as sides of beams, walls, columns, and similar parts of the work, may be removed after cumulative curing at not less than 50 degrees F for 24 hours after placing concrete. Providing the concrete is sufficiently hard to not be damaged by form removal operations and provided curing and protection operations are maintained.

C. Formwork supporting weight of concrete, such as beam soffits, joints, slabs, and other structural elements, may not be removed in less than 14 days and until concrete has attained design minimum compressive strength at 28 days. Determine potential compressive strength of in place concrete by testing field-cured specimens representative of concrete location or members.

D. Form facing material may be removed 4 days after placement only if shores and other vertical supports have been arranged to permit removal of form facing material without loosening or disturbing shores and supports.

E. Re-Use of Forms

Clean and repair surfaces of forms to be re-used in the work. Split, frayed, delaminated, or otherwise damaged form facing material will not be acceptable. Apply new form coating compound material to concrete contact surfaces as specified for new formwork.

When forms are extended for successive concrete placement, thoroughly clean surfaces, remove fins and laitance, and tighten forms to close all joints. Align and secure joints to avoid offsets. Do not use “patched” forms for exposed concrete surfaces, except as acceptable to the Architect.

No forming material will be allowed to be built permanently into exposed visible surfaces.

3.13 CONCRETE SURFACE REPAIRS

A. Patching Defective Areas

1. Repair and patch defective areas with cement mortar immediately after removal of forms but only when directed by the Engineer.

2. Cut out honeycomb, rock pockets, voids over 1/2-inch diameter, and holes left by tie rods and bolts down to solid concrete but, in no case, to a depth of less than 1-inch. Make edges of cuts perpendicular to the concrete surface. Before placing the cement mortar, thoroughly clean, dampen with water and brush-coat the area to be patched with neat cement grout. Proprietary patching compounds may be used when acceptable to the Engineer.

3. For exposed-to-view surfaces, blend white Portland cement and standard Portland cement so that, when dry, the patching mortar will match the color of the surrounding concrete. Provide test areas at inconspicuous location to verify mixture and color match before

proceeding with the patching. Compact mortar in place and strike off slightly higher than the surrounding surface.

4. Fill holes extending through concrete by means of a plunger type gun or other suitable device from the least exposed face, using a flush stop held at the exposed face to ensure complete filling.

B. Repair of Formed Surfaces

1. Repair exposed-to-view formed concrete surfaces that contain defects, which adversely affect the appearance of the finish. Remove and replace the concrete having defective surfaces if the defects cannot be repaired to the satisfaction of the Engineer. Surface defects, as such, include color and texture irregularities, cracks, spalls, air bubbles, honeycomb, rock pockets, and holes left by the rods and bolt; fins and other projections on the surface; and stains and other discolorations that cannot be removed by cleaning.

2. Repair concealed formed concrete surfaces that contain defects that adversely affect the durability of the concrete. If defects cannot be repaired, remove and replace the concrete having defective surfaces. Surface defects, as such, include cracks in excess of 0.01-inch wide, cracks or any width and other surface deficiencies which penetrate to the reinforcement or completely through non-reinforced sections, honeycomb, rock pockets, holes left by tie rods and bolts, and spalls except minor breakage at corners.

C. Repair of Unformed Surfaces

1. Test unformed surfaces, such as monolithic slabs, for smoothness and to verify surface plane to the tolerances specified for each surface and finish. Correct low and high areas as herein specified.

2. Test unformed surfaces sloped to drain for trueness of slope, in addition to smoothness, using a template having the required slope. Correct high and low areas as herein specified.

3. Repair finished unformed surfaces that contain defects, which adversely affect the durability of the concrete. Surface defects, as such, include crazing, cracks in excess of 0.01-inch wide or which penetrate to the reinforcement or completely through non-reinforced sections regardless of width, spalling, pop outs, honeycomb, rock pockets, and other objectionable conditions.

4. Correct high areas in unformed surfaces by grinding, after the concrete has cured sufficiently so those repairs can be made without damage to adjacent areas.

5. Correct low areas in unformed surfaces during or immediately after completion of surface finishing operations by cutting out the low areas and replacing with fresh concrete. Finish repaired areas to blend into adjacent concrete. Proprietary patching compounds may be used when acceptable to the Engineer.

6. Repair defective areas, except random cracks and single holes not exceeding 1-inch diameter, by cutting out and replacing with fresh concrete. Remove defective areas to sound concrete with clean, square cuts, and expose reinforcing steel with at least 3/4-inch clearance all around. Dampen all concrete surfaces in contact with patching concrete and brush with a neat cement grout coating or use concrete bonding agent. Place patching

concrete before grout takes its initial set. Mix patching concrete of the same material to provide concrete of the same type or class as the original adjacent concrete. Place, compact, and finish as required to blend with adjacent finished concrete. Cure in the same manner as adjacent concrete.

7. Repair isolated random cracks and single holes not over 1-inch in diameter by the dry-pack method. Groove the top of cracks and cut out holes to sound concrete and clean off dust, dirt, and loose particles. Dampen all cleaned concrete surfaces and brush with a neat cement grout coating. Place dry-pack before the cement grout takes its initial set. Mix dry-pack, consisting of one part Portland cement to 2-1/2 parts fine aggregate passing a No. 16 mesh sieve, using only enough water as required for handling and placing. Compact dry-pack mixture in place and finish to match adjacent concrete. Keep patched areas continuously moist for not less than 72 hours.

8. For repair of existing unformed surfaces, mechanically remove all lose concrete as required to expose sound aggregate. Clean concrete surfaces to achieve a contaminate free, open textured surface. Square cut or undercut perimeter to minimum depth as specified by the Repair Mortar Manufacturer. Remove all loose concrete around the exposed steel and hand tool or blast clean all portions of rebar with visible rust to near white metal finish. If half of the diameter of the reinforcing steel is exposed, chip out behind the reinforcing to a 1/2-inch minimum depth. Splice new reinforcing steel to existing where corrosion has depleted the cross-section area by 25 percent. Apply a corrosion inhibitor/primer/bonding agent to all exposed rebar and other steel components and to concrete surfaces to be repaired per Manufacturer's requirements, such as Sika Armatec 110. Apply a polymer-modified, cement-based, repair mortar, trowel applied as specified by the Manufacturer, such as Sika MonoTop 615.

9. Repair methods not specified above may be used subject to the acceptance of the Engineer.

3.14 QUALITY CONTROL TESTING DURING CONSTRUCTION

A. The Contractor will engage a special inspector/testing laboratory to perform all tests and to submit test reports to the Engineer and the Owner.

B. Concrete shall be sampled and tested for quality control during the placement of concrete, as follows:

1. Sampling Fresh Concrete - ASTM C172, except modified for slump to comply with ASTM C94.

2. Slump - ASTM 143; one test for each concrete load at point of discharge; and one for each set of compressive strength test specimens.

3. Air Content - ASTM C231, pressure method; one for each set of compressive strength test specimens.

4. Compression Test Specimen - ASTM C31; one set of four standard cylinders for each compressive strength test, unless otherwise directed. Mold and store cylinders for laboratory cured test specimens except when field-cure test specimens are required.

5. Concrete Temperature - Test hourly when air temperature is 40 degrees F and below, and when 80 degrees F and above; and each time a set of compression test specimens is made.

6. Compressive Strength Tests - ASTM C39; one set for each 100 cubic yards or fraction thereof, of each concrete class placed in any 1 day or for each 5,000 square feet of surface area placed; one specimen tested at 7 days, two specimens tested at 28 days, and one specimen retained in reserve for later testing if required.

    a. When the frequency of testing will provide less than five strength tests for a given class of concrete, conduct testing from at least five randomly selected batches or from each batch if fewer than five are used.

    b. When the total quantity of a given class of concrete is less than 50 cubic yards, the strength tests may be waived by the Engineer if, in the Engineer's judgment, adequate evidence of satisfactory strength is provided.

    c. If required by the building official, perform strength tests of cylinders cured under field conditions. Field cured cylinders shall be taken and molded at the same time and from the same samples as the laboratory cured test cylinders. When the strength of field-cured cylinders is less than 85 percent of companion laboratory-cured cylinders, evaluate current operations and provide corrective procedures for protecting and curing the in-place concrete.

C. Report test results in writing to the Engineer and the Owner on the same day that tests are made. Reports of compressive strength tests shall contain the Project identification name and number, date of concrete placement, name of Contractor, name of concrete supplier and truck number, name of concrete testing service, concrete type and class, location of concrete batch in the structure, design compressive strength at 28 days, concrete mix proportions and materials, compressive breaking strength, and type of break for both 7-day tests and 28-day tests.

D. Additional tests - The testing service will make additional tests of in-place concrete when test results indicate the specified concrete strengths and other characteristics have not been attained in the structure, as directed by the Engineer. The testing service shall conduct tests to determine adequacy of concrete by cored cylinders complying with ASTM C42, or by other methods as directed. Contractor shall pay for such tests conducted, and any other additional testing as may be required, when unacceptable concrete is verified.

END OF SECTION

SECTION 03 60 00 - GROUTING

PART 1 GENERAL

1.1 SUMMARY

A. This Section includes all work necessary to form, mix, place, cure, repair, finish, and do all other work as required to produce finished grout, in accordance with the requirements of the Contract Documents.

B. Work covered in this Section includes:

1. Grouting
2. Removal of loose and spalling grout and concrete
3. Anchoring, patching, grouting, and sealing

C. Related Sections:

1. Section 03 11 00 – Concrete Work

1.2 REFERENCE SPECIFICATIONS, CODES, AND STANDARDS

A. Specifications, codes, and standards shall be as specified in Section 03 11 00, Concrete Work and as referred to herein.

B. Commercial Standards:

1. CRD-C 621, Corps of Engineers Specification for Non-Shrink Grout
2. ASTM C109, “Standard Test Method for Compressive Strength of Hydraulic Cement Mortars (Using 2-inch or 50-mm Cube Specimens)”
3. ASTM C531, “Standard Test Method for Linear Shrinkage and Coefficient of Thermal Expansion of Chemical-Resistant Mortars, Grouts, Monolithic Surfacings, and Polymer Concretes”
4. ASTM C579, “Standard Test Methods for Compressive Strength of Chemical-Resistant Mortars, Grouts, Monolithic Surfacings, and Polymer Concretes”
5. ASTM C827, “Standard Test Method for Change in Height at Early Ages of Cylindrical Specimens of Cementitious Mixtures”

1.3 SUBMITTALS

A. Certified Test Results: Verifying the compressive strength, shrinkage, and expansion requirements specified herein.

B. Manufacturer's Literature: Containing instructions and recommendations on the mixing, handling, placement, and appropriate uses for each type of non-shrink and epoxy grout used in the work.

1.4 QUALITY ASSURANCE

Field Tests

A. Compression test specimens will be taken during construction from the first placement of each type of grout, and at intervals thereafter as selected by the Engineer to ensure continued compliance with these specifications. The specimens will be made by the Engineer or its representative.

B. Compression tests and fabrication of specimens for cement grout and non-shrink grout will be performed as specified in ASTM C 109 at intervals during construction as selected by the Engineer. A set of three specimens will be made for testing at 7 days, 28 days, and each additional time period as appropriate.

C. All grout, already placed, which fails to meet the requirements of these specifications, is subject to removal and replacement at the cost of the Contractor.

D. The cost of all laboratory tests on grout shall be borne by the Contractor and the Contractor shall obtain the specimens for testing. The Contractor shall also be charged for the cost of any additional tests and investigation on work performed which does not meet the specifications. The Contractor shall supply all materials necessary for fabricating the test specimens.

PART 2 PRODUCTS

2.1 PREPACKAGED GROUTS

A. Non-shrink grout: This type of grout is to be used wherever grout is required in the Contract Documents unless another type is specifically referenced.

B. Non-shrink grout shall be a prepackaged, inorganic, non-gas-liberating, non-metallic, non-corrosive, non-chloride, cement-based grout requiring only the addition of water. Manufacturer's instructions shall be printed on each bag or other container in which the materials are packaged. The specific formulation of each class of non-shrink grout specified herein shall be that recommended by the Manufacturer for the particular application.

C. Class A non-shrink grouts shall have minimum 28-day compressive strength of 5,000 pounds per square inch (psi); shall have no shrinkage (0.0 percent) and a maximum 4.0 percent expansion in the plastic state when tested in accordance with ASTM C827; and shall have no shrinkage (0.0 percent) and a maximum of 0.2 percent expansion in the hardened state when tested in accordance with CRDC 621.

D. Class B non-shrink grouts shall have minimum 28-day compressive strength of 5,000 psi and shall meet the requirements of CRD C621.

E. Application

1. Class A non-shrink grout shall be used for the repair of all holes and defects in concrete members which are water bearing or in contact with soil or other fill material, grouting under all equipment base plates, and at all locations where grout is specified in the contract documents; except, for those applications for Class B non-shrink grout specified

herein. Class A non-shrink grout may be used in place of Class B non-shrink grout for all applications.

2. Class B non-shrink grout shall be used or the repair of all holes and defects in concrete members which are not water-bearing and not in contact with soil or other fill material, grouting under all base plates for structural steel members, and grouting railing posts in place.

2.2 CONSISTENCY

A. The consistency of grouts shall be that necessary to completely fill the space to be grouted for the particular application. Dry pack consistency is such that the grout is plastic and moldable but will not flow. Where "dry pack" is called for in the Contract Documents, it shall mean a grout of that consistency; the type of grout to be used shall be as specified herein for the particular application.

B. The slump for topping grout and concrete fill shall be adjusted to match placement and finishing conditions but shall not exceed 4 inches.

2.3 MEASUREMENT OF INGREDIENTS

A. Measurements for cement grout shall be made accurately by volume using containers approved by the Engineer. Shovel measurement shall not be allowed.

B. Prepackaged grouts shall have ingredients measured by means recommended by the Manufacturer.

PART 3 EXECUTION

3.1 GENERAL

A. All surface preparation, curing, and protection of cement grout shall be as specified by the Manufacturer. The finish of the grout surface shall match that of the adjacent concrete.

B. The Manufacturer of Class A non-shrink grout shall provide on-site technical assistance upon request.

C. Base concrete or masonry must have attained its design strength before grout is placed, unless authorized by the Engineer.

3.2 GROUTING PROCEDURES

Prepackage Grouts: All mixing, surface preparation, handling, placing, consolidation, curing, and other means of execution of prepackaged grouts shall be done according to the instructions and recommendations of the Manufacturer.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

DIVISION 09 - FINISHES

SECTION 09 90 00 - PAINTING AND COATING

PART 1 GENERAL

1.1 THE REQUIREMENT

A. Work under this Section shall include the protective coating of all specified surfaces including all surface preparation, pretreatment, coating application, touch-up of factory coated surfaces, protection of surfaces not to be coated, cleanup, and appurtenant work, all in accordance with the requirements of the Contract Documents.

B. This specification is applicable to coated pipe, steel, concrete, and other surfaces listed in the coating schedule at the end of this section.

C. The Coating System Schedules summarize the surfaces to be coated, the required surface preparation, and the coating systems to be applied. Coating notes on the drawings are used to show exceptions to the schedules, to show or extend the limits of coating systems, or to clarify or show details for application of the coating systems.

D. Related Work Specified in Other Sections -- Shop coatings and/or factory finishes on fabricated or manufactured equipment may be specified in other divisions. Some items with factory finishes, or corrosion resistant finishes may be scheduled or directed to be painted by the Engineer to unify a wall finish or color scheme, at the Engineer's discretion.

E. Exclusions -- Do not coat the following surfaces unless specified or directed elsewhere: Stainless steel, aluminum, copper, brass, bronze, and other corrosion-resistant material (except for valve bodies and piping); Electrical switch-gear and motor control centers having factory finish; Fencing; Multiple coated factory finished baked enamel or porcelain products; Concealed areas such as ducts, piping, conduits, and items specified elsewhere for special linings and coatings.

F. Damaged Factory Finish -- If directed by the Engineer, refinish the entire exposed surfaces of equipment chipped, scratched, or otherwise damaged in shipment or installation.

G. All coating coming in contact with potable water shall be NSF approved.

1.2 REFERENCE SPECIFICATIONS, CODES, AND STANDARDS

A. Comply with the provisions of the following codes, specifications, and standards, except as otherwise shown or specified.

1. "Architectural Specification Manual" by the Painting and Decorating Contractors of America (PDCA), 333 Taylor Avenue North, Seattle, Washington 98109.

2. "Systems and Specifications" - Volume 2 of Steel Structures Painting Council (SSPC).

3. NSF International (NSF) Standard No. 61.

4. NSF International (NSF) Standard No. 600 – Health Effects Evaluation and Criteria for Chemicals in Drinking Water (Effective beginning January 1, 2023)

B. References herein to "NACE" shall mean the published standards of the National Association of Corrosion Engineers, P.O. Box 986, Katy, TX 77450.

C. Pipe Coating Commercial Standards

ANSI/AWWA C105	Polyethylene Encasement for Ductile Iron Piping for Water and Other Liquids.
ANSI/AWWA C203	Coal-Tar Protective Coatings and Linings for Steel Water Pipelines - Enamel and Tape - Hot Applied.
ANSI/AWWA C205	Cement-Mortar Protective Lining and Coating for Steel Water Pipe - 4-inch and Larger - Shop Applied
ANSI/AWWA C209	Cold Applied Tape Coatings for the Exterior of Special Sections, Connections, and Fittings for Steel Pipelines.
ANSI/AWWA C210	Liquid Epoxy Coating for Exterior and Interior of Steel Pipe.
ANSI/AWWA C213	Fusion Bonded Epoxy Coating for the Interior and Exterior of Steel Water Pipelines.
ANSI/AWWA C214	Tape Coating systems for the Exterior of Steel Water Pipelines.

D. Federal Specifications

DOD-P-23236A(SH)	Military Specification, Paint Coating Systems, Steel Ship Tank, Fuel and Saltwater Ballast.

1.3 CONTRACTOR SUBMITTALS

A. Coating Materials List -- The Contractor shall provide a coating materials list which indicates the Manufacturer and the coating number, keyed to the coating systems herein. The amount of copies to submit shall be as specified within Section 01 10 00, Summary of Work.

B. Coating Manufacturer's and Applicator Information -- For each coating system to be used the Contractor shall submit, the following listed data.

1. Manufacturer's data sheet for each product used, including statements on the suitability of the material for the intended use.

2. Manufacturer's instructions and recommendations on surface preparation and application.

3. Colors available for each product and each coat.

4. Compatibility of shop and field applied coatings (where applicable).

5. Material safety data sheet (MSDS) for each product used.

6. The Manufacturer’s recommended products and procedures for field coating repairs and field preparation of field cut pipe ends.

7. The name of the proposed coating applicator shop along with certification that the applicator shop is qualified and equipped to apply the coatings systems as specified.

8. Certificate -- Submit Manufacturer's certificate of compliance with the specifications and standards signed by a representative in the Manufacturer's employ.

9. Samples -- Provide painted surface areas at the job for approval of main color selections or submit sample on 12-inch sample of substrate using required finish system at Engineer's discretion.

1.4 QUALITY ASSURANCE

A. Painter Qualifications -- The Painting/Coating Contractor must be capable of performing the various items of work as specified. The Painting/Coating Contractor shall furnish a statement covering experience on similar work, a list of machinery, plant, and other equipment available for the proposed work, and a financial statement, including a complete statement of the Painter/Coating Contractor's financial ability and experience in performing similar painting and coating work. The Painting/Coating Contractor shall have a minimum of 5 years practical experience and a successful history in the application of the specified products to concrete/steel surfaces. Upon request, the Painting/Coating Contractor shall substantiate this requirement by furnishing a list of references, which shall include jobs of similar nature.

B. The Contractor shall give the Engineer a minimum of 3 days advance notice of the start of any field surface preparation work of coating application work, and a minimum of 7 days advance notice of the start of any shop surface preparation work.

C. All such work shall be performed only in the presence of the Engineer unless the Engineer has granted prior approval to perform such work in its absence.

D. Inspection by the Engineer, or the waiver of inspection of any particular portion of the work, shall not relieve the Contractor of its responsibility to perform the work in accordance with these Specifications.

E. Surface Preparation -- Evaluation of blast cleaned surface preparation work will be based upon comparison of the blasted surfaces with the standard samples available from the NACE, using NACE standard TM-01-70.

F. Scaffolding shall be erected and moved to locations where requested by the Engineer to facilitate inspection. Additional illumination shall be provided by the Contractor to cover all areas to be inspected.

G. Paint Products -- No request for substitution shall be approved which decreases the film thickness designated or the number of coats to be applied, or which offers a change from the generic type of coating specified. Painting shall be done at such times as the Contractor and Engineer may agree upon in order that dust-free and neat work be obtained. All painting shall be in strict accordance with the Manufacturer's instructions and shall be performed in a manner satisfactory to the Engineer.

H. Manufacturer's Representative -- Require Coating Manufacturer's representative to be at job site when the first day's coating application is in progress and periodically during progress of the work.

I. Labels -- Deliver to the job site in the original sealed containers with Manufacturer's name, product name, type of product, Manufacturer's specification or catalog number or federal specification number, and instructions for reducing where applicable.

J. Colors -- Colors will be selected from Manufacturer's standard colors as reviewed by Engineer and approved by the Owner. Colors for special coatings that are limited in their availability and color selection will be chosen on the basis of Manufacturer's standard colors, provided that the Manufacturer's product line represents a color range comparable to similar products of other manufacturers.

K. Flame Spread -- Provide paint materials which will result in a Class II finish for all coated surfaces in exit corridors, and a Class III finish for all other interior rooms or areas.

L. Film Thickness Testing -- On ferrous metals, the dry film coating thickness shall be measured in accordance with the SSPC "Paint Application Specification No. 2" using a magnetic-type dry film thickness gauge such as Mikrotest model FM, Elcometer model 111/1EZ, or equal. Each coat shall be tested for the correct thickness. No measurements shall be made until at least 8 hours after application of the coating. On non-ferrous metals and other substrates, the coating thicknesses shall be measured at the time of application using wet film gauge readings and destructive film thickness tests.

1.5 DELIVERY, HANDLING, AND STORAGE

A. Deliver in labeled containers as specified above and store in a locked room accessible for inspection. Comply with fire and health regulations.

B. Provide adequate heat and forced mechanical ventilation for health, safety, and drying requirements. Use explosion proof equipment. Provide face masks.

C. Protect adjacent surfaces with suitable masking and drop cloths as required. Remove cloths or waste from the Project daily.

D. Apply to surfaces under recommended environmental conditions and within the limitations established by the Material Manufacturer. Do not apply coating in snow, rain, fog, or mist; or when the relative humidity exceeds 85 percent; or to damp or wet surfaces, unless otherwise permitted by the Coating Manufacturer's printed instructions. Coating application may be continued during inclement weather only if the areas and surfaces to be painted are enclosed and heated within the temperature limits specified by the Paint Manufacturer during application and drying periods.

1.6 PROTECTION

A. Follow all safety recommendations of Manufacturer regarding ventilation and danger from explosion or breathing paint fumes or skin exposure, and all applicable O.S.H.A. and other regulations.

B. Protect surface adjacent to work being coated from overspray, drips, or other damage.

1.7 EXTRA STOCK

Provide one gallon of each type and color, fully labeled, at completion of job.

PART 2 PRODUCTS

2.1 GENERAL

A. Definitions -- The terms "paint," "coatings," or "finishes" as used herein, shall include surface treatments, emulsions, enamels, paints, epoxy resins, tape, and all other protective coatings, excepting galvanizing or anodizing, whether used as a pretreatment, primer, intermediate coat, or finish coat. The term "DFT" means minimum dry film thickness.

B. General -- Coating materials shall be sealed in containers that plainly show the designated name, formula or specification number, batch number, color, date of manufacture, Manufacturer's directions, and name of Manufacturer, all of which shall be plainly legible at the time of use.

C. The Contractor shall use coating materials suitable for the intended use and recommended by their Manufacturer for the intended service.

D. Compatibility -- In any coating system only compatible materials from a single manufacturer shall be used in the work. Particular attention shall be directed to compatibility of primers and finish coats. If necessary, subject to the approval of the Engineer, a barrier coat shall be applied between existing prime coat and subsequent field coats to ensure compatibility.

E. Colors -- All colors and shades of colors of all coatings shall be as selected or specified by the Engineer. Each coat shall be of a slightly different shade, to facilitate inspection of surface coverage of each coat. Finish colors shall be as selected from the Manufacturer's standard color samples by the Engineer. Color pigments shall be lead free.

F. Protective Coating Materials -- Products shall be standard products produced by recognized manufacturers who are regularly engaged in production of such materials for essentially identical service conditions. Where requested, the Contractor shall provide the Engineer with the names of not less than 10 successful applications of the proposed Manufacturer's products demonstrating compliance with this specification requirement.

G. Substitute or "Or-Equal" Submittals -- Unless otherwise specified, materials are from the catalogs of the companies listed herein. Materials by other manufacturers are acceptable provided that they are established as being compatible with and of equal quality to the coatings of the companies listed. The Contractor shall provide satisfactory documentation from the firm manufacturing the proposed substitute or "or equal" material that said material meets the specified requirements and is equivalent or better than the listed materials.

H. The cost of all testing and analyzing of the proposed substitute materials that may be required by the Engineer shall be paid by the Contractor. If the proposed substitution requires changes in the contract work, the Contractor shall bear all such costs involved and the costs of allied trades affected by the substitution.

2.2 INDUSTRIAL COATING SYSTEMS

A. General

Provide and apply the industrial coatings systems which follow as listed in the coating schedule, as required by these specifications, and as directed by the Engineer. Coat all existing and new

exposed interior or exterior surfaces and submerged and intermittently submerged surfaces as indicated, except as specifically excluded in Part 1 of this section or on the drawings or finish schedules. Coating System Numbers listed below shall be used as the Coating System code letter, and shall be used on any coating submittals or correspondence.

B. Industrial coating systems shall be as follows

1. Coating System 100

   a. Location -- Exposed, unprimed, non-galvanized, nonsubmerged metal surfaces, both interior and exterior including piping, and structural steel.

   b. Surface Preparation -- As specified herein.

   c. Coating System -- Apply prime coat and topcoat, 4.0-6.0 mils each coat of Tnemec Series 66-2 Hi-Build Epoxoline, or equal. Color as selected by Owner.

2. Coating System 101

   a. Location -- Exposed metal surfaces, shop primed, both interior and exterior including piping, railings, ladders, steel doors, and any other metal items not otherwise specified.

   b. Surface Preparation -- As specified herein.

   c. Coating System -- Apply shop prime coat 3.0 mils DFT Tnemec Series 90-97 Tneme-Zinc, one coat 4.0 - 6.0 mils DFT Tnemec Series 66 Hi-Build Epoxoline, and 3.0 - 4.0 mils DFT of Tnemec Series 175 Endura Shield, or equal. Color as selected by Owner.

3. Coating System 102

   a. Location -- Unprimed or non-galvanized, continuously or intermittently submerged metal items, both interior and exterior including piping, structural steel, and all other metal items not otherwise specified.

   b. Surface Preparation -- As specified herein.

   c. Coating System -- Prime, intermediate and topcoat, 4.0-6.0 mils each coat of Tnemec Series 22 / FC22, or equal. Color as selected by Owner.

4. Coating System 103

   a. Location -- Vertical concrete walls, exterior, below finish grade, not exposed to view.

   b. Surface Preparation – Surface should be free of oil, grease, dirt, laitance and loose material. Dry surfaces must be dampened with water and kept damp until application.

   c. Paint System – Apply MasterSeal 610 and 614 waterborne emulsified-asphalt damp proofing compound, or equal. Apply a prime coat of MasterSeal 610 asphalt emulsion, cut 20% by volume with clean water. Allow prime coat to dry tacky to touch and apply one coat of MasterSeal 614 by trowel. Fill in all crevices and grooves, making sure the coating is continuous and free from breaks and pinholes. Carry coating over exposed

top and outside edge of footing. Spread around all joints, grooves, and slots and into all chases, corners, reveals and soffits. Bring the coating to finished grade. All to set and backfill as described.

d. Backfilling – Place backfill at last 24-48 hours after application but within 7 days. Do not rupture or damage the film or displace the coating. Some situations may require protection board.

5. Coating System 104

a. Location – Non-submerged, exposed to view, PVC piping.

b. Surface Preparation -- As specified herein.

c. Coating System -- Apply one coat, 4.0-6.0 mils Tnemec Series 66-2 Hi-Build Epoxoline, or equal. Color as selected by Owner.

2.3 SPECIAL PIPE AND SEVERE SERVICE COATING SYSTEMS

A. General

The following coatings are for buried pipe and surfaces used in severe service conditions. The Manufacturers' products listed in this paragraph are materials which satisfy the material descriptions of this paragraph and have a documented successful record for long term submerged or severe service conditions. Proposed substitute products will be considered as indicated within the paragraph entitled " ‘Or-Equal’ Clause” in Section 01 10 00, Summary of Work.

B. Special pipe and severe service coating systems shall be as follows

1. Coating System 200 -- Cement Mortar Coating

a. Location -- Exterior surfaces of buried steel pipe and fittings, non-galvanized.

b. Surface Preparation - As specified herein.

c. Coating System -- A 1-1/2-inch minimum thickness mortar coating reinforced with 3/4-inch galvanized welded wire fabric shall be provided. The cement mortar shall contain no less than 1-part Type V cement to 3 parts sand. The cement mortar shall be cured by a curing compound meeting the requirements of "Liquid Membrane-Forming Compounds for Curing Concrete" ASTM C 309-81, Type II, white pigmented, or by enclosure in an 8-mil thick polyethylene sheet with all joints and edges lapped by at least 6 inches. At the Engineer's discretion, the hot applied coal tar epoxy coating may be used as the curing membrane for the mortar coating.

2. Coating System 201 -- Hot Applied Coal Tar Epoxy Coating

a. Location -- Exterior surface of concrete pipe and cement-mortar coated pipe and fittings.

b. Surface Preparation -- As specified herein.

c. Coating System -- The hot applied coal tar epoxy shall be a solvent free 100 percent solids coal tar epoxy chemically compatible with hydrating cement and suitable for application on moist surfaces of freshly placed cement mortar or concrete and properly prepared cured surfaces. The coal tar epoxy coating material shall be Amercoat 1972B or equal. The finish coal tar epoxy coating shall have a minimum DFT of 26 mils.

3. Coating System 202 -- Coal-Tar Epoxy Coating System

   a. Location -- Exterior surface of buried steel pipe, fittings, and other ferrous surfaces.

   b. Surface Preparation -- As specified herein.

   c. Coating System -- High build, two-component amine or polyamide cured coal-tar epoxy shall have a solids content of at least 68 percent by volume, suitable as a long-term coating of buried surfaces, and conforming to AWWA C210. Prime coats are for use as a shop primer only. Prime coat shall be omitted when both surface preparation and coating are to be performed in the field. The coal-tar epoxy coating system shall include:

      1) Prime coat (DFT = 1-1/2 mils), Amercoat 83HS, Tnemec P66, or equal.

      2) Finish coats (Two or more, DFT = 18 mils), Amercoat 78 HB, Tnemec 46 H-413, or equal.

      3) Total system DFT = 19-1/2 mils.

4. Coating System 203 -- Fusion Bonded Epoxy

   a. Location -- Ferrous surfaces of sleeve couplings, steel pipe, and fittings.

   b. Surface Preparation -- As specified herein.

   c. Coating System -- The coating material shall be a 100 percent powder epoxy applied in accordance with the ANSI/AWWA C213 "AWWA Standard for Fusion-Bonded Epoxy Coating for the Interior and Exterior of Steel Water Pipelines". The coating shall be applied using the fluidized bed process.

      1) Liquid Epoxy -- For field repairs, the use of a liquid epoxy will be permitted, applied in not less than three coats to provide a DFT 16 mils. The liquid epoxy shall be a 100 percent solids epoxy recommended by the Powder Epoxy Manufacturer.

      2) Coating (DFT = 16 mils), Scotchkote 203, or equal.

      3) Total system DFT = 16 mils.

5. Coating System 204 -- Hot, Coal-Tar Enamel

   a. Location -- Exterior surfaces of buried steel pipe and fittings, non-galvanized.

   b. Surface Preparation - As specified herein

c. Coating System -- Coal-Tar Enamel materials and procedures shall be in accordance with ANSI/AWWA C203. This system shall consist of a primer layer, coal-tar enamel layer, coal-tar saturated non-asbestos felt outer wrap, and a finish coat. Total system DFT = 188 mils.

6. Coating System 205 -- Hot Applied Tape

   a. Location -- Exterior surfaces of buried steel pipe and fittings, non-galvanized.

   b. Surface Preparation -- As specified herein.

   c. Coating System -- Tape coating materials and procedures shall be in accordance with ANSI/AWWA C203. This system shall consist of a cold-applied liquid primer and heated coal-tar base tape. Total system DFT = 50 mils.

7. Coating System 206 -- Cold Applied Tape

   a. Location -- Exterior surfaces of buried steel pipe and fittings, non-galvanized.

   b. Surface Preparation -- As specified herein.

   c. Coating System -- Tape coating materials and procedures shall be in accordance with ANSI/AWWA C209. Prefabricated tape shall be Type II. The system shall consist of a primer layer, inner layer tape of 35 mils, and an outer layer tape of 35 mils. Total system DFT = 70 mils.

8. Coating System 207 -- PVC Tape

   a. Location -- Small galvanized steel pipe and fittings.

   b. Surface Preparation -- As specified herein.

   c. Coating System -- Prior to wrapping pipe with PVC tape, the pipe and fittings shall be primed using a primer recommended by the PVC Tape Manufacturer. After being primed, the pipe shall be wrapped with a 20-mil adhesive PVC tape, half lapped for a total thickness of 40 mils.

9. Coating System 208 -- Mastic

   a. Location -- Pipe and fitting joints, and general buried surface coating repair and touch up.

   b. Surface Preparation - As specified herein.

   c. Coating System -- Mastic shall be a one-part solvent drying heavy bodied thixotropic synthetic elastomeric coating with chemically inert resins and fillers and an average viscosity of 650,000 CPS at 77 degrees Fahrenheit (F), thereby requiring generous applications by hand or trowel. Total coat thickness shall be 30 mils, minimum. Mastic shall be Protecto Wrap 160 H or equal and be fully compatible with pipeline coating systems.

10. Coating System 209 -- Polyethylene Encasement

a. Location -- Ductile iron, steel and concrete cylinder pipe and fittings

b. Surface Preparation -- None required.

c. Coating System -- Except as otherwise specified, application of polyethylene encasement shall be in accordance with ANSI/AWWA C105 using Method C.

11. Coating System 210 – Wax Tape

a. Location – Buried ductile iron and steel pipe fittings and couplings where specified.

b. Surface Preparation – As specified herein

c. Coating System -- Except as otherwise specified, application of wax tape installation shall be in accordance with ANSI/AWWA C217.

12. Coating System 211 – Amine Cured Epoxy

a. Location – Sanitary sewer manhole and wet well interior concrete surfaces where shown.

b. Surface Preparation – Per manufacturer's recommendations.

c. Coating System – Solvent-free 100% solids, ultra-high build two-component epoxy coating system, thixotropic in nature and filled with select fillers to minimize permeability and provide sag resistance with high physical strengths and broad range of chemical resistance. Coating shall be meet these requirements:

Parameter	Requirement
Product Type	Amine cured epoxy
Color	Light Blue
Solids Content (vol %)	100
Mix Ratio	3:1
Compressive Strength, psi	18,000
Tensile Strength, psi	7,600
Tensile Elongation, %	1.50
Flexural Modulus, Type D	88
Bond Strength – Concrete	>Tensile Strength of Concrete
Chemical Resistance	
Sever Municipal Sewer	All types of service
Successful Pass	Sanitation District of LA County Coating Evaluation Study or SSPWC 210.2.3.3

d. Coating system shall be applied by a certified applicator of the epoxy coating manufacturer and according to manufacturer specifications.

e. Coating system shall be Raven 405 or approved equal. The coating shall be applied with minimum thickness of 120 mils.

2.4 ARCHITECTURAL COATING SYSTEMS

A. General

"Paint" as used herein means all coating systems materials, including primers, emulsions, enamels, stains, sealers and fillers, and other applied materials whether used as prime, intermediate or topcoat.

Fungus Control: Submit evidence for all paints attesting the passing of Federal Test Method Standard No. 141, Method 6271.1 showing no fungus growth or other approved test results.

Apply to surfaces under recommended environmental conditions and within the limitations established by the Material Manufacturer. Acrylics require 60 degrees F and above temperature and below 50 percent relative humidity. Apply water-based paints only when the temperature of surfaces to be painted and the surrounding air temperatures are between 50 degrees F and 90 degrees F unless otherwise permitted by the Paint Manufacturer's printed instructions.

B. Architectural coating systems shall be as follows

1. Coating System 300

    a. Location -- Vertical, exterior concrete masonry unit walls exposed to view.

    b. Surface Preparation -- As specified herein.

    c. Coating System -- Apply prime, intermediate and topcoat, 75 square foot per gallon (ft^2/gal), 100 ft^2/gal and 100 ft^2/gal respectively for each coat of Tnemec Series 156 Envirocrete or equal. Color as selected by Owner.

2. Paint System 301

    a. Location -- Vertical concrete exterior walls and flat concrete exterior roofs and slabs exposed to view.

    b. Surface Preparation -- As specified herein.

    c. Coating System -- Apply two coats 6.0-9.0 mils (100 ft^2/gal) each coat, Tnemec Series 156 Envirocrete, or equal. Color as selected by Owner.

3. Paint System 302

    a. Location -- Interior concrete masonry unit walls and interior and exterior wood walls, ceilings, and other wood surfaces not otherwise specified, exposed to view.

    b. Surface Preparation -- As specified herein.

    c. Coating System -- Prime as specified by Coating Manufacturer. Apply two coats 6.0 - 9.0 mils (100 ft^2/gal) each coat, Tnemec Series 156 Envirocrete, or equal. Color as selected by Owner.

4. Paint System 303

a. Location -- Wood surfaces not otherwise specified, exposed to view.

b. Surface Preparation -- As specified herein.

c. Coating System -- Apply an alkyd primer as recommended by the Manufacturer, 2 mils. Apply finish coats (two or more coats 6 mils total) of single component, water based acrylic latex coating, Tnemec Series 6, Carboline 3350 or equal. Total DFT = 8 mils. Color as selected by Owner.

5. Paint System 304

a. Location -- Interior drywall surfaces not otherwise specified, exposed to view.

b. Surface Preparation - As specified herein.

c. Coating System -- Apply two coats 2.0 - 3.0 mils each coat of single component, water based acrylic latex coating, Tnemec Series 6, Carboline 3350 or equal. Color as selected by Owner.

6. Paint System 305

a. Location -- Exterior brick surfaces not otherwise specified, exposed to view.

b. Surface Preparation -- Surfaces shall be cleaned with a Manufacturer's approved chemical cleaner and power washed. Surfaces shall be completely dry, free from efflorescence, oils, paint, and other contaminants before the coating system is applied. Coating system shall be applied according to the Manufacturer's published recommendations. A Manufacturer's representative shall be present during application of the coating system, if required by the Manufacturer's warranty.

c. Coating System -- Apply two coats of masonry water retardant material. The system shall be clear, non-staining, silane-modified-siloxane, Fabrishield 161, Rainstopper 1500, or equal. The selected coating system shall provide a minimum of a 5-year Manufacturer's warranty.

7. Paint System 306

a. Location -- Exterior siding, trim and related products, all comprised of fiber cement material with a factory installed primer.

b. Surface Preparation -- If cleaning is required, surface shall be cleaned in a manner approved by both the coating system manufacturer and the siding manufacturer. Under no circumstances shall fiber cement siding products be cleaned with high pressure water blasting, sand blasting, or acid washing as these techniques may damage the surface of the fiber cement. Low pressure water spray and a medium-stiff, nonmetallic bristle brush may be used for cleaning fiber cement products. Coating system shall be applied according to the coating system manufacturer's published recommendations. A manufacturer's representative shall be present during application of the coating system, if required by the manufacturer's warranty. Coating system must be applied within 180 days of installation of the factory primed siding

products, or less if the siding product manufacturer's warranty requires painting in less than 180 days.

c. Coating System -- Apply primer coat of high performance acrylic primer/sealer specifically engineered for high-performance protection of exterior, above-grade, cementitious surfaces and fiber cement siding. Apply topcoat of 100% acrylic latex, cross-linked. The system shall Sherwin Williams Loxon Concrete & Masonry Primer/Sealer and Sherwin Williams Emerald Exterior Acrylic, or approved equal. The selected coating system shall provide a minimum of a five-year manufacturer's warranty.

PART 3 EXECUTION

3.1 STORAGE, MIXING, AND THINNING OF MATERIALS

A. Manufacturer's Recommendations -- Unless otherwise specified herein, the Coating Manufacturer's printed recommendations and instructions for thinning, mixing, handling, applying, and protecting its coating materials, for preparation of surfaces for coating, and for all other procedures relative to coating shall be strictly observed.

B. All protective coating materials shall be used within the Manufacturer's recommended shelf life.

C. Storage and Mixing -- Coating materials shall be protected from exposure to cold weather, and shall be thoroughly stirred, strained, and kept at a uniform consistency during application. Coatings of different manufacturers shall not be mixed together.

3.2 SURFACE PREPARATION STANDARDS

A. The following referenced surface preparation specifications of the Steel Structures Painting Council shall form a part of this specification.

1. Solvent Cleaning (SSPC-SP1) -- Removal of oil, grease, soil, salts, and other soluble contaminants by cleaning with solvent, vapor, alkali, emulsion, or steam.

2. Hand Tool Cleaning (SSPC-SP2) -- Removal of loose rust, loose mill scale, loose paint, and other loose detrimental foreign matter, by hand chipping, scraping, sanding, and wire brushing.

3. Power Tool Cleaning (SSPC-SP3) -- Removal of loose rust, loose mill scale, loose paint, and other loose detrimental foreign matter, by power tool chipping, descaling, sanding, wire brushing, and grinding.

4. White Metal Blast Cleaning (SSPC-SP5) -- Removal of all visible rust, oil, grease, soil, dust, mill scale, paint, oxides, corrosion products, and foreign matter by blast cleaning.

5. Commercial Blast Cleaning (SSPC-SP6) -- Removal of all visible oil, grease, soil, dust, mill scale, rust, paint, oxides, corrosion products, and other foreign matter, except that staining shall be limited to no more than 33 percent of each square inch of surface area.

6. Brush-Off Blast Cleaning (SSPC-SP7) -- Removal of all visible oil, grease, soil, dust, loose mill scale, loose rust, and loose paint.

7. Near-White Blast Cleaning (SSPC-SP10) -- Removal of all visible oil, grease, soil, dust, mill scale, rust, paint, oxides, corrosion products, and other foreign matter, except that staining shall be limited to no more than 5 percent of each square inch of surface area.

8. High- and Ultra High- Pressure Water Jetting (SSPC-SP12): Water jetting at high- or ultra-high-pressure to prepare a surface for recoating using pressure above 10,000 pounds per square inch (psi).

9. Surface Preparation of Concrete (SSPC-SP-13) - Surface preparation of concrete by mechanical, chemical, or thermal methods prior to the application of bonded protective coating or lining systems.

10. Industrial Blast Cleaning (SSPC-SP14): Blast cleaning to remove all visible oil, grease, dust, and dirt, when viewed without magnification

3.3 CORRECTIONS AND CLEANUP

At completion any damaged, de-laminated or defaced coated surfaces shall be touched up, restored, and left in first class condition. Any coated or finished surfaces damaged in fitting or erection shall be restored. If necessary, an entire wall shall be refinished rather than spot finished. Upon completion and prior to final acceptance, all equipment and unused materials accumulated in the coating process shall be removed from the site and any spillage, spatter spots or other misplaced coating material shall be removed in a manner which will not damage surfaces. Perform required patching, repair, and cleaning to the satisfaction of the Engineer. Cooperate and coordinate work with the work of other trades in the removal and replacement of hardware, fixtures, covers, switch plates, etc., as required for coating.

3.4 SURFACE PREPARATION

A. General

Prepare all surfaces scheduled to receive new coating systems, as required to provide for adequate bonding of the specified coating system to the substrate material. Request review of prepared surfaces by the Engineer prior to proceeding. For existing coated surfaces, hand wash with cleaner or product recommended by Coating Manufacturer to properly prepare existing surface and provide for bonding of coating specified to follow. Remove any loose, peeling or flaking coating, or mildewed areas. Surface preparation minimums shall be as follows:

1. Exposed metal items, non-submerged, unprimed, non-galvanized both interior and exterior, including piping, structural steel and all other metal items not otherwise specified, shall undergo surface preparation in accordance with SSPC-SP6, "Commercial Blast Cleaning".

2. Exposed metal items, shop primed, both interior and exterior including piping, steel doors, steel ladders to be painted, and railings, and all other metal items not otherwise specified, shall undergo surface preparation in accordance with SSPC-SP1, "Solvent Cleaning"; SSPC-SP2, "Hand Tool Cleaning"; and SSPC-SP3, "Power Tool Cleaning" as may be required to remove grease, loose, or peeling or chipped paint.

3. Metal items, unprimed or non-galvanized, continuously or intermittently submerged, both interior and exterior including piping, structural steel, and all other metal items not otherwise specified, shall undergo surface preparation in conformance with SSPC-SP10, "Near-White Blast Cleaning".

4. Stainless Steel – Non-submerged and submerged, exposed piping and fittings, both interior and exterior shall undergo surface preparation in accordance with SSPC-SP1, "Solvent Cleaning".

5. Polyvinyl Chloride (PVC) – Non-submerged, both interior and exterior, process piping and plumbing, shall be lightly sanded prior to application of the specified coating system to follow.

6. Non-submerged Concrete - Clean all concrete surfaces of dust, form oil, curing compounds, or other incompatible matter. Etch and prime if required by Manufacturer for specified coating products to follow. Allow minimum 28-day cure of concrete prior to application of coating systems.

7. Concrete Masonry Units -- Repair all breaks, cracks, and holes with concrete grout. The surface must be free of dirt, dust, loose sand, and other foreign matter. Brush clean. Allow minimum 28-day cure of concrete joint mortar and repair grout prior to application of coatings system.

8. Wood -- Wood surfaces shall be thoroughly cleaned and free of all foreign matter with cracks, nail holes, and other defects properly filled, smoothed, and sandpapered to fine finish. Wipe clean of dust.

9. Preparation of All Existing Coated Surfaces -- Removed rough and defective coating film from material surfaces to be painted. Touch up with approved primer. Clean all greasy or oily surfaces, to be painted, with benzine or mineral spirits or Rodda's Gresof before coating, or as recommended by Manufacturer. For walls, patch existing nicks and gouges, sand to match wall finish.

10. Sewer Manhole and Wet Well Interior Concrete – Clean all concrete surfaces of oils, grease, incompatible existing coatings, waxes, form release, curing compounds, efflorescence, sealers, salts, and other contaminants. All concrete or mortar that is not sound or has been damaged by chemical exposure shall be removed to a sound concrete surface or replaced. Infiltration shall be stopped by using a material which is compatible with the repair materials and is suitable for top-coating with the epoxy coating system. Cementitious repair materials shall be troweled to provide a smooth surface with an average profile equivalent to coarse sandpaper to optimally receive the epoxy coating. No bug holes or honeycomb surfaces should remain. The repair materials shall be allowed to cure according to the manufacturer recommendations. Curing compounds should not be used unless approved for compatibility with the specified epoxy coating system.

3.5 PRIME COATING

A. Exposed Steel -- Prime coat all exposed steel in accordance with SSPC PS 13.01 for epoxy-polyamide coating systems. Prime coats shall be applied following completion of surface preparation requirements as specified in paragraph 3.4.A.1 above.

B. Galvanized Metal -- After surface preparation specified above, prime galvanized metal items receiving paints as specified with Tnemec Series 66 Hi-Build Epoxaline or equal, verifying with Manufacturer before application the compatibility with coatings specified to follow.

C. Shop Primed Metal -- Where indicated on the plans or coating schedule and following the surface preparation procedures specified in paragraph 3.4.A.2 above, the Contractor shall apply intermediate and topcoats of the specified paint system to shop primed metal. The Contractor shall verify with the Manufacturer(s) representative of the item(s) to be painted, before application, the compatibility of shop primers with the specified intermediate and topcoat coating systems.

D. Non-Shop Primed Metal and Piping -- Prime coat all exposed metal and piping, except stainless steel, received at job site following completion of surface preparation requirements as specified in Paragraph 3.4.A.1 above. Prime paint in accordance with SSPC PS No. 13.01 for epoxy-polyamide primers. Epoxy-polyamide primers shall conform to the standards set forth in SSPC Paint Specification No. 22.

E. Cast-In-Place Reinforced Concrete -- After surface preparation specified above, prime coat concrete as specified in the coating schedule found elsewhere in the specifications.

F. Concrete Masonry Units -- After surface preparation specified above, prime coat as specified in the coating schedule found elsewhere in the specifications.

G. Wood Surfaces -- Following surface preparation specified above, prime coat exterior exposed wood surfaces with appropriate coating system as specified in the painting schedule.

3.6 FIELD PRIME

Wherever shop priming has been damaged in transit or during construction, the damaged area shall be cleaned and touched up with field primer specified herein or returned to the shop for resurfacing and re-priming, at the Engineer’s discretion. Metal items delivered to the job site unprimed shall be cleaned and primed as specified herein.

3.7 APPLICATION

A. Thickness -- Apply coatings in strict conformance with the Manufacturer's application instructions. Apply each coat at the rate specified by the Manufacturer to achieve the dry mil thickness specified. If material must be diluted for application by spray gun, build up more coating to achieve the same thickness as undiluted material. Correct apparent deficiency of film thickness by the application of an additional coat.

B. Porous Surfaces -- Apply paint to porous surfaces as required by increasing the number of coats or decreasing the coverage as may be necessary to achieve a durable protective and decorative finish.

C. Blast cleaned ferrous metal surfaces shall be painted before any rusting or other deterioration of the surface occurs. Blast cleaning shall be limited to only those surfaces that can be coated in the same working day.

D. Coatings shall be applied in accordance with the Manufacturer's instructions and recommendations, and this Section, whichever has the most stringent requirements.

E. Special attention shall be given to edges, angles, weld seams, flanges, nuts and bolts, and other places where insufficient film thicknesses are likely to be present. Use stripe coating for these areas.

F. Special attention shall be given to materials which will be joined so closely that proper surface preparation and application are not possible. Such contact surfaces shall be coated prior to assembly or installation.

G. Ventilation -- Adequately ventilate enclosed rooms and spaces during painting and drying periods.

H. Drying Time -- Do not apply next coat of coat until each coat is dry. Test non-metallic surfaces with moisture meter. The Manufacturer's recommended drying time shall mean an interval under normal condition to be increased to allow for adverse weather or drying conditions. Coating Manufacturer's representative shall verify by cure testing, complete cure of coatings systems used for immersion service.

3.8 COATING SCHEDULE

Coating Schedule

Item	Location	Material	Coating System
Piping Coatings[1] (exterior surface of pipe)	Exposed and in Vaults	Ductile Iron	Coating System 101
Piping Coatings	Buried	Ductile Iron	Coating System 209 and Section 33 31 10
Vaults	Exterior (walls below grade)	Concrete	Coating System 103

Notes:

1. Pipe interior coatings (linings) shall be in accordance with applicable utility piping specifications.
2. Coating of exposed valves and couplings to be shop-applied fusion-bonded epoxy Finish coat shall be same coating system as adjacent piping to match in color, unless otherwise directed by the Engineer.
3. If a location and material are not specifically identified in the table, the coating systems specified in Section 2, Products, shall apply to the entire project as noted in the specifications for each coating system.

DIVISION 31 - EARTHWORK

SECTION 31 05 13 - SOILS FOR EARTHWORK

PART 1 GENERAL

1.1 SUMMARY

A. This Section includes range of soil and subsoil materials intended to be referenced by other sections, generally for fill and grading purposes. Materials are indicated by "Type" to assist in referencing from other sections and on Drawing notes.

B. Section includes:

1. Subsoil materials
2. Topsoil materials

C. Related Sections

1. Section 31 05 16 - Aggregates for Earthwork
2. Section 31 10 00 – Site Clearing
3. Section 31 22 13 - Rough Grading
4. Section 31 23 16 – Excavation
5. Section 31 23 17 - Trenching
6. Section 31 23 18 – Rock Removal
7. Section 31 23 23 - Fill
8. Section 31 37 00 - Riprap

1.2 REFERENCES

A. American Association of State Highway and Transportation Officials:

B. ASTM International (ASTM):

1. ASTM D698 - Standard Test Method for Laboratory Compaction Characteristics of Soil Using Standard Effort (12,400 ft-lbf/ft3 (600 kN-m/m3))
2. ASTM D2487 - Standard Classification of Soils for Engineering Purposes (Unified Soil Classification System)
3. ASTM D6938 - Standard Test Method for In-Place Density and Water Content of Soil and Soil-Aggregate by Nuclear Methods (Shallow Depth)

1.3 SUBMITTALS

A. Section 01 33 00 - Submittal Procedures: Requirements for submittals.

B. Materials Source: Submit name of imported materials source.

C. Manufacturer's Certificate: Certify Products meet or exceed specified requirements.

1.4 QUALITY ASSURANCE

A. Furnish materials of each type from same source throughout the Work.

B. Soil Testing:

1. Soil sampling and testing to be completed by an independent laboratory approved by the Engineer.

2. Frequency of testing shall be determined by the Engineer.

3. All soil testing shall be paid for by the Contractor.

C. Compaction Tests:

1. Maximum density at optimum moisture content determined by ASTM D698 (AASHTO T99).

2. In-place density in accordance with Nuclear Testing Method, ASTM D6938.

D. Soil Classification: All imported materials shall be classified in accordance with ASTM D2487.

PART 2 PRODUCTS

2.1 SUBSOIL MATERIALS

A. Subsoil Type S1, Select Native Material:

1. Select earth obtained from on-site excavations approved for use by Engineer.

2. Graded.

3. Free of peat, humus, vegetative matter, organic matter, and rocks larger than 6 inches in diameter.

4. Processed as required to be placed in thickness as prescribed and at the optimum moisture content to obtain level of compaction required by these specifications.

B. Subsoil Type S2, Imported Fill Material:

1. Imported earth approved for use by Engineer.

2. Meeting the requirements of Subsoil Type S1.

2.2 TOPSOIL MATERIALS

A. Topsoil Type TS1, Select Native Topsoil Material:

1. Top 6 - 12 inches of existing soil containing organic matter.

2. Engineer decision shall be final as to determination of what material is topsoil quality.

3. Graded.

4. Free of roots, rocks larger than 1/2-inch subsoil, debris, large weeds, and foreign matter.

a. Screening: Single screened.

B. Topsoil Type TS2, Imported Topsoil Material:

1. Imported borrow.

2. Friable loam.

3. Reasonably free of roots, rocks larger than 1/2-inch, subsoil, debris, large weeds, and foreign matter.

a. Screening: Single screened.

4. Acidity range (pH) of 5-1/2 to 7-1/2.

5. Containing minimum of 4 percent and maximum of 25 percent inorganic matter.

2.3 SPOILS

A. All excess material not suitable or not required for backfill and grading shall be hauled off site and disposed of at a location provided by the Contractor and approved by the Engineer.

B. Make arrangements for disposal of the material at no additional cost to the Owner.

C. Landfill permit to be obtained by the Contractor and provided to Engineer prior to commencement of disposal.

2.4 SOURCE QUALITY CONTROL

A. Testing and Analysis of Subsoil Material: Perform in accordance with ASTM D698 (AASHTO T99).

B. When tests indicate materials do not meet specified requirements, change material, or vary compaction methods and retest. Additional testing shall be completed and paid for by the Contractor with no reimbursement by the Owner.

C. Furnish materials of each type from same source throughout the Work.

PART 3 EXECUTION

3.1 EXCAVATION

A. Excavate material of every nature and description to the lines and grades as indicated on the Drawings and/or as required for construction of facilities.

B. Site within clearing limits shall be stripped of topsoil as required to obtain additional topsoil necessary to complete Work indicated in the Drawings or as specified.

C. When practical, do not excavate wet topsoil.

D. Stockpile excavated material meeting requirements for subsoil materials and topsoil materials.

E. Remove excess excavated subsoil and topsoil not intended for reuse from Site.

F. Remove excavated materials not meeting requirements for subsoil materials and topsoil materials from Site.

3.2 STOCKPILING

A. Stockpile soils at locations shown in the Drawings or at locations as approved by Engineer for redistribution as specified.

1. Site may not have sufficient area to stockpile excavated material that will be required for fill later in the Project. If additional stockpile area is required to complete the Project on schedule, arrange off-site stockpile areas.

2. No additional payments will be made for stockpiling excavated materials off-site.

B. Stockpile in sufficient quantities to meet Project schedule and requirements.

C. Separate differing materials with dividers or stockpile apart to prevent mixing.

D. Prevent intermixing of soil types or contamination.

E. Direct surface water away from stockpile site to prevent erosion or deterioration of materials.

1. Grade surface of stockpiles to prevent ponding of water.

2. Cover stockpiles to minimize the infiltration of water.

F. Stockpile unsuitable and/or hazardous materials on impervious material and cover to prevent erosion and leaching, until disposed of.

3.3 STOCKPILE CLEANUP

A. Remove stockpile, leave area in clean and neat condition. Grade site surface to prevent free standing surface water.

B. When borrow area is indicated, leave area in clean and neat condition. Grade site surface to prevent free standing surface water.

END OF SECTION

SECTION 31 05 16 - AGGREGATES FOR EARTHWORK

PART 1 GENERAL

1.1 SUMMARY

A. This Section includes a range of coarse and fine aggregate materials intended to be referenced by other Sections, generally for fill and grading purposes. Materials are indicated by "Type" to assist in referencing from other Sections and in Drawing notes.

B. Section Includes:

1. Coarse aggregate materials
2. Fine aggregate materials

C. Related Sections

1. Section 31 05 13 - Soils for Earthwork
2. Section 31 23 17 - Trenching
3. Section 31 23 19 - Dewatering
4. Section 32 11 23 - Aggregate Base Courses
5. Section 33 11 10 – Water Utility Distribution and Transmission Piping
6. Section 33 31 10 – Sanitary Sewerage Piping
7. Section 33 41 10 – Storm Utility Drainage Piping

4. ASTM D4318 - Standard Test Method for Liquid Limit, Plastic Limit, and Plasticity Index of Soils

5. ASTM D6938 - Standard Test Method for In-Place Density and Water Content of Soil and Soil-Aggregate by Nuclear Methods (Shallow Depth)

1.3 SUBMITTALS

A. Section 01 33 00 - Submittal Procedures: Requirements for submittals.

B. Materials Source: Submit name of imported materials suppliers.

C. Manufacturer's Certificate: Certify Products meet or exceed specified requirements.

D. Results of aggregate sieve analysis and standard proctor tests for all granular material.

1.4 QUALITY ASSURANCE

A. Furnish each aggregate material from single source throughout the Work.

B. Aggregate Testing:

1. Aggregate sampling and testing to be completed by an independent laboratory approved by the ENGINEER.

2. The frequency of testing shall be determined by the ENGINEER.

3. All aggregate testing shall be paid for by the CONTRACTOR.

C. Compaction Tests:

1. Maximum density at optimum moisture content determined by ASTM D698 (AASHTO T99).

2. In-place density in accordance with Nuclear Testing Method, ASTM D6938.

D. Aggregate Classification: All imported materials shall be classified in accordance with ASTM D2487.

PART 2 PRODUCTS

2.1 COARSE AGGREGATE MATERIALS

A. Coarse Aggregate Type A1, Dense-Graded Aggregate: Crushed rock with ¾-inch-0, 1-inch-0, 1-1/2-inch-0, 2-inch-0 and 2-1/2-inch-0 gradation as shown in the Drawings and meeting the requirements provided below.

1. Grading - Dense-graded base aggregate shall be crushed rock, including sand. Uniformly grade the aggregates from coarse to fine.

2. Sieve analysis shall be determined according to AASHTO T27.

3. The aggregates shall conform to one of the grading requirements Table 31 05 16-A below.

Table 31 05 16-A
Grading Requirements for Dense-Graded Aggregate
Separated Sizes
Percent Passing (by weight)

Sieve Size	2-1/2" - 0	2" - 0	1-1/2" - 0	1" - 0	3/4" - 0
3”	100				
2-1/2”	95 - 100	100			
2”	-	95 - 100	100		
1-1/2"	-	-	95 - 100	100	
1-1/4”	55 - 75	-	-	-	
1”	-	55 - 75	-	90 - 100	100
3/4"	-	-	55 - 75	-	90 - 100
1/2"	-	-	-	55 - 75	-
3/8”	-	-	-	-	55 - 75
1/4"	30 - 45	30 - 45	35 - 50	40 - 55	40 - 60
No. 4*	-	-	-	-	-
No. 10	[1]	[1]	[1]	[1]	[1]

[1] Of the fraction passing the 1/4-inch sieve, 40 percent to 60 percent shall pass the No. 10 sieve.
* Report percent passing sieve when no grading requirements are listed.

B. Coarse Aggregate Type A2, Granular Drain Backfill Material: Crushed or uncrushed rock or gravel as shown in the Drawings.

1. Material shall be clean and free draining.
2. Sieve analysis shall be according to AASHTO T27.
3. Grading: Meeting the gradation requirements provided in Table 31 05 16-B below.

Table 31 05 16-B
Grading Requirements for Granular Drain Backfill Material
Separated Sizes
Percent Passing (by weight)

Sieve Size	Separated Sizes 1-1/2-inch – 3/4-inch	Separated Sizes 3/4-inch – 1/2-inch
2-inch	100	
1-1/2-inch	90 - 100	
1-inch	20 - 55	100
3/4-inch	0 - 15	85 - 100
1/2-inch	-	0 - 15
3/8-inch	0 - 5	-

2.2 SAND

A. Sand: Sand material shall consist of granular material, naturally produced, or produced from crushed gravel, or dredge sand that is reasonably free of organic material, mica, clay, fly ash, and other deleterious material, meeting the gradations of Table 31 05 16-C below.

Table 31 05 16-C
Grading Requirements for Sand
Separated Sizes
Percent Passing (by weight)

Sieve Size	Coarse Sand	Medium Sand	Fine Sand
1-inch	100	100	100
3/8-inch	95 - 100	95 - 100	-
#4	80 - 100	70 - 95	90 - 100
#30	10 - 30	10 - 45	-
#100	-	2 - 10	2 - 10
#200	0 - 8	0 - 7	0 - 4
Sand Equivalent	50 min.	50 min.	50 in.

2.3 SOURCE QUALITY CONTROL

A. Coarse Aggregate Material - Testing and Analysis: Perform in accordance with ASTM C136 and ASTM D698 (AASHTO T99).

B. Sand - Testing and Analysis: Perform in accordance with ASTM C136 and ASTM D698 (AASHTO T99).

C. When tests indicate materials do not meet specified requirements, change material and retest. Additional testing shall be completed and paid for by the CONTRACTOR with no reimbursement by the OWNER.

PART 3 EXECUTION

3.1 STOCKPILING

A. Stockpile materials imported to site as shown in the Drawings or at locations as approved by ENGINEER for redistribution as specified.

B. Separate different aggregate materials with dividers or stockpile individually to prevent mixing.

C. Prevent intermixing of aggregate types or contamination.

D. Direct surface water away from stockpile site to prevent erosion or deterioration of materials.

1. Grade surface of stockpiles to prevent ponding of water.
2. Cover stockpiles to minimize the infiltration of water.

3.2 STOCKPILE CLEANUP

A. Remove stockpile, leave area in clean and neat condition. Grade site surface to prevent free standing surface water.

B. When borrow area is indicated, leave area in clean and neat condition. Grade site surface to prevent free standing surface water.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 31 10 00 - SITE CLEARING

PART 1 GENERAL

1.1 SUMMARY

A. This Section includes clearing site of incidental paving and curbs, debris, grass, trees, and other plant life in preparation for site or building excavation work.

B. Related Sections:

1. Section 01 56 39 – Temporary Tree and Plant Protection
2. Section 02 41 00 - Demolition
3. Section 31 22 13 - Rough Grading
4. Section 31 23 18 - Rock Removal

1.2 DEFINITIONS

A. Clearing: Removal of interfering or objectionable material lying on or protruding above ground surface.

B. Grubbing: Removal of vegetation and other organic matter including stumps, buried logs, and roots greater than 2-inch caliper to a depth of 12 inches below subgrade.

C. Interfering or Objectionable Material: Trash, rubbish, and junk; vegetation and other organic matter, whether alive, dead, or decaying; topsoil.

D. Limits of Disturbance: Work area boundary as shown on the Plans.

E. Root Wad: Tree stump and root mass including all roots greater than 1-inch diameter.

F. Stripping: Removal of topsoil remaining after applicable scalping is completed.

1.3 SUBMITTALS

A. Section 01 33 00 - Submittal Procedures: Requirements for submittals.

B. Clearing, Grubbing, and Stripping Plan: Drawings clearly showing proposed limits to clearing, grubbing, and stripping activities at Site.

C. Certification or disposal permit for landfill and/or waste disposal site.

D. A copy of written permission of private property owners, with copy of fill permit for said private property, as may be required for disposal of materials.

1.4 QUALITY ASSURANCE

A. Existing Conditions: Determine the extent of Work required and limitations before proceeding with Work.

B. Obtain Engineer's approval of staked clearing, grubbing, and stripping limits prior to commencing clearing, grubbing, and stripping.

C. Conform to applicable local, state, and federal codes for environmental requirements and disposal of debris,

1. Burning on Project Site will not be permitted.

2. Use of herbicides will not be permitted.

D. Permits: The Contractor is responsible for obtaining all necessary permits required for completion of the Work described in this Section.

E. Protection of Persons and Property: Meet all federal, state, and local safety requirements for the protection of laborers, other persons, and property in the vicinity of the work and requirements of the General Provisions.

PART 2 PRODUCTS

2.1 MATERIALS

A. Existing Materials: All materials, equipment, miscellaneous items, and debris involved, occurring or resulting from demolition, clearing, and grubbing work shall become the property of the Contractor at the place of origin, except as otherwise indicated in the Drawings or specifications.

B. Wound Paint: Emulsified asphalt formulated for use on damaged plant tissues.

PART 3 EXECUTION

3.1 GENERAL

A. Clear, grub, and strip areas needed for waste disposal, borrow, or Site improvements within limits shown in approved Clearing, Grubbing, and Stripping Plan.

B. Remain within the property lines at all times.

C. Do not injure or deface vegetation or structures that are not designated for removal.

3.2 EXAMINATION

A. Verify existing plant life designated to remain is tagged or identified.

B. Identify waste and salvage areas for placing removed materials.

3.3 PREPARATION

A. Carefully coordinate the work of this Section with all other work and construction.

B. Call Oregon Utility Notification Center at 1-800-332-2344, not less than three working days before performing Work.

C. Request underground utilities to be located and marked within and surrounding construction areas.

1. Disconnect or arrange for disconnection of utilities (if any) affected by required work.

2. Keep all active utilities intact and in continuous operations.

D. Prepare Site only after:

1. Erosion and sediment controls are in place.

a. Limit areas exposed uncontrolled to erosion during installation of temporary erosion and sediment controls and in compliance with Oregon Erosion and Sediment Control Manual and ESC Permits.

2. Tree and vegetation protection is installed.

a. Protect existing site improvements, trees, and shrubs to remain to preclude damage during construction.

b. Follow the provisions set forth in 01 56 39, Temporary Tree and Plant Protection for all temporary tree and plant protection measures.

3. Temporary fencing is installed along the Limits of Disturbance.

4. Notification of utility agencies; disconnect or arrange for disconnection of utilities (if any) affected by required work. Keep all active utilities intact and in continuous operation.

3.4 PROTECTION

A. Utilities: Locate, identify, and protect utilities located by utilities and indicated in the Drawings to remain from damage.

B. Survey control: Protect benchmarks, survey control points, and existing structures from damage or displacement.

C. Preservation and Trimming of Trees, Shrubs, and Other Vegetation:

1. Follow the provisions set forth in 01 56 39, Temporary Tree and Plant Protection.

D. Landscaped Areas:

1. When any portion of the Work crosses private property or landscaped areas, excavate topsoil separately and pile it on the opposite side of the trench from the subsoil.

2. Conduct Work in a manner that will restore original conditions as nearly as practicable.

3. Remove and replace any trees, shrubs, plants, sod, or other vegetative material as needed to complete Work.

4. All shrubs or plants shall be balled by experienced workers, carefully handled and watered, and replaced in their original positions without damage. Sod shall be handled in a similar manner.

5. Wherever sod cannot be saved and restored, the ground must be reseeded and cared for until a stand of grass is reestablished.

6. Plants or shrubs killed or destroyed shall be replaced and paid for by the Contractor.

7. It is the intent of this paragraph that the Contractor shall leave the surface and plantings in substantially the same conditions as before the Work is undertaken.

E. Miscellaneous Site Features: Protect all existing miscellaneous site features from damage by excavating equipment and vehicular traffic, including but not limited to existing structures, fences, mailboxes, sidewalks, paving, and curbs.

F. Repair and Replacement:

1. Damaged items, including but not restricted to those noted above, shall be repaired or replaced with new materials as required to restore damaged items or surfaces to a condition equal to and matching that existing prior to damage or start of work of this contract.

2. Any damage to existing facilities or utilities to remain as caused by the Contractor's operations shall be repaired at the Contractor's expense.

3.5 LIMITS

A. As follows, but not to extend beyond Limits of Disturbance and within the approved disturbance limits:

1. Excavation: 5 feet beyond top of cut slopes.

2. Trench Excavation: 6 feet from trench centerline, regardless of actual trench width.

3. Fill:

a. Clearing and Grubbing: 5 feet beyond toe of permanent fill.

b. Stripping: 2 feet beyond toe of permanent fill.

4. Structures: 15 feet outside of new structures.

5. Roadways: Clearing, grubbing, scalping, and stripping 5 feet from roadway shoulders.

6. Other Areas: As shown.

B. Remove rubbish, trash, and junk from entire area within the Limits of Disturbance as material is generated. Stockpiling shall not be permitted without written approval of Owner.

3.6 CLEARING AND GRUBBING

A. Clear and grub areas within limits shown in approved Clearing, Grubbing, and Stripping Plan.

B. Except in areas to be excavated, all holes resulting from the clearing and grubbing operations shall be backfilled and compacted in accordance with the applicable sections of these Specifications.

C. Clearing:

1. Remove trees, saplings, snags, stumps, shrubs, brush, vines, grasses, weeds, and other vegetative growth within the clearing limits shown in the Drawings, except those trees and shrubs noted to remain in the Drawings or as directed by the Engineer.

2. Clearing shall be performed in such a manner as to remove all evidence of the presence of vegetative growth from the surface of the Project Site and shall be inclusive of sticks and branches of thickness or diameter greater than 3/8-inch and of grasses, weeds, exceeding 12 inches in height except as otherwise indicated.

3. Clear undergrowth and deadwood, without disturbing subsoil.

D. Grubbing: Clear areas required for access to site and execution of Work and remove all stumps, root wads, and roots over 1-inch diameter to the following depths:

1. Future Structures and Building Areas	24 Inches
2. Roads and Parking Areas	18 Inches
3. All other Areas	12 Inches

3.7 TREE REMOVAL

A. Exercise care in cutting, felling, trimming, and handling of those trees shown for removal to prevent damage to neighboring trees and structures to remain.

B. Tree Salvage: As shown on the Plans.

C. No trees may be removed unless approved and permitted by the Engineer.

D. Do not top trees unless otherwise specified or approved by Owner in writing.

E. Refer to Section 01 56 39, Temporary Tree and Plant Protection for tree protection requirements.

3.8 REMOVAL AND DISPOSAL

A. Native vegetation may be mulched and used on Site.

B. Asphalt and Gravel Surfaces:

1. Asphalt, concrete, and gravel surfaces designated for removal shall be done to full depth.

2. Asphalt, concrete, and gravel removed at Site may be reused at Site where shown in the Drawings or following approval of the Engineer.

3. Haul removed asphalt, concrete, and gravel which is unsuitable for reuse or that exceeds quantity required.

C. Remove debris, rock, abandoned piping, and extracted plant life from Site.

D. Remove from the Site all debris, materials, equipment, and items found thereon and materials and debris resulting from the Work, except as otherwise indicated.

1. All existing improvements designated on the Drawings or specified to be removed including but not limited to structures, pipelines, walls, footings, foundations, slabs, pavements, curbs, fencing, and similar structures occurring above, at, or below existing ground surface shall be included in the Work.

2. Unless otherwise specified, any resulting voids shall be thoroughly cracked out for drainage and backfilled with suitable excavated or imported material compacted to the density of the adjacent soil.

E. Continuously clean-up and remove waste materials from site. Do not allow materials to accumulate on site.

F. Do not burn or bury materials on site. Leave site in clean condition.

G. Removal: All material resulting from demolition, clearing, and grubbing, and trimming operations shall be removed from the Site and disposed of in a lawful manner. Materials placed on property of private property owners shall be by written permission only.

H. Cleanup: During and upon completion of work, promptly remove all unused tools and equipment, surplus materials, and debris.

I. Adjacent areas shall be returned to their existing condition prior to the start of Work.

3.9 CLEANUP

A. During the time Work is in progress, make every effort to maintain the Site in a neat and orderly condition.

B. All refuse, broken pipe, excess fill material, cribbing, and debris shall be removed as soon as practicable.

C. Should the Work not be maintained in a satisfactory condition, the Owner may cause the work to stop until the cleanup of the Work has been done to the satisfaction of the Engineer.

D. The Work will not be considered complete, or the final payment certificate issued until all rubbish, unused material, or equipment shall have been removed and the premises left in a condition satisfactory to the Owner and the Engineer.

END OF SECTION

SECTION 31 22 13 - ROUGH GRADING

PART 1 GENERAL

1.1 SUMMARY

A. This Section includes rough grading and filling associated with contouring of Site in preparation for building excavation and subsequent site work.

B. Section Includes:

1. Excavating topsoil
2. Excavating subsoil
3. Cutting, grading, filling, and rough contouring of Site

C. Related Sections:

1. Section 01 45 00 - Quality Control
2. Section 31 05 13 - Soils for Earthwork
3. Section 31 05 16 - Aggregates for Earthwork
4. Section 31 10 00 - Site Clearing
5. Section 31 23 16 - Excavation
6. Section 31 23 17 - Trenching
7. Section 31 23 18 - Rock Removal
8. Section 31 23 23 - Fill

1.2 REFERENCES

A. American Association of State Highway and Transportation Officials:

1. AASHTO T99 - Standard Specification for Moisture-Density Relations of Soils Using a 2.5-kg (5.5-lb) Rammer and a 305-mm (12-in.) Drop

B. ASTM International (ASTM):

1. ASTM C136 - Standard Test Method for Sieve Analysis of Fine and Coarse Aggregates
2. ASTM D698 - Standard Test Method for Laboratory Compaction Characteristics of Soil Using Standard Effort (12,400 ft-lbf/ft3 (600 kN-m/m3))
3. ASTM D2419 - Standard Test Method for Sand Equivalent Value of Soils and Fine Aggregate
4. ASTM D2434 - Standard Test Method for Permeability of Granular Soils (Constant Head)

5. ASTM D2922 - Standard Test Method for Density of Soil and Soil-Aggregate in Place by Nuclear Methods (Shallow Depth)

6. ASTM D3017 - Standard Test Method for Water Content of Soil and Rock in Place by Nuclear Methods (Shallow Depth)

1.3 SUBMITTALS

A. Section 01 33 00 - Submittal Procedures: Requirements for submittals.

B. Soils for Earthwork: As specified in Section 31 05 13, Soils for Earthwork.

C. Aggregates for Earthwork: As specified in Section 31 05 16, Aggregates for Earthwork.

1.4 CLOSEOUT SUBMITTALS

A. Project Record Documents: Accurately record actual locations of utilities remaining by horizontal dimensions, elevations or inverts, and slope gradients.

1.5 QUALITY ASSURANCE

A. Perform Work in accordance with ASTM C136, ASTM D2419, and ASTM D2434.

PART 2 PRODUCTS

2.1 MATERIALS

A. Subsoil Fill: Types S1 and S2 as specified in Section 31 05 13, Soils for Earthwork.

B. Topsoil: As specified in Section 31 05 13, Soils for Earthwork.

1. Type TS1, Select Native Topsoil Material, as may be available.

2. TS2, Imported Topsoil Material, as may be required.

C. Structural Fill: Type A1, Dense-Graded Aggregate as specified in Section 31 05 16, Aggregates for Earthwork. Size of aggregate as shown in the Drawings.

D. Granular Fill: Type A2, Granular Drain Backfill Material as specified in Section 31 05 16, Aggregates for Earthwork. Size of aggregate as shown in the Drawings.

PART 3 EXECUTION

3.1 EXAMINATION

A. Verify survey benchmark and intended elevations for the Work are as indicated on Drawings.

3.2 PREPARATION

A. Call Oregon Utility Notification Center at 1-800-332-2344 not less than 3 working days before performing Work.

1. Request underground utilities to be located and marked within and surrounding construction areas.

2. Notify Engineer of any potential conflicts resulting from utility locations and the Drawings.

3. Notify utility company to remove and relocate utilities, as may be necessary.

B. Identify required lines, levels, contours, and datum.

C. See Section 31 10 00, Site Clearing for additional requirements in protection of existing utilities, survey control, plant life, and landscaped areas in coordination with the Work of this Section.

3.3 TOPSOIL EXCAVATION

A. Excavate and stockpile topsoil as specified in Section 31 05 13, Soils for Earthwork.

3.4 SUBSOIL EXCAVATION

A. Excavate subsoil from areas to be further excavated, re-landscaped, or re-graded as shown in the Drawings.

B. When practical, do not excavate wet subsoil. When wet subsoil must be excavated and is to be reused on site for the Work, process wet material to obtain optimum moisture content.

C. Stockpile excavated material in area designated onsite in accordance with Section 31 05 13, Soils for Earthwork.

D. When excavating through roots, perform Work by hand and cut roots with sharp axe.

E. Benching Slopes: Horizontally bench existing slopes greater than 1:2 to key placed fill material to slope to provide firm bearing.

F. Stability: Replace damaged or displaced subsoil as specified for fill.

3.5 FILLING

A. General:

1. Grading and filling operations shall not take place when weather conditions and moisture content of fill materials prevent the attainment of specified density.

2. Vertical curves or roundings at abrupt changes in slope shall be established as approved by Engineer.

3. Bring all graded areas to a relatively smooth, even grade and slope by blading or dragging. Remove high spots and fill depressions.

B. Fill areas to contours and elevations shown in the Drawings with unfrozen materials.

C. Topsoil Fill:

1. Scarify prepared subgrade to depth of 4 inches immediately prior to placing topsoil.

2. Place topsoil in areas to be seeded to depths indicated in the Drawings, minimum depth of 6 inches.

3. Place topsoil material loose; do not compact, do not place in wet or muddy conditions.

D. Place material in continuous layers as follows:

1. Subsoil Fill: Maximum 8 inches compacted depth.

2. Structural Fill: Maximum 12 inches compacted depth.

3. Granular Fill: Maximum 12 inches compacted depth.

E. Maintain optimum moisture content of fill materials to attain required compaction density.

F. Slope grade away from building minimum 2 percent slope for minimum distance of 10 feet, unless noted otherwise.

G. Make grade changes gradual. Blend slope into level areas.

H. Repair or replace items indicated in the Drawings to remain which are damaged by excavation or filling. All costs shall be borne by the Contractor.

3.6 TOLERANCES

A. Top Surface of Subgrade: Plus or minus 1/10 from required elevation.

3.7 FIELD QUALITY CONTROL

A. Perform laboratory material tests in accordance with AASHTO T99.

B. Perform in place compaction tests in accordance with the following:

1. Density Tests: ASTM D2922

2. Moisture Tests: ASTM D3017

C. Frequency and location of testing is dependent upon type of material placed. See Section 01 45 00, Quality Control for testing requirements.

D. When tests indicate Work does not meet specified requirements, remove Work, replace, and retest at the sole expense of the Contractor.

END OF SECTION

SECTION 31 23 16 – EXCAVATION

PART 1 GENERAL

1.1 SUMMARY

A. This Section includes excavation required for building foundations, site structures, or under slabs-on-grade or paving. Excavating for utilities outside building is included in Section 31 23 17, Trenching.

B. Section Includes:

1. Excavating for building foundations
2. Excavating for paving, roads, and parking areas
3. Excavating for slabs-on-grade
4. Excavating for site structures
5. Excavating for landscaping

C. Related Sections:

1. Section 01 45 00 - Quality Control
2. Section 02 41 00 - Demolition
3. Section 31 05 13 - Soils for Earthwork
4. Section 31 05 16 - Aggregates for Earthwork
5. Section 31 10 00 - Site Clearing
6. Section 31 22 13 - Rough Grading
7. Section 31 23 17 - Trenching
8. Section 31 23 18 - Rock Removal
9. Section 31 23 19 - Dewatering
10. Section 31 23 23 - Fill
11. Section 31 50 00 - Excavation Support and Protection
12. Section 33 11 10 - Water Utility Distribution and Transmission Piping.
13. Section 33 31 10 – Sanitary Utility Sewerage Piping
14. Section 33 41 10 – Storm Utility Drainage Piping

1.2 DEFINITIONS

A. Common Excavation: All excavation required for Work, regardless of the type, character, composition, or condition of the material encountered. Common Excavation shall further include all debris, junk, broken concrete, and all other material. All excavation shall be classified as Common Excavation, unless provided as Rock for under Section 31 23 18, Rock Removal below.

B. Common Material: All soils, aggregate, debris, junk, broken concrete, and miscellaneous material encountered in Common Excavation, excluding rock as defined below.

C. Concrete Excavation: The removal of pieces of concrete larger than 1 cubic yard in volume that requires drilling, splitting and breaking methods, or a necessitating a trench width increase of 18 inches or more than the width of the preceding 10 feet of trench. Concrete excavation includes materials composed of Portland cement that are not identified other than manholes, structures, sewer pipe, or other appurtenances.

D. Exploratory Excavation: The removal and replacement of material from locations shown on the Drawings, or as directed for the purpose of investigating underground conditions and identifying potential utility conflict between existing and proposed utilities.

E. Overbreak: Material beyond and outside of the slope limits established by the Owner's Representative, which becomes displaced or loosened during excavation and is excavated.

F. Pothole Excavation: Pothole excavation is the removal and replacement of all materials via coring, vacuum extraction, or similar method, not classified as exploratory excavation, for the purposes of locating an underground utility and to investigate underground conditions.

G. Rock Removal: As defined in Section 31 23 18, Rock Removal.

H. Spoils: Excavated materials from Site unsuitable for use as fill or not required for backfill and grading.

I. Unsuitable Materials: See Spoils.

1.3 REFERENCES

A. Local utility standards when working within 24 inches of utility lines.

1.4 SUBMITTALS

A. Section 01 33 00 - Submittal Procedures: Requirements for submittals.

B. Excavation support plan and utility protection plan as specified in Section 31 50 00, Excavation Support and Protection.

1.5 QUALITY ASSURANCE

A. Allowable Tolerances: Final grades shall be plus or minus 0.1-foot.

B. Provide adequate survey control to avoid unauthorized over-excavation.

C. Weather Limitations:

1. Material excavated when frozen or when air temperature is less than 32 degrees Fahrenheit (F) shall not be used as fill or backfill until material completely thaws.

2. Material excavated during inclement weather shall not be used as fill or backfill until after material drains and dries sufficiently for proper compaction.

1.6 NOT USED

PART 2 PRODUCTS - Not Used

PART 3 EXECUTION

3.1 PREPARATION

A. Prior to commencing work in this Section, become familiar with site conditions. In the event discrepancies are found, notify the Engineer as to the nature and extent of the differing conditions.

B. Call Oregon Utility Notification Center at 1-800-332-2344 not less than 3 working days before performing Work.

1. Request underground utilities to be located and marked within and surrounding construction areas.

2. Coordinate with and notify utility companies should it be necessary to remove or relocate facilities.

C. Identify required lines, levels, contours, and datum.

D. See Section 31 10 00, Site Clearing for additional requirements in protection of existing utilities, survey control, plant life, and landscaped areas in coordination with Work in this Section.

3.2 SITE CONDITIONS

A. Quantity Survey: The Contractor shall be responsible for calculations for quantities and volume of cut and fill from existing site grades to finish grades established under this contract as indicated in the Drawings or specified and shall include the cost for all earthwork in the total basic bid.

B. Dust Control: Must meet all federal, state, and local requirements. Protect persons and property from damage and discomfort caused by dust. Water surfaces as necessary and when directed by Engineer to quell dust.

C. Soil Control: Soil shall not be permitted to accumulate on surrounding streets or sidewalks nor to be washed into sewers.

3.3 EXISTING UNDERGROUND UTILITIES

A. Protect active utilities encountered, located or otherwise, and notify persons or agencies owning same.

B. Remove inactive or abandoned utilities from within the project grading limits in accordance with Section 33 11 50, Existing Pipe Abandonment.

C. For sewer and other miscellaneous drainage facilities, fill and plug pipes as follows:

1. General:

   a. Remove all structures to a minimum of 3 feet below subgrade, unless otherwise noted.

   b. Cover top surface of all abandoned structures with two sheets of nonwoven geotextile, extended at least 1-foot beyond the outside walls of the abandoned manhole, sump, or basin.

   c. Plug all abandoned pipes with permanent plugs as specified in Section 33 05 50, Existing Pipe Abandonment.

2. Sumps:

   a. Remove existing sediment, soil, and water. Properly dispose of these materials in accordance with the requirements of these specifications.

   b. Remove top cone and first solid concrete section to a depth of approximately 8 to 10 feet below ground.

   c. Fill sump with CLSM.

   d. Backfill remaining voids for facilities within existing or proposed roadways with approved materials meeting the requirements of Section 32 11 23, Aggregate Base Courses.

3. Salvaging Manhole Frames, Covers, and Grates:

   a. Remove manhole frames, covers, and grates scheduled for salvage and store in approved location.

   b. Frames, grates, and covers meeting Specifications may be salvaged from structures to be adjusted and may be reused in the Work if of suitable size and condition.

   c. Replace, at no additional cost to the Owner, all items damaged or lost by the Contractor with similar items that are comparable in all respects with those they are to replace, and which are adequate for the intended purpose.

   d. Clean salvaged components to be reused of foreign material by methods that will not harm the components.

4. Existing Manhole Frames and Covers: Manhole frames and covers removed by the Contractor are the property of the Owner. Notify the Engineer a minimum of 48 hours before removal to arrange for pickup of the removed frames and covers, if not reused.

3.4 PRESERVATION OF EXISTING IMPROVEMENT

A. Protect adjacent existing structures which may be damaged by excavation work.

1. Conduct operations in such a manner that existing street facilities, utilities, railroad tracks, structures, and other improvements, which are to remain in place, will not be damaged. Furnish and install cribbing and shoring or whatever means necessary to support material around existing facilities, or to support the facilities themselves, and maintain such supports until no longer needed.

2. Open slopes shall not be cut within 5 feet of any existing spread footings unless approved by the Engineer.

3. Do not interfere with 45 degree bearing splay of foundations unless approved by the Engineer

4. Excavated material shall not be placed adjacent to existing or proposed structures.

3.5 EXCAVATION

A. General:

1. Method of excavation shall be the Contractor's option, but care shall be exercised as final grade is approached to leave it in undisturbed condition.

2. If the final grade for supporting structures is disturbed, it shall be restored to requirements of these Specifications and satisfaction of the Engineer at no additional cost to Owner.

3. The Contractor is advised that footings should be poured as soon as possible to minimize unfavorable final grade conditions from developing.

4. Provide all measures to ensure public safety.

B. Control of Water:

1. Provide and maintain equipment to remove and dispose of water during the course of the work of this Section and keep excavations dry and free of frost or ice.

2. Bearing surfaces that become softened by water or frost must be re-excavated to solid bearing at Contractor's expense and backfilled with compacted crushed rock at Contractor's expense.

3. Grade top perimeter of excavation to prevent surface water from draining into excavation.

4. See additional requirements in Section 31 23 19, Dewatering.

C. Frozen Ground: Frost protection shall be provided for all structural excavation work. Foundation work shall not be placed on frozen ground.

D. Excavate material of every nature and description to the lines and grades as indicated in the Drawings and/or as required for construction of the facility.

1. Allow for forms, shoring, working space, granular base, topsoil, and similar items, wherever applicable.

2. Trim excavations to neat lines. Remove loose matter and lumped subsoil.

E. Excavated Materials: Soils excavated at Site will be treated and used as one of two general categories of material as provided below.

1. Fill:

a. Subsoil Type S1, Select Native Fill, as approved for use by Engineer.

2. Spoils:

a. Ensure there is sufficient suitable material available to complete embankments and other required fillings prior to disposing of any excavated materials.

b. Make arrangements for disposal of spoils and include as part of contract work in preparing of project bids.

c. Landfill permit or written permission from private property owner to be obtained by the Contractor and provided to the Engineer.

F. Shoring:

1. As specified in Section 31 50 00, Excavation Support and Protection.

G. Slope existing banks with machine to angle of repose or less until shored.

1. Shape, trim, and finish cut slopes to conform to lines, grades, and cross-sections shown, with proper allowance for topsoil or slope protection, where shown.

2. Protection of excavation side slopes:

a. Use excavation methods that will not shatter or loosen excavation slopes.

b. Where practical, excavate materials without previous loosening and in limited layers or thickness to avoid breaking the material back of the established slope line.

c. Avoid overbreaks. Overbreak is incidental to the Work, except in cases where the Owner's Representative determines that such overbreak was unavoidable.

d. Excavation in rock or rocky cuts:

1) Once completed, thoroughly test the slopes with bars or other approved means to remove all loose, detached, broken, or otherwise unstable material.

2) Remove jutting points. Scale slopes using mine scaling rods or other approved methods to remove loose or overhanging materials and provide a safe, trim, neat, and stable condition.

3) Dispose of the materials removed under this subparagraph in the same manner as other excavated material.

e. Remove all exposed roots, debris, and all stones more than 3 inches in size which are loose or could become loosened.

3. Construct slopes free of all exposed roots.

4. Construct slopes free of unstable rock and loose stones exceeding 3 inches in diameter.

5. Round tops of cut slopes in soil to not less than a 6-foot radius, provided such rounding does not extend off-site, outside of easements, outside of rights-of-way, or adversely impacts existing facilities, adjacent property, or completed Work.

6. Trim all surfaces neatly and smoothly.

H. Compact disturbed load bearing soil in direct contact with foundations to original bearing capacity; perform compaction in accordance with Section 31 23 17, Trenching and Section 31 23 23, Fill.

I. Notify Engineer of unexpected subsurface conditions.

J. Over-excavation for Unsuitable Foundation Conditions:

1. Cross-sectional dimensions and depths of excavations shown in the Drawings shall be subject to such changes as may be found necessary by the Engineer to secure foundations free from soft, weathered, shattered, and loose material or other objectionable materials.

2. Unsuitable materials encountered shall be removed and replaced with Coarse Aggregate Type A1, 2-1/2-inch – 0 gradation, as specified in Table 31 05 16-A of Section 31 05 16, Aggregates for Earthwork. All material placed shall be compacted to 95 percent of maximum dry density.

3. Unsuitable materials shall be removed and replaced only as directed in writing by Engineer.

K. Rock Removal:

1. Remove boulders and rock up to 1/2 cubic yard measured by volume per the requirements of this Section.

2. Remove larger boulders and rock material as specified in Section 31 23 18, Rock Removal.

3. Concrete removal, as defined herein, shall be treated as Rock Removal.

L. Stockpile excavated material in area(s) designated on or off site in accordance with Section 31 05 13, Soils for Earthwork.

3.6 FIELD QUALITY CONTROL

A. Perform excavation and controlled fill operations in accordance with the requirements of this Section.

B. Coordinate the visual inspection and approval of all bearing surfaces by Engineer before installing subsequent work.

3.7 PROTECTION

A. Prevent displacement or loose soil from falling into excavation; maintain soil stability and store excavated materials at a distance from top of excavation.

B. Protect structures, utilities, and other facilities from damage caused by settlement, lateral movement, undermining, washout, and other hazards created by earth operations.

END OF SECTION

SECTION 31 23 17 - TRENCHING

PART 1 GENERAL

1.1 SUMMARY

A. This Section includes the requirements for excavation and backfill of all utilities, including installation of pipe bedding, pipe zone backfill, trench backfill, and related Work as shown on the Drawings and as specified.

B. Section includes:

1. Excavating trenches for pipe, utility vaults, and other utilities.
2. Compacted fill from top of utility bedding to final grades.
3. Trench and utility vault backfilling and compaction.

C. Related Sections:

1. Section 01 45 00 - Quality Control
2. Section 03 11 00 – Concrete Work
3. Section 31 05 13 - Soils for Earthwork
4. Section 31 05 16 - Aggregates for Earthwork
5. Section 31 10 00 - Site Clearing
6. Section 31 22 13 - Rough Grading
7. Section 31 23 16 - Excavation
8. Section 31 23 18 - Rock Removal
9. Section 31 23 23 - Fill
10. Section 31 23 24 - Flowable Fill
11. Section 31 37 00 - Riprap
12. Section 33 11 10 - Water Utility Distribution and Transmission Piping
13. Section 33 31 10 - Sanitary Utility Sewerage Piping: Sanitary sewer piping and bedding
14. Section 33 41 10 - Storm Utility Drainage Piping

1.2 REFERENCES

A. American Association of State Highway and Transportation Officials:

1. AASHTO T99 - Standard Specification for Moisture-Density Relations of Soils Using a 2.5-kg (5.5-lb) Rammer and a 305-mm (12-in.) Drop

B. ASTM International (ASTM):

1. ASTM C403 - Standard Test Method for Time of Setting of Concrete Mixtures by Penetration Resistance

2. ASTM D698 - Standard Test Method for Laboratory Compaction Characteristics of Soil Using Standard Effort (12,400 ft-lbf/ft3 (600 kN-m/m3))

3. ASTM D2922 - Standard Test Method for Density of Soil and Soil-Aggregate in Place by Nuclear Methods (Shallow Depth)

4. ASTM D3017 - Standard Test Method for Water Content of Soil and Rock in Place by Nuclear Methods (Shallow Depth)

5. D4832, Standard Test Method for Preparation and Testing of Controlled Low Strength Material (CLSM) Test Cylinders

1.3 DEFINITIONS

A. Controlled Low Strength Material (CLSM): Also referred to as Flowable Fill. Lean cement concrete fill. A self-compacting, cementitious material.

B. Flexible Pipe: For the purposes of these Specifications, tubing between 1/2-inch and 4-inch diameter constructed of polyvinyl chloride (PVC) and high-density polyethylene (HDPE) are considered flexible pipes. HDPE piping 4 inches in diameter and larger is also considered flexible pipe.

C. Geosynthetics: Geotextiles, geogrids, geomembranes, and drainage composite materials.

D. Imported Material: Materials obtained from sources offsite, suitable for specified use.

E. Lift: Loose (uncompacted) layer of material.

F. Obstructions: Items which may be encountered during utility and vault trenching which do not require replacement.

G. Optimum Moisture Content:

1. Determined in accordance with ASTM Standard specified to determine maximum dry density for relative compaction.

2. Determine field moisture content on basis of fraction passing 3/4-inch sieve.

H. Pipe Bedding: Trench backfill zone for full trench width which extends from the bottom outside surface of the pipe to a minimum of 6 inches below the bottom outside surface of pipe, conduit, cable, or duct bank to the trench foundation so as to uniformly support the barrel of the pipe.

I. Pipe Zone: Trench backfill zone for full trench width which extends from the bottom outside surface of the pipe to a minimum of 12 inches above the top outside surface of pipe, conduit, cable, or duct bank.

J. Pipe Bedding, Pipe Zone, and Trench Backfill Classifications:

1. Class A: Backfill with suitable native or imported material that is approved to meet the characteristics required for the specific surface loading or other criteria of the backfill zone.

2. Class B: Backfill with imported granular material consisting of gravel or crushed rock meeting the requirements of this Section and Coarse Aggregate Type A1 as specified in Section 31 05 16, Aggregates for Earthwork; typical designated size shall be 1-inch-0 or 3/4-inch-0.

3. Class C: Backfill with Fine Sand, as specified in Section 31 05 16, Aggregates for Earthwork.

4. Class D: Backfill with approved pit run or bar run material, well-graded from coarse to fine; maximum dimension shall be 3 inches.

5. Class E: Backfill with CLSM. See Section 31 23 24, Flowable Fill.

K. Pothole Excavations: Removal and replacement of all materials via coring, vacuum extraction, or similar method for the purposes of locating an underground utility and to investigate underground conditions.

L. Prepared Trench Bottom: The bottom of the trench on which the pipe bedding is to lie, and which provides support for the pipe.

M. Relative Compaction: Ratio, in percent, of as-compacted field dry density to laboratory maximum dry density as determined in accordance with ASTM Standards.

N. Rigid Pipe: For the purposes of these Specifications, pipe constructed of PVC, ductile iron, steel, concrete, and clay pipes are considered rigid pipes.

O. Sewer, Pipes, and Mains: Conduits of circular or other geometric shapes, used to convey liquids or gases, or other material.

P. Trench Backfill: Trench backfill zone for full trench width extending from the top of the pipe zone to pavement base rock, ground surface, or other surface material.

Q. Trench Stabilization: Removal of unsuitable material in the bottom of a trench and replacement with specified material for support of a pipe, main, conduit, structure, or appurtenances.

R. Utility: Any buried pipe, duct, conduit, or cable.

S. Well-Graded: A mixture of particle sizes with no specific concentration or lack thereof of one or more sizes that, when compacted, produces a strong and relatively incompressible soil mass free from detrimental voids.

1.4 SUBMITTALS

A. Section 01 33 00, Submittal Procedures: Requirements for submittals.

B. Excavation support plan and utility protection plan as specified in Section 31 50 00, Excavation Support and Protection.

C. Product Data:

1. Geotextile fabric, indicating fabric and construction

2. Marking tapes

3. Tracer wire

4. Connectors for tracer wire and/or marking tapes

5. Tracer wire locate boxes

6. Marker balls

7. Locator stations

8. Ground wires

9. Plastic or copper markers for service laterals.

D. Imported Materials:

1. Materials Source: Submit name and location of imported fill materials suppliers.

2. Manufacturer's Certificate: Certify Products meet or exceed specified requirements.

3. Submit results of aggregate sieve analysis and standard proctor test for granular material.

E. CLSM: Mix designs in accordance with Submittal requirements of Section 31 23 24, Flowable Fill.

F. Concrete: Mix designs in accordance with Submittal requirements of Section 03 11 00, Concrete Work.

1.5 QUALITY ASSURANCE

A. Subsoil and topsoil fill materials: In accordance with Quality Assurance requirements stated in Section 31 05 13, Soils for Earthwork.

B. Aggregate fill materials: In accordance with Quality Assurance requirements stated in Section 31 05 16, Aggregates for Earthwork.

C. CLSM:

1. In-place testing: In accordance with ASTM C403.

2. Compressive testing: In accordance with ASTM D4832.

D. Allowable Tolerances: Final grades shall be plus or minus 0.1-foot.

1.6 NOT USED

1.7 COORDINATION

A. Verify Work associated with lower elevation utilities is complete before placing higher elevation utilities.

B. Coordinate trenching and utility installation work with other work at utility construction location occurring near or adjacent to specified herein.

PART 2 PRODUCTS

2.1 FILL MATERIALS

A. Subsoil Fill: Type S1, Select Native Material as specified in Section 31 05 13, Soils for Earthwork.

B. Imported Granular Fill: Coarse Aggregate Type A1, Dense-Graded Aggregate with gradation as shown in the Drawings and specified in Section 31 05 16, Aggregates for Earthwork.

C. Concrete:

1. Lean concrete as specified in Section 31 23 24, Flowable Fill, with compressive strength of 100 pounds per square inch (psi).

2. Structural concrete as specified in Section 03 11 00, Concrete Work with compressive strength of 3,000 psi.

D. Drain Rock: Coarse Aggregate Type A2, Granular Drain Backfill Material with gradation as shown in the Drawings and specified in Section 31 05 16, Aggregates for Earthwork.

E. Sand: As specified in Section 31 05 16, Aggregates for Earthwork.

F. Trench Stabilization Material: Coarse Aggregate Type A1, Dense-Graded Aggregate, 2-1/2-inch - 0 gradation as specified in Section 31 05 16, Aggregates for Earthwork.

2.2 MARKING TAPE

A. Detectable:

1. Solid aluminum foil, visible on unprinted side, encased in protective high visibility, inert polyethylene plastic jacket.

2. Foil Thickness: Minimum 0.35 mils.

3. Laminate Thickness: Minimum 5 mils.

4. Width: 6 inches.

5. Identifying Lettering: Minimum 1-inch high, permanent black lettering imprinted continuously over entire length.

6. Joining Clips: Tin or nickel-coated furnished by Tape Manufacturer.

7. Manufacturers and Products:

    a. Reef Industries; Terra Tape, Sentry Line Detectable

    b. Mutual Industries; Detectable Tape

    c. Presco; Detectable Tape

B. Color: In accordance with APWA Uniform Color Code for Temporary Marking of Underground Facilities and as specified in NEMA Z535.1, Safety Color Code.

Color	Facility
Red	Electric power lines, cables, conduit, and lightning cables
Orange	Communicating alarm or signal lines, cables, or conduit
Yellow	Gas, oil, steam, petroleum, or gaseous materials
Green	Sewers and drain lines
Blue	Potable water
Purple	Reclaimed water, irrigation, and slurry lines

2.3 ELECTRONIC LOCATING MATERIALS

A. Marker Balls:

1. Exterior Material: High-density polyethylene.

2. Size: Maximum 4-1/2 inches in diameter.

3. Range: Locatable with standard electronic marker locating devices at depths up to 5 feet.

4. Field Type: Spherical RF field regardless of orientation.

5. Contain no floating or movable parts, and no batteries or active components.

6. Color: Provide colored marker balls per Article 2.03.B above.

7. Manufacturer and Product: Omni Marker Model 162 (green), Omni Marker Model 161 (blue), or equal.

B. Tracer Wire:

1. Direct burial No. 12 AWG solid, annealed copper-clad steel (CCS) high strength tracer wire.

2. Tensile Breaking Load: 380-pound average.

3. Jacket:

    a. High molecular weight high-density polyethylene complying with ASTM D1248, 30-volt rating.

    b. Color: Provide in colors per Article 2.03.B above.

4. Manufacturer and Product: Copperhead Industries; LLC, 12 CCS high strength reinforced tracer wire, or equal.

C. Tracer Wire Connectors:

1. Waterproof, corrosion proof and suitable for No. 12 AWG solid core wire.

2. Prefilled with silicone and suitable for use with low-voltage tracer lines of less than 50 volts.

3. Lug Connectors:

a. Waterproof plastic housing that encases the silicone prefilled lug terminals.

b. Manufacturer and Product: King Innovations; DryConnTM Direct Bury Lug or equal.

4. Twist Connectors:

a. Waterproof epoxy-filled packaging that encases the silicone prefilled twist connectors.

b. Manufacturer and Product: 3M Division; DBY Direct Bury Splice Kit 09053 connectors or equal.

D. Ground Wire: No. 12 AWG bare solid copper wire.

E. Locator Station:

1. Test Station:

a. Lexan® polycarbonate.

b. Color: Provide in colors per Article 2.03.B above.

2. Terminals suitable for No. 12 AWG leads.

3. Use single (two lead) locator stations with two terminals, one for ground wire and one for tracer wire, when only one tracer wire is terminated in manhole.

4. Use multi-lead locator stations with the appropriate number of terminals when 2 or more tracer wire leads are terminated in manhole.

5. Manufacturer and Product: Cott Manufacturing Company; FlangeFink® Cathodic Protection Test Station.

2.4 VISUAL IDENTIFICATION MATERIALS

A. Tracer Wire Locate Boxes:

1. Material: Polyolefin.

2. Cover:

a. Color: Provide in colors per Article 2.03.B above.

b. Provide box cover identification marking for facility type such as “Sewer Locate Wire”, as approved by Owner.

c. Locking type with a nominal 6-inch opening.

3. Manufacturer and Product: Carson Industries LLC; L Series Model 708 or equal.

B. Service Lateral Plastic or Copper Markers:

1. Service Lateral Plastic or Copper Markers: Use markers of the type that requires installation to be recessed below grade.

a. Material: Plastic or copper. In new concrete, use "new construction" markers; in existing concrete use "retrofit" markers and use adhesive recommended by the Manufacturer.

b. Plastic Pavement Markers:

1) UV stabilized and fade resistant.

2) Material: Meet or exceed a tensile strength of 3,500 psi, and meet test requirements as outlined in ASTM G53, Standard Practice for Light and Water Exposure of Nonmetallic Material.

3) Color: Provide in color per Article 2.03 B above with the words, "WARNING, BURIED [UTILITY TYPE], Call Before You Dig," molded to the top of marker.

a) Provide wording for specific facility as approved by Owner.

4) Manufacturer and Product: Rhino Marking and Protective Systems; A-TAG pavement markers or equal.

c. Copper Pavement Markers:

1) Material: Copper material chosen by Manufacturer.

2) Diameter: 1-5/32-inch.

3) Wording: Provide facility identification wording stamped on the top such as "Sewer Lateral" as approved by Owner.

4) Manufacturer and Product: Berntsen Concrete Marker; BP2-U or equal.

C. Service Lateral 2-inch by 4-inch Markers:

1. S4S Douglas fir, pressure-treated 2-inch by 4-inch lumber, utility grade or better.

2. Grade stamped by an American Lumber Standards certified inspection agency.

PART 3 EXECUTION

3.1 PREPARATION

A. Call Oregon Utility Notification Center at 1-800-332-2344 not less than three working days before performing Work.

1. Request underground utilities to be located and marked within and surrounding construction areas.

2. Coordinate with and notify utility companies should it be necessary to remove or relocate facilities.

3. Maintain and protect above and below grade utilities indicated to remain.

B. Identify required lines, levels, contours, and datum locations.

C. Drawings and/or specifications cover and govern replacement and restoration of foreseeable damage.

D. The site of an open cut excavation shall be first cleared of all obstructions preparatory to excavation in accordance with Section 31 10 00, Site Clearing.

E. See Section 31 10 00, Site Clearing for additional requirements in protection of existing utilities, survey control, plant life, and landscaped areas in coordination with Work in this Section.

1. Intent of Drawings and Specifications is that all streets, structures, and utilities be left in condition equal to or better than original condition.

2. Where damage occurs, and cannot be repaired or replaced, the Contractor shall purchase and install new material, which is satisfactory to Owner.

F. Potholing / Exploratory Test Pits: Dig such exploratory test pits and perform potholing as may be necessary in advance of trenching to determine the exact location and elevation of subsurface structures, pipelines, duct banks, conduits, and other obstructions which are likely to be encountered or need to be connected to and shall make acceptable provision for their protection, support, and maintenance of their continued operation.

G. Paved or Surfaced Streets:

1. Wherever paved or surfaced streets are cut, saw wheel, or approved cutting devices shall be used.

2. Width of pavement cut shall be as shown in the Drawings.

3. Any cut or broken pavement shall be removed from site during excavation.

H. Traffic:

1. Maintain street traffic at all times as required by the Drawings and as specified herein.

2. Erect and maintain barricades, warning signs, traffic cones, and other safety devices during construction in accordance with the latest edition of Manual of Uniform Traffic Control Devices (MUTCD), Part 6, to protect the traveling public in any area applicable.

3. Provide flaggers as required during active work in roadway areas.

I. Operations shall be confined to rights-of-way and easements provided. Avoid encroachment on, or damage to, private property or existing utilities unless prior arrangements have been made with copy of said arrangement submitted to Engineer.

3.2 EASEMENTS

A. Where portions of the Work are located on private property, easements and permits will be obtained by the Owner. Easements shall provide for the use of property for construction purposes to the extent indicated on the easements.

B. Copies of these easements and permits will be available from the Owner for inspection by the Contractor. It shall be the Contractor's responsibility to determine the adequacy of the easement obtained in every case.

C. Confine construction operations to within the easement limits or street right-of-way limits or make special arrangements with the property owners for the additional area required and notify the Engineer with a copy of the written approval from property owners of any such conditions.

D. Any damage to private property, either inside or outside the limits of right-of-way or easements provided by the Owner, resulting from Work shall be the responsibility of the Contractor. Before the Engineer will authorize final payment, the Contractor will be required to furnish the Owner with written releases from property owners where the Contractor has obtained special agreements or easements or where the Contractor's operations, for any reason, have not been kept within the construction right-of-way obtained by the Owner.

3.3 PROTECTION

A. Existing Facilities:

1. It is the intent of these specifications that all streets, structure, and utilities be left in a condition equal to or better than original condition at the completion of the Project.

2. Where damage occurs, and cannot be repaired or replaced, the Contractor shall purchase and install new material to the satisfaction to the Engineer.

3. Drawings and/or specifications cover and govern replacement and restoration of foreseeable damage.

B. Removal of Water:

1. As specified in Section 31 23 19, Dewatering.

2. At all times during construction provide and maintain ample means and devices with which to remove promptly and dispose of properly all water entering the excavations or other parts of the Work.

3. Keep all excavations dry until the utilities or vaults to be placed therein are completed. In water bearing sand, well points and/or sheeting shall be supplied, together with pumps and other appurtenances of ample capacity to keep the excavation dry as specified.

4. Dispose of water from the Work in a suitable legal manner without damage to adjacent property or structures.

C. Trench Protection:

1. Provide the materials, labor, and equipment necessary to protect trenches at all times.

2. Trench protection shall provide safe working conditions in the trench and protect the Work, existing property, utilities, pavement, etc.

3. The method of protection shall be according to the Contractor's design.

4. The Contractor may elect to use a combination of shoring, overbreak, tunneling, boring, sliding trench shields, or other methods of accomplishing the work provided the method meets the approval of all applicable local, state, and federal safety codes.

5. Damages resulting from improper shoring, improper removal of shoring, or from failure to shore shall be the sole responsibility of the Contractor.

3.4 LINES AND GRADES

A. Trench excavation for piping, utility vaults, and other utilities shall be performed to the alignment and grade as indicated in the Drawings.

B. Where grades are not shown in the Drawings, utilities shall be laid to grade between control elevations shown.

C. Water mains shall be installed with a minimum cover of 36 inches.

D. The Engineer reserves right to make changes in lines, grades, and depths of utilities when changes are required for Project conditions.

E. Changes in the grade and horizontal alignment of the pipeline as shown in the Drawings or as provided elsewhere in the Specifications may be necessary due to unanticipated interferences or other reasons.

1. No additional compensation will be allowed the Contractor for changes in horizontal alignment.

2. No additional compensation will be allowed for changes in grade which require additional depth of trench excavation and backfill up to 2 feet from those shown in the Drawings.

F. Use laser-beam instrument with qualified operator to establish lines and grades.

3.5 OBSTRUCTIONS

A. Obstructions to the construction of the trench, such as tree roots, stumps, abandoned pilings, abandoned buildings and concrete structures, logs, rubbish, and debris of all types shall be removed without additional compensation from the Owner.

B. The Engineer may, if requested by the Contractor or Owner, make changes in the trench alignment to avoid major obstructions if such alignment changes can be made within the

perpetual easement and right-of-way and without adversely affecting the intended function of the facility or increasing costs to the Owner.

3.6 INTERFERING ROADWAYS AND STRUCTURES

A. Remove, replace and/or repair any damage done during trenching activities to fences, buildings, cultivated fields, drainage crossings, and any other properties without additional compensation from the Owner.

1. Replace or repair these structures to a condition as good as or better than their pre-construction condition prior to commencing work in the area.

B. Paved Roadways:

1. Where paved roadways are cut as part of trenching activities, Class D trench backfill will be required to the bottom of pavement base.

2. New pavement shall be equal to or better than the existing paved surface.

3. New surface shall not deviate by more than 1/4-inch from the existing finish elevation.

C. Existing Structures:

1. If existing structures are encountered as part of trenching activities which will prevent construction and are not adequately shown in the Drawings, the Contractor shall notify the Engineer before continuing with the Work.

2. The Engineer may make such field revisions to the utility alignment as necessary to avoid conflict with the existing conditions.

3. The cost of waiting or “down time” during such field revisions shall be borne by the Contractor without additional cost to the Owner or liability to the Engineer.

4. If the Contactor fails to so notify the Engineer when a conflict of this nature is encountered, but proceeds with construction despite this interference, the Contractor shall do so at the Contractor’s own risk with no additional payment.

3.7 TRENCHING

A. Excavate subsoil as required for construction of utilities to elevations shown in the Drawings.

B. Remove boulders and rock up to 1/2 cubic yard measured by volume per the requirements of this Section. Remove larger boulders and rock material as specified in Section 31 23 18, Rock Removal.

C. Open Trench Limit:

1. Do not advance open trench beyond the distance which will be backfilled and compacted the same day.

2. A maximum length of open trench shall not exceed 100 feet at any one time.

3. Temporary resurfacing shall be completed within 300 feet of the associated open trench limit for each main pipe laying operation.

4. Cover or backfill excavations at the end of each day.

5. If the trench is not backfilled at the end of each working day:

    a. Provide means to prevent caving of excavation sides, as necessary, during non-working hours.

    b. Cover the excavation with a system as needed to provide public safety and prevention of entry during non-working hours.

    c. Provide signed and stamped submittal of caving prevention system and cover system.

6. New trenching shall not be started when earlier trenches need backfilling, or the surfaces of streets or other areas need to be restored to a safe and proper condition.

D. Utility Crossings: Avoid horizontal and vertical conflicts with existing utilities.

1. Perform excavation within 24 inches of existing utility service in accordance with utility's requirements.

2. Vertical clearance between the new pipe and existing utilities shall be 12 inches minimum, unless otherwise noted on the Drawings.

3. Where existing utility lines are damaged or broken during trenching activities, the utility shall be repaired or replaced. For water or sewer bearing lines, care being taken to insure a smooth flow line and absolutely no leakage at the new joints.

4. All expenses involved in the repair or replacement of leaking or broken utility lines that have occurred due to the Contractor's operations shall be borne by the Contractor, and the amount thereof shall be absorbed in the unit prices of its bid.

E. Water Lines Crossing Sewer Lines: Whenever water lines cross sewer lines, the Contractor shall comply with local Health Department requirements.

1. Wherever possible, the bottom of the water line shall be 18 inches or more above the top of sewer pipe. One full length of the water line pipe shall be centered at the crossing.

2. For clearances less than 1-1/2 feet, the Contractor shall replace the existing sewer pipe with ductile iron or PVC of equal size, centered at the utility crossing, or shall encase existing sewer pipe with concrete for a minimum of 10 feet on both sides of crossing, as directed by the Engineer, at no additional cost to the Owner.

F. Excavate trenches to width and depth as indicated on Drawings. No additional payment will be provided for trenching activities beyond dimensions shown in the Drawings.

1. Excavation for trenches in which pipelines are to be installed shall provide adequate space for workers to place and joint the pipe properly and safely, but in every case the trench shall be kept to a minimum width.

2. The width of the pipe trench at and below the top of the pipe shall be such that the clear space between the barrel of the pipe and the trench shall not exceed 12 inches on either side of the pipe.

3. Excavation for utility vaults and other structures shall be wide enough to provide 18 inches between the structure surface and the sides of the excavation.

4. For pipe or utility vaults to have bedding material, excavate to a depth of 6 inches below the bottom of the pipe or utility vault. Care shall be taken not to excavate below depths required.

5. If over digging occurs, the trench bottom shall be filled to grade with compacted bedding material.

G. Remove water or materials that interfere with Work.

1. The trench at all times shall be kept free from water to facilitate fine grading, the proper laying and joining of pipe, and prevention of damage to completed joints.

2. Adequate pumping equipment shall be provided to handle and dispose of the water without damage to adjacent property.

3. Water in the trench shall not be allowed to flow through the pipe while construction work is in progress unless special permission to do so has been given by the Engineer.

4. An adequate screen shall be provided to prevent the entrance of objectionable material into the pipe.

5. Remove and dispose of existing abandoned sewer pipe, structures, and other facilities as necessary to construct the improvements.

   a. Where the excavation activities require the removal of portions of an abandoned pipeline, masonry plugs shall be installed in the open ends of the pipe, unless otherwise noted in the Drawings or by the Engineer.

   b. Coordinate with Engineer prior to plugging.

   c. For plugs less than 36 inches in diameter, 8-inch-deep masonry units shall be used. For plugs in larger pipelines, 12-inch-deep masonry units shall be used.

6. The costs associated with the removal of water and materials noted above will be considered incidental to trench excavation and backfill.

H. Do not interfere with 45 degree bearing splay of foundations.

I. Over-excavation for Unsuitable Trench Foundation Conditions:

1. Cross-sectional dimensions and depths of excavations shown in the Drawings shall be subject to such changes as may be found necessary by the Engineer to secure foundations free from soft, weathered, shattered, and loose material or other objectionable materials.

2. Unsuitable materials shall be removed and replaced only as directed in writing by Engineer.

3. Unsuitable materials encountered shall be removed and replaced with Coarse Aggregate Type A1, 2-1/2-inch – 0 gradation, as specified in Table 31 05 16-A of Section 31 05 16, Aggregates for Earthwork. All material placed shall be compacted to 95 percent of maximum dry density.

4. Install nonwoven geotextile under trench stabilization material, over the soft or yielding excavated surface.

    a. Install the nonwoven geotextile ahead of placement of the trench stabilization material, continuously along the excavation bottom and centered on the pipe centerline.

    b. Use nonwoven geotextile width equal to the pipe diameter plus 2 feet.

    c. Place laps or splices in the geotextile in the direction of the pipe laying.

J. Trim excavation. Hand trim for bell and spigot pipe joints. Remove loose matter.

K. Excavated material shall be placed at locations and in such a manner that it does not create a hazard to pedestrian or vehicular traffic or interfere with the function of existing drainage facilities or system operation.

L. Remove excess subsoil not intended for reuse from site.

M. Stockpile excavated material in area designated on site in accordance with Section 31 05 13, Soils for Earthwork.

3.8 TUNNELING

A. In lieu of open cut trenching as specified above, the Contractor may utilize tunnel methods for installation of pipe where ground conditions are favorable and such methods will not disturb foundations under curbs, sidewalks, and other structures.

1. The Engineer must approve tunneling methods prior to utility installation.

2. Where tunneling is used, payment for the pipe installation will be made for the equivalent trench excavation and backfill as if the open cut method was used. Payment will not be made for surface restoration including pavement, curbs, sidewalks, and other surface improvements whose replacement is avoided by the tunneling method.

3.9 NOT USED

3.10 COMPACTION

A. Testing will be required to show specified densities of compacted backfill are being achieved by the Contractor's compaction methods.

B. Moisture Control:

1. Moisture condition backfill material to within 2 percent of optimum moisture content required for compaction throughout each lift of the fill.

2. Add moisture to granular backfill by sprinkling during compaction operation.

3. Compaction by ponding or jetting is not permitted.

C. Compact all materials and areas that are not accessible for in-place density testing, as determined by the Engineer, in place by whatever equipment and method is practicable or specified, and as approved by the Engineer.

1. Perform compaction at such moisture content as is required to produce well-filled, dense, and firm material in place that will show no appreciable deflection or reaction under the compacting equipment.

3.11 BEDDING

A. All utility vaults, potable water pipe 4-inch nominal diameter and over, all steel pipe, all concrete sewer pipe, all plastic pipe, all pipe under existing or future structures or roadways, and any and all utilities at a depth greater than 6 feet shall be laid in pipe bedding material.

B. Unless otherwise noted in the Drawings, pipe, or conduit of less than 4-inch diameter, outside structure lines and at a depth of less than 6 feet shall be bedded in native material properly shaped as specified below, all as detailed on the Drawings.

C. Compacted bedding material shall be placed the full width of the excavated trench to a depth as shown on the trench detail included in the Drawings.

1. In lieu of a detail, the depth shall be 6 inches.

D. Spread the bedding smoothly over entire width of trench to the proper grade so that the pipe is uniformly supported along the barrel.

E. Hand grade and compact each lift to provide a firm, unyielding surface along the entire pipe length. For rigid pipe, compact to at least 90 percent relative compaction.

F. Excavate bell holes at each joint to permit proper assembly and inspection of the joint.

G. Check grade and correct irregularities in bedding material.

H. Center pipes horizontally in trench width.

3.12 BACKFILLING

A. Backfill trenches to contours and elevations with unfrozen fill materials.

B. Systematically backfill to allow maximum time for natural settlement. Do not backfill over porous, wet, frozen, or spongy subgrade surfaces.

C. Maintain optimum moisture content of fill materials to attain required compaction density.

D. Place fill material, with the exception of CLSM, in continuous layers and compact in 6- to 8-inch lifts.

1. Prevent pipe from moving either horizontally or vertically during placement and compaction of pipe zone material.

2. Where trenches are under existing or future structures, paved areas, road shoulders, driveways, or sidewalks, or where designated on the Drawings or specified elsewhere in these specifications, the trench backfill shall be Class B or Class E and pipe zone backfill shall be Class B or Class E. Class B backfill shall be compacted to 95 percent of maximum density at optimum moisture content.

3. Where trenches are outside existing or future structures, paved areas, road shoulders, driveways, or sidewalks, or where designated on plans or specified elsewhere, the trench backfill shall be Class A and pipe zone backfill in these areas shall be Class B. For these locations, compaction of Class B backfill shall be to not less than 90 percent of maximum density at optimum moisture content. Class B backfill shall be compacted to not less than 95 percent of maximum density at optimum moisture content.

E. Employ placement method that does not disturb or damage nearby or adjacent foundation perimeter drainage or utilities in trench.

F. Do not use power-driven impact compactors to compact pipe zone material.

G. Backfill Immediately: All trenches and excavations shall be backfilled immediately after pipe or conduit is in approved condition to receive it and shall be carried to completion as rapidly as possible, unless otherwise directed by the Engineer.

H. Under no circumstances shall water be permitted to rise in open trenches after pipe has been placed.

I. Do not allow backfill material to free fall into the trench or allow heavy, sharp pieces of material to be placed as backfill until after at least 2 feet of backfill has been provided over the top of pipe.

J. Use hand compactors for compaction until at least 2 feet of backfill is placed over top of pipe. Thoroughly tamp each lift, including area under haunches, with handheld tamping bars supplemented by “walking in” and slicing material under haunches with a shovel to ensure that voids are completely filled before placing each succeeding lift.

K. Placement of Sand:

1. Place medium sand in lifts not exceeding 8 inches in uncompacted thickness.

2. Compact each lift to a minimum of 95 percent relative compaction prior to placing succeeding lifts.

L. Placement of CLSM:

1. Discharge from truck-mounted drum-type mixer into trench.

2. Place in lifts not exceeding 2 feet in thickness.

3. No compaction of CLSM is allowed.

4. Use steel plates to protect the CLSM from traffic a minimum of 24 hours. After 24 hours, the CLSM may be paved, or opened to traffic until permanent surface restoration is completed if it has hardened sufficiently to prevent rutting.

M. New trenching shall not be started when earlier trenches need backfilling, or the surfaces of streets or other areas need to be restored to a safe and proper condition.

N. Do not leave trench open at end of working day.

3.13 MARKING TAPE INSTALLATION

A. Continuously install marking tape along centerline of all buried piping, install 24 inches below finished grade. Coordinate with piping installation drawings.

3.14 ELECTRONIC LOCATING FACILITY INSTALLATION

A. Marker Balls:

1. Install according to Manufacturer's recommendations and as shown or directed and according to the following requirements:

a. Install marker balls directly above the pipe alignment at a depth no less than 3 feet and no more than 4-1/2 feet below final surface grade.

b. Install marker balls during trench backfill operations by placing the marker ball in compacted backfill.

c. Cover marker ball with a minimum of 6 inches of backfill and compact backfill before continuing trench backfill operations.

d. Install markers balls with trenchless pipe installations by core-drilling hole of a minimal diameter needed to allow clearance for placement of marker ball. Backfill with approved trench backfill, pavement base and pavement, as applicable.

2. Water Marker Ball Locations: Install at locations as required by Sewer Marker Ball Locations specified herein.

3. Sewer Marker Ball Locations:

a. Install marker balls directly above connection points, termination points and all fitting locations, and at a minimum spacing of 50 linear feet on sewers with a straight horizontal alignment.

b. Install marker balls at a minimum spacing of 25 lineal feet directly above sewer mains installed on a radius.

c. Install marker balls on new or reconstructed sewer service laterals, directly above the centerline of the end of the lateral at the curb, property line or other end of lateral location, as directed.

d. Install marker balls directly above every alignment change along sewer mains and service laterals.

e. Install marker balls directly above manholes for manholes with buried covers.

B. Tracer Wire and Terminal Appurtenances:

1. Tracer Wire:

    a. Install as shown or directed directly over the pipe centerline and on top of the pipe zone in all sewer trenches, including mainline sewers, service laterals and storm sewer inlet leads.

    b. Connect mainline and service lateral tracer wires using either an approved direct-bury lug connector or direct-bury twist connector.

    c. Extend tracer wire to locator stations in manholes, locator boxes, storm inlets, or other visually identifiable terminal appurtenances, allowing for access with electronic locating equipment, as shown or directed and according to the following requirements:

2. Locator Stations:

    a. Install locator stations as shown within manholes.

    b. Mount locator station to manhole wall within 18 inches of manhole rim with two stainless steel expansion anchors.

    c. Drill a minimum 3/8-inch diameter hole through the manhole wall within 18 inches of the finish grade of the manhole rim.

    d. Extend the tracer wire from the pipe trench in one continuous piece up the outside of the manhole and through the hole and into a locator station and attach to one of the lugs in the locator station.

    e. When multiple tracer wires are terminated in manhole install a multi-lead locator station.

    f. Extend a ground wire from the locator station through a minimum 3/8-inch diameter hole in the manhole wall.

    g. Install ground wire approximately 3 feet deep and extend from the outside manhole wall a minimum of 3 feet horizontally in any direction.

    h. Seal all holes drilled in manhole walls with silicone sealant.

3. Storm Inlet Tracer Wire Termination: Terminate tracer wire inside inlet and directly over storm outlet pipe by placing tracer wire as follows:

    a. Drill a minimum 3/8-inch diameter hole through inlet wall to pass tracer wire through to inside inlet wall.

    b. Seal hole with silicon sealer or material approved by Engineer.

    c. Leave 6 inches of coiled tracer wire along inside of inlet wall approximately 3 inches below the inlet frame and grate or as directed by Engineer.

4. Service Lateral Tracer Wire Termination: Terminate tracer wire at ends of service laterals as shown or directed, as follows:

a. Termination in Tracer Wire Locate Boxes: Extend the tracer wire in one continuous piece up vertically from the pipe trench and into the bottom of the locate box. Leave 18 inches of coiled tracer wire inside locate box.

b. Termination at 2-inch by 4-inch Markers: Extend tracer wire in one continuous piece directly up service lateral 2-inch by 4-inch markers and leave 18 inches of tracer wire wrapped around the exposed top end of 2-inch by 4-inch marker.

3.15 VISUAL IDENTIFICATION FACILITIES

A. Tracer Wire Locate Boxes: Install tracer wire locate boxes directly over service laterals at property line, service boundary, or other location as shown or directed by the Engineer.

B. Service Lateral Plastic or Copper Markers:

1. Install plastic or copper markers in the concrete curb directly over the centerline of the service lateral, as shown or directed by the Engineer.

2. Either plastic or copper markers may be used.

3. If there is not suitable concrete curb for marker placement, then install a lateral cleanout as close to property line as practical at location approved by Engineer.

C. Service Lateral 2-inch by 4-inch Markers:

1. Place a 2-inch by 4-inch marker at the end of each new service lateral not connected to a building sewer.

2. Omit markers only as approved.

3. Block the capped or plugged service lateral end with a wood block against undisturbed earth and install the marker.

4. Extend the marker from the blocked service lateral invert to at least 12 inches above the existing or proposed finish ground surface.

5. Install marker in one piece. No splicing will be accepted.

6. Paint the exposed portion of the marker after its installation with quality quick drying enamel white paint for a storm only sewer and green paint for a sanitary or combined sewer.

7. After the paint has dried, use black, quick drying enamel, and neatly indicate the distance from the ground surface to the top of the service lateral in feet and inches.

8. Do not disturb the position and location of the marker during the backfilling operation.

9. If the marker is broken, moved out of location, or vertical alignment is changed during the backfilling operation, reopen the trench, and replace the marker.

3.16 FIELD QUALITY CONTROL

A. All testing and reporting shall be conducted and completed by an independent laboratory provided by the Contractor. All testing and reporting shall be the responsibility of the Contractor.

B. Perform laboratory material tests in accordance with ASTM D698 (AASHTO T99).

C. In-place compaction testing of pipeline backfill materials shall be performed at 2-foot elevation increments, one test per 200 lineal feet of pipeline trench as measured along pipe centerline.

1. The Engineer may reduce the frequency when satisfied with method of compaction.

2. The Engineer may direct testing at a higher frequency at no additional cost to the Owner upon failure to obtain specified densities or if the Contractor changes compaction equipment or methods of compaction.

3. The Engineer shall determine all test locations.

D. Perform in place compaction tests in accordance with the following:

1. Density Tests: ASTM D2922

2. Moisture Tests: ASTM D3017

E. When tests indicate Work does not meet specified requirements, remove Work, replace, and retest at the sole expense of the Contractor.

3.17 SURFACE RESTORATION AND CLEANUP

A. Open Trenches: At the end of each workday, all open trenches shall be backfilled and all trenches within streets shall be temporarily paved or covered to the satisfaction of the Engineer and the local permitting agency.

1. Temporary paving shall be replaced with permanent street paving at the completion of construction within street rights-of-way, or sooner, if deemed necessary by the Engineer.

2. No gravel-filled trenches shall be left open within the street right-of-way at the end of the workday.

B. Topsoil:

1. Where trenches cross lawns, garden areas, pastures, cultivated fields, or other areas on which reasonable topsoil conditions exist, remove the topsoil to the specified depth and place the material in a stockpile.

2. Topsoil shall not be mixed with other excavated material.

3. After the trench has been backfilled, the topsoil shall be replaced.

C. Clean up and remove all excess materials, construction materials, debris from construction, etc. Replace or repair any fences, mailboxes, signs, landscaping, or other facilities removed or damaged during construction. Replace all lawns, topsoil, shrubbery, flowers, etc., damaged or

removed during construction. The Contractor shall be responsible for seeing that lawns, shrubs, etc. remain alive and leave premises in condition equal to original condition before construction.

3.18 NOT USED

END OF SECTION

SECTION 31 23 18 - ROCK REMOVAL

PART 1 GENERAL

1.1 SUMMARY

A. This Section includes removal of subsurface rock during excavation by mechanical method. The use of explosives for rock removal is not permitted for this Project.

B. Section Includes:

1. Removing identified and discovered rock during excavation.

2. Expansive tools to assist rock removal.

C. Related Sections:

1. Section 31 22 13 - Rough Grading

2. Section 31 23 16 - Excavation

3. Section 31 23 17 - Trenching

4. Section 31 23 23 - Fill

1.2 NOT USED

1.3 DEFINITIONS

A. Common Excavation: All excavation required for Work, regardless of the type, character, composition, or condition of the material encountered. All excavation shall be classified as Common Excavation, unless provided for under Rock Removal below.

B. Common Material: All soils, aggregate, debris, junk, broken concrete, and miscellaneous material encountered in Common Excavation, excluding rock as defined below.

C. Rock: Solid mineral material, including boulders, solid bedrock, or ledge rock, with volume in excess of 1/2 cubic yard of solid material which, by actual demonstration, cannot be reasonably excavated with suitable machinery as defined herein. The Engineer may waive the requirements for actual demonstration if the material encountered is well-defined rock.

D. Rock Removal: Removal of rock as defined herein by systematic and continuous drilling, hammering, breaking, splitting, or other methods approved by the Engineer.

E. Suitable Machinery: A track-mounted hydraulic excavator of the 52,800- to 72,500-pound class equipped with a single shank ripper or similar approved equipment.

1.4 SUBMITTALS

A. Section 01 33 00 - Submittal Procedures: Submittal procedures.

B. Shop Drawings: Indicate proposed method of rock removal.

C. Equipment: Manufacturer information regarding pound class of machinery proposed for rock removal.

D. Survey Report: Submit survey report mapping extent and locations of rock encountered, to be used in calculating total volume of rock removal.

1.5 NOT USED

1.6 PROJECT CONDITIONS

A. Conduct survey of rock uncovered in excavation for structures or trenching for utilities prior to removal of material.

1.7 NOT USED

PART 2 PRODUCTS – NOT USED

PART 3 EXECUTION

3.1 EXAMINATION

A. Verify site conditions and note subsurface irregularities affecting Work of this section.

3.2 PREPARATION

A. Identify required lines, levels, contours, and datum.

B. Engineer Approval for Rock Removal:

1. Prior to commencement of rock removal, expose all material anticipated to be rock by removing the common material above it and then notify the Engineer.

2. The Engineer, in association with the Contractor or the Contractor's representative, will measure the amount of material to be removed in an effort to reach a mutually agreeable volume for anticipated rock removal.

3. Prior to commencing the proposed rock removal, the Contractor must receive written approval by the Engineer stating the approximate volume of excepted rock removal to receive payment.

4. During rock removal activities, should it become apparent the previously agreed upon volume of rock removal will be exceeded, notify the Engineer immediately. Should the Contractor proceed with rock removal in excess of the previously agreed upon volume, the Contractor will do so at their own risk and expense.

3.3 ROCK REMOVAL BY MECHANICAL METHOD

A. Excavate and remove rock by mechanical method.

1. Use single shank ripper to fracture rock.

2. Drill holes and use expansive tools and wedges to fracture rock.

B. Cut away rock at bottom of excavation to form level bearing.

C. Remove shaled layers to provide sound and unshattered base for footings and foundations.

D. In utility trenches, excavate to 6 inches below invert elevation of pipe and 24 inches wider than pipe diameter.

E. For vaults and other structures, excavate to the depth necessary to install the structure and to a maximum of 18 inches beyond the outside walls of the vault or structure.

F. Remove excavated materials from site.

G. Correct unauthorized rock removal associated with structural excavations in accordance with backfilling and compacting requirements of Section 31 23 16, Excavation and as directed by Engineer.

H. Correct unauthorized rock removal associated with utility work in accordance with backfilling and compacting requirements of Section 31 23 17, Trenching and as directed by Engineer.

I. If material which would be classified as rock as defined herein is mechanically removed with equipment of a larger size than specified as Suitable Machinery herein, it shall be understood that any added costs for the removal of rock by this method shall be included in the unit price for common excavation and not paid for under this pay item. If material which would be classified as rock as defined herein is mechanically removed without hammering, breaking, or splitting, it will be considered common excavation and not paid for under this pay item. If equipment larger than the suitable machinery as defined herein is brought on the Project Site for the sole purpose of rock removal without hammering, breaking, or splitting, then such excavation will be considered rock removal.

3.4 NOT USED

3.5 FIELD QUALITY CONTROL

A. Request visual inspection of foundation bearing surfaces by Engineer before installing subsequent work.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 31 23 19 – DEWATERING

PART 1 GENERAL

1.1 SUMMARY

A. This Section includes temporary dewatering and surface water control systems for open excavations and utility trenches.

B. Section includes:

1. Dewatering systems.
2. Surface water control systems.
3. System operation and maintenance.
4. Water disposal.

C. Related Sections:

1. Section 31 05 16 - Aggregates for Earthwork
2. Section 31 23 16 - Excavation
3. Section 31 23 17 - Trenching

1.2 SUBMITTALS

A. Dewatering Plan:

1. Descriptions of proposed groundwater and surface water control facilities including, but not limited to, equipment; methods; standby equipment and power supply; pollution control facilities; discharge locations to be utilized; and provisions for immediate temporary water supply as required by this Section.
2. Dewatering plan to include design calculations and drawings indicating the location and size of pumps, well points, temporary pipelines and sediment control systems. Dewatering plan shall be prepared and stamped by a Professional Engineer registered in the State which the project is located and experienced in the design of dewatering systems.
3. Plan to be reviewed by the Engineer prior to the beginning of construction activities requiring dewatering. Review by the Engineer of the design shall not be construed as a detailed analysis of the adequacy of the dewatering system, nor shall any provisions of the above requirements be construed as relieving the Contractor of its overall responsibility and liability for the work.

1.3 DEFINITIONS

A. Dewatering includes the following:

1. Lowering of ground water table and intercepting horizontal water seepage to prevent ground water from entering excavations, trenches, tunnels, and /or shafts.

2. Reducing piezometric pressure within strata to prevent failure or heaving of excavations, trenches, tunnels, and /or shafts.

3. Disposing of removed water.

B. Surface Water Control: Removal of surface water within open excavations.

1.4 QUALITY CONTROL

A. All dewatering operations shall be adequate to assure the integrity of the finished project and shall be the responsibility of the Contractor.

B. Provide all labor, materials, and equipment necessary to dewater trench and structure excavations, in accordance with the requirements of the Contract Documents.

C. Secure all necessary permits to complete the requirements of this Section.

D. Control the rate and effect of the dewatering in such a manner as to avoid all objectionable settlement and subsidence.

E. Where the critical structures or facilities exist immediately adjacent to areas of proposed dewatering, reference points shall be established and observed at frequent intervals to detect any settlement which may develop.

1. The responsibility for conducting the dewatering operation in a manner which will protect adjacent structures and facilities rests solely with the Contractor.

2. The cost of repairing any damage to adjacent structures and restoration of facilities shall be the responsibility of the Contractor.

PART 2 PRODUCTS

2.1 EQUIPMENT

Dewatering, where required, may include the use of well points, sump pumps, temporary pipelines for water disposal, rock or gravel placement, and other means. Standby pumping equipment shall be maintained on the jobsite.

PART 3 EXECUTION

3.1 DEWATERING

A. Provide all equipment necessary for dewatering.

1. Have on hand, at all times, sufficient pumping equipment and machinery in good working condition.

2. Have available, at all times, competent workers for the operation of the pumping equipment.

3. Adequate standby equipment shall be kept available at all times to insure efficient dewatering and maintenance of dewatering operation during power failure.

B. Dewatering for structures and pipelines shall commence when groundwater is first encountered and shall be continuous until such times as water can be allowed to rise in accordance with the provisions of this Section or other requirements.

C. Site Grading:

1. At all times, site grading shall promote drainage.

2. Surface runoff shall be diverted from excavations.

3. Water entering the excavation from surface runoff shall be collected in shallow ditches around the perimeter of the excavation, drained to sumps, and be pumped or drained by gravity from the excavation to maintain a bottom free from standing water.

D. Dewatering shall at all times be conducted in such a manner as to preserve the undisturbed bearing capacity of the subgrade soils at proposed bottom of excavation.

E. If foundation soils are disturbed or loosened by the upward seepage of water or an uncontrolled flow of water, the affected areas shall be excavated and replaced with drain rock.

F. Maintain the water level below the bottom of excavation in all work areas where groundwater occurs during excavation construction, backfilling, and up to acceptance.

G. Flotation shall be prevented by maintaining a positive and continuous removal of water. The Contractor shall be fully responsible and liable for all damages which may result from failure to adequately keep excavations dewatered.

H. If well points or wells are used, they shall be adequately spaced to provide the necessary dewatering and shall be sandpacked and/or other means used to prevent pumping of fine sands or silts from the subsurface. A continual check shall be maintained to ensure that the subsurface soil is not being removed by the dewatering operation.

I. Dispose of water from the work in a suitable manner without damage to the environment or adjacent property. No water shall be drained into work built or under construction without prior consent of the Engineer. Water shall be filtered using an approved method to remove sand and fine sized soil particles before disposal into any drainage system.

J. The release of groundwater to its static level shall be performed in such a manner as to maintain the undisturbed state of the natural foundation soils, prevent disturbance of compacted backfill and prevent flotation or movement of structures, pipelines, and sewers.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 31 23 23 – FILL

PART 1 GENERAL

1.1 SUMMARY

A. This Section includes backfilling required at building perimeter and site structures to subgrade elevations, fill under interior and exterior slabs-on-grade or pavement, and fill under landscaped areas. Backfilling for utilities within building proper is included within this section; backfilling for utilities outside building is included in Section 31 23 17, Trenching.

B. Section includes:

1. Backfilling building perimeter to subgrade elevations.
2. Backfilling site structures to subgrade elevations.
3. Fill under slabs-on-grade.
4. Fill under paving.
5. Fill for over-excavation.

C. Related Sections:

1. Section 03 11 00 – Concrete Work
2. Section 31 05 13 - Soils for Earthwork
3. Section 31 05 16 - Aggregates for Earthwork
4. Section 31 22 13 - Rough Grading
5. Section 31 23 16 - Excavation
6. Section 31 23 17 - Trenching
7. Section 31 23 24 - Flowable Fill
8. Section 31 25 00 - Erosion and Sediment Controls
9. Section 31 37 00 - Riprap
10. Section 33 11 10 - Water Utility Distribution and Transmission Piping
11. Section 33 31 13 – Sanitary Utility Sewerage Piping
12. Section 33 41 10 - Storm Utility Drainage Piping

1.2 REFERENCES

A. American Association of State Highway and Transportation Officials:

1. AASHTO T99 - Standard Specification for Moisture-Density Relations of Soils Using a 2.5-kg (5.5-lb) Rammer and a 305-mm (12-in.) Drop.

B. ASTM International (ASTM):

1. ASTM C403 - Standard Test Method for Time of Setting of Concrete Mixtures by Penetration Resistance

2. ASTM D698 - Standard Test Method for Laboratory Compaction Characteristics of Soil Using Standard Effort (12,400 ft-lbf/ft3 (600 kN-m/m3)).

3. ASTM D2922 - Standard Test Method for Density of Soil and Soil-Aggregate in Place by Nuclear Methods (Shallow Depth).

4. ASTM D3017 - Standard Test Method for Water Content of Soil and Rock in Place by Nuclear Methods (Shallow Depth).

5. ASTM D4832 - Standard Test Method for Preparation and Testing of Controlled Low Strength Material (CLSM) Test Cylinders.

1.3 DEFINITIONS

A. Controlled Low Strength Material (CLSM): Also referred to as Flowable Fill elsewhere in these Specifications. A self-compacted, cementitious material.

B. Imported Material: Materials obtained from sources offsite, suitable for specified use.

C. Lift: Loose (uncompacted) layer of material.

D. Optimum Moisture Content:

1. Determined in accordance with ASTM Standard specified to determine maximum dry density for relative compaction.

2. Determine field moisture content on basis of fraction passing 3/4-inch sieve.

1.4 SUBMITTALS

A. Section 01 33 00 - Submittal Procedures: Requirements for submittals.

B. Imported Materials:

1. Materials Source: Submit name and location of imported fill materials suppliers.

2. Manufacturer's Certificate: Certify Products meet or exceed specified requirements.

3. Submit results of aggregate sieve analysis and standard proctor test for granular material.

C. CLSM: Mix designs in accordance with Submittal requirements of Section 31 23 24, Flowable Fill.

1.5 QUALITY ASSURANCE

A. Subsoil and topsoil fill materials: In accordance with Quality Assurance requirements stated in Section 31 05 13, Soils for Earthwork.

B. Aggregate fill materials: In accordance with Quality Assurance requirements stated in Section 31 05 16, Aggregates for Earthwork.

C. CLSM:

1. In-place testing: In accordance with ASTM C403.

2. Compressive testing: In accordance with ASTM D4832.

D. Allowable Tolerances: Final grades shall be plus or minus 0.1-foot.

PART 2 PRODUCTS

2.1 FILL MATERIALS

A. Subsoil Fill: Type S2, Imported Fill Material, as specified in Section 31 05 13, Soils for Earthwork.

B. Imported Granular Fill: Coarse Aggregate Type A1, Dense-Graded Aggregate with gradation as shown in the Drawings and specified in Section 31 05 16, Aggregates for Earthwork.

C. Concrete:

1. Lean concrete as specified in Section 31 23 24, Flowable Fill, with compressive strength of 100 pounds per square inch (psi).

2. Structural concrete as specified in Section 03 11 00, Concrete Work. Compressive strength as required by the application or as noted in the Drawings.

D. Drain Rock: Coarse Aggregate Type A2, Granular Drain Backfill Material with gradation as shown in the Drawings and specified in Section 31 05 16, Aggregates for Earthwork.

E. Foundation Stabilization Material: Coarse Aggregate Type A1, Dense-Graded Aggregate, 2-1/2-inch - 0 gradation as specified in Section 31 05 16, Aggregates for Earthwork.

PART 3 EXECUTION

3.1 EXAMINATION

A. Prior to Work in this Section, become familiar with Site conditions. In the event discrepancies are found, notify Engineer as to the nature and extent of the differing conditions.

B. Verify sub-drainage, damp-proofing, or waterproofing installation has been inspected.

C. Verify underground tanks are anchored to their own foundations to avoid flotation after backfilling.

D. Verify structural ability of unsupported walls to support loads imposed by fill.

3.2 SITE CONDITIONS

A. Quantity Survey: The Contractor shall be responsible for calculations for quantities and volume of cut and fill from existing site grades to finish grades established under this contract as indicated in the Drawings or specified and shall include the cost for all earthwork in the total basic bid.

B. Dust Control: Must meet all federal, state, and local requirements. Protect persons and property from damage and discomfort caused by dust. Water surfaces as necessary and when directed by Engineer to quell dust.

C. Soil Control: Soil shall not be permitted to accumulate on surrounding streets or sidewalks nor to be washed into sewers.

D. See provisions for Work in Section 31 25 00, Erosion and Sediment Controls.

3.3 PREPARATION

A. Identify required lines, levels, contours, and datum locations.

B. Control of Water:

1. Excavated areas shall be kept free of water and frost.

2. Bearing surfaces which become softened by water or frost shall be re-excavated to solid bearing at Contractor's expense and backfilled with compacted crushed rock at Contractor's expense.

3. See Section 31 23 19, Dewatering for additional details.

C. Compact subgrade to density requirements for subsequent backfill materials.

D. Cut out soft areas of subgrade not capable of compaction in place and replace with specified granular fill material. See Article 3.5, Over-excavation for Unsuitable Foundation Conditions in Section 31 23 16, Excavation for additional details.

E. Proof roll to identify soft spots; fill and compact to density equal to or greater than requirements for subsequent fill material.

F. Subgrade to be approved by Engineer prior to placement of structures and commencement of backfill activities.

G. Do not allow or cause any work performed or installed to be covered up or enclosed prior to required tests and approvals. Should any Work be enclosed or covered up, uncover at Contractor's expense.

3.4 BACKFILLING

A. Backfill areas to contours and elevations shown in the Drawings with unfrozen materials.

B. Do not place materials when weather conditions and/or moisture content prevent attainment of specified density.

C. Maintain optimum moisture content of backfill materials to attain required compaction density.

D. Employ placement method that does not disturb or damage other work.

E. Mechanical tampers permitted in confined areas.

F. Systematically backfill to allow maximum time for natural settlement. Do not backfill over porous, wet, frozen, or spongy subgrade surfaces.

G. Foundation Base for Structures:

1. Bring excavation to required subgrade elevation shown in the Drawings.

2. Place foundation base material to required grade shown in the Drawings.

3. Place foundation base material in 6-inch lifts and compact to 95 percent maximum dry density.

4. Pump Station Wet Well:

a. Concrete Footings and Slabs: Place a 18-inch minimum layer of Coarse Aggregate Type A1, Dense-Graded Aggregate, maximum size of 2-1/2-inch and less than 7% passing the No. 200 sieve extending a minimum of 2-feet beyond the horizontal limits of the foundation to required grade under all concrete footings.

5. Foundations established near finished site grades:

a. Place a 12-inch-thick layer of Coarse Aggregate Type A1, Dense-Graded Aggregate, maximum size of 1-1/2-inch and less than 7% passing the No. 200 sieve in the bottom of footing excavations to minimize disturbance of silty foundation soils during wet weather.

b. Lightly compact material with a light-weight hand-operated vibratory plate compactor.

c. To provide uniform support, slabs should be underlain by a minimum 12-inch-thick granular base course consisting of Coarse Aggregate Type A1, Dense-Graded Aggregate, maximum size of 1-1/2-inch and less than 7% passing the No. 200 sieve.

d. The base course material should be installed in a single lift and compacted to at least 95 percent of the maximum dry density. See Drawings for details.

H. Backfill for Structures:

1. Prior to placing backfill, remove forms, temporary construction, and debris below grade.

2. Backfill shall not be placed against poured concrete until 28 days have passed from completion of original concrete pour, unless otherwise approved by Engineer.

3. Heavy compactors and large pieces of construction equipment shall be kept away from any embedded wall a distance of a least 5 feet in order to avoid the build-up of excessive lateral pressures.

a. Over-compaction of fill near walls should be avoided.

4. Compaction within 5 feet of the walls shall be accomplished using hand-operated vibratory plate compactors or tamping units.

5. The maximum particle size of granular material placed against buried structures shall be limited to no greater than 1-1/2-inch diameter.

6. Structural fill backfill material shall be brought up on all sides of the walls and footings in such a manner as to avoid adverse differential lateral earth pressures on the vertical surfaces.

7. Appropriate lift thickness will depend on the type of compaction equipment used and the type of material being placed. All material shall be compacted to at least 95 percent of the standard maximum dry density.

   a. For moderate- to heavy-weight compactors, a maximum loose lift thickness of 12 inches shall be used.

   b. For hand-operated or small compactors, a maximum loose lift thickness of 8 inches shall be used.

8. Particular care must be taken to avoid damage to the pipe connections to the structure.

9. Utility trench backfill within 10 feet of all structural perimeters shall meet the requirements for structural fill.

I. For areas receiving surface structures or existing paved areas to be constructed or replaced, such as roadways, driveways, parking lots, and sidewalks:

1. Place Coarse Aggregate Type A1, Dense-Graded Aggregate, 3/4-inch-0 gradation in 6-inch lifts.

2. Compact with vibratory equipment to 95 percent maximum density, unless otherwise specified or shown in the Drawings.

J. NOT USED

K. Slope grade away from building minimum 2 percent slope for minimum distance of 10 feet, unless noted otherwise in the Drawings.

L. Make gradual grade changes. Blend slope into level areas.

M. Remove surplus backfill materials from Site in accordance with Section 31 23 16, Excavation.

3.5 FIELD QUALITY CONTROL

A. All testing and reporting shall be conducted and completed by an independent laboratory provided by the Contractor. Initial testing will be paid for by the Contractor. Subsequent testing after failure of initial acceptance testing shall be paid by the Contractor.

B. Perform laboratory material tests in accordance with ASTM D698 (AASHTO T99).

C. In-place compaction testing for structural fill material shall be performed at 2-foot elevation increments in the fill material with at a minimum of one test per each 2,500 square feet of material placed. The Engineer shall be provided with the results of each compaction test at the time of testing.

D. Perform in place compaction tests in accordance with the following:

1. Density Tests: ASTM D2922.

2. Moisture Tests: ASTM D3017.

E. When tests indicate Work does not meet specified requirements, remove Work, replace, and retest at the sole expense of the Contractor.

F. When testing of subgrade is not possible or feasible as detailed above, proof roll compacted fill surfaces under slabs-on-grade, pavers, paving, and as may be otherwise required by the Engineer.

3.6 PROTECTION OF FINISHED WORK

A. Reshape and re-compact fills subjected to vehicular traffic.

3.7 NOT USED

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 31 23 24 - FLOWABLE FILL

PART 1 GENERAL

1.1 SUMMARY

A. This Section includes flowable lean concrete mix used for structure backfill, utility bedding and backfill and other subgrade Site Work. Applications also include filling abandoned structures and utilities that remain in place.

B. Section Includes:

1. Structure backfill
2. Utility bedding
3. Utility backfill
4. Filling abandoned utilities

C. Related Sections:

1. Section 33 11 50 - Existing Pipe Abandonment
2. Section 31 23 16 - Excavation
3. Section 31 23 17 - Trenching
4. Section 31 23 23 - Fill
5. Section 33 11 10 - Water Utility Distribution and Transmission Piping
6. Section 33 31 10 - Sanitary Utility Sewerage Piping
7. Section 33 41 10 - Storm Utility Drainage Piping

1.2 DEFINITIONS

A. Flowable Fill: Also referred to as Controlled Low Strength Material (CLSM) elsewhere in the Specifications. Lean cement concrete fill.

B. Utility: Any buried pipe, duct, conduit, manhole, tank, or cable.

1.3 REFERENCE STANDARDS

A. ASTM International (ASTM):

1. ASTM C33 - Standard Specification for Concrete Aggregates
2. ASTM C94 - Standard Specification for Ready-Mixed Concrete
3. ASTM C150 - Standard Specification for Portland Cement

4. ASTM C260 - Standard Specification for Air-Entraining Admixtures for Concrete
5. ASTM C403 - Standard Test Method for Time of Setting of Concrete Mixtures by Penetration Resistance
6. ASTM C494 - Standard Specification for Chemical Admixtures for Concrete
7. ASTM C618 - Standard Specification for Coal Fly Ash and Raw or Calcined Natural Pozzolan for Use as a Mineral Admixture in Concrete
8. ASTM C1017 - Standard Specification for Chemical Admixtures for Use in Producing Flowing Concrete
9. ASTM C1040 - Standard Test Methods for Density of Unhardened and Hardened Concrete in Place by Nuclear Methods
10. ASTM D4832 - Standard Test Method for Preparation and Testing of Controlled Low Strength Material (CLSM) Test Cylinders

1.4 SUBMITTALS

A. Section 01 33 00 - Submittal Procedures: Requirements for submittals.

B. Manufacturer's Certificate: Certify that products meet or exceed specified requirements.

C. Field Quality-Control Submittals:

1. Mix Design:
    a. Furnish flowable fill mix design for each specified strength.
    b. Furnish separate mix designs when admixtures are required for the following:
        1) Flowable fill Work during hot and cold weather.
        2) Air entrained flowable fill Work.
    c. Identify design mix ingredients, proportions, properties, admixtures, and tests.
2. Furnish test results to certify flowable fill mix design properties meet or exceed specified requirements.

D. Delivery Tickets:

1. Furnish duplicate delivery tickets indicating actual materials delivered to Project Site.

1.5 QUALITY ASSURANCE

A. In-place testing of Flowable Fill: In accordance with ASTM C403.

B. Compressive testing of Flowable Fill: In accordance with ASTM D4832.

1.6 ENVIRONMENTAL REQUIREMENTS

A. Minimum Conditions: The following minimum conditions shall be met at time of flowable fill placement.

1. Do not install flowable fill during inclement weather.

2. Ambient temperature must be at least 34 degrees Fahrenheit (F) and rising.

3. Flowable fill shall be at 40 degrees F.

4. Subgrade on which flowable fill is to be placed shall be free of disturbed or soft material, debris, and water.

1.7 FIELD MEASUREMENTS

A. Verify field measurements before installing flowable fill to establish quantities required to complete the Work.

PART 2 PRODUCTS

2.1 FLOWABLE FILL

A. Flowable Fill:

1. Composed of cement, pozzolans, fine aggregate, water, and admixtures.

2. Low cement content.

3. Non-segregating, self-consolidating, free-flowing, and excavatable material which will result in a hardened, dense, non-settling fill.

4. Compressive strength at 28 days of 100 to 200 pounds per square inch (psi), if not otherwise shown in Drawings or specified.

2.2 MATERIALS

A. Portland Cement: ASTM C150, Type I – Normal.

B. Fine Aggregates: ASTM C33.

C. Water: Clean and not detrimental to concrete.

2.3 ADMIXTURES

A. Air Entrainment: ASTM C260.

B. Chemical Admixture: ASTM C494.

C. Fly Ash: ASTM C618 Class C or F, obtained from residue of electric generating plant using ground or powdered coal.

2.4 MIXES

A. Mix and deliver flowable fill according to ASTM C94, Option C.

B. Flowable Fill Design Mix:

ITEM	PROPERTIES
Cement Content	75 to 100 lb/cu yd
Fly Ash Content	None
Water Content	As specified
Air Entrainment	5 to 35 percent
28-Day Compressive Strength	Maximum 200 psi.
Unit Mass (Wet)	100 to 125 pcf
Temperature, Minimum at Point of Delivery	50 degrees F

C. Provide water content in design mix to produce self-leveling, flowable fill material at time of placement.

D. Design mix air entrainment and unit mass are for laboratory design mix and source quality control only.

2.5 SOURCE QUALITY CONTROL

A. Test and analyze properties of flowable fill design mix and certify results for the following:

1. Design mix proportions by weight of each material.

2. Aggregate: ASTM C33 for material properties and gradation.

3. Properties of plastic flowable fill design mix including:

   a. Temperature

   b. Slump

   c. Air entrainment

   d. Wet unit mass

   e. Yield

   f. Cement factor

4. Properties of hardened flowable fill design mix including:

   a. Compressive strength at 1-day, 7 days, and 28 days. Report compressive strength of each specimen and average specimen compressive strength.

b. Unit mass for each specimen and average specimen unit mass at time of compressive strength testing.

B. Prepare delivery tickets containing the following information:

1. Project designation
2. Date
3. Time
4. Class and quantity of flowable fill
5. Actual batch proportions
6. Free moisture content of aggregate
7. Quantity of water withheld

PART 3 EXECUTION

3.1 EXAMINATION

A. Verify excavation specified in Section 31 23 16, Excavation and trenching specified in Section 31 23 17, Trenching is complete.

B. Verify utility installation as specified in elsewhere in the specifications is complete and tested before placing flowable fill.

C. Verify excavation is dry and dewatering system is operating, as may be required, prior to placement of flowable fill.

3.2 PREPARATION

A. Support and restrain utilities to prevent movement and flotation during installation of flowable fill.

B. Protect structures and utilities from damage caused by hydraulic pressure of flowable fill before fill hardens.

C. Protect utilities and foundation drains to prevent intrusion of flowable fill.

3.3 INSTALLATION – FILL, BEDDING, AND BACKFILL

A. Place flowable fill by chute, pumping, or other methods as approved by Engineer.

B. Place flowable fill in lifts to prevent lateral pressures from exceeding structural capacity of structures and utilities.

C. Place flowable fill evenly on both sides of utilities to maintain alignment.

D. Place flowable fill to elevations indicated on Drawings without vibration or other means of compaction.

3.4 INSTALLATION – FILLING ABANDONED UTILITIES

A. As specified in Section 33 11 50, Existing Pipe Abandonment.

3.5 FIELD QUALITY CONTROL

A. Perform inspection and testing according to ASTM C94.

1. Take samples for tests for every 100 cubic yards of flowable fill, or fraction thereof, installed each day.

2. Sample, prepare, and test four compressive strength test cylinders according to ASTM D4832. Test one specimen at 3 days, one at 7 days, and two at 28 days.

3. Measure temperature at point of delivery when samples are prepared.

B. Further construction proceeding upon placed flowable fill will be permitted only after initial set is attained, as measured by ASTM C 403.

1. Perform in place penetration (density) tests using handheld penetrometer to measure penetration resistance of hardened flowable fill.

2. Perform tests at locations as directed by Engineer.

C. Defective Flowable Fill: The Engineer reserves the right to reject all flowable fill failing to meet the following test requirements or flowable fill delivered without the following documentation.

1. Test Requirements:

a. Minimum temperature at point of delivery.

b. Compressive strength requirements for each type of fill.

2. Documentation: Duplicate delivery tickets.

D. No traffic or construction equipment shall be allowed on flowable fill for a least 24 hours after placement.

3.6 CLEANING

A. Remove spilled and excess flowable fill from Project Site.

B. Restore facilities and Site areas damaged or contaminated by flowable fill installation to existing condition before installation.

END OF SECTION

SECTION 31 50 00 - EXCAVATION SUPPORT AND PROTECTION

PART 1 GENERAL

1.1 SUMMARY

A. This Section includes shoring and support systems of all types necessary to protect existing utility facilities and new utility facilities.

B. The Contractor is responsible for the selection and design of excavation support systems and the design of utility support systems in conformance with Federal, State, and City requirements and the minimum design criteria specified herein.

C. Temporary shoring is to be installed for protection of the existing trees to remain, structures to remain, buried utilities to remain, adjacent roadways and walkways, and surrounding properties.

D. Care must be taken during the planning and construction of earth support systems to minimize settlements and displacements of the shoring system itself and to surrounding properties.

E. Related Sections:

1. Section 31 23 16, Excavation
2. Section 31 23 17, Trenching
3. Section 31 23 19, Dewatering
4. Section 31 23 23, Fill
5. Section 33 11 10, Water Utility Distribution and Transmission Piping.
6. Section 33 31 10, Sanitary Utility Sewerage Piping.
7. Section 33 41 10, Storm Utility Drainage Piping.

1.2 DESIGN CRITERIA

A. Design excavation support systems and all components to support the earth pressures, unrelieved hydrostatic pressures, utility loads, equipment, traffic, railroad, and construction loads including impact, and other surcharge loads in such manner as will allow the safe and expeditious construction of the permanent structures to minimize ground movement or settlement, and to prevent damage to adjacent structures, roadways, railroads, and utilities.

B. Design support members to resist the maximum loads expected to occur during the excavation and support removal stages.

C. Design system so that water seepage is minimized. Provide dewatering and positive means for preventing sloughing and containing material behind lagging.

D. Design system to prevent sloughing and to contain running sand and silt behind the lagging.

E. Vertical support capacity shall be provided for wall systems and internal bracing elements for loads due to vertical force components and live loads on any portion of the system.

F. Design calculations and shop drawings of all excavation support systems.

1. Calculations and shop drawings shall be made and stamped by a registered Professional Civil or Structural Engineer experienced in the design of excavation support systems in the State of Oregon.

2. Comply with the applicable requirements of OSHA and the Oregon equivalent Structural Specialty Code with respect to excavation and construction.

1.3 SUBMITTALS

A. Section 01 33 00, Submittals - Submittal Procedures: Requirements for submittals.

B. Excavation Support Systems

1. Plans and details for trench and excavation support systems.

a. Calculations and shop drawings shall be made and stamped by an State of Oregon-registered Professional Engineer experienced in the design of excavation support systems and shall comply with the applicable requirements of OSHA and the Oregon equivalent Structural Specialty Code with respect to excavation and construction.

1) Arrangement, size, and details for individual excavation support systems.

2) Construction methods and sequencing to be used for the installation and removal of individual excavation support systems.

b. Provide plans, details, and calculations for Engineer review prior to the beginning of construction activities requiring such systems.

c. Review by the Engineer of the submitted design shall not be construed as a detailed analysis of the adequacy of the support system, nor shall any provisions of the above requirements be construed as relieving overall responsibility and liability for the work.

2. Provide plans, details, and calculations for trench and excavation support systems as required to obtain all necessary construction permits.

3. No excavations shall be started until the submittal review is complete and proper permits are obtained.

C. Excavation Plan

1. Designed to prevent damage to existing and surrounding properties.

D. Contingency Plan

1. Provide alternative procedures to be implemented if the excavation support systems are found to perform unfavorably or if obstructions are encountered in the installation of excavation support systems.

2. Contingency plan is to demonstrate a preparedness to mitigate the effects of movement or settlement.

3. The following minimum requirements for a contingency plan are:

a. Measures to be taken in order to protect existing facilities and neighboring properties from additional settlement or movement.

b. Identification of all material, manpower, equipment, and other items to be available and onsite at all times while excavations and dewatering activities are ongoing and reasonably after the work has been completed.

E. Site Conditions Survey

1. Videotape surveys, photographs, and other data significant in noting the pre-construction conditions of the existing Project Site, as well as the pre-construction conditions of the neighboring properties and their existing structures.

2. Provide to the Owner for record purposes prior to, but not more than 3 weeks before, commencement of any construction activities.

3. A complete set of all photographs and survey data of the post-construction conditions shall be completed and submitted prior to final inspection by the Owner and Engineer.

1.4 QUALITY ASSURANCE

A. Contractor is solely responsible for quality assurance of temporary shoring.

B. At each excavation support system location, provide the following:

1. Continual verification system is planned, executed, and maintained in accordance with applicable codes, regulations, and good construction practice.

2. Systematic observation of suitability of shoring materials.

3. Installation, excavation, settlement, and lateral deflection monitoring.

4. Groundwater control.

5. Adjacent construction activities.

6. Other factors, as necessary.

1.5 CONTRACTOR QUALIFICATIONS

A. The work of this Section shall be done by a firm specializing in this type of work. The firm shall:

1. Regularly and presently perform shoring installation as one of their principal services.

2. Have technical qualifications, experience, training, and facilities to properly install shoring.

3. Provide the services of a supervising engineer, registered in the State, with at least 5 years of experience in the design and construction of shoring walls.

4. A foreman or superintendent experienced in the installation and removal shoring walls shall be present while this work is performed.

1.6 PERMITTING

A. Secure all permits necessary to complete the requirements of this Section.

PART 2 PRODUCTS

2.1 GENERAL

A. Materials and equipment shall be safe and in good condition and shall conform to local, state, and federal codes.

PART 3 EXECUTION

3.1 GENERAL

A. Provide sheeting, shoring, and other protection and support systems wherever required, in accordance with current local, state, and federal laws, codes, and ordinances.

B. The Contractor is solely responsible for excavation protection and worker safety.

C. The Contractor shall be solely responsible for the protection of existing utilities and structures. Under no circumstance shall work threaten the integrity (physical and operational) of these utilities and/or structures.

3.2 EXCAVATION SUPPORT SYSTEMS

A. The excavation support systems shall not disturb the state of soil adjacent to the trench or excavation and below the excavation bottom.

B. Water control measures shall be provided at all times in accordance with the requirements specified in Section 31 23 19, Dewatering.

C. The support system shall extend below the main excavation bottom elevation to a depth adequate to prevent hydrostatic uplift, seepage and piping, and lateral movement and to adequately support applied vertical loads.

D. Damage to existing utilities or structures during installation of excavation support system shall be avoided. If damage occurs, it shall be repaired at no cost to the Owner and to the satisfaction of the utility owner.

E. A company representative from the excavation support system shall be onsite during initial setup of the system. Install excavation support system in strict conformance with the representative's recommendations.

3.3 CONTINGENCY PLAN IMPLEMENTATION

A. Excess movements or settlements: Work shall be stopped immediately and the causes of excess or detrimental movements evaluated if:

1. Damage is noted to existing site features or surrounding properties.

2. Shoring wall movements exceed the limits specified herein or per submitted calculations.

B. Immediately notify the Engineer and begin the implementation of the approved contingency plan to mitigate the effects of settlement or movement occurred.

3.4 REMOVAL OF SUPPORT SYSTEMS

A. Removal of excavation support systems shall be performed in a manner that does not disturb or damage adjacent new or existing structures or utilities.

B. Fill all voids immediately with specified backfill material.

C. All damage to property resulting from removal shall be promptly repaired at no cost to the Owner. The Engineer shall be the sole judge as to the extent and determination of the methods and materials for repair.

3.5 NOT USED

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

DIVISION 32 – EXTERIOR IMPROVEMENTS

SECTION 32 11 23 - AGGREGATE BASE COURSES

PART 1 GENERAL

1.1 SUMMARY

A. This Section includes construction of an aggregate subbase and base course for placement under asphalt or concrete paving, unit paving, or placed and left exposed.

B. Section Includes:

1. Aggregate subbase
2. Aggregate base course

C. Related Sections:

1. Section 31 22 13 - Rough Grading
2. Section 31 23 17 - Trenching
3. Section 31 23 23 - Fill
4. Section 31 37 00 - Riprap
5. Section 31 05 16 - Aggregates for Earthwork
6. Section 32 12 16 - Asphalt Concrete Pavement

1.2 REFERENCE STANDARDS

A. American Association of State Highway and Transportation Officials (AASHTO):

1. AASHTO M288 - Standard Specification for Geotextile Specification for Highway Applications
2. T11, Standard Method of Test for Materials Finer Than 75μm (No. 200) Sieve in Mineral Aggregates by Washing
3. T27, Standard Method of Test for Sieve Analysis of Fine and Coarse Aggregates
4. AASHTO T99 - Standard Specification for Moisture-Density Relations of Soils Using a 2.5-kg (5.5-lb) Rammer and a 305-mm (12-in.) Drop

B. ASTM International (ASTM):

1. ASTM D698 - Standard Test Method for Laboratory Compaction Characteristics of Soil Using Standard Effort (12,400 ft-lbf/ft3 (600 kN-m/m3))
2. ASTM D2167 - Standard Test Method for Density and Unit Weight of Soil in Place by the Rubber Balloon Method

3. ASTM D2922 - Standard Test Method for Density of Soil and Soil-Aggregate in Place by Nuclear Methods (Shallow Depth)

4. ASTM D2940 - Standard Specification for Graded Aggregate Material for Bases or Subbases for Highways or Airports

5. ASTM D3017 - Standard Test Method for Water Content of Soil and Rock in Place by Nuclear Methods (Shallow Depth)

1.3 DEFINITIONS

A. Completed Course: Compacted, unyielding, free from irregularities and standing water, with smooth, tight, even surface, true to grade, line, and cross-section.

B. Completed Lift: Compacted with uniform cross-section thickness.

C. Keystone: Fine aggregate used to aid in binding of loose surface stone.

1.4 SUBMITTALS

A. Section 01 33 00 - Submittal Procedures: Requirements for submittals.

B. Product Data:

1. Submit data for geotextile fabric and herbicide.

C. Materials Source: Submit name of aggregate materials suppliers.

D. Manufacturer's Certificate: Certify Products meet or exceed specified requirements.

1.5 QUALITY ASSURANCE

A. Furnish each aggregate material from single source throughout the Work.

PART 2 PRODUCTS

2.1 SHOULDER AGGREGATE

A. Of the size shown on the Plans.

B. Coarse Aggregate: Type A1, Dense-Graded Aggregate as specified in Section 32 05 16, Aggregates for Earthwork.

2.2 DENSE-GRADED BASE AGGREGATES

A. Of the size shown on the Plans.

B. Coarse Aggregate: Type A1, Dense-Graded Aggregate as specified in Section 32 05 16, Aggregates for Earthwork.

2.3 OPEN-GRADED BASE AGGREGATES

A. Of the size shown on the Plans.

B. Coarse Aggregate: Type A2, Granular Drain Backfill Material as specified in Section 32 05 16, Aggregates for Earthwork.

2.4 SOURCE QUALITY CONTROL

A. Perform tests necessary to locate acceptable source of materials meeting specified requirements.

B. Final approval of aggregate material will be based on test results of installed materials.

C. Should separation of coarse from fine materials occur during processing or stockpiling, immediately change methods of handling materials to correct uniformity in grading.

2.5 EQUIPMENT

A. Compaction Equipment: Adequate in design and number to provide compaction and to obtain specified density for each layer.

2.6 ACCESSORIES

A. Geotextile Fabric: AASHTO M288; non-woven, polypropylene.

PART 3 EXECUTION

3.1 SUBGRADE PREPARATION

A. Obtain Engineer's acceptance of subgrade before placing base course or surfacing material.

B. Verify compacted substrate is dry and ready to support paving and imposed loads.

1. Proof roll substrate with equipment approved by the Engineer in minimum two perpendicular passes to identify soft spots.

2. Remove soft substrate and replace with compacted fill as specified in Section 31 23 23.

3.2 PREPARATION

A. Correct irregularities in substrate gradient and elevation by scarifying, reshaping, and re-compacting.

B. Do not place base course or surfacing materials in snow or on soft, muddy, or frozen subgrade.

3.3 HAULING AND SPREADING

A. Hauling Materials:

1. Do not haul over surfacing in process of construction.

2. Loads: Of uniform capacity.

3. Maintain consistent gradation of material delivered; loads of widely varying gradations will be cause for rejection.

B. Spreading Materials:

1. Distribute material to provide required density, depth, grade, and dimensions with allowance for subsequent lifts.

2. Produce even distribution of material on prepared surface without segregation.

3. Should segregation of coarse from fine materials occur during placing, immediately change methods of handling materials to correct uniformity in grading.

4. Maintain consistent gradation of material. Widely varying gradation will be cause for rejection.

3.4 CONSTRUCTION OF COURSES

A. Untreated Aggregate Base Course:

1. If the required compacted depth of the base course exceeds 6 inches, construct it in two or more layers of nearly equal thickness. The maximum compacted thickness of any one layer shall not exceed 6 inches.

2. Completed Course Total Thickness: As shown on the Plans, 8-inch minimum.

3. Spread lift on preceding course to required cross-section. Place each layer in spreads as wide as practical and to the full width of the course before a succeeding layer is placed.

4. Lightly blade and roll surface until thoroughly compacted.

5. Add keystone to achieve compaction and as required when aggregate does not compact readily due to lack of fines or natural cementing properties, as follows:

a. Use 3/4-inch leveling course or surfacing material as keystone.

b. Spread evenly on top of base course, using spreader boxes or chip spreaders.

c. Roll surface until keystone is worked into interstices of base course without excessive displacement.

d. Continue operation until course has become thoroughly keyed, compacted, and will not creep or move under roller.

6. Blade or broom surface to maintain true line, grade, and cross-section.

B. Gravel Surfacing and Leveling Course:

1. Place shoulder aggregates in a single layer, or two or more layers of nearly equal thickness. The maximum compacted thickness of any one layer shall not exceed 9 inches.

2. Spread on preceding course in accordance with cross-section shown.

3. Blade lightly and roll surface until material is thoroughly compacted.

4. Complete Total Thickness: As shown on the Plans, 8-inch minimum.

3.5 ROLLING AND COMPACTION

A. Commence compaction of each layer of base immediately after spreading operations and continue until density of 95 percent of maximum density has been achieved as determined by AASHTO T99.

B. Roll each layer of material until there is no appreciable reaction or yielding under the compactor before succeeding layer is applied.

C. Shape and maintain the surface of each layer during compaction operations. Commence rolling at outer edges and continue toward center; do not roll center of road first.

D. Apply water as needed to obtain specified densities.

E. Place and compact each lift to the required density before succeeding lift is placed.

F. Surface Defects: Remedy by loosening and rerolling. Reroll entire area, including surrounding surface, until thoroughly compacted.

G. Finished surface shall be true to grade and crown before proceeding with surfacing.

3.6 SURFACE TOLERANCES

A. Blade or otherwise work surfacing as necessary to maintain grade and cross-section at all times, and to keep surface smooth and thoroughly compacted.

B. Finished Surface of Untreated Aggregate: Within plus or minus 0.04-foot of grade shown at any individual point.

C. Overall Average: Within plus or minus 0.04-foot from crown and grade specified.

3.7 FIELD QUALITY CONTROL

A. Quality control testing shall be performed by an independent testing laboratory provided by the Owner.

B. Refer to table below for minimum sampling and testing requirements for aggregate base course and surfacing. The Owner reserves the right to complete additional testing.

Property	Test Method	Frequency	Sampling Point
Gradation	AASHTO T11 and AASHTO T27	One sample every 500 tons but at least every 4 hours of production	Roadbed after processing
Moisture Density (Maximum Density)	AASHTO T99	One test for every aggregate grading produced	Production output or stockpile
In-Place Density and Moisture Content	AASHTO T310	One for each 500 ton but at least every 10,000 square feet of area	In-place completed, compacted area

3.8 CLEANING

A. Remove excess material from the Work area. Clean stockpile and staging areas of all excess aggregate. Restore per Specifications as applicable.

END OF SECTION

SECTION 32 12 16 - ASPHALT CONCRETE PAVEMENT

PART 1 GENERAL

1.1 SCOPE

This section includes the construction of asphalt concrete pavement.

1.2 REFERENCE STANDARDS

A. References herein to "AASHTO" shall mean Association of American State Highway Transportation Officials.

B. Standard Specifications: Where the term "Standard Specifications" is used, such reference shall mean the current edition of the Oregon Department of Transportation (ODOT) Standard Specifications for Highway Construction. Where reference is made to a specific part of the Standard Specifications, such applicable part shall be considered as part of this section of the Specifications. In case of a conflict in the requirements of the Standard Specifications and the requirements stated herein, the requirements herein shall prevail.

1.3 DEFINITIONS

A. Maximum Density Test (MDT): Theoretical maximum density of the bituminous mixture determined by multiplying the theoretical maximum specific gravity, determined by ASTM D2041 (Rice), by 62.4 pounds per cubic foot.

1.4 SUBMITTALS

A. Aggregate Qualification Tests: In accordance with Standard Specifications Section 00640 for aggregate used in aggregate base.

B. Aggregate Qualification Tests: In accordance with Standard Specifications Section 00745 for aggregate used in asphalt concrete.

C. Job mix formula shall be an approved job mix formula. Submit formula, supplier, and product identification to the Engineer 30 days prior to start.

1. Definite percentage for:

    a. Each sieve fraction.

    b. New asphalt cement.

    c. Recycled asphalt pavement.

2. Temperature of completed mix when discharged from mixer.

3. Character and quantity of anti-strip and recycling agents.

1.5 QUALITY ASSURANCE

A. All testing to determine compliance with the specifications shall be performed by an independent testing laboratory contracted by the Contractor and approved by the Engineer. All testing costs shall be borne by the Contractor.

B. A minimum of five nuclear densometer readings shall be taken in random locations within every test area. Each test area shall not exceed 200 tons of asphalt; however, smaller areas may be designated by the Engineer.

C. The surface smoothness of the new asphalt concrete pavement shall be such that when a 10-foot straightedge is laid longitudinally across the paved area in any direction, the new pavement shall not deviate from the straightedge more than 1/8-inch. Surface drainage shall be maintained. Additionally, paving must conform to the design grade and crown and contain no abrupt edges, low or high areas or any other imperfections as determined by the Engineer. Pavement construction not meeting these requirements will be repaired by grinding the existing pavement to a 1-1/2-inch depth and replacing with Level 3, 1/2-inch dense graded Asphaltic Concrete the full width at no cost to Owner.

1.6 PRE-PAVING CONFERENCE

A. Any supervisory personnel of the Contractor and any subcontractors who are to be involved in the paving work shall meet with the Engineer, at a time mutually agreed upon, to discuss methods of accomplishing all phases of the paving work.

B. The Contractor shall be prepared to review the size and type of equipment to be used and the anticipated rate of placement to determine equipment needs.

PART 2 PRODUCTS

2.1 AGGREGATE MATERIAL

A. Aggregate Base for Dense Graded Asphalt Concrete: The aggregate material shall be a clean, well-graded crushed base aggregate conforming to the Standard Specifications. Base course shall be 1-1/2-inch minus aggregate and leveling course shall be 3/4-inch minus aggregate.

2.2 ASPHALT CONCRETE PAVEMENT

A. Dense Graded Hot Mix Asphalt Concrete

1. Use Level 3, 1/2-inch-dense graded, PG 70-22 HMAC. Conform to the requirements as specified in Section 00745 of the Standard Specifications. Conform to the requirements as specified in Section 00745 of the Standard Specification.

2. Asphaltic concrete pavement delivered to the site shall be accompanied by a ticket with the approved "job mix formula" number shown. Loads without tickets identifying the job mix formula will not be accepted.

3. Percent of recycled asphalt pavement used in new asphalt pavement shall not exceed 30 percent. Recycled asphalt pavement may not be used in top wearing course unless otherwise approved by the Engineer.

B. Tack Coat

In accordance with Standard Specifications. Use AR 4000, AC-20 asphalt, or CSS-1 emulsified asphalt C.

C. Seal and Cover Coat

Asphalt material shall be CRS-2 cationic emulsified asphalt. Cover stone shall conform to size 1/4-inch #10 aggregate in the Standard Specifications.

D. Subgrade Geotextile

1. Dense Graded AC Mix-For subgrade separation using dense graded asphalt concrete, use subgrade geotextile with Certification Level B as specified in Section 02320 of the Standard Specifications.

E. Subgrade Stabilization

In the event that unstable materials are encountered during excavation, the additional excavation and installation of geotextile fabric and 12 inches of rock substructure will be required, as directed. Conform to the requirements as specified in Section 00331 of the Standard Specifications. For subgrade separation, use subgrade geotextile with Certification Level B as specified in Section 02320 of the Standard Specifications.

PART 3 EXECUTION

3.1 AGGREGATE PAVEMENT BASE

A. Place pavement base to the depth shown on the plans or as specified in all cases, pavement base shall be compacted to a minimum depth of 6 inches. Bring the top of the pavement base to a smooth, even grade at a distance below finished grade equivalent to the required pavement depth.

B. Compact the pavement base with mechanical vibratory or impact tampers to a density of not less than 95 percent of the maximum density, as determined by AASHTO T-99.

C. Obtain the Engineer's acceptance of the subgrade before beginning construction of the aggregate base course.

D. When, in the judgment of the Engineer, the weather is such that satisfactory results cannot be secured, suspend operations. Place no aggregate base course in snow or in soft, muddy, or frozen subgrade.

E. If the required compacted depth of aggregate base course exceeds 6 inches, construct in two or more lifts of approximately equal thickness. Maximum compacted thickness of any one lift shall not exceed 6 inches. Compact each layer to the specified density before a succeeding lift is placed.

3.2 ASPHALT CONCRETE PAVEMENT

A. Construct asphalt concrete pavement in accordance with Section 00745 of the Standard Specifications.

B. Conform to the requirements for prime coat and tack coat in the Standard Specifications. Tack coat all edges of existing pavement, manhole and clean out frames, inlet boxes, and like items. When rate is not specified, asphalt will be applied at the rate of 0.1-gallon per square yard.

C. Obtain the Engineer's acceptance of the aggregate base course before beginning construction of the asphalt concrete wearing course.

D. Hot mix asphalt shall be placed on dry, prepared surfaces, when air temperature in the shade of 40 degrees Fahrenheit (F) or warmer, unless otherwise authorized by the Engineer.

E. Placing asphalt pavement during rain or other adverse weather conditions will not be permitted unless otherwise authorized by the Engineer, except that asphalt mix in transit at the time these adverse conditions occur may be placed provided it is of proper temperature, the mix has been covered during transit, and it is placed on a foundation free from mud or free-standing water.

F. Correct any defects in material and workmanship, as directed, when determined detrimental by the Engineer. These include segregation of materials, non-uniform texture, and fouled surfaces preventing full bond between successive spreads of mixture. The corrections or replacement of defective material or workmanship shall be at the Contractor's expense.

G. Compact the bituminous mixture to at least 92 percent of the Theoretical Maximum Density.

H. The finished surface of each course of layer of mixture shall be of uniform texture, smooth, and free of defects and shall closely parallel that specified for the top surface finished grade. Remove and replace boils and slicks immediately with suitable materials.

I. The surface of each layer when tested with a Contractor-furnished 10-foot straightedge shall not vary from the testing edge by more than 0.02-foot for underlying courses of pavements and 0.015-foot for finished top courses or wearing courses of pavements. At no point shall the finished top of the wearing course vary more than 0.03-foot from the specified finished grade.

J. Lift thickness shall be as shown on the drawings or specified, but not to exceed 3 inches.

K. Do not place asphalt concrete pavement on emulsified asphalt (tack coat) until the asphalt separates from the water (breaks) but before it loses its tackiness.

L. Asphalt and sand seal edges where new asphalt concrete meets existing pavement.

3.3 FIELD QUALITY CONTROL

A. Job mix will be sampled immediately behind the paving machine.

B. Temperature of the mix will be measured immediately behind the paver.

C. The theoretical maximum specific gravity of the bituminous mixture will be determined in accordance with ASTM D2041.

D. Properties of the job mix will be measured using ASTM D2041.

E. Density of the compacted job mix will be measured in accordance with ASTM D2922.

3.4 ADJUSTMENT OF EXISTING MANHOLE COVERS AND VALVE BOXES

Prior to placing asphalt concrete pavement, the Contractor shall make all necessary adjustments to existing manhole frames and covers, and valve box covers to ensure that the tops of the manhole covers or valve box lids are flush with the finished grade of the adjoining pavement or ground surface, and that valve boxes and PVC pipes are centered and plumb over operating nut valve.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 32 91 13 - SOIL PREPARATION

PART 1 GENERAL

1.1 SUMMARY

A. Furnish labor, material and equipment required for placement and amendment of topsoils for areas to be planted, and the establishment of finish grades as shown on the Drawings and as specified herein.

B. Coordinate work with installation of other site work including earthwork, irrigation, seeding, and planting.

1.2 DEFINITIONS

A. Finish Grade: Elevation of finished surface of amended topsoil soil.

B. Manufactured Topsoil: Soil produced off-site by homogeneously blending mineral soils or sand with stabilized organic soil amendments to produce topsoil or planting soil.

C. Amended Topsoil: Native or imported topsoil or surface soil modified with organic soil amendments and organic fertilizers.

D. Subgrade: Surface or elevation of subsoil remaining after completing excavation, or top surface of a fill or backfill, before placing planting soil.

E. Topsoil: See Part 2 – Products.

1.3 SUBMITTALS

A. Product Data. Include Material Safety Data Sheets (MSDS) where applicable: For the following:

1. Organic Fertilizers, including application rates.
2. Organic Soil Amendments.

B. Samples for Verification: For the following:

1. 1/2 cubic foot compost.

2. 1/2 cubic foot of each imported topsoil. Furnish one sample from each site from which soil is to be furnished.

C. Product Certificates: For each type of manufactured product, signed by product manufacturer, and complying with the following:

1. Manufacturer’s certified analysis for standard products.

2. Analysis of other materials by a recognized laboratory made according to methods established by the Association of Official Analytical Chemists, where applicable.

D. Qualification Data: For testing agencies.

E. Material Test Reports:

1. Soil Fertility and Agricultural Suitability Analyses and Recommendations Reports for the following:

a. Existing on-site topsoil: From three typical locations as selected by Owner's Representative, minimum 30 days prior to beginning soil preparation work.

b. Imported topsoil: Minimum 30 days prior to beginning soil preparation work.

c. Amended topsoils: Provide soil analyses and results for soil samples taken from 3 typical locations as selected by Owner's Representative, minimum 7 days after soil preparation work has been completed and prior to installing plants.

2. Compost Analysis: Provide analysis for one representative sample of compost minimum 30 days prior to compost being delivered to Project Site and an analysis for one representative sample of compost delivered to the Project Site.

3. Soil Compaction Test: Provide results of soil compaction tests minimum of 7 days prior to planting and seeding.

F. Delivery Slips: Provide delivery slips as proof of shipment of specified materials.

1.4 QUALITY ASSURANCE

A. Soil Fertility and Agricultural Suitability-Testing Laboratory Qualifications: An independent laboratory, recognized by the State Department of Agriculture, with the experience and capability to conduct the testing indicated and that specializes in types of tests to be performed.

1. Acceptable Soil Testing Laboratories are:

a. A & L Western Agricultural Laboratories, (503) 968-9225.
b. Western Laboratories, Inc, (800) 658-3858.

B. Soil Analyses: Furnish soil analyses by a qualified soil-testing laboratory stating:

1. Soil Composition: USDA particle size analysis indicating percentages of sand, silt and clay, and percent organic matter.

2. Macro and micronutrient fertility tests as determined by pH, salinity, nitrate nitrogen, ammonium nitrogen, phosphate phosphorous potassium, calcium, magnesium, soluble copper, zinc, manganese, iron, saturation extract boron and sodium analyses.

3. Sodium Absorption Ratio (SAR).

4. Recommendations by the soil testing lab for fertilizer and soil amendments in pounds per 1,000 square foot or tons per acre, as necessary to correct soil deficiencies.

C. Compost Testing Laboratory Qualifications: An independent laboratory, with the experience and capability to conduct the testing indicated following U.S. Composting Council Seal of Testing Assurance (STA) procedures, or equivalent.

1. Acceptable STA Compost Testing Laboratories are:

a. A & L Western Agricultural Laboratories, (503) 968-9225.
b. Control Laboratories, (831) 724-5422.

D. Compost Analysis: Provide documentation from supplier that compost has reached a monitored temperature of 140 degrees Fahrenheit for at least one week. Engage an independent soil testing laboratory to test representative sample(s) of compost and furnish compost analysis report for the following parameters:

1. Percent organic matter, percent moisture, percent inerts (foreign matter), pH, soluble salts, and particle size.

2. Nutrient content, including: Nitrogen (N), Phosphorus (P), Potassium (K), Calcium (Ca), and Magnesium (Mg) and Sulfur (S).

3. Trace Metals, including: Arsenic (As), Cadmium (Cd), Chromium (Cr), Copper (Cu), Lead (Pb), Mercury (Hg), Nickel (Ni), and Zinc (Zn).

4. Maturity Indicator. Provide bio-assay results. Provide Carbon-Nitrogen ratio.

5. Stability Indicator: Provide respiration test results.

E. Request inspection and allow observation by Owner’s Representative of prepared soils before planting.

F. Soil Compaction Testing: Furnish soil compaction standard tests per ASTM 698. Request inspection and allow observation by Owner's Representative of prepared soils before planting.

1.5 DELIVERY, STORAGE AND HANDLING

A. Deliver packaged materials in manufacturer's unopened containers fully identified by name, brand, type, weight and analysis.

B. Store and handle packaged materials to prevent damage and intrusion of foreign matter.

C. Store stockpiled topsoil in area designated by Owner’s Representative. Provide erosion control measures for stockpiled topsoil on site to prevent contamination of the soil. Refer to 31 23 16, Excavation for control of dust and erosion.

1.6 SOIL AMENDMENT BID QUANTITIES

A. Bid quantities and types of soil amendments shall be based upon those listed in this Section. Types of amendments required and quantities shall be adjusted as necessary based upon

actual results of soil fertility and agricultural suitability analyses and recommendations for on-site topsoils.

B. For bidding purposed only, calculate the following amounts per 6-inch lift of topsoil over 1000 square-feet of landscape area:

1. 25 lbs. Gypsum (Calcium sulfate)
2. 35 lbs. Calcium carbonate limestone
3. 35 lbs. Dolomite limestone
4. 6 cu-yds Compost

1.7 SITE CONDITIONS

A. Topsoil placement and soil preparation shall not take place during periods where saturated soil or surface water is present in work areas.

B. Work shall not take place when temperature is less than 32 degrees Fahrenheit, or when frozen soil exists on site.

1.8 COORDINATION

A. Coordinate soil preparation 32 91 13, Soil Preparation such that topsoil, soil amendments and fertilizers are incorporated into ground fill areas in specified lifts to specified depths below finish grade for both planting areas and lawn areas. Topsoils shall be amended per recommendations of the Soils Testing Laboratory.

B. Coordinate work with installation of other site work, including irrigation, seeding, and planting.

PART 2 PRODUCTS

2.1 TOPSOIL

A. Topsoil Definition: ASTM D 5268; natural or cultivated surface-soil layer containing organic matter and sand, silt, and clay particles, conforming to USDA classification for Loam or Sandy Loam; friable, pervious, and black or a darker shade of brown, gray, or red than underlying subsoil; reasonably free of subsoil, clay lumps, gravel, and other objects more than 1 inches in any dimension; and free of weeds, roots, and other deleterious materials, with the following physical properties:

1. Organic Matter: 6 percent minimum.

2. Sodium Adsorption Ratio (SAR): less than 6.0.

3. Saturation Extract concentration for Boron: less than 1.0

4. pH range of from 6 to 8 (plus 0, minus 0.5).

5. Saturation Extract Conductivity: less than 4.0 dS/m @ 25 degrees Celsius as determined in a saturation extract.

6. Non-soil components: less than 1 percent by volume.

7. Heavy metal concentrations: below the USDA per year load limit.

8. Minimal weed seed.

    a. If regenerative noxious weeds (including, but not limited to, quack grass, nutsedge grass, and horsetail) are present in the soil, all resultant growth including roots shall be removed throughout one-year period after acceptance of work at no additional cost to Owner.

B. Topsoil Source: Reuse surface soil stockpiled on-site. Verify suitability of stockpiled surface soil to produce topsoil. Clean surface soil of roots, plants, sod, stones, clay lumps, and other extraneous materials harmful to plant growth. Ensure no contamination of the soils occurs during earthwork and grading, and that the soil remains friable and free of debris.

1. Import Topsoil: Supplement on-site topsoil with imported or manufactured topsoil from off-site sources when quantities are insufficient. Obtain topsoil displaced from naturally well-drained construction or mining sites where topsoil occurs at least 4 inches deep; do not obtain from agricultural land, bogs or marshes.

2.2 ORGANIC SOIL AMENDMENTS

A. Compost: Well-decomposed, commercially manufactured, stable, and weed-free organic matter from agricultural, food, biosolids, or yard debris sources; pH range of 5.5 to 8.0; 100 percent passing through 3/4-inch sieve; soluble salt content of 5 to 10 decisiemens/m; not exceeding 0.5 percent inert contaminants and free of substances toxic to plantings; and shall conform as follows:

1. Tested, at minimum, every six months for noxious weeds.

2. Organic matter source (feedstock): Agricultural, food, or industrial residuals; biosolids; yard trimmings; or source-separated or compostable mixed solid waste.

3. Organic Matter Content: 60 to 80 percent of dry weight as determined by ash method.

4. Moisture Content: 35 to 55 percent by weight

5. Free of refuse (less than 1 percent by dry weight), plastics, contaminants or any material toxic to plant growth.

6. Processed to meet U.S. Composting Council's Seal of Testing Assurance Program, or equivalent.

7. Carbon to Nitrogen Ratio: 40 to 1 or lower.

8. Composted for a minimum of 9 months and reach a monitored temperature of 140 degrees Fahrenheit for at least one week.

2.3 FERTILIZER

A. Organic fertilizer composition and rate to be determined and adjusted based upon soil analysis report. For bidding purposes, assume: Walts Organic Fertilizer, Organic Garden Blend 6-2-5, or approved equal.

1. Application rate @ 20 pounds per 1000 square feet in all planting beds and seeded areas.

B. Slow-Release Fertilizer: Granular or pelleted fertilizer consisting of 50 percent water- insoluble nitrogen, phosphorus, and potassium derived from natural organic sources in the following composition:

1. Composition: Nitrogen, phosphorous, and potassium in amounts recommended in soil reports from a qualified soil-testing agency.

PART 3 EXECUTION

3.1 EXAMINATION OF SITE CONDITIONS

A. Examine for site conditions that will adversely affect execution, permanence, quality of work, and survival of plant material and grasses.

B. Verify that subgrades and slopes of lawn and planting areas are acceptable to Owner's Representative prior to commencing work of this Section.

C. Should the Contractor find any discrepancies between the Drawings and the physical conditions, inform the Owner's Representative immediately for clarification.

D. Begin Work required under this Section only after conditions are satisfactory.

3.2 PREPARATION

A. Protect structures, utilities, sidewalks, pavements, and other facilities, and existing lawns and exterior plants from damage caused by soil preparation operations.

B. Prepare soils at a time when moisture conditions will permit proper cultivation.

C. Remove stones over 1-inch diameter, sticks, roots, mortar, concrete, rubbish, debris, and all materials harmful to plant life, and legally dispose of them off Owner's property.

D. Remove as required to eradicate noxious weed growth and roots.

1. Achieve complete removal of all weeds within all areas receiving new plantings and lawn areas.

2. In planting beds, kill achieved by working soil is permissible for annual non-noxious broad-leaf type weeds.

E. Locate and securely mark or flag irrigation sprinkler heads, area drains, catch basins, clean outs, manholes, valve boxes, and other site improvements not extending above finish grade. Provide erosion-control measures to prevent erosion or displacement of soils and discharge of soil-bearing water runoff or airborne dust to adjacent properties and walkways in accordance with 31 23 16, Excavation.

3.3 SOIL PREPARATION FOR PLANTING AREAS

A. This article pertains to those shrub bed areas where mass plantings of trees, shrubs and ground cover plants are scheduled.

B. Prepare subgrades by excavating and removing soil, rock and other construction material to 12 inches below finish grade. Cross-rip subgrades to depth of 6 inches prior to placing topsoil.

C. Place topsoil to depth as noted on Plant Legend then place compost, soil amendments, and fertilizers as recommended in Agricultural Soil Suitability Report per 1,000 square feet and rototill thoroughly to a depth of 8 inches. Place remainder of topsoil, compost, soil amendments, and fertilizers as recommended in Agricultural Soil Suitability Report per 1,000 square feet and rototill thoroughly to a depth of 8 inches, allowing for compaction, natural settlement, and depth of specified mulch.

1. It is the Contractor’s option to set up a facility on-site for the preparation and amendment of topsoils, instead of preparing and amending the topsoils in place as indicated in the paragraph above.

2. Set up facility in location as directed by Owner's Representative.

D. Water lightly and allow planting mix to settle. Add additional material at mixture indicated in paragraph above to bring soil level to grades shown on the Drawings with allowance at pavement edges for mulch placement. Provide compaction to 85 percent relative density.

E. Meet lines, grades and elevations shown, after light rolling and natural settlement. Fine grade shrub and ground cover areas to smooth even surface with loose, uniformly fine texture. Rake and drag shrub and ground cover areas to remove ridges and fill depressions to obtain firmness and finish grades preparatory to receiving planting.

F. Remove stones over 1/2-inch in any dimension and sticks, roots, rubbish and other extraneous matter.

3.4 SOIL PREPARATION FOR PLANTING PITS OF TREES

A. This article pertains to tree planting when occurring on an individual basis.

1. Backfill Mix: Prepare backfill mix and place in planting pits as shown and specified.

2. Grade smooth to elevations shown.

3.5 SOIL PREPARATION UNDER EXISTING TREES

A. Remove vegetation not indicated to remain beneath canopy of existing trees. Take care not to disturb roots of existing trees.

B. Lightly rake areas and add amended topsoil to meet proposed grades.

3.6 FINE GRADING

A. Finish grade after full settlement including mulch, shall be 1 inch below tops of curbs, walks, or existing grades in shrub areas and 3/4 inch lower in lawn areas.

B. Slope all areas to prevent puddling and drain surface water toward catch basins, drains, curbs, or off-site as shown on Drawings.

C. Soil in all areas shall be thoroughly settled, with a smooth surface free of humps and hollows, and shall be firm enough to resist undesirable impressions when stepped upon.

D. Use levels, screens, drags, or any other equipment necessary to establish and verify grades and surfaces.

E. Finish grade lawn, grass and planting areas to smooth, even surface with loose, uniformly fine texture.

F. Roll, rake, and drag lawn areas, remove ridges and fill depressions with amended topsoil to obtain firmness and finish grades as indicated.

G. Notify Owner’s Representative 36 hours in advance to review fine grading of lawn, grass and planting areas. Finish grades shall be prepared to the satisfaction of the Owner's Representative prior to planting.

3.7 CLEAN-UP

A. Clean up excess materials and debris from project site upon completion of work or sooner if directed by the Owner's Representative.

B. Leave in neat and tidy condition daily.

3.8 DISPOSAL

A. Disposal: Remove surplus soil and waste material, including excess subsoil, unsuitable soil, trash, and debris, and legally dispose of them off Owner’s property.

END OF SECTION

SECTION 32 91 21 - FINISH GRADING AND SEEDING

PART 1 GENERAL

1.1 SUMMARY

A. Section Includes:

1. Soil Preparation
2. Weed control
3. Fertilizing
4. Seeding
5. Mulching
6. Hydroseeding
7. Hydromulching
8. Erosion Control Blanket
9. Maintenance and Establishment Period

B. Related Sections:

1. Section 31 05 13 - Soils for Earthwork
2. Section 31 23 17 - Trenching

1.2 REFERENCES

A. ASTM International (ASTM):

1. ASTM C602 - Standard Specification for Agricultural Liming Materials.
2. 7 USC 1551-1611 - Federal Seed Act.

1.3 DEFINITIONS

A. Certified Seed: A grass or legume seed named variety that has been reviewed and accepted into the State Certified Seed program. Currently certified seed is individually sold in bags with a Certification Tag.

B. Pure Live Seed (PLS): Is a measure used to describe the percentage of a quantity of seed that will germinate. PLS is obtained by multiplying the purity percentage by the percentage of total viable seed, then dividing by 100.

C. Establishment Period: A period when planting work has been performed and initially accepted, and there is a contract requirement to care for the planted areas in some way until the period ends.

D. Sensitive Areas: Defined areas such as wetlands, natural water and riparian resources, special environmental zones, or where certain activities are restricted such as the use of chemicals.

E. Weeds: Vegetative species other than specified species to be established in given area.

F. Invasive Plants: Any species that appears on the State of Oregon or Clatsop County current noxious weed list, plus known problem species including phalaris arundinacea, mentha pulegium, holcus lanatus, anthoxanthum odoratum. The last crop plants (if listed as non-native on United States Department of Agriculture (USDA) Plants Database) are considered invasive if it comprises more than 15 percent in any newly established vegetation.

G. Weed Control: Removal and prevent regrowth of specified weeds, weed parts, and weed seeds from area within the Project limit.

1.4 SUBMITTALS

A. Product Data: Submit data for seed mix, mulch, tackifier, erosion control blanket, soil amendment materials, pesticides, herbicides, and other accessories. The product should meet or exceeds all product requirements specified herein.

B. Grass Seeds Manufacturer's Certificate: Certify products meet or exceed specified requirements.

1. Certification of seed analysis, germination rate, and inoculation. Include the year of production and date of packaging. Certify that each lot of seed has been tested by a testing laboratory certified in seed testing within 12 months of delivery date. Also include:

    a. Name and address of laboratory
    b. Date of test
    c. Lot number for each seed certified
    d. Test Results: Name, percentages of purity and of germination, and weed content for each seed mix.

C. Operation and Maintenance Data: Include maintenance instructions and weed control.

1.5 QUALITY ASSURANCE

A. Provide seed mixture in containers showing percentage of seed mix, germination percentage, inert matter percentage, weed percentage, year of production, net weight, date of packaging, and location of packaging.

B. Pesticide shall not be used in this Project.

1.6 QUALIFICATIONS

A. Seed Supplier: Company specializing in manufacturing Products specified in this section with minimum 3 years documented experience.

B. Installer: Company specializing in performing work of this section with minimum 2 years documented experience.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Deliver grass seed mixture in sealed containers. Seed in damaged packaging is not acceptable.

B. Deliver fertilizer in waterproof bags showing weight, chemical analysis, and name of manufacturer.

C. Deliver tackifier sealed containers showing weight, chemical analysis, and name of manufacturer.

1.8 MAINTENANCE SERVICE

A. Maintain seeded areas immediately after placement for 12 months from Date of Substantial Completion. Grass shall be well established and exhibits vigorous growing condition.

PART 2 PRODUCTS

2.1 SEED MIXTURE

A. Suppliers:

1. Sunmark Seeds, Portland, OR
2. PT Lawn Seed, Portland, OR
3. NaturesSeed.com
4. Approved equal

B. Seed Mixes: The following are the functional categories of seed mixes that may be included on projects (a category may have multiple functions on a Project Site):

1. Temporary Seeding - To provide short-term erosion control of disturbed soils and slopes that are not at finished grade, and which will be exposed for 2 months or longer before being disturbed again, until permanent seeding is performed, or all potential for erosion is removed.

2. Permanent Seeding - The final seeding or only seeding performed for erosion control.

3. Lawn Seeding - Seeding for areas where finished turf appearance is desired.

4. Wildflower Seeding - Seeding to develop growth of wildflowers. The seed mix will typically contain grass or other plant seed to provide erosion control.

5. Plant Seeding - Seeding which typically includes more than just grass species, such as seeds of woody or herbaceous plants.

6. Water Quality Seeding - For use in water quality facilities such as swales or settling basins.

7. Wetland Seeding - To vegetate existing or constructed wetlands.

8. Native Plant Seeding - Seeding to restore native vegetation.

C. Types of Seed Mixes: Seed mixes, quantities, standards, and other information

1. Water Quality Seed Mix: Water quality facilities NW Native bio-filtration seed mix, salmon-friendly, will perform well in the bottom of drainage swales, storm water retention ponds, and bio-filtration swales. This mixture will range from the continuously wet lowlands, up into the riparian zone, offering erosion control and habitat development.

Botanical Name	Common Name	PLS Lbs. per Acre
Elymus glaucus	Blue Wildrye	20
Festuca rubra rubra	Native Red Fescue	16.5
Deschampsia caespitosa	Tufted Hairgrass	5.2
Glyceria occidentallis	Western Mannagrass	0.9
Beckmania syzigachne	American Sloughgrass	0.9
TOTALS:		43.38

2. Roadside Seed Mix: Erosion control mix for vegetation along roadsides. It is also salt tolerant.

Botanical Name	Common Name	PLS Lbs. per Acre
Hordeum vulgare var Poco	Poco Barley	52.24
Hordeum brachyantherum	Meadow Barley	36.57

Bromus carinatus	California Brome	23.51
Festuca idahoensis romerii	Roemer's Fescue	7.18
Trifolium fragiferum	Strawberry Clover	5.22
Clarkia amonea	Farewell to Spring	1.96
Oenothera elata hookeri	Hooker's Evening Primrose	1.96
Deschampsia cespitosa	Tufted Hairgrass	1.31
Agrostis exerata	Spike Bentgrass	0.65
TOTALS:		130.6

2.2 ACCESSORIES

A. Straw Mulching Material: Oat or wheat straw, free from weeds, foreign matter detrimental to plant life, and dry. Hay or chopped cornstalks are not acceptable.

B. Wood and Bark Mulching Material: Chipped wood and bark, sawdust, and ground wood mulch should be free of growth or germination inhibiting ingredients.

C. Compost: Commercially manufactured fine and medium compost materials.

D. Tackifier: Commercial tackifier containing no agent toxic to plant life and exhibits no growth or germination inhibiting factors at one of the following forms:

1. Liquid Stabilizer Emulsion - Tackifier with a base material of liquid containing not less than 55 percent total solids by weight. It should allow exchange of air and moisture to the seeds and have an effective life of 1 year or more.

2. Dry Powder Tackifier - Tackifier base consisting of one or more active hydrocolloids from natural plant sources, which hydrates in water and blends with other slurry materials, and upon application tacks the slurry particles to the Soil surface.

E. Fertilizer: Commercial grade; recommended for grass to eliminate deficiencies of topsoil and suitable for application with equipment designed for that purpose.

1. Deliver fertilizers in separate or mixture containers that have the percentage of total nitrogen, available phosphoric acid, and water-soluble potash (NPK) in the amounts specified. Label each container with a quality compliance certificate.

2. Application rate shall be determined by the soil conditions, as indicated in analysis to determine the proportions of Nitrogen percent, phosphoric acid percent, soluble potash percent.

F. Lime: Not Used.

G. Water: Clean, fresh, and free of substances or matter capable of inhibiting vigorous growth of grass.

H. Erosion Control Blanket shall be open, flexible, and dimensionally stable network of fully-biodegradable, bonded, interlocking fibers. The blanket shall have a functional longevity of up to 12 months. Blanket fibers shall be turf green color or natural wood/straw color.

I. Pesticides/Herbicide: Not Used.

2.3 SOURCE QUALITY CONTROL – NOT USED

PART 3 EXECUTION

3.1 EXAMINATION

A. Verify permit requirements before starting work.

B. Planting Season: Plant seeds when growing conditions are conducive to seed germination and quick but thorough establishment of seedlings.

1. Depending on latitude and elevation in the Pacific Northwest, these conditions occur either in mid-August through early October or mid-April to late May.

2. Avoid planting seed during the heat of summer or in late fall to avoid freezes that kill sprouting grass seeds.

C. Weed Control Coordinator – Not Used.

D. Pesticide Applicator – Not Used.

3.2 SOIL PREPARATION

A. Prepare area for seeding in accordance with permits and as required for specified seed mixes.

Remove any matter detrimental or toxic to the growth of plants, including weeds, clods, rocks, or debris.

3.3 WEED CONTROL

A. Do not harm or disturb any vegetation that was planted as proposed on the planting plans. Do not compact soil with heavy equipment.

B. Inspect the Project for new growth of specified weeds at least monthly during the plants growing season and apply weed control measures as appropriate.

1. Inspect the area at least every 30 days after growing season has begun or as directed for continuing control of all vegetation considered as weeds.

2. Provide schedule of weed control measures.

3. Request to use wheeled or tracked construction equipment in sensitive areas.

C. Remove and control weeds according to the following:

1. Verify the weed control methods before proceeding with weed control activities.

2. Remove all specified weeds and ensure that weed seeds or reproducing plant parts such as vines, runners, or rhizomes do not remain or become disbursed during control activities.

3. Place weeds and related materials in an approved container and transport to an approved offsite disposal facility according to applicable laws and regulations.

4. Keep the site weed free including weeds not initially documented.

D. Weed Control at Sensitive Areas - as determined by the ENGINEER:

1. Use only hand or light mechanical weed control methods within 50 feet of sensitive areas.

2. Hand methods include the use of hand tools. Light mechanical methods include the use of hand carried, motorized machinery.

E. Weed Control Corrective Work - If corrective work for areas identified as deficient by the ENGINEER, it should be completed within a 15 Calendar Day period,

3.4 SEEDING

A. Apply Water Quality Seed Mix at rate indicated in Section 2.1.C.1 at all disturbed areas shown in the Drawings.

3.5 HYDROSEEDING AND HYDROMULCHING

A. Mix seeds, fertilizers, mulch, and tackifier with water in specific tank as follows:

1. Hydraulic Equipment should continuously mix and agitates the slurry providing a continuous, non-fluctuating delivery.

2. Provide a uniform distribution of the slurry.

3. Place seed, fertilizer, mulch, and tackifier in the hydroseeder tank no more than 30 minutes prior to application.

B. Hydroseeding operation: Perform hydroseeding according to the following:

1. One-Step Operation - Apply materials in one step only for the following situations:

a. When seeding in conjunction with erosion control matting. Apply seed, fertilizer, and tracer before installing matting.

b. When treating small areas that are 1,500 square feet or less and totaling no more than 0.5 acre, double the amount of seed to compensate for seed suspended above Soil by the mulch.

2. Two-Step Operation – for areas over 0.5 acre, use the two-step method for all hydroseeding/hydromulching operations:

a. Step 1 - Apply seed, fertilizer, and tracer.
b. Step 2 - Apply mulch and tackifier.

C. Seed -Thoroughly mix seeds when more than one kind is to be used.

D. Mulch - Apply at the following rates based on dry fiber weight:

1. Slopes Flatter Than 1V:2H - Apply cellulose fiber that includes a tackifier at a rate of 2,000 pounds per acre.

2. Slopes 1V:2H or Steeper - Apply cellulose fiber that includes a tackifier at a rate of 3,000 pounds per acre.

E. Tackifier for Cellulose Fiber Applications – apply dry tackifier to water tank at the following rates unless the Manufacture recommends a greater rate of application:

1. Slopes Flatter Than 1V:2H - 60 pounds per acre mixed with hydromulch fibers at the rate specified.

2. Slopes of 1V:2H or Steeper - 100 pounds per acre mixed with hydromulch fibers at the rate specified.

3.6 MECHANICAL SEEDING

A. Seeding, fertilizing, and covering: The following may be used to stabilize small, disturbed areas that are 1,500 square feet or less and totaling no more than 0.5 acre:

1. Seeds and fertilizer - Seed the disturbed area with the seed mix at the specified rate by mechanical spreader.

2. Cover - Cover seeded areas with one of the following:

    a. Straw mulch at a rate of 100 pounds per 1,000 square feet. Spread the mulch uniformly approximately 2 inches deep, in loose condition, which requires roughly 2-1/2 tons per acre of dry mulch. Do not use straw mulch on slopes of 1V:1.5H or steeper.

    b. Bark mulch spread uniformly at an approximate depth of 1/2-inch. Use well-decomposed mulch for seed mulching. Do not use bark mulch on slopes of 1V:1.5H or steeper.

    c. Suitable open-weave, biodegradable erosion control matting installed according to Manufacturer's instructions.

3.7 SEEDING OVER MULCHED AREAS

A. If an area has been previously mulched for erosion control or temporary seed and mulch is present on the soil surface, double the pound rate for each seed type used. Apply seed and fertilizer hydraulically or mechanically and add a green dye to the mixture to visibly aid uniform application. Upon approval, fertilizer and seed may only be applied after mulching if one of the following conditions apply:

    1. Mulch is punched into the soil by mechanized means. Avoid heavy equipment that may compact the soil. Roll seeded area with roller not exceeding 112 pounds/linear foot.

    2. Mulch that is held down with netting or like material

    3. Mulch is removed prior to seeding.

3.8 WORK QUALITY

A. After application, apply water with fine spray immediately after each area has been hydroseeded Apply water with fine spray immediately after each area has been mulched.

B. Drift - Prevent drift and displacement of seed and fertilizer regardless of equipment and methods used.

C. Displacement - Prevent seed, fertilizer, and mulch from falling or drifting onto other areas where grass is detrimental. Remove material that falls on plants, roadways, gravel shoulders, structures, and other surfaces where material is not specified.

D. Damage - Prevent damage to prepared areas and to completed fertilizer, seed, and mulch work. Replace all material that becomes displaced before acceptance of the work.

3.9 MAINTENANCE

A. Control growth of weeds.

B. Weed Control - Remove specified weeds prior to plants going to seed and keep weed control and seeded areas "Weed Free" throughout the Establishment Period.

C. Immediately reseed areas showing bare spots.

D. Repair washouts or gullies.

E. Protect seeded areas with warning signs during maintenance period.

F. Ensure that each seeded area has a uniform, healthy and weed-free stand of grass or other seeded plants growing at the end of the Establishment Period. The minimum living plant coverage standards for acceptance of seeding in a planted area are as follows:

1. Temporary Seeding:

    a. West of the Cascades - 70 percent coverage of ground surface.
    b. East of the Cascades - 30 percent coverage of ground surface.

2. Permanent Seeding:

    a. West of the Cascades - 90 percent coverage of ground surface.
    b. East of the Cascades - 30 percent coverage of ground surface.

3. Wetland Seeding - 70 percent coverage of ground surface.

4. Water Quality Seeding - 100 percent of ground surface.

G. Protection - Protect seeded areas from trespass and other hazards of damage. Use protective fences and signs at no additional cost to the OWNER. Obtain approval of protective methods used.

H. Fertilizing and Watering - Apply fertilizer according to grass and soil requirements. Apply water according to good horticultural practice under the prevailing conditions, as required to promote a healthy stand of plants. Obtain water at no additional cost to the OWNER.

I. Mowing – If mowing is required, do the first mowing of grass when soil is firm enough to prevent rutting and grass is about 3 inches tall. After mowing, leave grass that is approximately 2 inches tall. At each subsequent mowing, leave about 1-1/2 inches of growth. After the second mowing, grass clippings may be left in place upon written approval.

J. Repair and Restore - Repair and restore soil grades and re-seed damaged, settled, or unproductive areas to the specified conditions of this Section at no additional cost to the OWNER.

K. Finishing and Cleaning Up Cleanup - Remove weeds, trash, debris, stones, and other extraneous matter from seeded areas as directed and dispose of.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 32 93 00 - PLANTING

PART 1 GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:

1. Furnishing all labor, materials and equipment for installation of landscape planting as shown on the drawings and as specified.

B. Related Sections include the following:

1. Section 32 91 13, Soil Preparation
2. Section 32 92 21, Finish Grade and Seeding

1.3 DEFINITIONS

A. The following publications, referred to thereafter by basic designation only, form a part of this specification to the extent indicated by references:

1. STANDARDIZED PLANT NAMES, 1942 Edition, published by J. Horace McFarland Company.

2. FLORA OF THE PACIFIC NORTHWEST; by Hitchcock and Cronquist, latest edition,

3. Federal Standard for Fertilizers - Mixed, Commercial: FS0-F-241D

B. Balled and Burlapped Stock: Exterior plants dug with firm, natural balls of earth in which they were grown, with ball size not less than diameter and depth recommended by ANSI Z60.1, latest edition, for type and size of plant required; wrapped with burlap, tied, rigidly supported, and drum-laced with twine with the root flare visible at the surface of the ball as recommended by ANSI Z60.1, latest edition.

C. Balled and Potted Stock: Exterior plants dug with firm, natural balls of earth in which they are grown and placed, unbroken, in a container. Ball size is not less than diameter and depth recommended by ANSI Z60.1, latest edition, for type and size of plant required.

D. Bare-Root Stock: Exterior plants with a well-branched, fibrous-root system developed by transplanting or root pruning, with soil or growing medium removed, and with not less than minimum root spread according to ANSI Z60.1, latest edition, for type and size of plant required.

E. Container-Grown Stock: Healthy, vigorous, well-rooted plants grown in a container with a well-established root system reaching sides of container and maintaining a firm ball when removed from container. Container shall be rigid enough to hold ball shape and protect root mass during

shipping and be sized according to ANSI Z60.1, latest edition, for type and size of plant required.

F. Fabric Bag-Grown Stock: Healthy, vigorous, well-rooted plants established and grown in-ground in a porous fabric bag with well-established root system reaching sides of fabric bag. Fabric bag size is not less than diameter, depth, and volume required by ANSI Z60.1, latest edition, for type and size of plant.

G. Finish Grade: Elevation of finished surface of planting soil.

H. Groundcover: Low woody or herbaceous plants generally less than 24 inches high at maturity or per jurisdictional definition.

I. Healthy (Plants): Plants that are growing in a condition that expresses leaf size, crown density, color, and with annual growth rates typical of the species and cultivar's horticultural description, adjusted for the planting site conditions, drainage and weather conditions.

J. Kinked root: A root within the root package that bends more than 90 degrees.

K. Planting Soil: Native or imported topsoil, manufactured topsoil, or surface soil modified to become topsoil; mixed with soil amendments.

L. Subgrade: Surface or elevation of subsoil remaining after completing excavation, or top surface of a fill or backfill, before placing planting soil.

1.4 SUBMITTALS

A. Submit certifications, or samples of material requested for substitution.

B. A maximum of 1 month after the Contractor receives the authorization to proceed, the Contractor shall submit to the Owner's Representative, copies of all nursery invoices for plant materials to be used on site. The copies must indicate source of supply by name, address and phone number, order invoice number, and size and quantity for each species or variety ordered.

C. Inspection certificates:

1. All plant material shall meet requirements of State and Federal laws with respect to inspection for plant diseases and infestation.

2. Inspection certificates required by law shall accompany each shipment of plant materials and be submitted to the Owner's Representative.

1.5 QUALITY ASSURANCE

A. Work and material supplied shall comply with applicable requirements of the United States Department of Agriculture (USDA).

B. The Contractor shall protect all materials, at all times during handling, shipping and storage, from extreme weather conditions, wind, drying of roots or root ball injury.

1. Store fertilizers in a dry place and protect from intrusion of moisture.

2. Deliver plants at the time of planting, and handle with proper horticultural practice.

C. Plant materials showing damage from handling, shipping or during planting shall be rejected by the Owner's Representative and shall be replaced by the Contractor at their expense.

D. Provide quality, size, genus, species, and variety of exterior plants indicated, complying with applicable requirements in the latest edition of ANSI Z60.1, "American Standard for Nursery Stock."

1. Selection of exterior plants purchased under allowances will be made by Owner's Representative, who will tag plants at their place of growth before they are prepared for transplanting.

E. Tree and Shrub Measurements: Measure according to ANSI Z60.1, latest edition, with branches and trunks or canes in their normal position. Do not prune to obtain required sizes. Take caliper measurements 6 inches above ground for trees up to 4-inch caliper size, and 12 inches above ground for larger sizes. Measure main body of tree or shrub for height and spread; do not measure branches or roots tip-to-tip.

F. Observation: Owner's Representative may observe trees and shrubs either at place of growth or at site before planting for compliance with requirements for genus, species, variety, size, and quality. Owner's Representative retains right to observe trees and shrubs further for size and condition of balls and root systems, insects, injuries, and latent defects and to reject unsatisfactory or defective material at any time during progress of work. Remove rejected trees or shrubs immediately from Project site and replace.

G. Store fertilizers in a dry place and protect from intrusion of moisture.

H. Planting

1. All landscaping work shall be done under the supervision of a Contractor currently licensed in landscape construction, under respective jurisdictions, and having a minimum of two years of experience in landscape construction. All work shall be done in accordance with proper horticultural practices and hereinafter described.

2. Installer's Personnel Certifications: Certified Landscape Technician, CLT-Exterior or Certified Ornamental Landscape Professional, COLP.

I. Herbicide Application

1. Application of herbicides for weed control as may be required shall be made only by an applicator currently licensed under this state's law.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver exterior plants freshly dug.

B. Do not prune trees and shrubs before delivery, except as approved by Owner's Representative. Protect bark, branches, and root systems from sun scald, drying, sweating, whipping, and other handling and tying damage. Do not bend or bind-tie trees or shrubs in such a manner as to

destroy their natural shape. Provide protective covering of exterior plants during delivery. Do not drop exterior plants during delivery.

C. Handle planting stock by root ball.

D. Deliver exterior plants after preparations for planting have been completed and install immediately. If planting is delayed more than six hours after delivery, set exterior plants trees in shade, protect from weather and mechanical damage, and keep roots moist.

1. Heel-in bare-root stock. Soak roots in water for two hours if dried out.

2. Set balled stock on ground and cover ball with soil, peat moss, sawdust, or other acceptable material.

3. Do not remove container-grown stock from containers before time of planting.

4. Water root systems of exterior plants stored on-site with a fine-mist spray. Water as often as necessary to maintain root systems in a moist condition.

1.7 PROJECT CONDITIONS AND COORDINATION

A. Planting Restrictions: Plant during one of the following periods. Coordinate planting periods with maintenance periods to provide required maintenance from date of Substantial Completion.

1. Planting Season: West of Cascade Mountains, September 1 – May 15, unless otherwise specified; container grown materials located in irrigated areas may be planted at other times depending upon written approval by Owner's Representative.

B. Weather Limitations: Proceed with planting only when existing and forecasted weather conditions are between 35- and 80-degrees Fahrenheit and soil conditions are not saturated.

C. Coordination with seeded, plugged and sodded areas: Plant trees and shrubs after finish grades are established and before seeding, plugging and sodding designated areas, unless otherwise acceptable to Owner's Representative.

1. When planting trees and shrubs after seeding, plugging and sodding, protect these areas and promptly repair damage caused by the planting operations.

D. The Contractor shall coordinate planting work with soil preparation.

1.8 PLANT MATERIALS SUBSTITUTION

A. Plants, not specifically named in the plant list, will not be accepted unless specifically accepted in writing by the Owner's Representative.

B. Substitutes proposed for approval, in each case, shall possess the same essential characteristics as the kind of plant actually specified in regard to appearance, ultimate height, shape, and habit of growth, general soil, and other environmental requirements.

1.9 WARRANTY

A. The establishment and warranty periods for all types of plantings shall be initiated upon the Owner's Representative acceptance of the work and for the period of time listed below.

B. Trees, Shrubs, Vines, and Ornamental Grasses: 12 months.

C. Ground Covers, Biennials, Perennials, and Other Plants: 12 months.

D. General: The contractor shall provide a warranty for the vibrant and healthy survival of 100% of the trees through the warranty period. The contractor shall provide a warranty for the vibrant and healthy survival of 100% of the shrubs, vines and ornamental grasses through the warranty period. The contractor shall provide a warranty for the vibrant and healthy survival of 100% of the ground covers, biennials and perennials through the warranty period. The contractor shall replace all plants that have died, are dying or are not demonstrating vibrant and healthy growth, as determined by the Owner's Representative, immediately upon discovery by the contractor or direction from the Owner's Representative within the same period as the initial installation. The warranty shall be extended 12 months as originally specified for those plants which are replaced, beginning form the date of replacement. The replaced plants shall be of the same species and size as originally specified. Such replacement shall be made in the same manner as specified for the original plantings, and at no extra cost to the Owner. The replacement will be for one time as long as the contractor meets the requirements of these specifications and as reviewed by the Owner's Representative.

E. Warranty Guarantee

1. The contractor shall provide a financial instrument as a warranty guarantee in the amount of 100 percent of the contract amount (including all labor, equipment and materials). Acceptable instruments for the warranty guarantee are as follows:

    a. A warranty guarantee incorporated with the performance guarantee
    b. A warranty maintenance bond.
    c. Cash deposit with the Owner.

PART 2 PRODUCTS

2.1 TREES, SHRUBS AND GROUNDCOVER

A. General species, variety, quantity, size and condition of plant will be provided as indicated on the drawings.

Plant material shall be supplied, but not limited to form and conditions defined as follows:

Rhizome:	Section of root or stolon
Propagules:	Section of stem
Bulb:	Single bulb mass
Plug:	Rooted Cutting
Aquatic container:	Water filled container for floating plants

Seedling:	Rooted tree or shrub
Tubeling:	Rooted tree or shrub in single tube
Bare Root:	Shrub or tree with soil removed from root mass
Cutting:	Stem cut from parent stock
Ball and Burlap:	Tree or shrub with excavated root ball wrapped and tied
Container:	Standard pot or bag, per ANSI standard sizing.

B. Nomenclature shall conform to "Standardized Plant Names."

C. Quality definitions, grading tolerances, and caliper to height ratios no less than minimum specified in ANSI Z60.1.

D. Plant material shall be healthy nursery stock, well branched, full foliated when in leaf, free from disease, injury, insects, all weeds and weed roots.

E. Cold storage plants shall not be permitted.

F. Plant materials shall be nursery-grown unless otherwise specified. Nursery-grown plants shall have been growing continuously in licensed nurseries for the following minimum number of growing seasons:

Plant Materials	Time in Nursery
Evergreens and conifers	Two growing seasons
Deciduous	One growing season
Groundcover and Vines	One growing season

G. Balled and burlapped (B&B) stock shall be furnished with natural ball.

H. Potted and container stock shall be well rooted, vigorous enough to ensure survival and exhibit healthy growth.

I. Container stock shall have been growing in its container for a minimum of six (6) months and a maximum of two (2) years, with roots filling the containers but not showing evidence of being or having been root bound.

J. Trees: Provide untapped, straight, single-leader trees.

K. Plant materials shall be free from disease, insects, disfiguring knots, sun scale, injuries, bark abrasion, evidence of improper pruning and other objectionable disfigurements.

L. Trees and shrubs shall have all developed branching system; shrubs shall have full foliage and shall not be leggy.

M. Thin, weak, leggy, or misshapen plants will be rejected by the Owner's Representative.

N. Labels: The correct horticultural name, size and caliper and/or other data, as specified in the Plant Material List, written on durable labels in weather-resistant ink, shall be securely attached to all individually shipped plants and to each box, bundle, bale and container of plant

materials. Labels shall remain on representative plant materials until final acceptance of planting. Labels shall be affixed in such a manner that will not girdle the plant materials.

O. The species (botanical and common names), size, manner in which the plants are furnished, and spacing of the required plant materials, are noted on the planting plan.

P. The quantities of plant materials shall be as determined by the Contractor in accordance with the specified spacing, or location on plan. Surplus or shortages of plant quantities shall be the responsibility of the Contractor.

2.2 TREE STABILIZATION MATERIALS

A. Stakes and Guys:

1. Upright and Guy Stakes: Rough-sawn, sound, new softwood with specified wood pressure-preservative treatment, free of knots, holes, cross grain, and other defects, 2-by-2-inch nominal by length indicated, pointed at one end.

2. Retain one of first two subparagraphs below.

3. Flexible Ties: Wide rubber or elastic bands or straps of length required to reach stakes.

2.3 WATER

A. Water shall be suitable for irrigation, free from oil, acid, alkali, salt or other substances harmful to plant life.

2.4 MULCHES

A. Fir and/or hemlock bark, 1-inch minus size with less than 30% bark finer than 1/4-inch size. Sawdust and wood shavings will not be acceptable.

2.5 MISCELLANEOUS PRODUCTS

A. Wood Pressure-Preservative Treatment: AWPA C2, with waterborne preservative for soil and freshwater use, acceptable to authorities having jurisdiction, and containing no arsenic; including ammoniacal copper arsenate, ammoniacal copper zinc arsenate, and chromated copper arsenate.

B. Root Barrier: Black, molded, modular panels manufactured with 50 percent recycled polyethylene plastic with ultraviolet inhibitors, 85 mils thick, with vertical root deflecting ribs protruding 3/4 inch out from panel, and each panel 24 inches high and wide.

C. Anti-desiccant: Water-insoluble emulsion, permeable moisture retarder, film forming, for trees and shrubs. Deliver in original, sealed, and fully labeled containers and mix according to manufacturer's written instructions.

D. Burlap: Non-synthetic, biodegradable.

E. Mycorrhizal Fungi: Dry, granular inoculant containing at least 5300 spores per lb. of vesicular-arbuscular mycorrhizal fungi and 95 million spores per lb. of ectomycorrhizal fungi, 33 percent hydrogel, and a maximum of 5.5 percent inert material.

PART 3 EXECUTION

3.1 INITIAL INSPECTION OF PLANT MATERIAL

A. All plant materials must be inspected by the Owner's Representative before planting. All plant material shall be free from insects, diseases, and injuries and sizing shall be equal to or exceeding measurements specified. Transport and handle all materials in strict accordance with proper horticultural standards. The Contractor shall provide plants with habit and growth that is normal, sound, healthy and vigorous.

B. All plant materials not meeting specification requirements shall be rejected.

C. All native plants shall be nursery stock except hardwood cuttings. Nursery stock shall be grown from propagules or seed collected from western Oregon or western Washington sources only. Plants from off-site collection sources shall not be allowed, unless otherwise approved by the Owner's Representative.

D. Hardwood cuttings, as identified on the plant list, shall be taken from healthy, vigorous, one to three-year old, plants grown in full sunlight and obtained from the respective watershed identified by the Owner's Representative. Cuttings shall be from 1 to 2 feet in length and between ¼ and ¾ inches in diameter, as shown on plans. Each piece shall contain a minimum of two dormant buds per foot of length. Period of collection shall be at dormancy and at the optimum time per proper horticultural standards for cutting establishment.

3.2 PLANT BED PREPARATION

A. Prepare plant beds as directed in Section 32 91 13, Soil Preparation.

3.3 PLANT LAYOUT AND INSPECTION

A. Layout of major planting areas as indicated on the plans are approximate only, and the locations and identity of all trees, shrubs, ground covers and other plantings shall be outlined in the field by the Contractor, subject to review and approval by the Owner's Representative.

B. Inspection: The Contractor shall notify the Owner's Representative forty-eight (48) hours prior to beginning any planting. The Owner's Representative may adjust plant material location to meet field conditions. Planting shall not occur until the Owner's Representative has approved the location and layout of all plant beds.

3.4 TREES, SHRUBS, GROUNDCOVER AND OTHER PLANTINGS

A. Plant trees and shrubs upright and adjust to set best appearance or relationship to adjacent plants and structures. Shrubs and groundcovers shall be planted one half the distance from curbs, sidewalks, buildings and other objects, as specified in the spacing requirements.

Native Plant material shall be planted with regard to condition specified on plan, per, but not limited to the following:

Rhizome:	Cut into soil surface within 2 inches of surface
Propagule:	Cut into soil surface within 2 inches of surface
Bulb:	Set into soil 4 inches- 6 inches deep; point up
Plug:	Placed into soil at size of root mass
Aquatic container:	Dispersed into open water surface
Seedling:	Cut into soil as deep as root mass, compacted
Tubeling:	Cut into soil as deep as root mass, compacted
Bare Root:	Placed into plant pit sufficient for root mass, compacted
Cutting:	Dibble into soil per cutting installation detail on plan
Ball and Burlap:	Placed into plant pit twice the size of root ball, compacted
Container:	Placed into plant pit twice the size of container

B. Planting dates:

1. Planting of burlapped and container stock: Feb.15 - May 15, Oct. 1-Nov. 15.

C. Excavation for planting

1. Stockpile all excavated topsoil for planting operations.

2. In digging pits for trees, the contractor shall separate sod, topsoil suitable for backfill, and subsoil, and shall dispose of the sod, rocks and unsuitable material off-site.

3. Diameter or minimum width of planting pit or trenches shall be as shown on the drawings.

4. If standing water is encountered during excavation of the planting pits, the Contractor shall notify the Owner's Representative who will determine the corrective drainage measures required.

5. If underground obstructions or rocks are encountered in excavation of planting areas making it impossible to plant materials as shown on the contract documents, an alternate location for the planting shall be selected by the Owner's Representative.

6. Excess excavated topsoil shall be used to form saucers around plants as detailed. Soil not required or suitable for the above usage shall be properly disposed of off the project site.

7. Root crown to be visible before tree is set. Remove top of root ball media to locate if needed.

8. Burlap, twine and metal basket to be cut and removed entirely down to base of rootball after tree is set (material on bottom can remain). If rootball is unstable or breaking, only remove the top 12" of burlap.

9. Staking to remain no more than two years unless Owner's Representative directs longer staking period. Maintain 2" strap slack around trunk.

D. Cutting: Cut off cleanly all broken or frayed roots, smaller than 1/2 inch caliper.

E. Prior to completing backfilling, the upper two-thirds of the plant pit shall be flooded with the plant starter solution. Allow solution to soak away. Finish filling holes to finish grade and lightly compact soil around root ball.

F. Placement and compaction: Place and compact backfill soil mixture carefully to avoid injury to roots; fill all voids.

3.5 SHRUBS AND GROUNDCOVER PLANTING BED GRADES

A. Establish finish grades and slopes in accordance with finish grades as specified.

3.6 MULCHING

A. Mulch all shrubs and ground cover planting beds with a 2 inch layer of mulch material within two (2) days after planting. Cover entire bed areas; apply evenly. A 2 inch layer of mulch material shall be applied to saucer areas of trees and shrubs located outside of planting beds.

3.7 TREE STABILIZATION

A. Install trunk stabilization as follows unless otherwise indicated:

1. Upright Staking and Tying: Stake trees of 2- through 5-inch caliper. Stake trees of less than 2-inch caliper only as required to prevent wind tip out. Use a minimum of two stakes of length required to penetrate at least 18 inches below bottom of backfilled excavation and to extend to the dimension shown on Drawings above grade. Set vertical stakes and space to avoid penetrating root balls or root masses.

2. Use two stakes for trees up to 12 feet high and 2-1/2 inches or less in caliper; three stakes for trees above 12 feet high.

3. Support trees with bands of flexible ties at contact points with tree trunk. Allow enough slack to avoid rigid restraint of tree.

3.8 ROOT-BARRIER INSTALLATION

A. Install root barrier where trees are planted within 60 inches of paving or other hardscape elements, such as walls, curbs, and walkways unless otherwise shown on Drawings. Length shall be 6’each side of tree center (12’ total length).

3.9 ANTIDESICCANT

A. The application of the antidesiccant shall be prior to transplanting as a spray or during planting as a dip. The antidesiccant shall not be applied if rain is anticipated in one hour or less. If not previously applied, the Contractor shall, within 24 hours of completing backfilling, spray all evergreen and leafed-out deciduous plants with the antidesiccant thoroughly covering all leaves. The solution shall be mixed according to manufacturer's specifications.

3.10 PRUNING

A. Pruning shall be done at or after the time of planting in accordance with proper horticultural practice.

B. Pruning shall be limited to the minimum necessary to remove injured twigs and branches and to compensate for the loss of roots during transplanting but shall never exceed one-half of the branching structure.

1. Crossed or rubbing branches shall be removed providing the natural shape of the tree is preserved.

2. All cuts shall be made flush with the parent stem leaving no stubs. Pruning cuts shall be made in a manner to favor the earliest possible covering of the wound by callus growth. Cuts that produce large wounds and weaken the tree will not be acceptable. Evergreens shall not be pruned except to remove injured branches and/or double leaders. The use of pole shears and/or hedge shears for pruning deciduous and evergreen trees will not be permitted. All trimmings and other debris left over from the planting operations shall be collected and disposed of legally off the site.

C. With the permission of the Owner's Representative, pruning may be done before delivery of plants, but not before plants have been inspected and accepted.

3.11 CLEANUP

A. Keep premises free from accumulation of debris.

B. At completion of each area of work, remove all debris, equipment and surplus materials

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

DIVISION 33 - UTILITIES

SECTION 33 05 50 - EXISTING PIPE ABANDONMENT

PART 1 GENERAL

1.1 SUMMARY

A. This Section includes the removal of existing buried piping and abandonment in place of existing buried piping.

B. Section includes:

1. Pipe removal.

2. In-place abandonment of pipe.

C. Related Sections:

1. Section 03 60 00, Grouting.

2. Section 31 23 16, Excavation.

3. Section 31 23 17, Trenching.

4. Section 31 23 19, Dewatering.

5. Section 31 23 23, Fill.

6. Section 31 23 24, Flowable Fill.

1.2 SUBMITTALS

A. Provide all submittals in accordance with Section 01 33 00, Submittal Procedures.

B. Piping Abandonment Plan:

1. Identify locations specified for pipe abandonment.

2. Provide method to be utilized to abandon the pipe, including whether the pipe will be left in place or removed in its entirety.

C. Non-Shrink Grout: Product data in accordance with Section 03 60 00, Grouting.

D. CLSM: Mix designs in accordance with Submittal requirements of Section 31 23 24, Flowable Fill.

1.3 REQUIREMENTS OF REGULATORY AGENCIES

A. Permits: The Contractor is responsible for obtaining all necessary permits required for completion of the work described herein.

B. Protection of Persons and Property: Meet all federal, state, and local safety requirements for the protection of workmen, other persons, and property in the vicinity of the work and requirements of the General Provisions.

1.4 PROTECTION OF EXISTING WORK

A. Carefully examine the Contract Documents to determine the extent of the work of this Section.

B. Carefully coordinate the work of this Section with all other work and construction.

C. Take all necessary precautions to prevent damage to existing facilities or utilities which are to remain in place and be responsible for any damages to existing facilities or utilities, which are caused by the operations.

1.5 REPAIR OF DAMAGE

A. Work procedures shall provide for safe conduct of the work; careful removal and disposition of materials and equipment; protection of facilities, utilities and property which are to remain undisturbed; coordination with existing facilities and utilities to remain in service.

B. Any damage to existing facilities or utilities to remain as caused by the Contractor's operations shall be repaired to acceptance of Engineer.

C. Damaged items shall be repaired or replaced with new materials as required to restore damaged items or surfaces to a condition equal to and matching that existing prior to damage or start of work of this contract.

1.6 EXISTING CONDITIONS

A. If the pipe material contains any hazardous materials, such as asbestos, requiring special handling upon removal, it is the responsibility of the Contractor to remove and dispose of the material in accordance with all applicable federal, state, and local regulations.

PART 2 PRODUCTS

2.1 OWNERSHIP OF EXISTING MATERIALS

A. All materials, equipment, miscellaneous items, and debris involved, occurring, or resulting from pipe removal work shall become the property of the Contractor at the place of origin, unless otherwise specified in the Drawings or by the Engineer.

2.2 CONTROLLED LOW STRENGTH MATERIAL

A. As specified in Section 31 23 24, Flowable Fill.

PART 3 EXECUTION

3.1 PIPE REMOVAL

A. Where identified on the Drawings, remove, and dispose of all pipe material and associated appurtenances.

1. All fire hydrants, air release valves service lines and appurtenances being abandoned shall be removed to 36 inches below finished grade.

2. Existing service line appurtenances, including valve and meter boxes, shall be removed to 36 inches below finished grade.

B. All exposed ends of pipes and fittings to remain in service shall be capped or plugged with an appropriate ductile iron blind flange, cap or plug and restrained.

1. A pipe shall be considered in service if it is possible to flood the pipe with water by opening valves in the water system.

C. All excavation and backfilling associated with pipe removal shall be performed in accordance with 31 23 17, Trenching.

3.2 IN-PLACE ABANDONMENT OF PIPING

A. Where identified on the Drawings, abandon pipe in place.

B. All exposed ends of pipes being abandoned in place shall be cut and plugged with a minimum of two (2) feet of non-shrink grout.

C. Prior to placing grout, roughen interior pipe surface and apply epoxy bonding agent.

3.3 FILLING PIPE WITH CLSM

A. Where identified on the Plans, pipes to be abandoned-in-place shall be filled with CLSM.

B. CLSM shall be placed in a manner to ensure complete filling of the pipe, leaving no cavities or voids.

C. Install hot taps, saddles, fill lines and appurtenances as necessary for pumping CLSM from the surface into the pipe being filled.

D. CLSM shall be pumped up grade from fill lines rigidly connected to the pipes being filled.

E. Placement of CLSM by free flowing (non-pumped) methods will not be acceptable.

F. Fill lines shall be located at elevations lower than the pipe being filled.

G. As the CLSM is being placed, use other fill lines as view ports to ensure complete filling of the pipes.

H. Relocate pumping equipment as necessary to complete filling of the pipes.

I. Excavate and cut access holes in the pipes as necessary to complete filling operations.

J. Perform pipe filling operations in a manner to eliminate all air pockets.

K. Submit volume calculations for CLSM placed in each filled segment of piping to verify that pipelines have been completely filled.

3.4 CLEANUP

A. During and upon completion of work of this Section, promptly remove all unused tools and equipment, surplus materials, and debris.

B. Adjacent areas shall be returned to their existing condition prior to the start of work.

END OF SECTION

SECTION 33 05 64 - PRECAST CONCRETE VALVE VAULTS AND METER BOXES

PART 1 GENERAL

1.1 SUMMARY

A. Section Includes:

1. Precast concrete valve vaults.
2. Precast concrete meter boxes.

B. Related Section:

1. Section 05 50 00, Metal Fabrications
2. Section 31 05 16, Aggregates for Earthwork
3. Section 31 23 16, Excavation
4. Section 31 23 23, Fill
5. Section 33 11 10, Water Utility Distribution and Transmission Piping
6. Section 33 31 10, Sanitary Utility Sewerage Piping
7. Section 33 41 10, Storm Utility Drainage Piping

1.2 REFERENCE STANDARDS

A. ASTM International (ASTM):

1. ASTM A48 - Standard Specification for Gray Iron Castings.
2. ASTM A185 - Standard Specification for Steel Welded Wire Reinforcement, Plain, for Concrete.
3. ASTM A536 - Standard Specification for Ductile Iron Castings.
4. ASTM A615 - Standard Specification for Deformed and Plain Carbon-Steel Bars for Concrete Reinforcement.
5. ASTM B221 - Standard Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes.
6. ASTM C33 - Standard Specification for Concrete Aggregates.
7. ASTM C150 - Standard Specification for Portland Cement.
8. ASTM C260 - Standard Specification for Air-Entraining Admixtures for Concrete.
9. ASTM C478 - Standard Specification for Precast Reinforced Concrete Manhole Sections.

10. ASTM C497 - Standard Test Methods for Concrete Pipe, Manhole Sections, or Tile.

11. ASTM C890 - Standard Practice for Minimum Structural Design Loading for Monolithic or Sectional Precast Concrete Water and Wastewater Structures.

12. ASTM C913 - Standard Specification for Precast Concrete Water and Wastewater Structures.

13. ASTM C990 - Standard Specification for Joints for Concrete Pipe, Manholes, and Precast Box Sections Using Preformed Flexible Joint Sealants.

14. ASTM D698 - Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Standard Effort (12 400 ft-lbf/ft3 (600 kN-m/m3)).

15. ASTM D1557 - Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft3 (2,700 kN-m/m3)).

16. ASTM D4104 - Standard Test Method (Analytical Procedure) for Determining Transmissivity of Nonleaky Confined Aquifers by Overdamped Well Response to Instantaneous Change in Head (Slug Tests).

17. ASTM D6938 - Standard Test Method for In-Place Density and Water Content of Soil and Soil-Aggregate by Nuclear Methods (Shallow Depth).

1.3 COORDINATION

A. Coordinate Work with utilities within construction area.

B. The drawings identify precast vaults and meter boxes by Manufacturer and model number. This information is provided for dimensional information only. Provide precast items in accordance with the requirements of this Section.

1.4 NOT USED

1.5 SUBMITTALS

A. Section 01 33 00 - Submittal Procedures: Requirements for submittals.

B. Product Data: Submit data on valve vaults and meter boxes.

C. Shop Drawings for Precast Concrete Valve Vaults:

1. Indicate plan, location, and inverts of connecting piping.

2. All interior and exterior dimensions.

3. Location and type of lifting inserts, connection embeds, and joints.

4. Details of reinforcement.

5. Covers or hatches.

6. Ladders and grating.

D. Manufacturer's Certificate: Certify that precast concrete valve vaults and meter boxes meet or exceed ASTM standards and specified requirements.

E. Field Quality-Control Submittals: Indicate results of Contractor-furnished tests and inspections.

1.6 CLOSEOUT SUBMITTALS

A. Project Record Documents: Record actual locations and inverts of buried pipe, components, and connections.

1.7 QUALITY ASSURANCE

A. Perform Work according to standards identified in Article 1.2 herein.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Inspection: Accept materials on Site in Manufacturer's original packaging and inspect for damage.

B. Transport and handle precast concrete units with equipment designed to protect units from damage.

C. Storage:

1. Store precast concrete valve vaults and meter boxes according to Manufacturer instructions.

2. Do not place concrete units in position to cause overstress, warping, or twisting.

PART 2 PRODUCTS

2.1 DESIGN REQUIREMENTS

A. Performance and Design Criteria:

1. Watertight, Precast, Reinforced, Air-Entrained Concrete Structures:

a. Manufactured to conform to ASTM C913.

2. Loading:

a. Design to ASTM C890-A16 / AASHTO HS20 live loading and installation conditions.

b. Where vaults are below grade, a dead load of 125 pounds per cubic foot shall be added for the soil.

c. Lateral loads:

1) Static: 105 x Depth of fill per square foot (psf) triangular equivalent fluid pressure plus a surcharge of an additional 3 feet of soil depth in areas subject to vehicular traffic (assume traffic load in all areas, unless indicated otherwise by the Contract Documents).

2) Seismic acceleration: UBC Zone 3 requirements (I = 1.25) where I = importance factor, I = 1.25, but not less than 0.20 grams (g) acting on structure mass. Seismic loading need not be considered simultaneously with traffic surcharge.

3. Minimum 28-Day Compressive Strength: 3,000 pounds per square inch (psi).

4. Honeycombed or re-tempered concrete is not permitted.

5. No knockouts shall be cast into vault walls. All pipe penetrations shall be pre-formed or core-drilled at the required locations.

6. Accessories: Accessories such as ladders, floor grates at sumps, and other features shall be provided as shown on the Drawings.

7. Size: Vault dimensions shall be as required by the Drawings.

2.2 PRECAST CONCRETE VALVES AND METER BOXES

A. Manufacturers:

1. Manufacturer shall be Oldcastle Precast Inc. or approved equal.

B. Valve Vault and Meter Box Frames and Covers:

1. Cast Iron Castings:

a. ASTM A48, Class 30 or better.

b. Free of bubbles, sand, air holes, and other imperfections.

C. Access Steps:

1. Steel reinforced formed polypropylene:

a. ASTM C478

b. Reinforced rod: ASTM A615, Grade 60, 1/2-inch diameter

2. Aluminum: ASTM B221, Alloy 6061-T6

3. Width: Minimum 12 inches

4. Spacing: 12 inches on center vertically.

2.3 ACCESS HATCHES AND LIDS

A. Unless noted otherwise elsewhere in the Contract Documents, vaults shall have concrete top slabs with access openings as shown on the Drawings.

B. Vault Manufacturer shall provide the access hatches per the requirements of Section 05 50 00, Metal Fabrications.

C. Lids shall have lifting holes.

D. When leveling bolts are used to set the vault top sections, ensure the load from the top slab is transferred through grout to the vault walls so that the load is not carried by the leveling bolts.

2.4 MATERIALS

A. Portland Cement:

1. ASTM C150, Type II

B. Coarse Aggregates:

1. ASTM C33

2. Graded 1 inch to No. 4 sieve

C. Sand:

1. ASTM C33

2. Fineness Modulus: 2.35

D. Water:

1. Potable.

2. Clean and free of injurious amounts of acids, alkalis, salts, organic materials, and substances incompatible with concrete or steel.

E. Air-Entraining Admixtures: ASTM C260

F. Reinforcing Steel:

1. Deformed Bars: ASTM A615, Grade 40 minimum

2. Welded Wire Fabric: ASTM A185

G. Gaskets:

1. Rubber gaskets: ASTM C443

H. Joint Sealant:

1. ASTM C990

I. Bedding:

1. Aggregate Bedding Material: Fill Type A1 as specified in Section 31 05 16, Aggregates for Earthwork. Size as shown in the Drawings.

2.5 FABRICATION

A. Fabricate precast reinforced concrete structures according to ASTM C913, to dimensions indicated on Drawings, and to specified design criteria.

B. Vaults may be formed with separate top and bottom slabs.

C. Walls shall be cast so that all sides are continuous at corners and their full length with no block-outs or knockouts.

D. Horizontal joints may be provided so that walls can be placed in horizontal segments.

E. All horizontal joints shall be keyed to prevent offsets and shall be provided with a watertight gasket.

F. Finish:

1. Formed surfaces shall be smooth and uniform with no fins, bulges, or other irregularities.

2. Any void greater in width than 1/2-inch or deeper than 3/8-inch shall be repaired.

3. Unformed interior slab surfaces shall have a smooth steel trowel finish.

4. Unformed exterior slab surfaces shall have a light broom finish applied to a steel trowel finish.

2.6 MIXES

A. Design concrete mix to produce required concrete strength, air-entrainment, watertight properties, and loading requirements.

PART 3 EXECUTION

3.1 EXAMINATION

A. Verify that piping connections, sizes, locations, and inverts are as indicated on Drawings.

3.2 PREPARATION

A. Ream pipe ends and remove burrs.

B. Remove scale and dirt from components before assembly.

C. Establish invert elevations for each component in system.

D. Hand trim excavation to suit valve vaults and meter boxes; remove stones, roots, and other obstructions.

3.3 INSTALLATION

A. Vaults/Meter and Bedding:

1. Excavate as specified in Section 31 23 16, Excavation for Work of this Section.

2. Hand trim excavation for accurate placement of vaults and meter boxes to elevations indicated.

3. Place bedding material level in one continuous layer to a minimum compacted depth of 6 inches.

4. Compact bedding material to 95 percent maximum density.

5. Bases for precast concrete structures shall be set level so that bedding material fully and uniformly supports them in true alignment with uniform bearing throughout full perimeter. Do not level bases by wedging gravel under the edges.

6. Backfill around sides of vaults and meter boxes as required by the Drawings.

B. Connect piping.

3.4 FIELD QUALITY CONTROL

A. Request examination of subgrade by Engineer prior to placing aggregate base under precast materials.

B. Compaction Testing: In accordance with Field Quality Control requirements of Section 31 23 23, Fill.

C. When tests indicate Work does not meet specified requirements, remove Work, replace, and retest.

D. Frequency of Compaction Tests: In accordance with Section 01 45 00, Quality Control.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 33 11 10 - WATER UTILITY DISTRIBUTION AND TRANSMISSION PIPING

PART 1 GENERAL

1.1 SUMMARY

A. Work under this Section applies to furnishing and installation of pipe materials, fittings, and appurtenances normally encountered with water distribution and transmission systems, including potable water and fire water systems.

B. Section includes:

1. Pipe and fittings
2. Flexible couplings
3. Flanged coupling adapters
4. Insulating flanged joints
5. Tapping sleeves and valves
6. Flexible expansion joints
7. Bedding and cover materials

C. Related Requirements:

1. General

a. Furnish and install all piping systems shown and specified in accordance with the requirements of the Contract Documents.

b. Each buried piping system shall be complete, with all necessary fittings, valves, accessories, lining and coating, testing, excavation, backfill and encasement, to provide a functional installation.

c. Piping layouts shown in the Drawings are intended to define the general layout, configuration, and routing for pipe, as well as the size and type of piping to be installed. The piping plans are not pipe construction or fabrication drawings.

d. The Contractor shall cause the Supplier of pipes, valves, fittings, and appurtenances to coordinate piping installation such that all equipment is compatible and is capable of achieving the performance requirements specified in the Contract Documents.

e. It is the Contractor's responsibility to develop the details necessary to construct all piping systems, to accommodate the specific equipment provided, and to provide and install all spools, spacers, adapters, connectors, valves, gaskets, fittings, appurtenances etc., for a complete and functional system.

D. Related Sections:

1. Section 03 11 00 - Concrete Work
2. Section 31 05 13 - Soils for Earthwork
3. Section 31 05 16 - Aggregates for Earthwork
4. Section 31 23 16 - Excavation
5. Section 31 23 17 - Trenching
6. Section 31 23 23 - Fill
7. Section 31 23 24 - Flowable Fill
8. Section 33 05 64 - Precast Concrete Valve Vaults and Meter Boxes
9. Section 33 12 13 - Water Service Connections
10. Section 33 12 16 - Water Utility Distribution and Transmission Valves
11. Section 33 12 19 - Fire Hydrants
12. Section 33 13 00 - Testing and Disinfecting of Water Utility Piping

1.2 REFERENCE STANDARDS

A. American Association of State Highway and Transportation Officials (AASHTO):

1. AASHTO T99 - Standard Specification for Moisture-Density Relations of Soils Using a 2.5-kg (5.5-lb) Rammer and a 305-mm (12-in.) Drop

B. American Society of Mechanical Engineers (ASME):

1. ASME B16.1 - Gray Iron Pipe Flanges and Flanged Fittings: Classes 25, 125, and 250
2. ASME B16.5 - Pipe Flanges and Flanged Fittings, Steel Nickel Alloy, and other Special Alloys
3. ASME B16.21 - Nonmetallic Flat Gaskets for Pipe Flanges
4. ASME B31.10 - Standards of Pressure Piping

C. ASTM International (ASTM):

1. ASTM A36 - Standard Specification for Carbon Structural Steel
2. ASTM A123 - Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products
3. ASTM A193 - Standard Specification for Alloy-Steel and Stainless Steel Bolting for High Temperature or High Pressure Service and Other Special Purpose Applications
4. ASTM A307 - Standard Specification for Carbon Steel Bolts, Studs, and Threaded Rod 60 000 PSI Tensile Strength

5. ASTM A536, Standard Specification for Ductile Iron Castings.

6. ASTM D698 - Standard Test Method for Laboratory Compaction Characteristics of Soil Using Standard Effort (12,400 ft-lbf/ft3 (600 kN-m/m3))

7. ASTM D1598 - Standard Test Method for Time-to-Failure of Plastic Pipe Under Constant Internal Pressure

8. ASTM D1784 - Standard Specification for Rigid Poly (Vinyl Chloride) (PVC) Compounds and Chlorinated Poly (Vinyl Chloride) (CPVC) Compounds

9. ASTM D1785 - Standard Specification for Poly (Vinyl Chloride) (PVC) Plastic Pipe, Schedules 40, 80, and 120

10. ASTM D2241 - Standard Specification for Poly (Vinyl Chloride) (PVC) Pressure-Rated Pipe (SDR Series)

11. ASTM D3139 - Standard Specification for Joints for Plastic Pressure Pipes Using Flexible Elastomeric Seals

12. ASTM D6938 - Standard Test Method for In-Place Density and Water Content of Soil and Soil-Aggregate by Nuclear Methods (Shallow Depth)

13. ASTM F477 - Standard Specification for Elastomeric Seals (Gaskets) for Joining Plastic Pipe

D. American Water Works Association (AWWA):

1. AWWA C104 - Cement-Mortar Lining for Ductile-Iron Pipe and Fittings

2. AWWA C105 - Polyethylene Encasement for Ductile-Iron Pipe Systems

3. AWWA C110 - Ductile-Iron and Gray-Iron Fittings

4. AWWA C111 - Rubber-Gasket Joints for Ductile-Iron Pressure Pipe and Fittings

5. AWWA C115 - Flanged Ductile-Iron Pipe with Ductile-Iron or Gray-Iron Threaded Flanges

6. AWWA C151 - Ductile-Iron Pipe, Centrifugally Cast

7. AWWA C153 - Ductile-Iron Compact Fittings

8. AWWA C219 - Bolted, Sleeve-Type Couplings for Plain-End Pipe

9. AWWA C600 - Installation of Ductile-Iron Mains and Their Appurtenances

10. AWWA C605 - Underground Installation of Polyvinyl Chloride (PVC) Pressure Pipe and Fittings for Water

11. AWWA C606 - Grooved and Shouldered Joints

12. AWWA C900 - Polyvinyl Chloride (PVC) Pressure Pipe and Fabricated Fittings, 4 In. Through 60 In. (100 mm Through 1,500 mm), for Water Transmission and Distribution

E. Manufacturers Standardization Society of the Valve and Fittings Industry:

1. MSS SP-60 - Connecting Flange Joints between Tapping Sleeves and Tapping Valves

F. NSF International (NSF):

1. NSF Standard 61 - Drinking Water System Components – Health Effects

2. NSF Standard 372 - Drinking Water System Components – Lead Content

3. NSF 600 – Health Effects Evaluation and Criteria for Chemicals in Drinking Water

1.3 SUBMITTALS

A. Section 01 33 00 - Submittal Procedures: Requirements for submittals.

B. Product Data: Submit data on pipe materials, pipe fittings, restrained joint systems, and accessories.

C. Shop Drawings: Indicate piping layout, including piping specialties.

1. Layout Schedule for applicable segments of proposed transmission main alignment. Schedule shall include layout plan and dimensions, schedule of pipe fittings and specials, materials and class for each size and type of pipe, joint details, pipe supports, and any special provisions required for assembly.

D. Lining and coating data.

E. Manufacturer's Certificate: Certify that products meet or exceed specified requirements.

F. Manufacturer’s handling, delivery, storage, and installation requirements.

G. Field Quality-Control Submittals:

1. Pipeline hydrostatic testing plan.

2. Indicate results of Contractor-furnished tests and inspections.

H. Preconstruction Photographs:

1. Submit digital files of colored photographs of Work areas and material storage areas.

1.4 CLOSEOUT SUBMITTALS

A. As-Built Drawings:

1. Record actual locations of piping mains, valves, connections, thrust restraints, and invert elevations.

2. Identify and describe unexpected variations to subsoil conditions or discovery of uncharted utilities.

1.5 QUALITY ASSURANCE

A. Materials:

1. Unless otherwise noted, all water works materials provided for the Project shall be new, of first-class quality and shall be made by reputable manufacturers.

2. All material of a like kind shall be provided from a single manufacturer unless otherwise approved by the Owner's Representative.

3. All material shall be carefully handled and installed in good working order free from defect in manufacture, storage, and handling.

B. Markings:

1. Pipes and Fittings: Mark each pipe and fitting at plant. Include date of manufacture, Manufacturer's identification, specification standard, inside diameter of pipe, dimension ratio as applicable, pipe class as applicable, pipe number for laying purposes as applicable, and other information required for type of pipe.

2. Bolting materials (washers, nuts, and bolts) shall be marked with material type.

C. Testing:

1. Except where otherwise specified, all materials used in the manufacture of the pipe shall be tested in accordance with the applicable Specifications and Standards.

1.6 MATERIAL DELIVERY, STORAGE, AND HANDLING

A. In accordance with Manufacturer's written recommendations and as specified in these Contract Documents.

B. Pipe, specials, and fittings delivered to Project Site in damaged condition will not be accepted.

C. Storage:

1. Store and support pipe securely to prevent accidental rolling and to avoid contact with mud, water, or other deleterious materials.

2. Pipe and fittings shall not be stored on rocks, gravel, or other hard material that might damage pipe. This includes storage area and along pipe trench.

3. Do not store materials in direct sunlight.

4. Gaskets: Do not allow contact with oils, fuels, petroleum, or solvents.

D. Handling:

1. Pipe and appurtenances shall be handled in accordance with Manufacturer's recommendations or requirements contained in this section or subsequent sections dealing with the specific pipe material, whichever is more stringent.

2. Pipe shall be handled with proper equipment in a manner to prevent distortion or damage. Use of hooks, chains, wire ropes, or clamps that could damage pipe, damage coating or lining, or kink and bend pipe ends is not permitted.

3. Use heavy canvas, or nylon slings of suitable strength for lifting and supporting materials.

4. Lifting pipe during unloading or lifting into trench shall be done using two slings placed at quarter point of pipe section. Pipe may be lifted using one sling near center of pipe, provided pipe is guided to prevent uncontrolled swinging and no damage will result to pipe or harm to workers. Slings shall bear uniformly against pipe.

E. Pipe Plugs:

Provide and install a cap or plug on each end of pipe during transportation and onsite storage to protect linings and coatings from debris. Install watertight plug-in end of installed pipe at the end of the workday. Under no circumstances shall materials be dropped or dumped into the trench.

PART 2 PRODUCTS

2.1 WATER PIPING

A. General

1. All piping materials and specials shall meet the specifications of this Section and of the appropriate AWWA Standard Specifications. In the case of conflict, the more stringent specifications shall apply.

2. All coatings and materials specified herein which may come in contact with potable water shall conform to National Sanitation Foundation (NSF) Standard 61, 372 and 600.

3. Minimum Pressure Ratings: Unless otherwise specified herein or shown in the Drawings, the minimum working pressure rating of all water works materials specified herein shall be 1-1/2 times the operating pressure or 150 pounds per square inch (psi) minimum.

4. Gaskets:

a. Material: Styrene Butadiene Rubber (SBR) composition.

B. Ductile Iron Pipe:

1. Centrifugally cast, conforming to AWWA Standard C151.

2. Coating: Asphaltic exterior coating in accordance with AWWA Standard C151.

3. Pipe Mortar Lining: Shop-applied NSF 61 cement mortar lining, smoothed finish, complying with AWWA C104.

4. Pipe Thickness Class:

a. Comply with AWWA C151.

b. Class 52, unless shown to be greater in the Plans.

1) The Contractor shall be aware ductile iron piping with thickness class greater than Class 52 may have long fabrication and supplier lead times. The Contractor shall be responsible for coordinating product submittal and delivery times accordingly such as not to delay construction.

5. NOT USED

6. Polyethylene Encasement:

a. Comply with AWWA C105.

b. Polyethylene film shall be minimum 8-mil thick virgin linear low-density polyethylene (LLDPE).

c. Secure in place with 10-mil polyethylene tape

d. V-BIO Enhance Polyethylene Film shall be minimum 9-mil thick and provided where specified or shown on plans.

7. Joints:

a. Joint types shall be provided as identified in the Drawings and as required for the application.

b. Mechanical Joints:

1) Comply with AWWA C111.

c. Push-on Joints:

1) Comply with AWWA C111.

2) Manufacturers, without exception:

a) Tyton Joint by American Cast Iron Pipe Company, U.S. Pipe and Foundry Company, McWane, and Pacific States Cast Iron Pipe.

b) Fastite Joint by American Cast Iron Pipe Company.

d. Restrained Joints:

1) Joint restraint for pipe shall be accomplished with an integral lock mechanism, except as may be otherwise specified.

a) Any such system shall be a manufacturer's standard proprietary design, shall be as recommended by the Manufacturer for the application, and shall be performance proven.

2) Restraining components:

a) Ductile iron complying with AWWA C110 and/or C153, with the exception of a manufacturer's proprietary design dimensions.

b) Push-on joints for such fittings shall comply with AWWA C111.

3) Deflection:

a) The maximum pipe deflection shall not exceed one-half of the Manufacturer's stated joint deflection allowance.

4) Manufacturers:

a) For pipe larger than 12"

(1) "TR Flex", United States Pipe and Foundry Company.

(2) "Flex-Ring", American Cast Iron Pipe Company.

b) For pipe 12" and smaller

(1) "Field-Lok", United States Pipe and Foundry Company.

(2) "Fast Grip", American Cast Iron Pipe Company.

(3) "TR Flex", United States Pipe and Foundry Company.

(4) "Flex-Ring", American Cast Iron Pipe Company.

c) For all pipe sizes

(1) Wedge-type Restraint System – "MEGALUG", EBBA Iron, Inc. or equal.

(a) Where any restrained joint system requires the use of a wedge-type mechanical restraint gland for restraint, the glands shall be provided in quantities as may be required and shall be considered incidental to the joint restraint system.

(b) Wedge-type mechanical restraining glands shall not be used to restrain the plain end of plain end ductile iron or cast-iron fittings.

5) "Foster Adaptor", Infact Corporation

a) Where specified, mechanical joint (MJ) valves and fittings shall be connected using a bolt-through positive restraint mechanism manufactured of ductile iron conforming to ASTM A536, 65-45-12.

b) The positive restraint device shall connect the valves and/or fittings at a linear distance not to exceed three (3) inches and without attachment to pipe.

c) The device shall come complete with all accessories, including standard styrene butadiene rubber (SBR) MJ gaskets conforming to the latest revision of AWWA C111/ASTM F-477 and weathering steel (Corten) bolts conforming to AWWA C111/A21.11 and ASTM A242.

d) Nuts for 3 through 12-inch sizes shall be SAE Grade 5 steel with black oxide coating. Nuts for 14-inch and larger adaptors shall be heavy hex Corten steel conforming to ASTM A242.

e) MJ positive restraining device shall be supplied with NSF 61, 7-mil. fusion bonded epoxy conforming to AWWA C116/A21.16-09 as well as the coating, surface preparation and application requirements of ANSI/AWWA C550.

f) The device shall be used with standard mechanical joint fittings (AWWA C110 or C153) and valves and shall be Infact Corporation FOSTER ADAPTOR or equal.

e. Flanged Joints:

1) Flat faced, complying with AWWA C111 and C115, unless otherwise specified.

2) Bolt hole drilling according to ASME/ANSI B16.1, Class 125, or ASME/ANSI B16.1, Class 250, where specified. Flanges shall be attached with bolt holes straddling the vertical axis of the pipe unless otherwise shown.

3) The Contractor shall coordinate with pipe, valve, and fitting suppliers to make certain mating pipe, valve, and fitting flanges match in bolt pattern.

4) Pressure rating of flange joints shall not exceed the rating of the pipe or fitting of which they are a part, and the maximum pressure rating of the joint shall be 250 psi.

5) Flange joint connections shall not be exposed to test pressures greater than 1-1/2 times their rated working pressure.

6) Threaded flanges:

a) Ductile iron pipe spools with threaded flanges shall conform to AWWA C115.

b) Installed only on pipe with a minimum Class 53 wall thickness.

7) Buried flanges:

a) Flanged connections shall not be buried unless shown as such on the Drawings.

b) Buried flanges shall be wrapped with 2 layers of 10-mil tape along edges of flanges.

8) Gaskets:

a) Full faced, composed of synthetic rubber and 1/8-inch-thick conforming to ASME B21.1 and AWWA C111.

b) Ring gaskets will be permitted only where specifically noted in the Drawings and Specifications.

c) Gaskets for flanged joints shall be as follows:

(1) Pipe sizes between 6-inch and 24-inch diameter, service pressures of 150 psi or greater shall be Garlock 3760-U or equal.

(2) Pipe sizes 4-inch diameter and under, service pressures of 150 psi or greater shall be Garlock GYLON 3505 or equal.

(3) All pipe sizes with service pressures of 150 psi or less shall be Garlock 98206 or equal.

d) Gaskets for insulating flanged joints shall be as follows:

(1) Full faced, conform to ANSI 16.21.

(2) Material: Non-asbestos.

(3) Suitable for operating and test pressures of the pipe system.

(4) Manufacturer:

(a) Garlock GYLON 3505-or equal.

C. PVC:

1. All PVC pressure pipe shall be manufactured with an integral bell design capable of receiving an elastomeric gasket.

2. All PVC pressure pipe shall be dimensionally compatible with standard cast/ductile iron fittings produced according to AWWA C110 or AWWA C153, as applicable.

3. Deflection:

a. PVC pressure pipe may be deflected both horizontally and vertically at the joints after assembly.

b. Deflection by bending of the pipe rather than at the joints is not allowed.

c. The maximum pipe deflection shall not exceed one half of the Manufacturer's stated joint deflection allowance.

4. Joints:

a. Solvent-cement couplings are not permitted.

5. Gaskets: Comply with ASTM F477.

6. Size: 4-inch through 12-inch diameter

a. Comply with AWWA C900, DR 14, Class 305, unless shown otherwise in the Drawings or specified elsewhere.

7. Size: 14-inch through 48-inch diameter

a. Comply with AWWA C900, DR 18, Class 235, unless shown otherwise in the Drawings or specified elsewhere.

8. Restrained Joints:

a. For push-on pipe joint at pipe bells:

1) Material:

a) Body: Ductile iron. Comply with ASTM A536.

b) Bell Restraint Systems: Corten steel tie rods.

2) Coatings: Shop-applied liquid epoxy.

3) Construction:

a) A split serrated ring shall be used behind the pipe bell. A split serrated ring shall also be used to grip the pipe and a sufficient number of bolts shall be used to connect the bell ring and the gripping ring.

b) System shall be designed for a minimum 2 to 1 safety factor.

4) Manufacturers:

a) 4-inch through 12-inch diameter: EBAA Iron, Inc. - Series 1900 Bell Restraint Harness.

b) 14-inch through 48-inch diameter: EBAA Iron, Inc. - Series 2800 Bell Restraint Harness.

b. At mechanical joint fittings:

1) Material: Ductile iron. Comply with ASTM A536.

2) Coatings: Shop-applied liquid epoxy.

3) Construction:

a) Restraint accomplished by a restraint device consisting of a follower gland utilizing multiple gripping wedges.

b) The restraint system shall have a sufficient number of fastening bolts to connect the ring to the mechanical joint.

c) System shall be designed for a minimum 2 to 1 safety factor.

4) Fasteners:

a) T-bolts and nuts: High strength, low alloy steel.

b) Comply with AWWA C111.

5) Manufacturers:

a) EBAA Iron, Inc. - MEGALUG, Series 2000PV

b) Romac Industries, Inc. – 470 Series Pipe Restraining System

2.2 FITTINGS

A. Material: Ductile iron, complying with AWWA Standard C110.

1. Fittings conforming to AWWA C153 may be substituted in lieu of AWWA C110 fittings.

B. Fittings used for joining ductile iron and PVC pipe shall be of the type, size, and strength designated on the Plans, elsewhere in the specifications.

1. Fittings shall be mechanical joint, push-on type, flanged or plain-end as required and shown on the Drawings.

2. All restraint systems and flanged fittings shall be provided with bolts and gaskets as specified herein.

C. Pressure ratings: As specified for joining pipe above and as shown on the Drawings.

D. Coating and Lining:

1. Asphaltic exterior coating in accordance with AWWA Standard C110.

2. Cement Mortar Lining: Comply with AWWA C104.

3. Wax Tape Coating System (Field Coating): Petrolatum wax tape coating system where specified or shown on drawings:

a. General: Apply a wax tape coating system generally per AWWA C217 and consists of three parts: surface primer, wax-tape, and outer covering. All three parts shall be the product of the same manufacturer.

b. The primer shall be a blend of petrolatum, plasticizer, and corrosion inhibitors having a paste like consistency. It shall have a pour point of 100-degrees F to 110-degrees F and a flash point of 350-degrees. Use Trenton Wax-Tape Primer or approved equal.

c. The wax-tape shall consist of a synthetic-fiber felt, saturated with a blend of high melt microcrystalline wax, solvents, and corrosion inhibitors, forming a tape coating that is easily formable over irregular surfaces and which firms up after application. The tape shall have a saturant pour point between 125-degrees F and 130-degrees F and a dielectric strength equal to a minimum of 100-volts per mil. Tape thickness shall be 50-mils to 90-mils in 6-inch-wide rolls. Use Trenton No. 1 wax-tape or equal.

d. The outer covering shall consist of two layers of a plastic wrapper at total of one 150 gauge or three 50 gauge wound together as a single sheet. The plastic wrapper material shall consist of clear polyvinylidene chloride, high cling membranes wound together as a single sheet. Use Trenton Poly-Ply or approved equal.

E. Following information cast upon fittings:

1. Manufacturer's identification.

2. Country of manufacture.

3. Pressure rating.

4. For bends, number of degrees and/or fractions of a circle.

F. Owner may require additional metallurgical documentation or other certifications.

2.3 NUTS, BOLTS, AND WASHERS

A. All bolts shall have heavy hex head with heavy hex nuts.

B. For operating pressures greater than 150 psi:

1. Bolts: Steel alloy composition. Comply with ASTM A193.

2. Nuts: Comply with ASTM A194, Grade 2H.

3. Washers: Comply with ASTM F436.

C. For operation pressures of 150 psi or less:

1. Bolts: Low-carbon steel composition. Comply with ASTM A307, Grade B.

2. Nuts: Comply with ASTM A563A, Heavy Hex.

3. Washers: Comply with ASTM F844.

D. Higher-strength bolts with higher torque values as specified above for operation pressures greater than 150 psi shall not be used for assembly of flange joints including gray-iron flanges.

2.4 FLEXIBLE COUPLINGS

A. General

1. All flexible couplings shall be constructed to inside diameters that properly fit the connecting pipes.

2. The Contractor shall be responsible for selecting sleeve lengths appropriate to the application, subject to review and approval of the Engineer, recognizing that longer sleeves allow for larger deflections and may ease installation.

B. Flexible Couplings:

1. Description:

a. Comply with AWWA C219.

b. Type: Bolted, sleeved.

c. Configuration: Straight, transition, or reducing as shown in the Drawings.

d. Center rings and end rings: Ductile iron. Comply with ASTM A536.

e. Gaskets: Virgin styrene butadiene rubber (SBR) compounded for water service. Comply with ASTM D2000.

f. Bolts and nuts: High strength low alloy steel. Comply with AWWA C111.

g. Lining and coating: Factory-applied fusion bonded epoxy.

h. Working pressure: Up to 260 psi.

2. Manufacturers:

a. For 2-inch to 24-inch diameter:

1) Romac Industries, Inc. – Style 501 or equal.

b. For 12-inch diameter and larger:

1) Romac Industries, Inc. – 400 Series or equal.

C. Insulating Flexible Couplings:

1. The Contractor shall be responsible for selecting couplings appropriate to the application, subject to review and approval of the Engineer, recognizing that different pipe materials will require specific sizing and material selection for couplings.

2. Description:

a. Comply with Flexible Coupling specifications above.

b. Insulating Boot: Ethylene propylene diene monomer (EPDM) compounded for water service. Comply with ASTM D2000.

3. Manufacturers:

a. For 4-inch to 14-inch diameter:

1) Romac Industries, Inc. – Style IC501 or equal.

b. For 12-inch to 96-inch diameter:

1) Romac Industries, Inc. – Style IC400 or equal.

D. Restrained Flexible Couplings:

1. Description:

a. Body: Steel. Comply with ASTM A36.

b. Restrained gland: Ductile iron. Comply with ASTM A536, Grade 65-45-12.

c. Gaskets: Virgin styrene butadiene rubber (SBR) compounded for water service. Comply with ASTM D2000.

d. Bolts and nuts: All-thread rod, at a minimum complying with ASTM A193 Grade B7. Nuts per ASTM A194 Grade 2H.

e. Lining and coating: Factory-applied fusion bonded epoxy.

f. Working pressure: 250 psi. Test pressure: 400 psi.

2. Manufacturers:

a. Romac Industries, Inc. – Style 400RG

b. EBAA Iron – 3800 MEGA-COUPLING

2.5 FLANGED COUPLING ADAPTERS

A. Flanged Coupling Adapters:

1. All flanged coupling adapters shall be constructed to diameters that properly fit the connecting plain end pipe and the flanged fitting.

2. Description:

a. Comply with AWWA C219.

b. Flange: AWWA Class D Steel Ring Flange, compatible with ANSI Class 125 and 150 bolt circles.

c. End ring and body:

1) Steel. Comply with ASTM A36.

2) Ductile iron. Comply with ASTM A536, Grade 65-45-12.

d. Flange: Compatible with ANSI Class 125 and 150 bolt circles.

e. Gaskets: Virgin styrene butadiene rubber (SBR) compounded for water service. Comply with ASTM D2000.

f. Bolts and nuts: High strength low alloy steel bolts and nuts. Comply with AWWA C111 composition requirements.

g. Lining and coating: Factory-applied fusion bonded epoxy.

h. Working pressure rating: Equal to the maximum rating of the flange.

3. Manufacturers:

a. Romac Industries, Inc.

1) Style FCA501

a) For 3-inch to 16-inch diameter.

2) Style FC400.

a) For 12-inch to 96-inch diameter.

B. Restrained Flanged Coupling Adapters:

1. Description:

a. Gland and flange body: Ductile iron. Comply with ASTM A536.

b. Flange: Compatible with ANSI Class 125 and 150 bolt circles.

c. Gaskets: Virgin styrene butadiene rubber (SBR) compounded for water service. Comply with ASTM D2000.

d. Restraining bolts and lugs: Ductile iron. Comply with ASTM A536.

e. T-bolts, Bolts, and nuts: High strength low alloy steel. Comply with AWWA C111 composition requirements.

f. Lining and coating: Factory-applied fusion bonded epoxy.

2. Manufacturers:

a. Romac Industries, Inc. – RFCA Restrained Flanged Coupling Adapters.

b. EBAA Iron – MEGAFLANGE Restrained Flange Adapter.

2.6 TAPPING SLEEVES AND VALVES

A. Tapping Sleeves:

1. Description:

a. Type: Dual compression.

b. Material:

1) Body: Stainless steel, Type 304.

2) Flanged outlet: Stainless steel, Type 304.

c. Outlet Flange Dimensions and Drilling: Comply with ASME B16.1, Class 150, and MSS SP-60.

d. Outlet Gasket:

e. Provide with Type 304 stainless steel test plug.

f. Nuts, bolts, and washers: Stainless steel, Type 304.

2. Manufacturers:

a. Romac Industries, Inc. – Model STS 420

b. JMC Industries, Inc.

B. Tapping Valves:

1. Resilient wedge gate valves specified in Section 40 05 61, Gate Valves.

2.7 FLEXIBLE EXPANSION JOINTS

A. Description

1. Installed at locations indicated in the Drawings.

2. End connections: As shown in the Drawings.

3. Material: Ductile iron, AWWA C153.

4. Working pressure: 350 psi, minimum.

5. Construction:

a. An expansion joint designed and cast as an integral part of a double ball and socket type flexible joint.

b. Manufactured of ductile iron, conforming to requirements of AWWA C153 and ASTM A536.

c. Deflection: Minimum of 15 degrees deflection per ball.

d. Expansion:

1) 12-inch diameter and under: 8-inch.

2) Greater than 12-inch diameter: 16 inches.

e. The flexible expansion joint unit shall not impart a thrust force while under internal pressure.

f. Each flexible expansion joint shall be hydrostatically tested to the Manufacturer's published pressure rating prior to shipment.

g. Lining: All interior "wetted" parts shall be shop-lined with a minimum of 15 mils of fusion bonded epoxy conforming to the applicable requirements of AWWA C213 and shall be holiday tested with a 1500-volt spark test conforming to said specification.

h. Coating: Coal tar epoxy.

6. Quality Assurance: Hydrostatically tested to Manufacturer's published pressure rating prior to shipment.

7. Appropriately sized polyethylene sleeves, meeting AWWA C105 requirements, shall be included for direct bury applications.

B. Manufacturers

1. EBAA Iron, Inc. – Flex-Tend or equal. Force Balanced Flex-Tend where specified or shown on plans.

2.8 UNDERGROUND PIPE MARKERS

A. As specified in Section 31 23 17, Trenching.

2.9 CONCRETE ENCASEMENT AND CRADLES

A. Concrete:

1. As specified in the Drawings.

2. Type: reinforced, air entrained as shown in the Drawings.

3. Compressive Strength: Minimum 3,000 psi at 28 days.

4. Finish: Rough troweled.

B. Concrete Reinforcement: As specified in the Drawings.

2.10 BEDDING AND COVER MATERIALS

A. Bedding and Cover:

1. Pipe Bedding: Coarse Aggregate Material Type A1, as specified in Section 31 05 16, Aggregates for Earthwork. Aggregate size as shown in the Drawings.

2. Pipe Zone Backfill: Coarse Aggregate Material Type A1, as specified in Section 31 05 16, Aggregates for Earthwork. Aggregate size as shown in the Drawings.

3. Trench Backfill from Pipe Zone to Finish Grade:

a. Material type varies by location, as shown in the Drawings.

b. Coarse Aggregate Material Type A1, as specified in Section 31 05 16, Aggregates for Earthwork. Aggregate size as shown in the Drawings.

c. Subsoil Type S1 or S2, as specified in Section 31 05 13, Soils for Earthwork.

2.11 NOT USED

2.12 ACCESSORIES

A. Concrete for Thrust Restraints: As specified in the Drawings.

B. Manhole and Cover: As specified in Section 33 05 13- Manholes and in the Drawings.

C. Miscellaneous Steel Rods, Bolt, Lugs, and Brackets:

1. Comply with ASTM A36 or ASTM A307.

2. Grade A carbon steel.

PART 3 EXECUTION

3.1 EXAMINATION

A. Verify that existing utility water main size, location, and invert are as indicated on Drawings.

3.2 PREPARATION

A. Preconstruction Site Photos:

1. Take photographs along centerline of proposed pipe trench; minimum one photograph for each 100 feet of pipe trench.

2. Show mailboxes, curbing, lawns, driveways, signs, culverts, and other existing Site features.

3. Include Project name, date taken, and sequential number of each photograph in physical log or CD.

B. Inspection:

1. All pipe sections, specials, and jointing materials shall be carefully examined for defects.

2. No piping or related materials shall be laid that is known to be defective. Any defective piece installed shall be removed and replaced with a new pipe section in a manner satisfactory to the Engineer at the Contractor's expense.

3. Defective material shall be marked and removed from the job site before the end of the day.

C. Pipe Cutting:

1. Cut pipe ends square, ream pipe and tube ends to full pipe diameter, and remove burrs.

2. Use only equipment specifically designed for pipe cutting; use of chisels or hand saws is not permitted.

3. Grind edges smooth with beveled end for push-on connections.

4. Prior to assembly of field cut pipe, the reference mark shall be re-established with a pencil or crayon. The location of the reference mark at the proper distance from the bevel end shall be in accordance with the Manufacturer's recommendations.

D. Remove scale and dirt on inside and outside before assembly. Cleaning of each pipe or fitting shall be accomplished by swabbing out, brushing out, blowing out with compressed air, or washing to remove all foreign matter.

E. Prepare pipe connections to equipment with flanges or unions.

3.3 INSTALLATION

A. Bedding:

1. Excavation:

a. Excavate pipe trench as specified in Section 31 23 17, Trenching for Work of this Section.

b. All pipe trenches shall be excavated below the proposed pipe invert as required to accommodate the depths of pipe bedding material as scheduled on the Drawings.

c. Remove large stones or other hard matter which could damage pipe or impede consistent pipe bedding backfilling or compaction.

d. Trench base shall be inspected prior to placement of pipe.

e. Hand trim excavation for accurate placement of pipe to elevations as indicated on Drawings.

2. Dewater excavation as specified in Section 31 23 19, Dewatering to maintain dry conditions and to preserve final grades at bottom of excavation.

3. Provide sheeting and shoring as specified in Section 31 23 17, Trenching.

4. Place bedding material at trench bottom, level fill materials in one continuous layer not exceeding 6 inches compacted depth and compact to 95 percent of maximum density.

B. Piping:

1. Install pipe according to AWWA C600 for ductile iron piping. Install according to AWWA C605 for PVC piping.

2. Handle and assemble pipe according to Manufacturer instructions and as indicated on Drawings.

3. Lift or roll pipe into position. Do not drop or drag pipe over prepared bedding.

4. Steel Rods, Bolt, Lugs, and Brackets: Coat buried steel with one coat of coal tar coating before backfilling.

5. Sanitary Sewer Separation:

a. Install new water lines and appurtenances in compliance with local and state regulations governing the horizontal and vertical separations between water and sewer facilities.

b. Variance:

1) If a variance is proposed due to requested design revisions or if an existing facility has been installed at a different location or elevation than indicated on the Plans, submit written proposal for review and approval by the Engineer.

2) Include the reason for the variance, type of material and condition of the sewer line, location of the water and sewer facilities, horizontal and vertical skin-to-skin clearances and corrective measures proposed.

3) Each variance will be considered on a case-by-case basis.

4) Review Time: Allow a minimum of 5 working days review and response to each proposal.

6. Install ductile iron fittings according to AWWA C600.

7. Joints:

   a. Pipe jointing surfaces shall be clean and dry when preparing surfaces for joining.

   b. Lubricants, primers, adhesives, etc. shall be used as recommended by the Pipe or Joint Manufacturer's specifications.

   c. The jointing materials or factory-fabricated joints shall then be placed, fitted, joined, and adjusted in such a manner as to obtain a watertight joint.

   d. Trenches shall be kept water-free and as dry as possible during bedding, laying, and jointing.

   e. As soon as possible after the joint is made, sufficient backfill material shall be placed along each side of the pipe to prevent movement of the pipe from any cause.

8. Flanged Joints: Not to be used in underground installations except within structures, unless shown otherwise in the Drawings.

9. Deflection:

   a. PVC pressure pipe may be deflected both horizontally and vertically at the joints after assembly.

   b. Deflection by bending of the pipe rather than at the joints is not allowed.

   c. The maximum pipe deflection shall not exceed one-half of the Manufacturer's stated joint deflection allowance.

   d. Set a laser, string line, or other approved alignment guide along the centerline of previously installed pipe to the point where pipe joint deflection is required. The approved alignment guide shall extend to the end of the proposed subsequent pipe length. A measurement will be taken from the alignment guide to the centerline of the subsequent pipe length to determine the amount of pipe joint deflection proposed. Measured deflection shall not exceed the specified allowable deflection for the purposes of aligning the pipe.

10. Install pipe and fittings to the line and grade specified on the Drawings, with joints centered, pipe properly supported and restrained against movement, and all valve stems plumb. Re-lay pipe that is out of alignment or grade.

11. High Points:

    a. Install pipe with no high points, unless otherwise shown in the Drawings.

    b. If unforeseen field conditions arise that necessitate high points, install air release valves as directed by Engineer.

12. Bearing:

    a. Install pipe to have bearing along entire length of pipe.

    b. Excavate bell holes to permit proper joint installation where necessary or as directed by Engineer.

    c. Do not lay pipe in wet or frozen trench.

13. Prevent foreign material from entering pipe during placement.

14. Install pipe to allow for expansion and contraction without stressing pipe or joints.

15. Close pipe openings with watertight plugs during Work stoppages.

16. All pipe ends which are to be permanently closed shall be plugged or capped and restrained against internal pressure.

17. Install access fittings to permit disinfection of water system performed under Section 33 13 00 – Testing and Disinfecting of Water Utility Piping.

18. Cover:

    a. Establish elevations of buried piping with not less than 36 inches of cover.

    b. Measure depth of cover from final surface grade to top of pipe barrel.

19. Pipe Markers:

    a. Install as specified in Section 31 23 17, Trenching.

C. Tapping Sleeves and Valves:

1. As indicated on Drawings and according to Manufacturer instructions.

D. Polyethylene Encasement:

1. Encase piping in polyethylene where indicated on Drawings to prevent contact with surrounding backfill material.

2. Comply with AWWA C105.

3. Encasement shall be two (2) layers of 8 mil polyethylene encasement, V-bio, by US Pipe.

E. Thrust Restraints:

1. Provide valves, tees, bends, caps, and plugs with concrete thrust blocks at locations shown in the Drawings and as required to facilitate testing of lines.

2. Pour concrete thrust blocks against undisturbed earth.

3. Locate thrust blocks to ensure that pipe and fitting joints will be accessible for repair.

4. Provide thrust restraint bearing area on subsoil as shown in details within the Drawings.

5. Install tie rods, clamps, setscrew retainer glands, or restrained joints.

6. Protect metal-restrained joint components against corrosion with polyethylene film or wax tape as specified herein.

7. Avoid encasing mechanical and flanged joints in concrete. Provide clearance between concrete and mechanical and flange joints to allow future bolt removal.

F. Backfilling:

1. Backfill of piping systems shall be as specified in Section 31 23 17, Trenching.

G. Testing and Disinfection of Potable Water Piping System:

1. In accordance with AWWA C600 (for ductile iron piping), AWWA C605 (for PVC piping), AWWA C651 and as specified in Section 33 13 00, Testing and Disinfecting of Water Utility Piping.

2. All chlorinated water used in disinfection of the water main shall either be discharged through an approved connection to a public sanitary sewer system or shall be dechlorinated to limits acceptable by the Oregon Department of Health (DOH) and as required by project permits prior to discharge into any storm drainage system or open drainage way.

3. No chlorinated water shall be discharged into a storm drainage system or open drainage way without a dechlorination under a plan meeting DOH's requirements.

3.4 FIELD QUALITY CONTROL

A. Compaction Testing: See Section 31 23 17, Trenching for Compaction Testing requirements for piping trenches.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 33 12 13 - WATER SERVICE CONNECTIONS

PART 1 GENERAL

1.1 SUMMARY

A. This section includes pipe materials, fittings, valves, meters and backflow preventers encountered with service connections 2 inches in diameter and smaller from the main to a water meter.

B. Section Includes:

1. Pipe and fittings for 2- inch diameter and smaller water service connections.
2. Corporation stop assemblies.
3. Curb stop assemblies.
4. Meter setting equipment.
5. Water meters.
6. Backflow preventers.
7. Underground pipe markers.
8. Precast concrete vaults.
9. Bedding and cover materials.

C. Related Requirements:

1. Section 03 11 00 – Concrete Work
2. Section 31 05 13 - Soils for Earthwork
3. Section 31 05 16 - Aggregates for Earthwork
4. Section 31 23 17 - Trenching
5. Section 31 23 23 - Fill
6. Section 33 05 64 - Precast Concrete Valve Vaults and Meter Boxes
7. Section 33 13 00 - Testing and Disinfecting of Utility Piping

1.2 REFERENCE STANDARDS

A. American Association of State Highway and Transportation Officials:

1. AASHTO T99 - Standard Specification for Moisture-Density Relations of Soils Using a 2.5-kg (5.5-lb) Rammer and a 305-mm (12-in.) Drop.

B. American Society of Mechanical Engineers:

1. ASME B16.15 - Cast Bronze Threaded Fittings.

C. American Society of Sanitary Engineering:

1. ASSE 1012 - Performance Requirements for Backflow Preventers with an Intermediate Atmospheric Vent.

2. ASSE 1013 - Performance Requirements for Reduced Pressure Principle Backflow Preventers and Reduced Pressure Principle Fire Protection Backflow Preventers.

D. ASTM International:

1. ASTM A48 - Standard Specification for Gray Iron Castings.

2. ASTM B62 - Standard Specification for Composition Bronze or Ounce Metal Castings.

3. ASTM B88 - Standard Specification for Seamless Copper Water Tube.

4. ASTM C858 - Standard Specification for Underground Precast Concrete Utility Structures.

5. ASTM D698 - Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Standard Effort (12,400 ft-lbf/ft3 (600 kN-m/m3)).

6. ASTM D1785 - Standard Specification for Poly(Vinyl Chloride) (PVC) Plastic Pipe, Schedules 40, 80, and 120.

7. ASTM D2241 - Standard Specification for Poly(Vinyl Chloride) (PVC) Pressure-Rated Pipe (SDR Series).

8. ASTM D2466 - Standard Specification for Poly(Vinyl Chloride) (PVC) Plastic Pipe Fittings, Schedule 40.

9. ASTM D2855 - Standard Practice for Making Solvent-Cemented Joints with Poly (Vinyl Chloride) (PVC) Pipe and Fittings.

10. ASTM D6938 - Standard Test Method for In-Place Density and Water Content of Soil and Soil-Aggregate by Nuclear Methods (Shallow Depth).

11. ASTM F876 – Standard Specification for Crosslinked Polyethylene (PEX) Tubing

12. ASTM F2023 – Standard Test Method for Evaluating the Oxidative Resistance of Crosslinked Polyethylene (PEX) Tubing and Systems to Hot Chlorinated Water

13. ASTM F2080 – Standard Specification for Cold-Expansion Fittings with Metal Compression-Sleeves for Crosslinked Polyethylene (PEX) Pipe

14. ASTM F2657 - Standard Test Method for Outdoor Weathering Exposure of Crosslinked Polyethylene (PEX) Tubing

E. American Welding Society:

1. AWS A5.8 - Specification for Filler Metals for Brazing and Braze Welding.

F. American Water Works Association:

1. AWWA C600 - Installation of Ductile-Iron Mains and Their Appurtenances.

2. AWWA C700 - Cold-Water Meters - Displacement Type, Bronze Main Case.

3. AWWA C701 – Cold-Water Meters – Turbine Type, for Customer Service.

4. AWWA C702 – Cold-Water Meters – Compound Type.

5. AWWA C706 - Direct-Reading, Remote-Registration Systems for Cold-Water Meters.

6. AWWA C800 - Underground Service Line Valves and Fittings.

7. AWWA C901 - Polyethylene (PE) Pressure Pipe and Tubing, 1/2 In. (13 mm) Through 3 In. (76 mm), for Water Service.

8. AWWA C904 – Crosslinked Polyethylene (PEX) Pressure Tubing, 1/2 In. Through 3 In., for Water Service.

9. AWWA M6 - Water Meters - Selection, Installation, Testing, and Maintenance.

G. National Sanitation Foundation International:

1. NSF/ANSI Standard 14 – Plastic Piping System Components and Related Materials

2. NSF/ANSI Standard 61 - Drinking Water System Components - Health Effects

3. NSF/ANSI Standard 372 - Drinking Water System Components - Lead Content

H. Plastic Pipe Institute (PPI) Technical Report 3 (TR-3):

1. Policies and Procedures for Developing Hydrostatic Design Basis (HDB), Hydrostatic Design Stresses (HDS), Pressure Design Basis (PDB), Strength Design Basis (SDB), Minimum Required Strength (MRS) Ratings, and Categorized Required Strength (CRS) for Thermoplastic Piping Materials or Pipe.

1.3 SUBMITTALS

A. Section 01 33 00 - Submittal Procedures: Requirements for submittals.

B. Product Data: Submit data on pipe materials, pipe fittings, corporation stop assemblies, curb stop assemblies, meters, meter setting equipment, service saddles, backflow preventer, and accessories.

C. Shop Drawings: Indicate details showing meter boxes, vaults and accessories.

D. Manufacturer's Certificate: Certify that products meet or exceed specified requirements.

E. Manufacturer Instructions: Submit detailed instructions on installation requirements, including storage and handling procedures.

F. Field Quality-Control Submittals: Indicate results of Contractor-furnished tests and inspections.

1.4 CLOSEOUT SUBMITTALS

A. Project Record Documents: Record actual locations of piping mains, connections, thrust restraints, and invert elevations.

B. Identify and describe unexpected variations to subsoil conditions or discovery of uncharted utilities.

1.5 QUALITY ASSURANCE

A. Perform Work according to City of Warrenton standards.

B. Unless otherwise noted, all water works materials provided shall be new, of first class quality and shall be made by reputable manufacturers.

C. All material of like kind shall be provided from a single manufacturer unless otherwise approved by the Engineer.

D. All material shall be carefully handled and installed in good working order free from defect in manufacture, storage and handling.

E. Where an item is to be used but does not have its quality specified herein, it shall be equal to that specified in the appropriate American Water Works Association (AWWA) Standard Specification.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Inspection: Accept materials on Site in manufacturer's original packaging and inspect for damage.

B. Store products and materials off ground and under protective coverings and away from walls.

C. Exercise care in handling precast concrete products to avoid chipping, cracking, and breakage.

PART 2 PRODUCTS

2.1 GENERAL

A. Service line material shall conform to the latest version of AWWA C800 and as follows:

1. Minimum working pressure rating of all service line material shall be 150 psi.

2. All water works materials provided shall be rated for the test pressures indicated for the water main and as specified in Section 33 13 00, Testing and Disinfection of Water Utility Pipelines.

B. All materials in contact with potable water shall conform to ANSI/NSF Standard 61 and meet the "lead free" requirements of the Safe Drinking Water Act amendment, effective January 4, 2014, as per the lead content evaluation procedures outlined in NSF/ANSI Standard 372.1.

1. All fittings shall either be cast or permanently stamped with markings identifying the item as complying with NSF 61 per the requirements of NSF 372 for "lead free".

2. All brass in contact with potable water shall comply with ASTM B584.

2.2 WATER PIPING AND FITTINGS

A. Copper Tubing:

1. Comply with ASTM B88.

2. Type K, annealed, seamless.

3. Fittings: Cast bronze alloys, threaded. Conform to ASTM B584, meeting "lead free" requirements above, and ASME B16.15.

a. Mechanical surfaces shall have a 100% machine finish with no gaps or low spots due to insufficient parent material.

b. All fittings shall either be stamped or embossed with the manufacturer's name.

c. All fittings shall either be cast or permanently stamped with markings identifying the item as complying with NSF 61 per the requirements of NSF 372 for "lead free".

d. Manufacturers:

1) Ford.
2) Mueller.

4. Joints: Compression.

B. Crosslinked Polyethylene (PEX) Tubing

1. Piping

a. All pipe shall be crosslinked polyethylene manufactured using the high-pressure peroxide method of crosslinking (known as PEXa). Pipe shall conform and be third-party certified to AWWA C904, ASTM F876, NSF/ANSI 14 and NSF/ANSI 61.

b. Pipe shall be rated for continuous operation of 100 psi gauge pressure at 180°F temperature, and 160 psi gauge pressure at 73.4°F temperature as defined in AWWA C904.

c. Pipe shall be rated for continuous operation at 200 psi gauge pressure at 73°F temperature when evaluated using a 0.63 design factor (see item 20 for details).

d. Pipe shall be listed by PPI to standard TR-3 as Standard Grade.

e. Pipe to be tested for resistance to hot chlorinated water in accordance with ASTM F2023. Pipe to have a minimum Class 3 chlorine resistance rating when evaluated to F876 and tested in accordance with F2023.

f. PEXa pipe shall be listed with a material designation code of "3306" per the ASTM F876 standard and PPI TR-3.

g. Pipe to have a co-extruded UV Shield made from UV-resistant polyethylene, color blue. Pipe to have minimum recommended UV exposure time of 12 months when tested in accordance with ASTM F2657 and evaluated in accordance with ASTM F876.

h. Pipe shall be manufactured in a facility whose quality management system is certified according to ISO 9001.

i. Bend Radius: The minimum bend radius for cold bending of PEXa pipe shall be not more than five (5) times the outside diameter.

2. Fittings

a. Compression joint fittings shall be manufactured in accordance with AWWA C800. Fittings must meet the pressure requirements of the PEX pipe at 73°F when used with stainless steel or plastic inserts.

b. Cold-expansion compression-sleeve fittings shall be in accordance with ASTM F2080.

3. Manufacturers:

a. PEX tubing shall be MUNICIPEX® as manufactured by REHAU Construction, LLC, or approved equal.

2.3 CORPORATION STOP ASSEMBLIES

A. Corporation Stops:

1. Body: Bronze alloy.

2. Valve Type: Ball.

3. Direct Tapping: Corporation stops for direct tapping shall have AWWA tapered thread inlet and outlet connections compatible with service piping specified.

4. Less Than or Equal to 1-Inch Diameter:

   a. Inlets: AWWA tapered thread or male iron pipe thread.

   b. Outlets: Connections compatible with either copper or polyethylene tubing.

   c. Thread patterns for the saddle outlet and corporation stop inlet shall be compatible for proper installation.

5. Greater Than 1-Inch Diameter:

   a. Inlets: Male iron pipe thread.
   b. Outlets: Connections compatible with connecting service pipes.

B. Service Saddles:

1. Material: Ductile iron with stainless steel straps.

2. Coating: Epoxy or nylon.

3. For Services Less Than or Equal to 1-Inch Diameter:

   a. Single strap.
   b. AWWA “CC” tapered thread.

4. For Services Greater Than 1-Inch Diameter:

   a. Double strap.
   b. Female pipe thread outlet.

5. Designed to hold pressures in excess of pipe working pressure.

6. Saddles used on PVC shall be formed for PVC pipe and shall have flat, stainless steel straps.

C. Manufacturers:

1. Mueller.
2. Or approved equal.

2.4 CURB STOP ASSEMBLIES

A. Curb Stops:

1. Body: Bronze alloy. Comply with ASME B16.15.

2. Valve Type: Ball.

3. Sealing: Positive pressure.

B. Manufacturers:

1. Mueller.
2. Or approved equal.

2.5 METER SETTING EQUIPMENT

A. Description:

1. Height: 12 inches.

2. Material: Copper.

3. Construction:

a. Angle meter stop with drilled padlock wing.

b. Angle check valve.

c. Inlets and Outlets: Horizontal setting, with matching couplings, fittings, and stops.

4. Furnish test valves.

5. For services 1-inch and smaller:

a. Meters saddle nuts for installation and removal of meter.

6. For services greater than 1-inch:

a. Equip with a locking bypass.

B. Manufacturers:

1. Ford.
2. Mueller.

2.6 WATER METERS

A. Supplied by Owner.

2.7 BACKFLOW PREVENTERS

A. As specified in Section 40 05 13, Common Work Results for Process Piping.

2.8 UNDERGROUND PIPE MARKERS

A. As specified in Section 33 11 10, Water Utility Distribution Piping.

2.9 METER BOXES

A. Supplied by Owner.

2.10 MATERIALS

A. Bedding and Cover:

1. Pipe Bedding: Coarse Aggregate Material Type A1, as specified in Section 31 05 16, Aggregates for Earthwork. Aggregate size as shown in the Drawings.

2. Pipe Zone Backfill: Coarse Aggregate Material Type A1, as specified in Section 31 05 16, Aggregates for Earthwork. Aggregate size as shown in the Drawings.

3. Trench Backfill from Pipe Zone to Finish Grade:

a. Material type varies by location, as shown in the Drawings.

b. Coarse Aggregate Material Type A1, as specified in Section 31 05 16, Aggregates for Earthwork. Aggregate size as shown in the Drawings.

c. Subsoil Type S1, as specified in Section 31 05 13, Soils for Earthwork.

PART 3 EXECUTION

3.1 GENERAL

A. All service lines shall be installed continuous, without joints or splices, complete from the new water main (insulating corporation stop) to the new meter location or as otherwise shown.

B. Install service pipelines perpendicular to the main, unless shown otherwise.

3.2 INSTALLATION

A. Construct the depth of trench for service connection piping to provide a minimum of 30 inches of cover over the top of the pipe, unless otherwise shown.

B. Excavation, backfill and surface restoration shall be performed in accordance with provisions stated in Section 31 23 17, Trenching.

C. Do not damage the main in any way during the service installation.

D. Water Main Tap

1. All direct service taps shall be made with a drilling and tapping machine intended for use on ductile iron pipe as manufactured by Mueller or approved equal. Hand held equipment is not allowed. Coupons shall be removed from pipe.

    a. The drilling and tapping machine shall have alignment tool guides and a placement strap.

2. Direct threaded taps shall engage a minimum of four (4) full threads.

3. Direct taps shall require the use of two (2) layers of 3 mil tetrafluoroethylene (TFE) tape on the threads of the corporation stop. Liquid TFE will not be allowed.

4. Direct taps for 1-inch diameter services are allowed only on mains that are 6 inches in diameter or larger.

5. Service saddles are required on water mains 4 inches in diameter and larger and for all services taps larger than 1-inch diameter.

6. Install corporation stop at a 45-degree angle from the cross section vertical axis of the water main being tapped, unless otherwise shown on the Plans.

7. Install swing joint on all 2-inch diameter services.

E. Piping

1. Cut service pipes using tools specifically designed to leave a smooth, even, and square end on the material being cut.

2. Ream cut ends to the full inside diameter of the pipe.

3. Clean pipe ends to a sound, smooth finish prior to using compression connections which seal to the outside surface of the pipe.

F. Water Meters:

1. Install positive displacement meters according to AWWA M6 and as shown in the Drawings.

G. Backflow Preventers:

1. Install backflow preventers where indicated on Drawings and according to manufacturer instructions.

2. Testing and Installation Requirements: Comply with local water company requirements and plumbing codes.

H. Service Connections:

1. Install water service according to details in the Drawings.

2. Install water meters and backflow preventer in precast concrete meter boxes located on Site as specified in Section 33 05 17, Precast Concrete Valve Vaults and Meter Boxes

3. Locate meter boxes as shown in the Drawings. Final location to be determined in the field by Engineer.

I. Service Renewal:

1. Install service line and angle meter stop from the water main to the inside of existing meter box location.

2. Where service renewals are to be connected to existing meters, stub up and terminate service run at angle meter stop where shown.

3. Where no meter is to be installed, place angle meter stop at 18 inches from face of curb with 12 inches to the springline in an approved box.

4. Owner will connect all service lines at the new meters or to existing service piping as shown.

5. Adjust meter box to finished grade after the service piping has been installed and surface has been restored to the satisfaction of the Engineer.

J. Trenchless Installation:

1. All water service installations under existing pavement, curbs, sidewalks or other surface improvements may be installed by trenchless construction techniques at Contractor option where ground conditions are favorable and such methods will not disturb foundations under curbs, sidewalks and other structures.

2. The Owner's Representative must approve all trenchless installation methods.

3. Where trenchless pipe installation is used, payment for the pipe installation will be made for the equivalent trench excavation and backfill as if the open cut method was used. Payment will not be made for surface restoration including pavement, curbs, sidewalks and other surface improvements whose replacement is avoided by use of a trenchless method, such as tunneling.

3.3 NOT USED

3.4 FLUSHING AND DISINFECTION

A. Flush and disinfect all service connections and appurtenances in accordance with Section 33 13 00, Testing and Disinfection of Water Utility Distribution Pipelines.

3.5 FIELD QUALITY CONTROL

A. Pressure test water distribution system according to AWWA C600 and Section 33 11 10, Water Utility Distribution Piping.

B. Compaction Testing for Bedding: See Section 33 11 10, Water Utility Distribution Piping for compaction testing requirements. If tests indicate Work does not meet specified requirements, remove Work, replace, and retest.

END OF SECTION

SECTION 33 12 16 - WATER UTILITY DISTRIBUTION AND TRANSMISSION VALVES

PART 1 GENERAL

1.1 SUMMARY

A. This Section includes valves and valve boxes for installation with buried water distribution and transmission main, including fire hydrants and tapping sleeves.

B. Section Includes:

1. Valves.
2. Valve boxes.
3. Valve operator extensions.

C. Related Sections:

1. Section 03 11 00 – Concrete Work
2. Section 33 11 10 - Water Utility Distribution and Transmission Piping
3. Section 33 12 13 - Water Service Connections
4. Section 33 12 19 - Fire Hydrants
5. Section 33 13 00 - Testing and Disinfecting of Water Utility Piping
6. Section 40 05 51.15 – Gate Valves
7. Section 40 05 51.18 – Butterfly Valves

1.2 REFERENCE STANDARDS

A. American Society of Mechanical Engineers (ASME):

1. ASME B16.1 - Gray Iron Pipe Flanges and Flanged Fittings: Classes 25, 125, and 250
2. ASME B16.5 - Pipe Flanges and Flanged Fittings, Steel Nickel Alloy, and other Special Alloys
3. ASME 1.20.1 - General Purpose Pipe Threads (Inch)

B. American Water Works Association (AWWA):

1. AWWA C504 - Rubber-Seated Butterfly Valves, 3 In. Through 72 In.
2. AWWA C509 - Resilient-Seated Gate Valves for Water Supply Service
3. AWWA C550 - Protecting Interior Coatings for Valves and Hydrants
4. AWWA C600 - Installation of Ductile-Iron Mains and Their Appurtenances

5. AWWA C605 - Underground Installation of Polyvinyl Chloride (PVC) and Molecularly Oriented Polyvinyl Chloride (PVCO) Pressure Pipe and Fittings

C. ASTM International (ASTM):

1. ASTM B62 - Standard Specification for Composition Bronze or Ounce Metal Castings

2. ASTM B584 - Standard Specification for Copper Alloy Sand Castings for General Applications

D. NSF International (NSF):

1. NSF 61 - Drinking Water System Components - Health Effects

2. NSF 372 - Drinking Water System Components - Lead Content

1.3 COORDINATION

A. The Contractor shall cause the Supplier of valves to coordinate installation such that all pipes, valves, fittings, appurtenances, and equipment are compatible and capable of achieving the performance requirements specified in the Contract Documents.

B. Coordinate Work of this Section with City of Warrenton Department of Public Works standards and utilities within construction area.

1.4 SUBMITTALS

A. Section 01 33 00 - Submittal Procedures: Requirements for submittals.

B. Product Data: Submit Manufacturer's latest published literature. Include illustrations, installation and maintenance instructions, and parts lists.

C. Manufacturer's Certificate: Certify that products meet or exceed specified requirements.

D. Manufacturer Instructions: Submit detailed instructions on installation requirements, including storage and handling procedures.

E. Lining and coating data.

F. Valve Labeling: Schedule of valves to be labeled indicating in each case the valve location and the proposed labeling for the valve.

G. Certification of Valves Larger than 12 inches: Furnish certified copies of hydrostatic factory tests, indicating compliance with applicable standards.

H. Source Quality-Control Submittals: Indicate results of factory tests and inspections.

I. Field Quality-Control Submittals: Indicate results of Contractor-furnished tests and inspections.

1.5 CLOSEOUT SUBMITTALS

A. Project Record Documents: Record actual locations of valves.

B. Operation and Maintenance Data: Submit information for valves.

1.6 MAINTENANCE MATERIAL SUBMITTALS

A. Tools: Furnish one tee wrench of required length to Owner.

1.7 QUALITY ASSURANCE

A. Cast Manufacturer's name, maximum working pressure, size of valve, and year of fabrication into valve body.

B. Valve Testing: Each valve body shall be tested under a test pressure equal to twice its design water-working pressure.

C. Certification: Prior to shipment, submit for all valves over 12 inches in diameter, certified, notarized copies of the hydrostatic factory tests, showing compliance with the applicable standards of AWWA, American National Standards Institute (ANSI), ASTM, etc. Valves tested and supplied shall be trackable and traceable by serial number, tagged or otherwise noted on valve, upon arrival to Site.

D. Unless otherwise noted, all water works materials provided for the Project shall be new, of first-class quality and shall be made by reputable manufacturers.

E. All material of a like kind shall be provided from a single manufacturer, unless otherwise approved by the Engineer.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Prepare valves and accessories for shipment according to applicable AWWA standards.

B. Seal valve and ends to prevent entry of foreign matter.

C. Inspection: Accept materials on Site in Manufacturer's original packaging and inspect for damage.

D. Storage:

1. Store materials in areas protected from weather, moisture, or other potential damage.

2. Do not store materials directly on ground.

E. Handle products carefully to prevent damage to interior or exterior surfaces.

F. All defective or damaged materials shall be replaced with new materials at no cost to the Owner.

PART 2 PRODUCTS

2.1 GENERAL

A. All materials in contact with potable water shall conform to ANSI/NSF Standard 61 and meet the “lead free” requirements of the Safe Drinking Water Act amendment, effective January 4, 2014, as per the lead content evaluation procedures outlined in NSF/ANSI Standard 372.1.

1. All fittings shall either be cast or permanently stamped with markings identifying the item as complying with NSF 61 per the requirements of NSF 372 for “lead free”.

2. All brass in contact with potable water shall comply with ASTM B584.

2.2 RESILIENT WEDGE GATE VALVES

A. As specified in Section 40 05 51.16, Gate Valves.

B. Connecting Hardware:

1. As specified in Article 2.3, Nuts, Bolts and Washers of Section 33 11 10, Water Utility Distribution and Transmission Piping.

C. Gaskets:

1. As required for the end connection types specified in Section 33 11 10, Water Utility Distribution and Transmission Piping.

2.3 DOUBLE-DISC GATE VALVES - NOT USED

2.4 SOLID WEDGE, METAL-SEATED GATE VALVES - NOT USED

2.5 RUBBER-SEATED BUTTERFLY VALVES

A. As specified in Section 40 05 51.18, Butterfly Valves.

B. Operation:

1. All buried valves shall be provided with 2-inch square operating nuts.

C. Connecting Hardware:

1. As specified in Article 2.3, Nuts, Bolts and Washers of Section 33 11 10, Water Utility Distribution and Transmission Piping.

D. Gaskets:

1. As required for the end connection types specified in Section 33 11 10, Water Utility Distribution and Transmission Piping.

2.6 ACTUATORS

A. Unless otherwise indicated, all valves shall be furnished with manual actuators.

B. Actuators shall be sized for the valve design pressure in accordance with AWWA C504.

C. All gear-assisted valves that are buried and submerged shall have the actuators hermetically sealed and grease-packed.

D. All valves 6 inches to 30 inches in diameter may have traveling-nut actuators, worm-gear actuators, spur- or bevel-gear actuators, as appropriate for each valve.

2.7 VALVE BOXES

A. Provide all buried valves with valve boxes, covers and risers.

B. Valve Boxes:

1. Materials: Cast iron.

2. Construction:

a. Walls not less than 3/16-inch thick at any point.

b. Internal diameter not less than 5 inches.

3. Type: Two-piece extension.

4. Manufacturers:

a. Olympic Foundry.

b. Brooks Products.

C. Covers:

1. Construction:

a. Prevents dislodging and rotation from traffic.

b. Allows a hand-held pry bar to be applied for easy removal.

2. Materials: Cast iron.

3. Lid Inscription: W.

4. Manufacturers: Matching that of valve box.

D. Riser:

1. Polyvinyl Chloride (PVC) Pipe:

a. ASTM D3034, SDR 35 PVC.

b. White, Schedule 40, 8-inch diameter.

c. Length as shown on details in the Drawings.

2.8 VALVE OPERATOR EXTENSIONS

A. As shown in the Drawings.

B. Provide operator extensions to a maximum of 12 inches below grade where depth to valve exceeds 36 inches. Provide with a 2-inch square operating nut and rock guard as shown on the Drawings.

2.9 ACCESSORIES

A. Concrete for Thrust Restraints: Concrete type as specified in Section 03 11 00 – Concrete Work.

PART 3 EXECUTION

3.1 PREPARATION

A. Conduct operations to not interfere with, interrupt, damage, destroy, or endanger integrity of surface or subsurface structures, utilities, and landscape in immediate or adjacent areas.

B. Identify required lines, levels, contours, and datum locations.

C. Locate, identify, and protect from damage utilities to remain.

D. Access:

1. All valves shall be installed to provide easy access for operation, removal, and maintenance.

2. Avoid conflicts between valve operators and above grade construction such as structural members or handrails.

E. Valve Accessories:

1. Where combinations of valves, sensors, switches, and controls are specified, it shall be the responsibility of the Contractor to properly assemble and install these various items so that all systems are compatible and operating properly.

2. The relationship between interrelated items shall be clearly noted on shop drawing submittals.

3.2 INSTALLATION

A. General:

1. All valves, operating units, stem extensions, valve boxes, and accessories shall be installed in accordance with the Manufacturer's written instructions and as shown in the Drawings and as specified herein.

2. Valves shall be firmly supported to avoid undue stresses on the pipe.

3. Stem extensions shall be braced at no greater than 10 feet intervals and be provided with double universal joints to allow for misalignment, where applicable.

B. Perform trench excavation, backfilling, and compaction as specified in Section 33 11 10, Water Utility Distribution and Transmission Piping.

C. Install valves in conjunction with pipe laying.

D. Set valves plumb.

E. Provide buried valves with valve boxes installed flush with finished grade.

1. Valves installed out of paved or otherwise hard-surfaced areas shall be set in a concrete pad at finished grade.

2. Concrete valve box pads shall be 18 inches square and be not less than 6 inches thick.

F. Disinfection of Water Piping System:

1. Flush and disinfect system as specified in Section 33 13 00, Testing and Disinfection of Water Utility Piping.

3.3 FIELD QUALITY CONTROL

A. Pressure test valving for water distribution system according to AWWA C600 and in accordance with Section 33 13 00, Testing and Disinfection of Water Utility Piping.

B. Field Testing of Valves:

1. All valves 24-inch diameter or larger, and all in-line transmission main valves, shall be pressure and leakage tested at the Site and shall pass the field testing prior to installation.

2. Valves shall be tested at 1.5 times normal operating pressure, 150 pounds per square inch (psi) minimum.

3. No valve shall be accepted for installation that fails to pass the field pressure test. Any valves failing field pressure tests shall be replaced by the CONTRACTOR at no additional cost to the OWNER.

4. ENGINEER shall witness field testing.

3.4 NOT USED

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 33 12 19 - FIRE HYDRANTS

PART 1 GENERAL

1.1 SUMMARY

A. This Section addresses dry-barrel fire hydrants used in water supply service.

B. Section includes:

1. Fire hydrants used in water main installations.

C. Related Sections:

1. Section 03 11 00 – Concrete Work
2. Section 31 05 16 - Aggregates for Earthwork
3. Section 31 23 17 - Trenching
4. Section 33 13 00 – Testing and Disinfection of Water Utility Piping

1.2 REFERENCE STANDARDS

A. American Water Works Association (AWWA):

1. AWWA C502 - Dry-Barrel Fire Hydrants
2. AWWA C550 - Protective Interior Coatings for Valves and Hydrants
3. AWWA C600 - Installation of Ductile-Iron Mains and Their Appurtenances

B. National Fire Protection Association (NFPA):

1. NFPA 291 - Recommended Practice for Fire Flow Testing and Marking of Hydrants

1.3 COORDINATION

A. All hydrants supplied for the Project shall be of like kind from a single manufacturer.

1.4 SUBMITTALS

A. Section 01 33 00, Submittal Procedures: Requirements for submittals.

B. Product Data: Submit Manufacturer's latest published literature, including illustrations, installation and maintenance instructions, and parts lists.

C. Shop Drawings: Submit description of proposed installation.

D. Manufacturer's Certificate: Certify that products meet or exceed specified requirements.

E. Manufacturer Instructions: Submit detailed instructions on installation requirements, including storage and handling procedures.

F. Field Quality-Control Submittals: Indicate results of Contractor-furnished tests and inspections.

1.5 CLOSEOUT SUBMITTALS

A. Project Record Documents: Record actual locations of fire hydrants and service valves.

B. Operation and Maintenance Data: Submit data for hydrants.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Prepare hydrants and accessories for shipment according to AWWA standards.

B. Seal hydrant and ends to prevent entry of foreign matter.

C. Inspection: Accept materials on Site in Manufacturer's original packaging and inspect for damage.

D. Storage:

1. Store materials in areas protected from weather, moisture, or potential damage.

2. Do not store materials directly on ground.

E. Handle materials in a way that prevents damage to interior and exterior surfaces.

PART 2 PRODUCTS

2.1 FIRE HYDRANTS

A. Manufacturers:

1. Mueller Company, Super Centurion 250 Model A-423, or approved equal.

B. Dry-Barrel Breakaway Type:

1. Comply with AWWA C502.

2. Body: Cast iron.

3. Valve: Compression type.

4. Burial Depth: As indicated on Drawings.

5. Inlet Connection Size: 6 inches.

6. Valve Opening: 5-1/4 inches in diameter.

7. End Connections: Mechanical joint or bell end.

8. Bolts and Nuts: Galvanized steel.

9. Interior Coating: Comply with AWWA C550.

10. Direction of Opening: Counterclockwise unless otherwise indicated.

C. Hose Connections:

1. One 4-1/2-inch diameter pumper, two 2-1/2-inch diameter hose nozzles.

2. Obtain thread type and size from local fire department.

3. Attach nozzle caps by separate chains.

D. Finishes:

1. Primer and two coats of enamel.

2. Color: R-1317, Safety Yellow.

2.2 NSF INTERNATIONAL (NSF) REQUIREMENTS

A. All fire hydrants must be NSF/ANSI Standard 61 certified and meet the "lead free" requirements of the Safe Drinking Water Act amendment, effective January 4, 2014, as per the lead content evaluation procedures outlined in NSF/ANSI Standard 372.

2.3 ACCESSORIES

A. Concrete for Thrust Restraints: Concrete type as specified in Section 03 11 00, Concrete Work.

B. Aggregate: Aggregate for hydrant drainage as specified in Section 31 05 16, Aggregates for Earthwork.

2.4 OUT OF SERVICE COVERS/OUT OF SERVICE RINGS

A. Provide orange plastic bag with reflective tape, or red plastic hydrant out of service rings.

PART 3 EXECUTION

3.1 EXAMINATION

A. Verify location and size of hydrants from Drawings. Final location of hydrants to be determined by Engineer in the field.

B. Obtain clarification and directions from Engineer prior to execution of Work.

C. If installing a hydrant on an existing water system, verify invert elevation of existing piping is as indicated on Drawings prior to excavation and installation of fire hydrant.

3.2 PREPARATION

A. Conduct operations not to interfere with, interrupt, damage, destroy, or endanger integrity of surface or subsurface structures, utilities, and landscape in immediate or adjacent areas.

B. Identify required lines, levels, contours, and datum locations.

C. Locate, identify, and protect from damage utilities to remain.

D. Do not interrupt existing utilities without permission and without making arrangements to provide temporary utility services.

1. Notify Owner and Engineer not less than 48 hours in advance of proposed utility interruption.

2. Do not proceed without written permission from Engineer.

3. Only District staff shall operate valves in existing system.

3.3 INSTALLATION

A. Perform trench excavation, backfilling, and compaction as specified in Section 31 23 17, Trenching.

B. Install pier support block and drainage gravel for fire hydrants; do not block drain hole.

1. Place drainage gravel around the pier block and bottom of hydrant to 6 inches above the hydrant drain opening.

2. Place textile fabric to cover drain rock prior to placement of backfill.

3. Setting shall allow the hydrant barrel to drain into drainage gravel at base of hydrant.

C. Set fire hydrants plumb with pumper nozzle facing roadway.

D. Set fire hydrants with centerline of pumper nozzle 18 inches above finished grade, and with safety flange not more than 6 inches nor less than 2 inches above grade. Install hydrant extensions where required and as approved.

E. Paint hydrants according to color scheme of local authorities having jurisdiction. Touch up paint after hydrant installation and testing.

F. After hydrostatic testing, flush hydrants, and check for proper drainage.

G. Disinfection of Water Piping System:

1. Flush and disinfect system as specified in Section 33 13 00, Testing and Disinfection of Water Utility Piping.

3.4 FIELD QUALITY CONTROL

A. Pressure test water distribution system according to AWWA C600 and Section 33 11 10, Water Utility Distribution and Transmission Piping, Field Quality Control.

3.5 CONCRETE HYDRANT PADS

A. When hydrant is place within sidewalks, form and pour-in-place 36-inch by 36-inch by 6-inch, 4,000 pounds per square inch (psi) concrete pad around the hydrant after the hydrant has been installed and set to grade.

B. Center hydrant pad on the hydrant. Set hydrant pad so top of pad is flush with surrounding surface, or as directed by the Engineer.

C. Hydrant pads may be adjusted to reach the back of curb if the hydrant pad is no less than 1-foot in any one direction.

3.6 OUT-OF-SERVICE HYDRANT PADS

A. To indicate that the fire hydrant is NOT operational, secure reflective tape, an orange plastic bag over the entire hydrant assembly or an approved out-of-service cover.

B. An out-of-service ring may also be used in addition to the bag or cover in case of removal of the cover.

C. Maintain the plastic bag up until the waterline is accepted by the Owner.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 33 13 00 - TESTING AND DISINFECTION OF WATER UTILITY PIPING

PART 1 GENERAL

1.1 SUMMARY

A. This Section includes hydrostatic pressure testing, disinfection, and purity testing of potable water systems piping, fittings, valves, and domestic water services.

B. Section Includes:

1. Pressure testing and disinfection of potable water distribution and transmission piping systems and appurtenances.

2. Testing and reporting of results.

C. Related Sections:

1. Section 33 11 10 - Water Utility Distribution and Transmission Piping

2. Section 33 12 16 - Water Utility Distribution and Transmission Valves

3. Section 33 12 19 - Fire Hydrants

4. Section 33 12 13 - Water Service Connections

1.2 REFERENCE STANDARDS

A. American Water Works Association (AWWA):

1. AWWA B300 - Hypochlorites

2. AWWA B301 - Liquid Chlorine

3. AWWA C600 - Installation of Ductile-Iron Mains and Their Appurtenances

4. AWWA C605 - Underground Installation of PVC and PVCO Pressure Pipe and Fittings

5. AWWA C651 - Disinfecting Water Mains

6. AWWA C655 - Field Dechlorination

1.3 SUBMITTALS

A. Section 01 33 00 –Submittals Procedures: Requirements for submittals.

B. Product Data: Submit procedures, proposed chemicals, and treatment levels.

C. Manufacturer's Certificate: Certify that products meet or exceed specified requirements.

D. Pipeline Testing and Disinfection Plan: To be submitted for review and approval by the Engineer a minimum of 1 month before testing is to start. As a minimum, the plan shall include the following:

1. Testing schedule.
2. Hydrostatic Testing Plan:
    a. Narrative of the proposed process.
    b. Proposed equipment to be used.
    c. Disposal location for excess water used to fill mains.
3. Disinfection Plan:
    a. Narrative of the proposed process.
    b. Proposed chemicals and equipment (including list of all pumps and meters) to be used.
    c. Calculations for the amount of chlorine required to achieve required chlorine residual levels.
    d. Proposed method of mixing, injecting, and distributing of chlorine solution throughout all portions of the new water system facilities.
    e. Proposed plan for testing chlorine levels throughout the length of pipeline.
4. Proposed testing locations.
5. Proposed plan for water conveyance, including flow rates.
6. Proposed plan for water control.
7. Proposed plan for water disposal, including flow rates. Include proposed plan for dechlorination of disinfection water, including discharge points.
8. Proposed measures to be incorporated in the Project to minimize erosion while discharging water from the pipeline.

1.4 CLOSEOUT SUBMITTALS

A. Disinfection Report:

1. Type and form of disinfectant used.
2. Date and time of disinfectant injection start and time of completion.
3. Test locations.
4. Name of person collecting samples.
5. Initial and 24-hour disinfectant residuals in treated water in parts-per million (ppm) for each outlet tested.
6. Date and time of flushing start and completion.
7. Disinfectant residual after flushing in ppm for each outlet tested.

1.5 QUALITY ASSURANCE

A. Perform Work according to AWWA C651.

PART 2 PRODUCTS

2.1 EQUIPMENT

A. All test equipment, chemicals for chlorination, temporary valves, bulkheads, or other water control equipment and materials shall be determined and furnished by the Contractor subject to the Engineer's review. No materials shall be used which would be injurious to the construction or its future functions.

B. All temporary thrust restraint and equipment and facilities required for hydrostatic testing will be considered incidental.

C. As a minimum, furnish the following equipment and materials for the testing:

Amount	Description
2	Graduated containers approved by the Engineer.
1	Hydraulic pump approved by the Engineer with hoses, valves, and fittings as needed and required for the testing and disinfection of the facilities.
1	High range chlorine test kit, as approved by Engineer, with digital readout. Range of detection shall be between 5 and 200 ppm. Accuracy of 3 percent.
2	Pressure gauges with pressure range at least 120 percent greater than the required maximum test pressure with graduations in 2 pounds per square inch (psi) increments. Gauges shall have been calibrated with 90 days of pressure testing.

2.2 DISINFECTION CHEMICALS

A. Chemicals:

1. Hypochlorite: Comply with AWWA B300.

2. Liquid chlorine: Comply with AWWA B301.

2.3 DECHLORINATION CHEMICALS

A. Chemicals:

1. Comply with AWWA C655.

PART 3 EXECUTION

3.1 HYDROSTATIC TESTING OF WATER PIPING

A. Make all necessary provisions for conveying water to the points of use and for the disposal of test water.

B. No section of the pipeline shall be hydrostatically tested until backfill has been placed, compacted, and passed required density testing and all field-placed concrete or mortar has attained full strength.

1. At the Contractor's option, early strength concrete may be used when the full-strength requirements conflict with schedule requirements.

2. All such substitutions and installations shall be approved by the Engineer prior to installation.

C. Provide 72-hour notification to the Engineer and Owner prior to conducting hydrostatic testing.

1. Provide coordination and scheduling required for the Owner and Engineer to witness and provide necessary labor for operating Owner's existing system during hydrostatic testing and disinfecting procedures.

2. The Contractor shall not operate any part of the existing water systems.

D. Pipe Filling:

1. Fill pipes slowly from the lowest elevation to highest point along test section with potable water.

2. Take all required precautions to prevent entrapping air in the pipes.

3. Allow for natural absorption of water by the lining of the pipe to occur.

4. Apply specified test pressure by pumping.

E. Testing of Mains:

1. Ductile Iron: In accordance with AWWA C600.

2. Polyvinyl chloride (PVC): In accordance with AWWA C605.

3. General:

a. Tests shall be conducted under a hydrostatic test pressure not less than 1.25 times the stated anticipated maximum sustained working pressure of the pipeline measured at the highest elevation along the test section and not less than 1.5 times the stated working pressure at the lowest elevation of the test section, minimum 150 psi, unless otherwise shown in the Drawings.

b. In no case shall the test pressure exceed the rated working pressure for any joint, thrust restraint, valve, fitting, or other connected appurtenance of the test section.

c. Testing shall be performed by applying the specified test pressure by pumping.

d. Once the test pressure has been attained, the pump shall be valved off.

e. The test will be conducted for a 2-hour period with the allowable leakage not to exceed the value as calculated per the Allowable Leakage formula below.

f. During the test period, there shall be no appreciable or abrupt loss in pressure.

4. Allowable Leakage:

   a. Flanged Joints: Pipe, fittings, and valves with flanged joints shall be completely watertight. No leakage allowed.

   b. Mechanical or Push-on Joints: Pipe, fittings, and valves with rubber gasketed joints shall have a measured loss not to exceed the rate given in the following Allowable Leakage formula:

$$AL = \frac{LD(P)^{1/2}}{148{,}000}$$

      In the above formula:

      AL = Allowable leakage, in gallons per hour
      L = Length of pipe tested, in feet
      D = Nominal diameter of pipe, in inches
      P = Average test pressure during the leakage test, in pounds per square inch.

5. Maintaining Pressure:

   a. During the test period, operate the pump as required to maintain pressure in the pipe within 5 psi of the specified test pressure at all times.

   b. At the end of test period, operate the pump until the specified test pressure is again obtained.

      1) The pump suction shall be in a clean, graduated barrel, or similar device or metered so that the amount of water required to restore the test pressure may be accurately measured.

      2) Sterilize this makeup water by adding chlorine to a concentration of 25 milligrams per liter (mg/L).

   c. The Engineer will determine the quantity of water required to maintain and restore the required pressure at the end of the test period.

   d. Each hour's loss stands on its own and will not be averaged.

6. Defects, Leakage, Failure:

   a. If the test reveals any defects, leakage in excess of the allowable, or failure, furnish all labor, equipment, and materials required to locate and make necessary repairs.

   b. Correct any visible leakage regardless of the allowable leakage specified above.

   c. All leaks shall be repaired in a manner acceptable to the Engineer.

   d. The testing of the line shall be repeated until a test satisfactory to the Engineer has been achieved.

3.2 DISINFECTION OF WATER PIPING

A. Disinfection shall be in accordance with the latest version of AWWA C651 following Engineer's acceptance of hydrostatic testing.

B. Chlorination by means of tablets or powders (calcium hypochlorite) placed in each length of pipe during installation is specifically prohibited.

C. Flush all foreign matter from the pipeline, branches, and services.

1. Provide at no additional cost to the Owner, hoses, temporary pipes, ditches, etc., as required to dispose of flushing water without damage to adjacent properties.

2. Flushing velocities shall be at least 2.5 feet per second (fps).

3. For large diameter pipe where it is impractical or impossible to flush the pipe at 2.5 fps velocity, clean the pipe in place from the inside by brushing and sweeping, then flush the line at a lower velocity.

D. Chlorine Application:

1. Fill the test section of main from the lowest elevation and maintain a steady flow rate while injecting the water main with chlorinated water.

2. Flow (bleed) a blow-off, standpipe or hydrant at the water main's high point(s) to allow air to escape and ensure all interior pipe surfaces are wetted.

E. Chlorine Residual:

1. Measure chlorine residual with a high-range chlorine test kit at a point near to the injection point while filling the main.

2. Adjust the dose rate as necessary to maintain the target dose rate.

F. Potable water piping shall be disinfected with a solution containing a minimum 25 ppm and a maximum 50 ppm chlorine.

1. Once the main is completely filled with super-chlorinated water, measure the chlorine residual a minimum of once every 200 feet of main and once for each main branch, 2-inch service, or as directed by the Engineer.

2. The chlorine solution shall remain in the piping system for a period of 24 hours, after which time the sterilizing mixture shall have a strength of at least 10 ppm of chlorine.

3. If check samples fail to produce acceptable results, the disinfection procedure shall be repeated at the expense of the Contractor until satisfactory results are obtained.

G. Flush piping, branches, and services with municipal potable water until the chlorine residual is below 1.5 ppm and approximately the same as the source water.

1. There is no minimum flushing velocity for this step.

H. Disposal of any water containing chlorine shall be performed in accordance with the latest edition of AWWA C651 and C655, and all state or local requirements.

1. Disposal may be made into existing sanitary sewer systems providing approvals are obtained from the respective system owners.

2. Any chlorinated water discharged to open stream channels must be dechlorinated prior to discharge to levels acceptable by Oregon State Department of Environmental Quality.

3.3 DISINFECTION AND TESTING OF WATER MAIN END CONNECTIONS AND TIE-INS

A. Disinfection of potable water piping and appurtenances at end connections and tie-ins to the existing system which are required to remain in service due to restrictions in allowable shutdown time shall be disinfected as described below.

B. Prior to connecting new potable water piping and appurtenances with existing piping and appurtenances, the interior of all new pipe, fittings, valves, and appurtenances shall be swabbed or sprayed with a 1 percent to 5 percent calcium hypochlorite solution.

C. In accordance with AWWA C651, swabbing or spraying of connection piping is allowed only if the total length of piping is equal to or less than one pipe length (18 feet). All runs of new piping over 18 feet in total length will require hydrostatic pressure testing, flushing and disinfection as detailed elsewhere in this Section.

D. Following the disinfection procedures described above, connection of the new piping and appurtenances to the existing water system shall be made.

1. During the system startup, the Engineer and Contractor shall visually inspect all new fittings, piping, valves, and appurtenances for evidence of leakage.

2. Any leakage observed during this period shall be promptly repaired by the Contractor, at Contractor's expense, as required by the Engineer.

3.4 FIELD QUALITY CONTROL

A. Bacteriological Sampling and Testing:

1. The Owner will collect samples after the line is flushed in accordance with the latest edition of AWWA C651. Contractor responsible for payment of testing costs.

a. The locations for sample collection shall be at the sole discretion of the Owner and Engineer.

b. The chlorine residual must be below 1.5 ppm or restored to the level maintained in the Owner's distribution system, when the sample is taken.

2. Bacterial Testing: After completing the chlorination procedure, test the main according to the following:

a. Bacterial Sampling

1) Option A:

a) Take an initial set of samples using sampling site procedures outlined herein.

b) Resample after a minimum of 24 hours' time has elapsed using sampling site procedures outlined herein.

c) Both sets of successive samples must pass for the main to be approved for service.

2) Option B:

a) Allow main to sit for a minimum of 24 hours without any water use.

b) Using sampling site procedures outlined herein, collect two sets of samples a minimum of 15 minutes apart while the sampling taps are left running.

c) Both sets of samples must pass for the main to be approved for service.

3) Allow 24 hours for the test results for each sample set.

b. Sampling Locations

1) The Owner will take one bacteriological sample from the end of the main and on each branch.

2) For long runs of main, at least one sample will be taken for every 1,200 feet of new main and as directed.

c. Sample Testing

1) The Owner will test the sample set for coliform bacteria and publish the test results within 24 hours.

d. Evaluating the Test Results

1) If one or more of the sample set tests positive for coliforms (fails), repeat chlorination and sampling processes specified herein after correcting the cause of the failure and as directed by the Engineer.

2) When two consecutive sample sets test negative (passing)for coliform bacteria, the bacterial testing is complete.

e. Completion of Bacterial Testing

1) Upon completion of bacterial testing, notify the Owner shall notify the Engineer and Contractor in writing that the testing is complete and the main is ready for tie-in.

f. Multiple Positive (Failing) Test Results

1) If sample sets continue to test positive for coliforms, the Engineer will determine how to proceed, up to and including repeating the chlorination procedure or rejecting the pipe.

3. Results of the bacteriological testing shall be satisfactory with the Oregon Health Authority and/or other appropriate regulatory agencies, or disinfection shall be repeated by the Contractor.

B. Optional Sampling and Testing

1. If a pipeline is not promptly returned to service, the situation will be evaluated by the Owner to determine if the water quality may have been impacted and if additional testing as specified herein is warranted.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 33 41 10 - STORM UTILITY DRAINAGE PIPING

PART 1 GENERAL

1.1 SUMMARY

A. This Section includes pipe materials and accessories normally used with gravity storm drainage sewers.

B. Section includes:

1. Storm drainage piping
2. Piping accessories
3. Connection to existing manholes
4. Catch basins and area drains
5. Cleanouts
6. Bedding and cover materials

C. Related Sections:

1. Section 03 11 00 – Concrete Work
2. Section 03 60 00 - Grouting
3. Section 31 05 13 - Soils for Earthwork
4. Section 31 05 16 - Aggregates for Earthwork
5. Section 31 23 16 - Excavation
6. Section 31 23 17 - Trenching
7. Section 31 23 23 - Fill
8. Section 33 30 10.13 - Sewer and Manhole Testing
9. Section 33 05 13 - Manholes

1.2 REFERENCE STANDARDS

A. American Association of State Highway and Transportation Officials (AASHTO):

1. AASHTO T99 - Standard Specification for Moisture-Density Relations of Soils Using a 2.5-kg (5.5-lb) Rammer and a 305-mm (12-in.) Drop.

B. ASTM International (ASTM):

1. ASTM A74 - Standard Specification for Cast Iron Soil Pipe and Fittings.

2. ASTM A123 - Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.

3. ASTM C76 - Standard Specification for Reinforced Concrete Culvert, Storm Drain, and Sewer Pipe.

4. ASTM C443 - Standard Specification for Joints for Concrete Pipe and Manholes, Using Rubber Gaskets.

5. ASTM C913 - Standard Specification for Precast Concrete Water and Wastewater Structures.

6. ASTM C923 - Standard Specification for Resilient Connectors Between Reinforced Concrete Manhole Structures, Pipes, and Laterals.

7. ASTM C1479 - Standard Practice for Installation of Precast Concrete Sewer, Storm Drain, and Culvert Pipe Using Standard Installations.

8. ASTM D698 - Standard Test Method for Laboratory Compaction Characteristics of Soil Using Standard Effort (12,400 ft-lbf/ft3 (600 kN-m/m3)).

9. ASTM D1784 - Standard Specification for Rigid Polyvinyl Chloride (PVC) Compounds and Chlorinated Polyvinyl Chloride (CPVC) Compounds.

10. ASTM D2321 - Standard Practice for Underground Installation of Thermoplastic Pipe for Sewers and Other Gravity-Flow Applications.

11. ASTM D2466 - Standard Specification for Polyvinyl Chloride (PVC) Plastic Pipe Fittings, Schedule 40.

12. ASTM D2729 - Standard Specification for Polyvinyl Chloride (PVC) Sewer Pipe and Fittings.

13. ASTM D6938 - Standard Test Method for In-Place Density and Water Content of Soil and Soil-Aggregate by Nuclear Methods (Shallow Depth).

14. ASTM D3034 - Standard Specification for Type PSM Polyvinyl Chloride (PVC) Sewer Pipe and Fittings.

15. ASTM D3139 - Standard Specification for Joints for Plastic Pressure Pipes Using Flexible Elastomeric Seals.

16. ASTM D3212 - Standard Specification for Joints for Drain and Sewer Plastic Pipes Using Flexible Elastomeric Seals.

17. ASTM F477 - Standard Specification for Elastomeric Seals (Gaskets) for Joining Plastic Pipe.

18. ASTM F679 - Standard Specification for Polyvinyl Chloride (PVC) Large-Diameter Plastic Gravity Sewer Pipe and Fittings.

C. American Water Works Association (AWWA):

1. AWWA C104 - Cement-Mortar Lining for Ductile-Iron Pipe and Fittings.

2. AWWA C105 - Polyethylene Encasement for Ductile-Iron Pipe Systems.

3. AWWA C111 - Rubber-Gasket Joints for Ductile-Iron Pressure Pipe and Fittings.

4. AWWA C150 - Thickness Design of Ductile-Iron Pipe.

5. AWWA C151 - Ductile-Iron Pipe, Centrifugally Cast.

6. AWWA C900 - Polyvinyl Chloride (PVC) Pressure Pipe and Fabricated Fittings, 4 In. Through 12 In. (100 mm Through 300 mm), for Water Transmission and Distribution.

1.3 COORDINATION

A. Notify affected utility companies at least 72 hours prior to construction.

1.4 SUBMITTALS

A. In accordance with Section 01 33 00, Submittal Procedures.

B. Product Data: Submit Manufacturer catalog cuts and other information indicating proposed materials, accessories, details, and construction information.

C. Manufacturer's Certificate: Certify that products meet or exceed specified requirements. The certificate shall be signed by an authorized agent of the Manufacturer.

D. Test and Evaluation Reports: Submit reports indicating field tests made and results obtained.

E. Manufacturer Instructions:

1. Indicate special procedures required to install specified products.

2. Submit detailed description of procedures for connecting new storm sewer to existing storm sewer line.

F. Field Quality-Control Submittals: Indicate results of Contractor-furnished tests and inspections.

1.5 CLOSEOUT SUBMITTALS

A. Project Record Documents: Record invert elevations and actual locations of pipe runs, connections, manholes, and cleanouts.

B. Identify and describe unexpected variations to subsoil conditions or discovery of uncharted utilities.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Inspection: Accept materials on Site in Manufacturer’s original packaging and inspect for damage.

B. Storage:

1. Store materials according to Manufacturer instructions.

C. Protection:

1. Protect materials from moisture, dust, and direct sunlight by storing in clean, dry location remote from construction operations areas.

2. Block individual and stockpiled pipe lengths to prevent moving.

3. Provide additional protection according to Manufacturer instructions.

1.7 EXISTING CONDITIONS

A. Field Measurements:

1. Verify field measurements prior to fabrication.

2. Indicate field measurements on Shop Drawings.

PART 2 PRODUCTS

2.1 STORM DRAINAGE PIPING

A. Polyvinyl Chloride (PVC) Pipe:

1. Material:

a. Manufactured from rigid polyvinyl chloride compounds conforming to ASTM D1784, Class 12454.

b. At locations indicated in the Drawings, pipe shall conform to AWWA C900.

2. Pipe and fittings 4 inches to 15 inches in diameter, non-pressurized:

a. Comply with ASTM D3034, SDR 35.

3. Pipe and fittings 18 inches and larger in diameter, non-pressurized:

a. Comply with ASTM F679, PS46.

b. Pipe shall have a minimum stiffness of 46 pounds per square inch (psi).

4. AWWA C900 Pipe:

a. At locations shown in the Drawings.

b. Four inches to 12 inches in diameter.

c. DR 25.

d. Pipe shall have minimum stiffness of 129 psi.

5. End Connections: Bell and spigot style, with rubber-ring-sealed gasket joint.

6. Joints:

a. Integral bell push-on type: Comply with ASTM D3212.

b. For use with AWWA C900 pipe: Integral bell push-on type comply with ASTM D3139.

7. Gaskets:

a. Factory installed.

b. Elastomeric gaskets: Comply with ASTM F477.

B. Ductile Iron Pipe:

1. Comply with AWWA C151.

2. Minimum Special Thickness Class: 52.

3. End Connections: Bell and spigot or plain, as shown in the Drawings.

4. Outside Coating:

a. Type: Asphaltic coating, minimum 1-mil uniform thickness.

b. Comply with AWWA C151.

5. Lining:

a. Cement mortar lined.

b. Comply with AWWA C104.

6. Fittings:

a. Material: Ductile iron.

b. Comply with AWWA C153 or AWWA C110.

c. Lining: Cement-mortar lined according to AWWA C104.

7. Coating:

a. Asphaltic exterior coating in accordance with AWWA C151.

8. Joints:

a. Rubber gasket joint devices.

b. Comply with AWWA C111.

C. High Density Polyethylene (HDPE) Pipe:

1. Double wall, ribbed pipe with smooth interior.

2. Solid pipe, perforated pipe, and fittings shall meet the requirements of ASTM F 405 and F 667

3. Pipe 3 inches to 10 inches in diameter: Comply with AASHTO M 252.

4. Pipe 12 inches to 60 inches in diameter: Comply with AASHTO M 294.

5. Joints: Integral bell push-on type.

6. Manufacturers:

    a. ADS, N-12 with ProLink joints, or equal.

D. Acrylonitrile-Butadiene-Styrene (ABS) Pipe:

1. Single walled. Comply with ASTM D2680, SDR 23.5.

2. Perforated.

    a. Three-eighths-inch diameter holes, 3 inches on center.

3. Inside Nominal Diameter: 4 inches.

    a. Minimum Wall Thickness: 0.157 inches.

    b. One row of perforations on each side of pipe, approximately 45 degrees above bottom centerline of pipe.

4. Inside Nominal Diameter: 6 inches.

    a. Minimum Wall Thickness: 0.235 inches.

    b. Two rows of perforations on each side of pipe, approximately 45 degrees above bottom centerline of pipe.

5. Ends:

    a. Style: Bell and spigot.

    b. Type: Solvent sealed.

6. Fittings: ABS.

7. Joints:

    a. Type: Solvent weld.

    b. Comply with ASTM D2235.

E. Reinforced Concrete Pipe:

1. Comply with ASTM C76, Class V, with Wall Type C.

2. Reinforcement: Mesh.

3. End Connections: Bell and spigot.

4. Fittings: Reinforced concrete.

5. Joints:

    a. Rubber compression gasket.

    b. Comply with ASTM C443.

2.2 FLEXIBLE COUPLINGS

A. Description:

1. Resilient chemical-resistant elastomeric polyvinyl chloride (PVC) coupling.

2. Attachment: Two Series 300 stainless-steel clamps, screws, and housings.

2.3 FLEXIBLE PIPE BOOT FOR MANHOLE PIPE ENTRANCES

A. Description:

1. Material: Ethylene propylene rubber (EPDM).

2. Comply with ASTM C923.

3. Attachment: Stainless-steel clamp and hardware.

2.4 CONCRETE ENCASEMENT AND CRADLES

A. Concrete:

1. As specified in Section 03 11 00, Concrete Work.

2. Strength: Minimum 3,000 psi at 28 days.

3. Air entrained.

4. Finish: Rough troweled.

B. Concrete Reinforcement: As specified in Section 03 11 00, Concrete Work.

2.5 MANHOLES

A. Description:

1. As specified in Section 33 05 13 - Manholes.

2. Material: Reinforced precast or cast-in-place concrete.

3. Diameter: As shown in the Drawings.

4. Top: Eccentric cone.

5. Frames and Covers: Watertight cast iron.

6. Cover Inscription: “S”.

2.6 CATCH BASINS AND AREA DRAINS

A. Construction:

1. Material: Reinforced precast or cast-in-place concrete pipe sections.

a. Minimum compressive strength of 3,000 psi at 28 days.

b. Precast concrete inlets shall conform to ASTM C913.

2. Joints: Lipped male/female.

3. Nominal Interior Dimensions: As shown in the Drawings.

B. Lids and Frames:

1. Materials: Cast iron.

2. Lid:

a. Removable.

b. Design: Linear grill.

3. Nominal Lid and Frame Size: As shown in the Drawings.

2.7 CLEANOUTS

A. Construction:

1. Per details provided in the Drawings.

B. Lids and Frames:

1. Materials: Cast iron. Meet H-20 load requirement.

2.8 MATERIALS

A. Bedding and Cover:

1. Pipe Bedding: Coarse Aggregate Material Type A1, as specified in Section 31 05 16, Aggregates for Earthwork. Aggregate size as shown in the Drawings.

2. Pipe Zone Backfill: Coarse Aggregate Material Type A1, as specified in Section 31 05 16, Aggregates for Earthwork. Aggregate size as shown in the Drawings.

3. Trench Backfill from Pipe Zone to Finish Grade:

a. Material type varies by location, as shown in the Drawings.

b. Coarse Aggregate Material Type A1, as specified in Section 31 05 16, Aggregates for Earthwork. Aggregate size as shown in the Drawings.

c. Subsoil Type S1 and/or S2, as specified in Section 31 05 13, Soils for Earthwork.

2.9 MIXES

A. Grout: As specified in Section 03 60 00, Grouting.

2.10 ACCESSORIES

A. Underground Pipe Markers: As specified in Section 31 23 17, Trenching.

PART 3 EXECUTION

3.1 EXAMINATION

A. Verify that trench cut, or excavation base is ready to receive Work.

B. Verify that excavations, dimensions, and elevations are as indicated on Drawings.

3.2 PREPARATION

A. Correct over-excavation in accordance with Section 31 23 17, Trenching.

B. Remove large stones or other hard materials that could damage pipe or impede consistent backfilling or compaction.

C. Protect and support existing sewer lines, utilities, and appurtenances.

D. Utilities:

1. Maintain profiles of utilities.

2. Coordinate with other utilities to eliminate interference.

3. Notify Engineer if crossing conflicts occur.

3.3 INSTALLATION

A. Bedding:

1. Excavate pipe trench as specified in Section 31 23 17, Trenching.

2. Excavate to lines and grades as indicated on Drawings, or as required to accommodate installation of utility.

3. Pipe base shall be observed by Engineer prior to placement of the pipe.

4. Dewater excavations to maintain dry conditions and to preserve final grades at bottom of excavation.

5. Provide sheeting and shoring as specified in Section 31 50 00, Excavation Support and Protection.

6. Placement:

a. Place bedding material at trench bottom.

b. Level materials in continuous layer not exceeding 6 inches compacted depth.

c. Compact to 95 percent of the Standard Proctor maximum density by AASHTO T-99.

B. Piping:

1. Install pipe, fittings, and accessories according to standards listed below, and seal joints watertight.

a. PVC, HDPE, ABS: Comply with ASTM D2321.

b. Ductile Iron: Comply with AWWA C600.

c. Reinforced Concrete: Comply with ASTM C1479.

2. Lift or roll pipe into position. Do not drop or drag pipe over prepared bedding.

3. Lay pipe to slope gradients and line as indicated on Drawings.

4. Variations:

a. Maximum Variation from Indicated Line: 1/32-inch per inch of pipe diameter, but no more than 1/2-inch, providing that such variation does not result in a level or reverse-sloping invert.

b. Maximum Variation from Indicated Grade: 1/32-inch per inch of pipe diameter, but no more than 1/4-inch.

c. Variation in the invert elevation between adjoining ends of pipe, include fittings, shall not exceed 1/64-inch per inch of pipe diameter, or 1/2-inch maximum.

5. Begin at downstream end and progress upstream.

6. Assemble and handle pipe according to Manufacturer's instructions, except as may be modified on Drawings or by Engineer.

7. Make straight field cuts without chipping or cracking pipe.

8. Keep pipe and fittings clean until Work has been completed and accepted by Engineer.

9. Assemble pipe joints in accordance with Manufacturer's recommendations/specifications.

10. Cap open ends during periods of Work stoppage.

11. Lay bell and spigot pipe with bells upstream.

12. Backfill and compact as specified in Section 31 23 17, Trenching.

13. Do not displace or damage pipe when compacting.

14. Pipe Markers: As specified in Section 31 23 17, Trenching.

C. Joints:

1. Just prior to joining the pipes, the surfaces of the joint rings shall be wiped clean, and the joint rings and rubber gaskets shall be liberally lubricated with an approved type of vegetable oil soap.

2. The spigot end, with the gasket placed in the groove, shall be entered into the bell of the pipe already laid, making sure that both pipes are properly aligned.

3. Before the joint is fully "home," the position of the gasket in the joint shall be determined by means of a suitable feeler gauge supplied by the Pipe Manufacturer.

4. If the gasket is found not to be in proper position, the pipes shall be separated, and the damaged gasket replaced.

5. The pipe is then forced "home" firmly and fully.

6. In its final position, the joint between the pipes shall not be deflected more than 1/2-inch at any point.

D. Connection to Existing Manholes:

1. Drilling:

a. Core drill existing manhole to clean opening.

b. Use of pneumatic hammers, chipping guns, and sledgehammers are not permitted.

2. Install watertight neoprene gasket and seal with non-shrink concrete grout.

3. Encasement:

a. Concrete encase new sewer pipe minimum of 24 inches to nearest pipe joint.

b. Use epoxy binder between new and existing concrete.

4. Prevent construction debris from entering existing sewer line when making connection.

E. Manholes:

1. Install manholes as specified in Section 33 05 13, Manholes.

F. Wye Branches and Tees:

1. Concurrent with pipe-laying operations, install wye branches and pipe tees at locations indicated on Drawings.

2. Use standard fittings of same material and joint type as sewer main.

3. Maintain minimum 5-foot separation distance between wye connection and manhole.

4. Use saddle wye or tee with stainless-steel clamps for taps into existing piping.

5. Mount saddles with solvent cement or gasket and secure with metal bands.

6. Lay out holes with template and cut holes with mechanical cutter.

G. Catch Basins

1. Form bottom of excavation clean and smooth, and to indicated elevation.

2. Cast-in-place Concrete Construction:

a. Form and place cast-in-place concrete base pad, with provision for storm sewer pipe end sections.

b. Level top surface of base pad.

c. Sleeve concrete shaft sections to receive storm sewer pipe sections.

d. Establish elevations and pipe inverts for inlets and outlets as indicated on Drawings.

3. Mount lid and frame level in grout, secured to top cone section to indicated elevation.

H. Backfilling:

1. Backfill around sides and to top of pipe as specified in Section 31 23 23, Fill.

2. Maintain optimum moisture content of bedding material as required to attain specified compaction density.

3.4 FIELD QUALITY CONTROL

A. Request inspection by Engineer prior to and immediately after placing bedding.

B. Testing:

1. If tests indicate that Work does not meet specified requirements, remove Work, replace, and retest.

2. Pipe Testing: As specified in Section 33 30 10.13, Sewer and Manhole Testing.

3. Compaction Testing: See Section 31 23 17, Trenching for Compaction Testing requirements for piping trenches.

3.5 PROTECTION

A. Protect pipe and aggregate cover from damage or displacement until backfilling operation is in progress.

END OF SECTION

DIVISION 40 – PROCESS INTERCONNECTIONS

SECTION 40 05 51 – COMMON REQUIREMENTS FOR PROCESS VALVES

PART 1 GENERAL

1.1 SUMMARY

A. This Section includes basic materials and methods related to valves commonly used for process systems, including pump stations, utility vaults, and water and wastewater treatment. This Section is to be used in conjunction with 40 05 61, Gate Valves, 40 05 64, Butterfly Valves, and 40 05 78.19, Combination Air Valves for Water Service.

B. Section Includes:

1. Valves.

C. Related Sections

1. Section 03 11 00, Concrete Work
2. Section 33 11 10, Water Utility Distribution and Transmission Piping
3. Section 40 05 00, Common Work Results for Process Interconnections
4. Section 40 05 61, Gate Valves
5. Section 40 05 64, Butterfly Valves
6. Section 40 05 78.19, Combination Air Valves for Water Service

1.2 REFERENCE STANDARDS

A. American Water Works Association (AWWA):

1. AWWA C504 - Rubber-Seated Butterfly Valves, 3 In. Through 72 In.
2. AWWA C509 - Resilient-Seated Gate Valves for Water Supply Service.
3. AWWA C541 - Hydraulic and Pneumatic Cylinder and Vane-Type Actuators for Valves and Slide Gates.
4. AWWA C550 - Protective Interior Coatings for Valves and Hydrants.

B. ASTM International (ASTM):

1. ASTM B62 - Standard Specification for Composition Bronze or Ounce Metal Castings.
2. ASTM B584 - Standard Specification for Copper Alloy Sand Castings for General Applications.

C. Manufacturers Standardization Society of the Valve and Fittings Industry (MSS):

1. MSS SP-25 - Standard Marking System for Valves, Fittings, Flanges and Unions.

D. NSF International (NSF):

1. NSF 61 - Drinking Water System Components - Health Effects.

2. NSF 372 - Drinking Water System Components - Lead Content.

1.3 COORDINATION

A. Contractor shall be solely responsible to coordinate Work of this Section with piping, equipment, and appurtenances.

1.4 SUBMITTALS

A. Section 01 33 00 - Submittal Procedures: Requirements for submittals.

B. Product Data:

1. Submit Manufacturer's latest published literature. Include illustrations, installation and maintenance instructions, and parts lists.

2. Submit valve cavitation limits.

3. Submit Manufacturer data for actuator with model number and size indicated.

C. NOT USED

D. Manufacturer's Certificate: Certify that products meet or exceed specified requirements.

E. Manufacturer Instructions: Submit installation instructions and special requirements, including storage and handling procedures.

F. Lining and coating data.

G. Valve Labeling Schedule: Indicate valve locations and nametag text.

H. Certification of Valves Larger than 12 inches: Furnish certified copies of hydrostatic factory tests, indicating compliance with applicable standards.

I. Source Quality-Control Submittals: Indicate results of factory tests and inspections.

J. Field Quality-Control Submittals: Indicate results of Contractor-furnished tests and inspections, including factory-applied coatings.

1.5 CLOSEOUT SUBMITTALS

A. Project Record Documents: Record actual locations of valves and actuators.

B. Operation and Maintenance Data: Submit information for valves.

1.6 MAINTENANCE MATERIAL SUBMITTALS

A. Spare Parts:

1. Furnish one set of Manufacturer's recommended spare parts.

B. Tools:

1. Furnish special wrenches and other devices required for Owner to maintain equipment.

2. Furnish compatible and appropriately labeled toolbox when requested by Owner.

1.7 QUALITY ASSURANCE

A. Cast Manufacturer's name, pressure rating, size of valve, and year of fabrication into valve body.

B. Valve Testing: Each valve body shall be tested under a test pressure equal to twice its design water-working pressure.

C. Certification: Prior to shipment, submit for all valves over 12 inches in diameter, certified, notarized copies of the hydrostatic factory tests, showing compliance with the applicable standards of AWWA, ANSI, ASTM, etc. Valves tested and supplied shall be trackable and traceable by serial number, tagged or otherwise noted on valve, upon arrival to Site.

D. Maintain clearances as indicated on Drawings.

E. Unless otherwise noted, all water works materials provided for the Project shall be new, of first-class quality and shall be made by reputable manufacturers.

F. All material of a like kind shall be provided from a single manufacturer, unless otherwise approved by the Engineer.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Inspection: Accept materials on Site in Manufacturer's original packaging and inspect for damage.

B. Store materials according to Manufacturer instructions.

1. Store materials in areas protected from weather, moisture, or other potential damage.

2. Do not store materials directly on ground.

C. Protection:

1. Protect materials from moisture and dust by storing in clean, dry location remote from construction operations areas.

2. Protect valve ends from entry of foreign materials by providing temporary covers and plugs.

3. Provide additional protection according to Manufacturer instructions.

D. Handle products carefully to prevent damage to interior or exterior surfaces.

E. All defective or damaged materials shall be replaced with new materials at no cost to the Owner.

1.9 EXISTING CONDITIONS

A. Field Measurements:

1. Verify field measurements prior to fabrication.

2. Indicate field measurements on Shop Drawings.

PART 2 PRODUCTS

2.1 GENERAL

A. All materials in contact with potable water shall conform to ANSI/NSF Standard 61 and meet the “lead free” requirements of the Safe Drinking Water Act amendment, effective January 4, 2014, as per the lead content evaluation procedures outlined in NSF/ANSI Standard 372.1.

1. All fittings shall either be cast or permanently stamped with markings identifying the item as complying with NSF 61 per the requirements of NSF 372 for “lead free”.

2. All brass in contact with potable water shall comply with ASTM B584.

2.2 VALVES

A. Description: Valves, operator, actuator, handwheel, chainwheel, extension stem, floor stand, worm and gear operator, operating nut, chain, wrench, and other accessories as required and shown in the Drawings.

B. Operation:

1. Open by turning counterclockwise; close by turning clockwise.

2. Cast directional arrow on valve or actuator with OPEN and CLOSE cast on valve in appropriate location.

C. Valve Construction:

1. Bodies: Rated for maximum temperature and pressure to which valve will be subjected as specified in valve Sections.

D. Connecting Nuts and Bolts: Stainless steel.

2.3 RESILIANT-SEATED GATE VALVES

A. As specified in Section 40 05 61, Gate Valves.

2.4 RUBBER-SEATED BUTTERFLY VALVES

A. As specified in Section 40 05 64, Butterfly Valves.

2.5 VALVE ACTUATORS

A. All valves shall be furnished with manual actuators, unless otherwise indicated in the Drawings.

B. Valves in sizes up to and including 4 inches in diameter shall have direct acting lever or handwheel actuators of the Manufacturer's best standard design.

C. Actuators shall be sized for the valve design pressure in accordance with AWWA C504.

D. Provide actuators with position indicators for shutoff valves 6 inches and larger.

E. Comply with AWWA C541 and C542, where applicable.

F. Furnish gear operators for valves 8 inches and larger, and chainwheel operators for valves mounted over 7 feet above floor.

G. Provide gear and power actuators with position indicators.

H. Gear-Assisted Manual Actuators:

1. Provide totally enclosed gears.

2. Maximum Operating Force: 60-pound-force (lbf).

3. Bearings: Permanently lubricated bronze.

4. Packing: Accessible for adjustment without requiring removal of actuator from valve.

I. Handwheel:

1. Furnish permanently attached handwheel for emergency manual operation.

2. Rotation: None during powered operation.

3. Permanently affix directional arrow and cast OPEN or CLOSE on handwheel to indicate appropriate direction to turn handwheel.

4. Maximum Operating Force: 60 lbf.

J. NOT USED

K. NOT USED

L. NOT USED

M. NOT USED

2.6 SOURCE QUALITY CONTROL

A. Testing: Test valves according to Manufacturer's standard testing protocol, including hydrostatic, seal, and performance testing.

PART 3 EXECUTION

3.1 EXAMINATION

A. Verify that piping system is ready for valve installation.

3.2 PREPARATION

A. Access: All valves shall be installed to provide easy access for operation, removal, and maintenance and to avoid conflicts between valve operators and structural members or handrails.

B. Valve Accessories: Where combinations of valves, sensors, switches, and controls are specified, it shall be the responsibility of the Contractor to properly assemble and install these various items so that all systems are compatible and operating properly. The relationship between interrelated items shall be clearly noted on shop drawing submittals.

3.3 INSTALLATION

A. Install valves, extensions, and accessories according to Manufacturer instructions.

B. Firmly support valves to avoid undue stresses on piping.

C. Coat studs, bolts, and nuts with anti-seizing lubricant.

D. Clean field welds of slag and splatter to provide a smooth surface.

E. Install valves with stems upright or horizontal, not inverted.

F. Install valves with clearance for installation of insulation and allowing access.

G. Provide access where valves and fittings are not accessible.

H. Comply with Division 40 - Process Interconnections for piping materials applying to various system types.

I. Valve Applications:

1. Install shutoff and drain valves at locations as indicated on Drawings and as specified in this Section.

2. Install shutoff and isolation valves.

3. Isolate equipment, part of systems, or vertical risers as indicated on Drawings.

4. Install valves for throttling, bypass, or manual flow control services as indicated on Drawings.

J. Disinfection of Water Piping System:

1. Flush and disinfect system as specified in Section 33 13 00, Testing and Disinfection of Water Utility Piping.

3.4 FIELD QUALITY CONTROL

A. Valve Field Testing:

1. Test for proper alignment.

2. If specified by valve Section, field test equipment to demonstrate operation without undue leakage, noise, vibration, or overheating.

3. Engineer will witness field testing.

3.5 NOT USED

SECTION 40 05 61 - GATE VALVES

PART 1 GENERAL

1.1 SUMMARY

A. This Section includes gate valves for use in buried service, fire hydrant assemblies and combination air release/vacuum valve assemblies. Coordinate with Section 33 12 16, Water Utility Distribution and Transmission Valves.

B. Section Includes:

1. Resilient-seated gate valves.
2. General duty gate valves smaller than 3 inches.

C. Related Sections:

1. Section 33 12 16, Water Utility Distribution and Transmission Valves
2. Section 33 11 10, Water Utility Distribution and Transmission Piping
3. Section 40 05 51, Common Requirements for Process Valves

1.2 REFERENCE STANDARDS

A. American Society of Mechanical Engineers (ASME):

1. ASME B16.1 - Gray Iron Pipe Flanges and Flanged Fittings.

2. ASME B16.5 - Pipe Flanges and Flanged Fittings: NPS 1/2 through 24 - Metric/Inch Standard.

3. ASME B16.42 - Ductile Iron Pipe Flanges and Flanged Fittings: Classes 150 and 300.

4. ASME B1.20.1 - Pipe Threads, General Purpose (Inch).

B. ASTM International (ASTM):

1. ASTM A126 - Standard Specification for Gray Iron Castings for Valves, Flanges, and Pipe Fittings.

2. ASTM B62 - Standard Specification for Composition Bronze or Ounce Metal Castings.

3. ASTM B584 - Standard Specification for Copper Alloy Sand Castings for General Applications.

C. American Water Works Association (AWWA):

1. AWWA C509 - Resilient-Seated Gate Valves for Water Supply Service.

2. AWWA C515 – Reduced-Wall, Resilient-Seated Gate Valves for Water Supply Service

3. AWWA C550 - Protecting Interior Coatings for Valves and Hydrants.

D. Manufacturers Standardization Society of the Valve and Fittings Industry (MSS):

1. MSS SP-70 - Gray Iron Gate Valves, Flanged and Threaded Ends.
2. MSS SP-80 - Bronze Gate, Globe, Angle and Check Valves.

E. NSF International (NSF):

1. NSF/ANSI Standard 61 - Drinking Water System Components - Health Effects
2. NSF/ANSI Standard 372 - Drinking Water System Components - Lead Content

1.3 SUBMITTALS

A. Section 01 33 00 - Submittal Procedures: Requirements for submittals.
B. As required by Section 33 12 16 - Water Utility Distribution and Transmission Valves.

PART 2 PRODUCTS

2.1 GENERAL

A. All materials in contact with potable water shall conform to ANSI/NSF Standard 61 and meet the “lead free” requirements of the Safe Drinking Water Act amendment, effective January 4, 2014, as per the lead content evaluation procedures outlined in NSF/ANSI Standard 372.1.

1. All fittings shall either be cast or permanently stamped with markings identifying the item as complying with NSF 61 per the requirements of NSF 372 for “lead free”.

2. All brass in contact with potable water shall comply with ASTM B584.

2.2 RESILIENT-SEATED GATE VALVES

A. Description:

1. Comply with AWWA C509.

2. Minimum Pressure Rating:

a. Twelve-inch Diameter and Smaller: 200 pounds per square inch (gauge) (psig).
b. Sixteen-inch Diameter and Larger: 150 psig.

3. End Connections: As shown in the Drawings.

a. Standard mechanical joint ends comply with ANSI/AWWA C111.

b. Flanged end dimensions and drilling comply with ANSI/ASME B16.1, class 125. Comply with AWWA C115 & ASME 16.5.

1) The CONTRACTOR shall coordinate with pipe, valve, and fitting suppliers to make certain pipe, valve, and fitting flanges match in bolt pattern.

4. Gear Actuators: Conforming to AWWA C509 for manual valves.

5. Linings and Coatings:

a. Corrosion-resistant fusion bonded epoxy conforming to AWWA C550 and NSF 61.

b. All internal and external ferrous surfaces.

c. Do not coat flange faces of valves.

6. Bi-directional flow.

B. Operation:

1. Non-rising stem.

2. Open counterclockwise when viewing the valve from above, unless otherwise indicated in the Drawings.

3. Buried Valves: All buried valves shall be provided with 2-inch square operating nuts.

4. In-Plant Service Valves: Valves for in-plant or exposed service shall be furnished with handwheel operators, unless otherwise specified in Section 40 05 51, Common Requirements for Process Valves.

C. Materials:

1. Wedge:

a. ASTM A126, cast iron or ASTM A536, ductile iron.
b. Fully encapsulated.

2. Body and Bonnet:

a. ASTM A126, cast iron or ASTM A536, ductile iron.

3. Stem, Stem Nuts, Glands, and Bushings: ASTM B584, bronze.

4. Valve Body Bolting: Stainless steel.

D. Manufacturers:

1. Clow Valve Company.
2. M&H Valve.
3. U.S. Pipe.
4. American Flow Control.
5. Mueller Company.

2.3 DOUBLE-DISC GATE VALVES – NOT USED

2.4 SOLID WEDGE, METAL-SEATED GATE VALVES – NOT USED

2.5 GENERAL-DUTY GATE VALVES - SMALLER THAN 3 INCHES

A. Two inches and Smaller:

1. MSS SP 80, Class 125.
2. Body and Trim: ASTM B584, bronze.
3. Bonnet: Union.
4. Operation: Handwheel.
5. Inside screw with back-seating stem.
6. Wedge Disc: Solid; ASTM B584, bronze.
7. End Connections: Threaded.

B. Two and one-half inches to 3 inches:

1. MSS SP 70, Class 125.
2. Stem: Non-rising.
3. Body: ASTM A126, cast iron.
4. Trim: Bronze.
5. Bonnet: Bolted bonnet.
6. Handwheel, outside screw and yoke.
7. Wedge Disc: Solid, with bronze seat rings.
8. End Connections: ASME B16.1, ASME B16.5, ASME B16.42, flanged.

C. Manufacturers:

1. Stockham, Figure B-103.
2. Nibco, Model T-113.
3. Milwaukee Valve, Model 105.
4. Approved equal.

2.6 SOURCE QUALITY CONTROL

A. Testing: Test gate valves according to AWWA C509.

PART 3 EXECUTION

3.1 INSTALLATION

A. As required by Section 33 12 16, Water Utility Distribution and Transmission Valves.
B. Install according to Manufacturer's instructions.
C. Support valves in plastic piping to prevent undue stresses on piping.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 40 05 64 - BUTTERFLY VALVES

PART 1 GENERAL

1.1 SUMMARY

A. This Section includes butterfly valves for buried service. Coordinate with Section 33 12 16, Water Utility Distribution and Transmission Valves and Section 40 05 51, Common Requirements for Process Valves.

B. Section Includes:

1. Rubber-seated butterfly valves.

C. Related Sections:

1. Section 33 12 16, Water Utility Distribution and Transmission Valves
2. Section 33 11 10, Water Utility Distribution and Transmission Piping
3. Section 40 05 51, Common Requirements for Process Valves.

1.2 REFERENCE STANDARDS

A. American Society of Mechanical Engineers (ASME):

1. ASME B16.1 - Gray Iron Pipe Flanges and Flanged Fittings.

2. ASME B16.5 - Pipe Flanges and Flanged Fittings: NPS 1/2 through 24 - Metric/Inch Standard.

3. ASME B16.42 - Ductile Iron Pipe Flanges and Flanged Fittings: Classes 150 and 300.

B. ASTM International (ASTM):

1. ASTM A126 - Standard Specification for Gray Iron Castings for Valves, Flanges, and Pipe Fittings.

2. ASTM A536 - Standard Specification for Ductile Iron Castings.

3. ASTM B62 - Standard Specification for Composition Bronze or Ounce Metal Castings.

4. ASTM B584 - Standard Specification for Copper Alloy Sand Castings for General Applications.

C. American Water Works Association (AWWA):

1. AWWA C504 - Rubber-Seated Butterfly Valves, 3 In. (75 mm) Through 72 In. (1,800 mm).

2. AWWA C550 - Protecting Interior Coatings for Valves and Hydrants.

D. NSF International (NSF):

1. NSF/ANSI Standard 61 - Drinking Water System Components - Health Effects
2. NSF/ANSI Standard 372 - Drinking Water System Components - Lead Content

1.3 SUBMITTALS

A. Section 01 33 00 - Submittal Procedures: Requirements for submittals.
B. As required by Section 33 12 16 - Water Utility Distribution and Transmission Valves.

PART 2 PRODUCTS

2.1 GENERAL

A. All materials in contact with potable water shall conform to ANSI/NSF Standard 61 and meet the "lead free" requirements of the Safe Drinking Water Act amendment, effective January 4, 2014, as per the lead content evaluation procedures outlined in NSF/ANSI Standard 372.1.

1. All fittings shall either be cast or permanently stamped with markings identifying the item as complying with NSF 61 per the requirements of NSF 372 for "lead free".

2. All brass in contact with potable water shall comply with ASTM B584.

2.2 RUBBER-SEATED BUTTERFLY VALVES

A. Description:

1. Comply with AWWA C504, Class 150B.

2. Minimum Pressure Rating:

a. Twelve-inch (300-millimeter) Diameter and Smaller: 200 pounds per square inch (gauge) (psig).

b. Sixteen-inch (400-millimeter) Diameter and Larger: 150 psig.

3. End Connections: As shown in the Drawings.

a. Standard mechanical joint ends comply with ANSI/AWWA C111.

b. Flanged end dimensions and drilling comply with ANSI/ASME B16.1, class 125, unless shown otherwise.

1) The CONTRACTOR shall coordinate with pipe, valve, and fitting suppliers to make certain pipe, valve, and fitting flanges match in bolt pattern.

4. Gear Actuators: Conforming to AWWA C504 for manual valves.

5. Linings and Coatings:

a. Corrosion-resistant fusion bonded epoxy conforming to AWWA C550 and NSF 61.

b. All internal and external ferrous surfaces.

c. Do not coat flange faces of valves.

6. Bubble-tight at the rated pressure for bi-directional flow.

7. Style: Wafer.

8. Shaft: Self-lubricating, sleeve-type bearings. One-piece, through-shaft construction.

a. Valve shafts shall be full size for that portion of the shaft extending through the valve bearings, valve disc, and shaft seal.

b. Any portion of the shaft turned down for any reason shall have fillets with radii equal to the offset to minimize stress concentrations at the junction of the different shaft diameters. The turned down portion of the shaft shall be capable of transmitting the maximum operator torque without exceeding a torsional steel stress of 11,500 pounds per square inch (psi).

9. Seats: Mounted on body for valves 24 inches and smaller; field replaceable (mechanically retained in a machined groove) for valves larger than 24 inches.

10. Packing: Replaceable without dismantling valve.

B. Operation:

1. Open counterclockwise, unless otherwise indicated in the Drawings.

2. Operators shall be of the traveling nut, self-locking type and shall be designed to hold the valve in any intermediate position between full open and fully closed without creeping or fluttering.

3. Buried Valves: All buried valves shall be provided with 2-inch square operating nuts.

C. Materials:

1. Body: ASTM A126, cast iron or ASTM A536, ductile iron. Integrally cast flanged or mechanical end joints.

2. Shaft: Stainless steel.

3. Disc: ASTM A126, cast iron or ASTM A536, ductile iron.

4. Seats: Resilient, replaceable, Buna-N.

5. Seating Surfaces: Type 316 stainless steel.

6. Bearings:

a. Sleeve: Corrosion-resistant and self-lubricating.

D. Manufacturers:

1. M&H Valve.
2. Henry Pratt Company.
3. Mueller Company.
4. Kennedy Valve Company.
5. Dezurik.

2.3 SOURCE QUALITY CONTROL

A. Testing: Test butterfly valves according to AWWA C504.

PART 3 EXECUTION

3.1 INSTALLATION

A. As required by Section 33 12 16, Water Utility Distribution and Transmission Valves.

B. Install according to Manufacturer's instructions.

END OF SECTION

SECTION 40 05 78.19 – COMBINATION AIR VALVES FOR WATER SERVICE

PART 1 GENERAL

1.1 SUMMARY

A. Section Includes: Combination air valves for water service.

B. Related Sections:

1. Section 09 90 00 - Painting and Coating

2. Section 40 05 51 - Common Requirements for Process Valves

1.2 REFERENCE STANDARDS

A. American Water Works Association:

1. AWWA C512 - Air Release, Air/Vacuum, and Combination Air Valves for Waterworks Service.

B. ASME International:

1. ASME B16.1 - Gray Iron Pipe Flanges and Flanged Fittings: Classes 25, 125, and 250.

C. ASTM International:

1. ASTM A126 - Standard Specification for Gray Iron Castings for Valves, Flanges, and Pipe Fittings.

2. ASTM A536 - Standard Specification for Ductile Iron Castings.

D. International Organization for Standardization:

1. ISO 9001 - Quality Management Systems.

E. NSF International:

1. NSF 61 - Drinking Water System Components - Health Effects.

2. NSF 372 - Drinking Water System Components - Lead Content.

1.3 COORDINATION

A. Section 01 30 00 - Administrative Requirements: Requirements for coordination.

B. Coordinate Work of this Section with installation of process piping.

1.4 NOT USED

1.5 SUBMITTALS

A. Section 01 33 00 - Submittal Procedures: Requirements for submittals.

B. Product Data: Submit Manufacturer catalog information.

C. Shop Drawings: Indicate materials, dimensions, weights, and end connections in assembly drawings.

D. Manufacturer's Certificate: Certify that products meet or exceed specified requirements.

E. Manufacturer Instructions: Submit special procedures and setting dimensions.

F. Source Quality-Control Submittals: Indicate results of factory tests and inspections.

G. Field Quality-Control Submittals: Indicate results of Contractor-furnished tests and inspections.

H. Manufacturer Reports: Certify that equipment has been installed according to Manufacturer instructions.

1.6 CLOSEOUT SUBMITTALS

A. Project Record Documents: Record actual locations of combination air valves.

1.7 QUALITY ASSURANCE

A. Materials in Contact with Potable Water: Certified to NSF 61 and NSF 372.

B. Manufacturer Quality Management System: Certified to ISO 9001.

C. Perform Work according to City of Warrenton standards.

1.8 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing products specified in this Section with minimum three years' experience.

B. Installer: Company specializing in performing Work of this Section with minimum three years' experience.

1.9 DELIVERY, STORAGE, AND HANDLING

A. Inspection: Accept materials on Site in Manufacturer's original packaging and inspect for damage.

B. Store materials according to Manufacturer instructions.

C. Protection:

1. Protect materials from moisture and dust by storing in clean, dry location remote from construction operations areas.

2. Furnish temporary end caps and closures on piping and fittings and maintain in place until installation.

3. Provide additional protection according to Manufacturer instructions.

1.10 EXISTING CONDITIONS

A. Field Measurements:

1. Verify field measurements prior to fabrication.

2. Indicate field measurements on Shop Drawings.

1.11 WARRANTY

A. Furnish five-year Manufacturer's warranty for combination air valves.

PART 2 PRODUCTS

2.1 COMBINATION AIR VALVES FOR WATER SERVICE

A. Description:

1. Type:

a. Fully automatic, float operated.

b. Body: Double.

2. Comply with AWWA C512.

3. Size: As indicated on Drawings.

4. Suitable for potable water service.

B. Materials:

1. Body and Cover: 316 Stainless Steel or Ductile Iron ASTM A536 Grade 60-40-18.

2. Float, Seat, and Trim: 316 Stainless Steel.

3. Seats: Buna-N.

4. Seals: Buna-N.

C. End Connections:

1. Size 4 Inches and Smaller: Threaded, NPT.

2. Size Larger than 4 Inches: Flanged, ASME B16.5.

D. Manufacturers:

1. DeZurik, APCO AVV-1800/1800K, Dual Body Combination Air Valves, or approved equal.

2.2 INSULATION

A. As indicated on Drawings.

2.3 FINISHES

A. Prepare piping appurtenances for field finishes as specified in Section 09 90 00 - Painting and Coating.

2.4 SOURCE QUALITY CONTROL

A. Certificate of Compliance:

1. If fabricator is approved by authorities having jurisdiction, submit certificate of compliance indicating Work performed at fabricator's facility conforms to Contract Documents.

2. Specified shop tests are not required for Work performed by approved fabricator.

PART 3 EXECUTION

3.1 EXAMINATION

A. Verify that field dimensions are as indicated on Drawings.

B. Inspect existing flanges for nonstandard bolt hole configurations or design and verify that new pipe and flanges mate properly.

3.2 PREPARATION

A. Thoroughly clean end connections before installation.

B. Close pipe and equipment openings with caps or plugs during installation.

C. Surface Preparation: Clean surfaces to remove foreign substances.

3.3 INSTALLATION

A. According to Manufacturer instructions.

B. Provide access for operation, removal, and maintenance, and to avoid discharge to occupied areas or other equipment.

C. Installation Standards: Install Work according to City of Warrenton standards.

3.4 FIELD QUALITY CONTROL

A. Inspect for interferences and proper supports.

B. Testing:

1. As specified in Section 40 05 51 - Common Requirements for Process Valves.

2. Demonstrate operation without undue noise or vibration.

C. Manufacturer Services: Furnish services of Manufacturer's representative experienced in installation of products furnished under this Section for not less than two days on Site for

installation, inspection, startup, field testing, and instructing Owner's personnel in operation and maintenance of equipment.

D. Equipment Acceptance:

1. Adjust, repair, modify, or replace components failing to perform as specified and rerun tests.

2. Make final adjustments to equipment under direction of Manufacturer's representative.

3. Repair damaged coatings with material equal to original coating.

E. Furnish installation certificate from Equipment Manufacturer's representative attesting that equipment has been properly installed and is ready for startup and testing.

3.5 CLEANING

A. Keep interior of air release valves clean as installation progresses.

3.6 DEMONSTRATION

A. Demonstrate equipment startup, shutdown, routine maintenance, and emergency repair procedures to Owner's personnel.

END OF SECTION

ACRONYMS

1 INTRODUCTION

We understand that the City of Warrenton (the City) is planning to install an approximately 10,000 foot long, 18-inch diameter ductile iron waterline. Based on preliminary plans provided to us, the pipeline is planned to have a minimum cover that varies from 30- to 42-inches. Therefore, we anticipate that the pipeline will have an average depth of 4- to 5-feet to invert. However, profiles included in the preliminary plans provided by Consor indicate that the pipeline will be deeper in certain locations along the alignment, but still less than 10-feet to invert.

2 GEOLOGIC SETTING

2.1 Regional Geology

The Oregon Coast Range began as a mid-oceanic volcanic island chain, riding atop the ocean basaltic Kula and Juan de Fuca plates that collided with the North American continental plate during the early Eocene, 55 million years ago (Orr and others, 1992). These volcanic rocks of accreted islands form the backbone of the coastal mountains and are the oldest known rocks in the Coast Range. As the islands were accreted to North America, and the Kula and Juan de Fuca plates on which they were riding were forced beneath the continental plate, a trough was created between the ancestral Cascade Mountains and the accreted volcanic islands. During the Eocene and early Miocene, 55 to 16 million years ago, silt, sand, mud, and volcanic debris were deposited in the forearc basin and onto the subsiding accreted island chain from the landmass to the east. During the Oligocene and early Miocene, deposition over the subsiding accreted islands and the forearc basin continued from increased volcanism in the Western Cascades. During the Miocene, the ocean retreated to the west and the western edge of the North American plate wrinkled and buckled upwards by pressure from the subducting Juan de Fuca plate. Subduction of the Juan de Fuca plate under North America has pushed the Coast Range upwards and created the Coast Range physiographic province, a narrow north-south trending belt of moderately high mountains and coastal headlands, 30 to 60 miles wide and about 200 miles long, typically consisting of Tertiary marine sedimentary and volcanic rocks (Orr and others, 1992).

2.2 Local Geology

Published mapping by Walsh (1987), Niem and Niem (1985) and Schlicker and others (1972) indicates the pipeline alignment is underlain by Quaternary (from 1.8 million years ago to the present) beach sand, dune sand and flood plain alluvium silty clay. Neim and Neim (1985) describe the beach sand as consisting of well sorted, fine- to medium grained quartzo-feldspathic sands and the dune sand as well sorted, fine grained, quartzo-feldspathic sands with cross bedding.

2.3 Seismic Setting

The contemporary tectonics and seismicity of the region are the result of oblique, northeastward subduction at a rate of about 37 millimeters per year (mm/yr) (DeMets and others, 2010) of the Juan de Fuca oceanic plate beneath the North American continental plate (Wells and others, 1998; Wells and Simpson, 2001). This complex tectonic setting produces east-west compressive strain along the Cascadia Subduction Zone (CSZ), as well as northward translation and rotation of the mobile, crustal, Cascadia forearc blocks that span the leading edge of the North American plate (Wells and others, 1998; McCaffrey and others, 2007, 2013). Rotation of the Sierra-Nevada block and expansion of the Basin and Range drive the northward migration and clockwise rotation of the Cascadia forearc blocks (Pezzopane and Weldon, 1993; Wells and others, 1998; Wells and Simpson, 2001). As a result, the southern portion of the forearc, the Oregon Coast block, is impinging on western Washington and northwest Oregon at a rate of about 8 to 12 mm/yr causing crustal shortening in northwest Oregon and western Washington (Wells and others, 1998; Wells and Simpson, 2001; Mazzotti and others, 2002).

The combined effect of margin-normal subduction and margin-parallel shortening produces complex and diverse deformation within the northern edge of the Cascadia forearc and triggers large (greater than magnitude [M] 6), damaging earthquakes from three seismogenic source zones:

- The locked zone of the CSZ fault interface, which produces great mega-thrust earthquakes;
- The deep intraslab portion of the CSZ (i.e., the subducted portion of the Juan de Fuca Plate), the source of Wadati-Benioff zone earthquakes; and
- The overriding North American Plate, where shallow crustal faults rupture.

All three sources potentially produce earthquakes that impact the ground motion hazards at the project site. Offshore, elastic release of strain accumulated in the locked plate interface of the CSZ produces great megathrust earthquakes (greater than M 8.0) occurring at

irregular intervals that span from about 100 to more than 1,200 years, with an average recurrence interval of about 300 to 500 years (Atwater and Hemphill-Haley, 1997; Clague, 1997; Goldfinger and others, 2003 and 2012); the most recent rupture occurred in A.D. 1700 (Satake and others, 1996; Atwater and Hemphill-Haley, 1997; Clague, 1997; Yamaguchi and others, 1997; Goldfinger and others, 2003 and 2012).

Onshore, migration and rotation of tectonic blocks produce deformation along shallow faults within the upper part of the crust. At depth, rupture within the subducting slab, referred to as the intraslab, has produced some of the largest recorded earthquakes (M 6.5 to 7) to strike the Pacific Northwest, the northern California Coast, and Western Washington. However, over the past century, intraslab earthquakes have been markedly infrequent in Oregon. The following sections briefly describe the location, characteristics, and seismicity of each of the sources.

2.3.1 Cascadia Subduction Zone: Mega-Thrust Interface Source

CSZ mega-thrust earthquakes originate along the interface between the subducting oceanic plates and the North American plate. Because of the significant uncertainty of the landward extent of a potential rupture surface, estimates of the closest distance between the project and potential rupture surface range from about 5 to 40 horizontal miles. Focal depths for mega-thrust earthquakes are commonly on the order of about 15 to 25 miles. Rupture of the interface could result in earthquakes with moment magnitudes (Mw) on the order of 8.5 to over 9.0, with strong shaking that lasts for several minutes. No large earthquakes have occurred in this zone during historic times (the last 170 years). However, geologic evidence suggests that coastal estuaries have experienced rapid subsidence at various times within the last 2,000 years (Atwater, 1987; Atwater and Hemphill-Haley, 1997) as a result of tectonic movement associated with mega-thrust earthquakes on the CSZ. It appears that ruptures of this zone have occurred at irregular intervals that span from about 100 to more than 1,200 years, with an average recurrence interval of about 300 to 500 years (Atwater and Hemphill-Haley, 1997). Based on historical tsunami records in Japan (Satake and others, 1996) the most recent interplate event on the CSZ was a Mw 9 event on January 26, 1700.

2.3.2 Cascadia Subduction Zone: Intraslab Source

CSZ intraslab earthquakes originate from within the subducting oceanic plates as a result of down-dip tensional forces and bending caused by mineralogical and density changes in the plates at depth. These earthquakes typically occur 28 to 37 miles beneath the surface. The nearest seismogenic intraslab portion of the Juan de Fuca plate is approximately 30 to 60 miles below the Portland area. Ludwin and others (1991) estimate that the maximum Mw from this source zone would be about 7.5. Ground shaking produced by intraplate

earthquakes would be less intense and less prolonged in the Portland area than ground motions generated by large subduction zone interface earthquake events. Historic seismicity from this source zone includes the 1949 Mw 6.7 Olympia earthquake, the 1965 Mw 6.7 earthquake between Tacoma and Seattle, and the 2001 Mw 6.8 Nisqually earthquake. While intraslab events have occurred frequently in the Puget Sound area, they are historically rare in Oregon.

2.3.3 Shallow Crustal Source

Shallow crustal earthquakes within the North American Plate have historically occurred in a diffuse pattern within Pacific Northwest, typically within the upper 4 to 19 miles of the continental crust. The largest known crustal earthquake in the Pacific Northwest is the 1872 North Cascades earthquake at approximate Mw 6.5 to 7.0. Other examples include the 1993 Mw 5.6 Scotts Mill earthquake and the 1993 Mw 6.0 Klamath Falls earthquake.

2.3.4 Quaternary Faults and Folds

Faults and associated folds which demonstrate geological evidence of co-seismic surface deformation during the Quaternary time period in Oregon and Washington have been located and characterized by the United States Geological Survey (USGS). The USGS provides approximate fault locations and a detailed summary of available fault information in the USGS Quaternary Fault and Fold Database. The database defines four categories of faults, Class A through D, based on evidence of tectonic movement known or presumed to be associated with large earthquakes during Quaternary time (within the last 2.6 million years). For Class A faults, geologic evidence demonstrates that a tectonic fault exists and that it has likely been active within the Quaternary period. For Class B faults, there is equivocal geologic evidence of Quaternary tectonic deformation, or the fault may not extend deep enough to be considered a source of significant earthquakes. Class C and D faults lack convincing geologic evidence of Quaternary tectonic deformation or have been studied carefully enough to determine that they are not likely to generate significant earthquakes.

According to the USGS Quaternary Fault and Fold Database (USGS, 2023), there are 5 Class A features, within approximately 20 miles of the project site. Their names, general locations relative to the site, and the time since their most recent deformation are summarized in Exhibit 2-1. The CSZ itself is approximately 6 miles west of the project site, with an average slip rate of approximately 40 millimeters (1.5 inches) per year.

Exhibit 2-1: USGS Class A Faults Within an Approximate 20-Mile Radius of the Project Site

Fault Name	USGS Fault Number	Approximate Length	Approximate Distance and Direction from Project Site[1]	Slip Rate Category[2]	Time Since Last Deformation[3]
Cascadia Fold and Fault Bed	784	301 miles	5.7 miles West	Between 1.0 and 5.0 mm/yr	< 15 ka
Unnamed Offshore Faults	785	174 miles	9.3 miles West	Between 1.0 and 5.0 mm/yr	< 15 ka
Willapa Bay Fault Zone	592	23 miles	14.7 miles North	Between 0.2 and 1.0 mm/yr	<750 ka
Nehalem Bank Fault	789	62.8	16.9 miles West	Between 1.0 and 5.0 mm/yr	< 15 ka
Fault H	790	30.4	17.2 miles SW	Greater than 5.0 mm/yr	< 15 ka

NOTES:

[1] Approximate distance between project site and nearest extent of fault mapped at the ground surface.

[2] mm = millimeters; yr = year.

[3] Ma = "Mega-annum" or million years ago; ka = "Kilo-annum" or one thousand years ago.

3 EXPLORATION PROGRAM

Shannon & Wilson explored subsurface conditions at the project site with six Cone Penetetration Tests (CPTs), designated CPT-1 to CPT-6 and one geotechnical boring designated B-1. The CPT's were completed to depths ranging from 60.4 to 101.5 feet below ground surface (bgs) between January 23 to January 25, 2024. During explorations, a vibrating wire piezometer (VWP) was installed to allow the measurement of groundwater levels in boring B-1.

Approximate locations of the explorations are shown on the Site and Exploration Plan, Figure 2. Details of drilling, sampling procedures, and our log of the materials encountered are presented in Appendix A, Field Explorations.

3.1 Laboratory Testing

Soil samples obtained during our field exploration were transported to our laboratory for further examination. Representative samples were selected for laboratory tests. The laboratory testing program included moisture contents and grain size analyses. Laboratory testing was performed by Shannon & Wilson in accordance with applicable ASTM International (ASTM) standard test procedures. Results of the laboratory testing are presented in Appendix B and are shown on the log of the boring included in Appendix A.

4 SUBSURFACE CONDITIONS

4.1 Geotechnical Units

Shannon & Wilson grouped the materials encountered in our field explorations into two geotechnical units. The soil classifications are presented in the individual boring logs. The geotechnical units are as follows:

- **Fill:** Asphalt and Base Aggregate; and
- **Holocene Beach Sand:** Poorly Graded Sand (SP).

These geotechnical units were grouped based on their engineering properties, geologic origins, and their distribution in the subsurface. Contacts between the units may be more gradational than shown in the boring log in Appendix A.

4.2 Groundwater

Based on pore water dissipation testing in the CPTs, depth to groundwater was inferred in the CPT locations at the time of testing. Additionally, during explorations, a vibrating wire piezometer was installed to measure the groundwater level in boring B-1. The vibrating wire piezometer was installed to allow for ongoing groundwater level measurements. A summary of groundwater measurements is provided in Exhibit 4-1.

Exhibit 4-1: Depth to Groundwater Summary

Exploration (Method)	Date	Depth of Water (ft)	Approximate Ground Surface Elevation (ft)	Approximate Groundwater Elevation (ft)
B-1	1/23/2024	2.8	11.4	8.6
CPT-1 (PWD_1)	1/25/2024	8.93	14.5	5.6
CPT-2 (PWD_1)	1/24/2024	3.62	9.6	6.0
CPT-3 (PWD_1)	1/24/2024	4.90	13.6	8.7
CPT-4 (PWD_1)	1/24/2024	1.02	10.1	9.1
CPT-5 (PWD_1)	1/25/2024	5.40	11.4	6.0
CPT-6 (PWD_1)	1/23/2024	2.39	12.8	10.4

NOTES:

[1] Measurement inferred from Pore Water Dissipation Test in Cone Penetrometer (PWD)

Groundwater levels should be expected to vary with changes in topography and precipitation. Generally, groundwater highs occur at the end of the wet season in late spring or early summer, and groundwater lows occur towards the end of the dry season in the early to mid-fall.

5 GEOLOGIC HAZARDS

5.1 Landslide Hazard

According to the Oregon Department of Geology and Mineral Industries, no landslides have been mapped along the proposed pipeline alignment. Relative earthquake hazard maps prepared for coastal communities by DOGAMI (IMS-10) indicate that the proposed alignment is in an area of low landslide hazard. Based on the site topography and mapped landslide hazard, we consider the risk of earthquake induced landslides impacting the proposed pipeline to be low.

5.2 Liquefaction

Soil liquefaction is a phenomenon in which excess pore water pressure of loose to medium dense, saturated, granular soils increases during ground shaking to a level near the initial effective stress. The increased excess pore pressure results in a reduction of soil shear strength. The effects of liquefaction typically include lateral spreading, slope instability, and ground settlement.

Soil behavior under seismic loading is the primary factor in determining the susceptibility of soil to liquefaction. Important factors in evaluating soil behavior are relative density, the fines content (percent of soil by weight smaller than 0.075 millimeters, passing the No. 200 sieve), and the plasticity characteristics of the fines. Relative density can be estimated from CPT tip resistances and shear wave velocity measurements that were performed for this project. We completed grain size analyses to evaluate the index parameters of the soils at the site.

5.2.1 Liquefaction Analysis and Liquefaction-Induced Settlement

We evaluated liquefaction potential of the soils based on the boring and CPT results completed for this study. The CPT soundings were evaluated using the computer program CLiq Version 2 by GeoLogismiki, which incorporates the Boulanger and Idriss (2014) method. Our analysis was completed using a peak ground acceleration (PGA_M) of 0.8g and a mean Mw 8.89, based on the total seismic source contribution, according to USGS's Unified Hazard Tool with a 2,475-year return period. Exhibit 5-1 presents a summary of liquefaction induced settlement under the proposed pipeline.

Exhibit 5-1: Summary of Liquefaction-Induced Settlement

Exploration ID	Approximate Pipe Invert Elevation (feet)	Approximate Elevations of Liquefaction Susceptible Soils (feet)	Approximate Total Settlement at Pipe Invert[1] (inch)
CPT-1	6	4 to -46	1.5
CPT-2	6	4 to -51	2.5
CPT-3	6	8.5 to -46.5	3.0
CPT-4	6	8 to -50	2.0
CPT-5	6	6 to -48.5	3.5
CPT-6	6	10 to -47.5	3.0

Liquefaction-induced settlement magnitudes based on CPT soundings were estimated using Boulanger and Idriss (2014).

Soil deposits are not homogeneous; and liquefaction-induced settlement seldom occurs uniformly, even in small, localized areas (Ishihara and Yoshimine 1992), making differential settlements difficult to predict. Based on the available data and considering the range of liquefaction-induced settlement for the borings and CPT soundings along the proposed alignment, it is our qualitative assessment that the average liquefaction-induced differential settlement of the pipeline for the design earthquake ground motions will likely be less than or equal to approximately 1 inch in 500 feet.

We anticipate the estimated settlements could impact the buried pipeline that will be within or above the identified potentially liquefiable layers. Consequently, we recommend the designers of these structures consider the liquefaction-induced settlements.

5.2.2 Potential Increased Flotation Effect

The proposed pipelines within the identified potentially liquefiable soil layers will be subjected to increased buoyance forces beyond those during static conditions due to the dramatic increase in the pore water pressure associated with soil liquefaction.

The assessment of potential flotation of the pipeline from liquefaction involves determining if sufficient resistance to buoyancy forces is provided by the weight of the pipelines and resistance of the surrounding soil to uplift. We recommend the risk for flotation be evaluated during final design based on the specific pipeline and structure embedment within the liquefiable soil. Seismic mitigations for potential pipeline flotation are discussed

in Section 5.5 with additional guidance on the unit weight of various backfill materials and buoyant unit weight of soil in Section 6.2.

5.3 Lateral Spreading

Lateral spreading hazards can exist in areas with mild slopes adjacent to a much steeper slope or vertical face. Lateral spreading failure can occur if soil liquefaction develops during a seismic event and the ground acceleration (inertial force) briefly surpasses the yield acceleration (shear strength) of the liquefied soil. This can cause both the liquefied soil and an overlying non-liquefied crust of soil to displace laterally down mild slopes or towards an embankment face. The displacements are cumulative and permanent in nature.

The proposed pipeline alignment is approximately 750 to greater than 1,000 feet from the nearest free face. Based on the distance to the free face and the presence of existing infrastructure between the site and the Columbia River, the potential for lateral spreading to impact the pipeline is low.

5.4 Fault Surface Rupture

As presented in Exhibit 2-1, the closest mapped fault to the site is mapped approximately 5.7 miles west of the proposed alignment. Consequently, it is our opinion that the risk of surface fault rupture along the alignment is low during a design life of 100 years or less.

5.5 Seismic Hazard Mitigation

Where liquefied soil buoyant forces could cause flotation along the pipeline, mitigation strategies largely consist of protecting the pipeline with weighted pipe, such as encasements, or anchoring the pipeline with special foundation systems. For mitigation of differential settlements, lateral forces, and permanent ground displacements, potential measures consist of the selection of appropriate pipe materials and joints capable of withstanding predicted movements, and the use of specialized earthquake-resistant pipe and joints, as necessary.

Seismic mitigation for flotation of pipelines may include the use of backfilling with Controlled Low Strength Material (CLSM) above the pipeline. If CLSM is used, it will result in additional lateral forces on the pipeline during placement of the CLSM; therefore, we recommend consideration be given to the other methods, or very specific restrictions are placed on lift thickness and allowable time for setup of the CLSM before additional lifts are placed during construction.

6 PIPELINE DESIGN RECOMMENDATIONS AND CONSIDERATIONS

6.1 Bedding, Pipe Zone and Trench Backfill

The following are recommendations for pipe bedding, pipe zone, trench backfill, foundation (subgrade) preparation, and soil stiffness properties for pipe design. The recommendations below are consistent with the City of Warrenton Engineering Design Standards, which follow the 2018 Oregon Standard Specifications for Construction requirements for bedding, pipe zone, and trench backfill.

6.1.1 Bedding

The pipe bedding zone in the trench should be constructed with imported, well-graded, clean crushed rock material suitable for compaction and allowing for flexible joints. The on-site excavation spoils will be predominantly graded sands that are not suitable for use as bedding material. The bedding material should consist of imported, ¾-inch-minus crushed aggregate, as specified in the current Oregon Standard Specification for Construction, Item 00405.12, Bedding. Provided that the subgrade soil is competent, and is not disturbed by the excavation equipment, the minimum thickness of granular bedding below the invert of the pipeline should be 6 inches for 18-inch diameter pipelines in accordance with Oregon Standard Drawing RD300.

In areas where wet, weak, or disturbed subgrade conditions are encountered, the required subgrade stabilization (subgrade overexcavation/replacement) will likely result in thicker pipe bedding. During our explorations, soft clay soils were encountered in the pipe zone in CPT-1, CPT-4 and CPT-6. Additionally, high groundwater is expected at various locations along the alignment. For estimating purposes, in high groundwater areas we recommend planning for installation of a crushed rock drainage layer at a minimum. The crushed rock drainage layer should be at least 12 inches thick and installed below the pipe bedding to facilitate dewatering, such as engineered sump pumping from within this drainage layer to maintain groundwater within this layer. To prevent soils fines from migrating into the drainage layer during sump pumping (described below), we recommend a non-woven geotextile such as Mirafi 140N, Amoco Style 4550 (or equivalent), be placed between the subgrade soils and the bottom of the drainage layer and on the sides of the drainage layer. We recommend that the actual amount of over-excavation and additional work related to the acceptance of the subgrade be determined in the field, observed, and approved by a qualified Owner's Representative.

The drainage layer should be constructed with open, free-draining crushed rock materials with a 1½- to 3/4-inch gradation, conforming to Oregon Standard Specifications for Construction (OSSC 2018, 00430.11). The crushed rock for the working mat/drainage system should also have less than 2 percent by weight passing the No. 200 wet sieve; and 90 percent of particles by weight retained on the U.S. No. 4 sieve should have at least two fractured faces. In areas where the drainage rock described above is used, the material can also serve as the pipe bedding.

If native soil migration or softening of the native subgrade soils is observed during construction, or is a result of construction activities, we recommend a non-woven geotextile such as Mirafi 140N, Amoco Style 4550 (or equivalent), be placed between the subgrade soils and the bedding layer.

6.1.2 Pipe Zone

For the pipe zone material, bedding material specified in OSSC 2018, Item 00405.12, should be used for flexible pipes. In accordance with Oregon Standard Drawing RD300 the pipe zone materials should extend at least 12 inches above the top of an 18-inch pipe, or as determined by the manufacturer or civil engineer. Pipe zone compaction should be at least 90 percent of maximum density, as determined by a proctor, conforming to AASHTO T99.

6.1.3 Trench Backfill

Within roadways, shoulders, and settlement sensitive areas we recommend the use of ¾-inch-minus crushed aggregate, with less than 7 percent by dry weight passing a U.S. Standard No. 200 Sieve, and it should meet OSSC 2024 00405.14 (Class B Backfill). We recommend the backfill be compacted to at least 95 percent of the maximum dry density, as determined by AASHTO T 99 or as recommended by the civil engineer.

In non-settlement sensitive areas Class A Backfill may be used. We recommend the backfill be compacted to at least 90 percent of the maximum dry density, as determined by AASHTO T 99. If native topsoil was present prior to excavation in non-paved areas, then it should be replaced within the upper 12-inches of the adjacent ground surface. The topsoil should be mounded over the trench to allow for settlement.

6.2 Uplift Design and Potential Flotation Effects

The assessment of potential pipeline flotation from liquefaction involves determining if enough resistance to buoyancy forces is provided by the weight of the pipeline and contents, and resistance of the surrounding soil to pipeline uplift. We recommend the risk

for flotation be evaluated based on the specific pipeline embedment within the liquefiable soil. For the discussion on seismic mitigation for flotation, please refer to Section 5.54.6.

For preliminary evaluation purposes, the project structural engineer can evaluate flotation hazards by treating the liquefied soil as a heavy viscous fluid with a unit weight of 95 pounds per cubic foot (pcf). The depth of the fluid can be taken as the distance from the design groundwater elevation to the bottom of the pipeline. Exhibit 6-1 summarizes the total and buoyant unit weights for the various native and imported backfill materials.

Exhibit 6-1: Summary of Total and Buoyant Unit Weights

Material	Total Unit Weight, γ (pcf)	Buoyant Unit Weight, γ' (pcf)
Native Backfill	110	47
Crushed Rock Backfill	130	67
Controlled Low Strength Material (CLSM)	145	83
Liquefied Native Soil	--	95

7 CONSTRUCTION CONSIDERATIONS

7.1 Groundwater Control

We understand that the proposed alignment will typically be installed using open-cut construction methods. In general, the majority of the open cut excavations will be made through graded sands with a portion of the excavation below the water table. In areas where graded sands are present and the excavations are 1 to 3 feet below the water table, we anticipate dewatering can generally be handled by internal sump pumps inside the trench excavation, pumping from within the drainage layer described in Section 6.1.1. In excavations 3 to 12 feet below the water level, an active dewatering system outside the trench should be considered necessary, such as wells or well-points. Wells or well-points mitigate the potential for running soils by reducing pore water pressure buildup in the soil and will also help to stabilize the subgrade especially for excavations that may be near the contact between the fine-grained alluvium gravelly terrace deposits. Running soils could soften, disturb, or weaken the subgrade and could result in long term settlements of the pipeline. Additional details regarding typical external dewatering systems is presented in Section 7.1.2.

Our recommended approach for evaluating the subsurface soil and groundwater conditions prior to performing the excavations is to dig test pits (or perform potholes or install additional observation wells near the proposed alignment) approximately 6 to 8 weeks prior

to the start of excavating. Test pits are likely to provide the most benefit as they will provide relevant information of not only the groundwater depth, but also on the overall stability of the excavation and subgrade conditions. Test pits should be performed to a similar depth as the planned open-cut excavations and at spacings of 400 to 500 feet. The test pits would give further indication of the plasticity of the soil, allowing City representatives and the contractor to visually evaluate the depth and potential adverse effects of groundwater for a particular construction period and to evaluate the potential need for external dewatering systems, for excavation and subgrade instability, and subgrade stabilization depths. If active dewatering is found to be necessary based on the test pit excavations, then we would still recommend supplementing the active dewatering system with internal sump pumps operating within the drainage layer.

We recommend the construction contract documents be prepared in such a way as to accommodate the groundwater control decisions, type of external dewatering systems, and unit price methods of payment during construction.

7.1.1 Sump Pumps

We recommend incorporating a drainage layer into the trench excavation. The sump pumps should be installed at sufficient spacing to keep the groundwater level within the drainage rock layer.. Additional details regarding the recommended drainage layer is discussed in Section 6.1.1.

7.1.2 Wells and Well Points

External dewatering systems, such as wells and well points, should be designed by the Contractor to draw groundwater levels down to below the bottom of the excavations where required during construction. External dewatering will help prevent disturbance and instability of the surrounding soil during excavation and construction of permanent facilities, which would likely lead to constructability issues and short- and long-term settlement.

The contractor should retain the services of a specialized dewatering subcontractor to design and oversee the installation, operation, and removal of the dewatering systems. The type of dewatering system (i.e., vacuum wellpoints and/or dewatering wells) and the spacing and depth of dewatering system components will depend on the contractor's dewatering system design. However, we anticipate, based on the variability of the soils to be dewatered, vacuum well-points may need to be installed on 5- to 6-foot centers. If dewatering wells are selected, we anticipate they may need to be spaced between 20 and 30 feet.

Vacuum well-points or dewatering wells should be developed immediately upon completion using methods such as over-pumping until a visibly clear discharge is achieved and the specific capacity of the wells reaches a minimum level.

Observation wells should be installed close to the trench to measure groundwater depths and to confirm that the target groundwater drawdown has occurred before beginning trench excavation below the groundwater levels. The observation wells should be developed as part of the installation procedure to enable reliable groundwater level measurements to be made. Observation wells installed before the dewatering system can be utilized to observe subsurface soils and static groundwater conditions. However, our recommended approach for evaluating the subsurface conditions ahead of the construction is discussed in Section 7.1.

7.1.3 Control of Surface Water

Surface water should be controlled/redirected so as not to allow it to flow into open excavations. Any water collected, as well as any excavated soil, should be treated and disposed of in a manner meeting local, state, and federal environmental regulations and requirements.

7.2 Temporary Pipeline Excavation Stability

The majority of the trench excavation can be accomplished with a suitably designed trench shield (often referred to as trench boxes), designed or selected by the Contractor, provided the dewatering recommendations prepared in our report are implemented and excavations are less than approximately 10 feet in depth.

Note that while trench boxes are typically used for shallow pipeline installations in the type of soil encountered in our explorations above the groundwater table, they do not provide full-time lateral support for the excavation sidewalls and are typically solely for worker safety. Therefore, excavation sidewalls may still experience sloughing or instability, which could cause damage to existing adjacent infrastructure near the excavation, including adjacent pavement, pipelines or culverts.

If caving, sloughing, or raveling is a potential and/or observed for any excavations, we would recommend that the voids between the sidewalls and the shoring should be immediately backfilled with crushed rock to prevent trench side wall instability and undermining of existing utilities or pavement sections. The voids should be filled with 3/4-inch minus imported crushed rock materials (OSSC, 2018 Item 00405.12) immediately after the trench box is placed to maintain tight contact to the sidewall soils.

We are providing the above information and opinions solely as a service to our client. Under no circumstances should the information provided, and opinions expressed above, be interpreted to mean that Shannon & Wilson is assuming responsibility for construction site safety or the contractor's activities; such responsibility is not being implied and should not be inferred.

7.3 Wet Weather Construction

Excavation and construction operations may expose the on-site soils to inclement weather conditions. The stability of exposed soils may rapidly deteriorate due to a change in moisture content (i.e., wetting or drying) or the action of heavy or repeated construction traffic. Accordingly, excavations should be adequately protected from the elements and from the action of repetitive or heavy construction loadings.

8 LIMITATIONS

The analyses, interpretations, conclusions, and recommendations contained in this report are based on site conditions as they presently exist and further assume that the explorations are representative of the subsurface conditions throughout the site; that is, the subsurface conditions everywhere are not significantly different from those disclosed by the current explorations. If future phases of work at the site uncover subsurface conditions different from those encountered in these explorations, we should be advised at once so that we can review these encountered conditions and reconsider our interpretations and conclusions, where necessary. If there is a substantial lapse of time between the submission of this report and the start of future phases of work at the site, or if conditions have changed because of natural forces or construction operations at or adjacent to the site, we recommend that we review our report to determine the applicability of the conclusions and recommendations.

Within the limitations of scope, schedule, and budget, the analyses, interpretations, conclusions, and recommendations presented in this report were prepared in accordance with generally accepted professional geotechnical engineering principles and practice in this area at the time this report was prepared. We make no other warranty, either express or implied. These interpretations and conclusions were based on our understanding of the project as described in this report and the site conditions as observed previously and at the time of our current explorations.

This report was prepared for the exclusive use of Consor, and the City of Warrenton, as covered in this report. During future phases of work involving construction, the data contained in this report should be provided to the contractors for their information, but our

report interpretations, conclusions, and recommendations should not be construed as a warranty of subgrade conditions as included in this report, and should not used as a basis for contractor bidding.

The scope of this report did not include environmental assessments or evaluations regarding the presence or absence of wetlands, or hazardous or toxic substances in the soil, surface water, groundwater, or air, on or below or around this site, or for the evaluation or disposal of contaminated soils or groundwater should any be encountered.

Shannon & Wilson, Inc., has prepared and included, "Important Information About Your Geotechnical/Environmental Report," to assist you and others in understanding the use and limitations of this report.

APPENDIX A: FIELD EXPLORATIONS

A.1 GENERAL

The geotechnical field exploration program included six cone penetration tests (CPTs), designated CPT-1 to CPT-6 and one geotechnical boring, designated B-1. A vibrating wire piezometer (VWP) was installed in boring B-1. Completed boring locations were measured in the field and are shown on the Site and Exploration Plan, Figure 2. Shannon & Wilson geology and engineering staff were present during the drilling of the geotechnical borings and borehole installations to locate the drilling sites, log the materials encountered, and collect soil samples.

This appendix describes the techniques used to advance and sample the borings and presents logs of the materials encountered.

A.2 DRILLING

One geotechnical boring designated B-1 was completed adjacent to CPT-5. The boring was completed to a depth of 15-feet below ground surface (bgs) with a track-mounted Geoprobe 6622CPT drilling rig operated by Oregon Geotechnical Explorations, Inc. (OGE), of Keizer, Oregon. The approximate locations are shown in the attached Figure 2, Site and Exploration Plan.

A.2.1 Direct Push

The boring CPT-5a was complete using a direct push drilling method where vehicle weight and percussive force are used to advance the drilling rod. Continuous disturbed samples were collected in the boring with a 2-inch plastic sheath. All samples were visually identified and described in the field, sealed to retain moisture, and returned to our laboratory for additional examination and testing.

A.3 CONE PENETRATION TEST (CPT) RESULTS

A.3.1 General

The field exploration program as part of this study included a total of four Cone Penetration Tests (CPTs), designated CPT-1 to CPT-6, performed along the path of the proposed pipeline. The approximate locations are shown in the attached Figure 2, Site and Exploration Plan. The CPTs were completed to a depth of between 60.4 to 101.5 feet bgs and were completed by OGE between January 23, and January 25, 2024.

A.3.2 Cone Penetration Testing

OGE pushed the CPTs using a truck-mounted CPT rig. In some instances, a track-mounted Geoprobe 6622CPT was used to predrill through asphalt layers or gravel. During a CPT, a specialized cone assembly at the end of a steel probe is hydraulically pushed down through the subsurface. The cone assembly contains load cells and associated strain gauges which monitor the deformation of the load cells. One set of load cells deforms with increasing resistance to cone tip penetration. Another set of load cells deforms with increasing frictional resistance encountered on a sleeve on the outside of the assembly.

The cone assembly also contains a piezometer, which measures pore pressure. Pore pressure is useful in estimating soil behavior type because penetration has varying effects on pore pressure, depending on the type of material being penetrated. Data from the strain gauges and from the piezometer is transmitted from the cone assembly back through extension rods to the CPT recording device via a cable. Analysis software using industry-standard calculations then convert the raw data signals from the instruments into tip resistance, skin friction, and pore pressure. The same software applies correlations to the processed data to estimate the soil type and equivalent Standard Penetration Test (SPT) N-value.

A.3.3 CPT Logs

All CPT data was reduced and correlated by OGE. Summary graphic and numeric logs of the CPT data, prepared by OGE, are attached to the end of this appendix. Logs include depth in feet, tip resistance (Qt) in tons per square foot, local friction (Fs) in tons per square foot, friction ratio (Fs/Qt) expressed as a percentage, pore pressure (Pw) in pounds per square inch, estimated soil behavior type, and estimated SPT N-value (N60).

A.4 MATERIAL DESCRIPTIONS

Soil samples were described and identified visually in the field in general accordance with ASTM D2488, Standard Practice for Description and Identification of Soils (Visual-Manual Procedure). Consistency, color, relative moisture, degree of plasticity, and other distinguishing characteristics of the samples were noted. Once transported to Shannon & Wilson, the SPT and hand grab samples from the hand auger were re-examined and the field descriptions, and identifications were modified where necessary. The specific terminology used is defined in the Soil Description and Log Key, Figure A1.

A.5 DRILL LOGS

The summary logs of the borings are presented in the Logs of Borings, Figure A2. Material descriptions and interfaces on the logs are interpretive, and actual changes may be gradual. The left-hand portions of the logs show individual sample intervals, percent recovery, SPT data, and natural moisture content measurements. Material descriptions and geotechnical unit designations are shown in the center of the boring logs, and the right-hand portions provides a graphic log, miscellaneous comments, and a graphic depicting hole installation and backfill details.

A.6 BOREHOLE INSTALLATIONS

A vibrating wire pressure transducer was installed to allow for ongoing measurements of groundwater levels. Installation details are discussed below and shown graphically on the Logs of Borings.

A.6.1 Vibrating Wire Piezometers

A vibrating wire pressure transducer (Geokon model 4500S) was installed in boring B-1 to allow for ongoing groundwater level measurements. A vibrating wire pressure transducer (VWP) measures pressure using a pressure-sensitive diaphragm with a vibrating wire element attached to it. A cable runs from the transducer to the ground surface, where a readout device can be attached. Pressure acting on the outside face of the diaphragm causes it to deflect, which changes the tension of the wire element and the frequency of its vibration. The readout device measures the frequency of the induced vibration, which is converted to pressure, or head of groundwater above the transducer. The vibrating wire pressure transducer was permanently grouted into place in the borehole. The instrument was taped to a measured length of polyvinyl chloride (PVC) pipe to control the depth of installation. Prior to insertion, an initial "zero" reading was taken at "zero" head. With the transducer and PVC pipe in place, the hole was tremie grouted with bentonite cement grout. The cable leading up from the transducer is protected at the surface by a flush-mount monument set in concrete. The VWP installation depth is indicated on the boring log.

Shannon & Wilson, Inc. (S&W), uses a soil identification system modified from the Unified Soil Classification System (USCS). Elements of the USCS and other definitions are provided on this and the following pages. Soil descriptions are based on visual-manual procedures (ASTM D2488) and laboratory testing procedures (ASTM D2487), if performed.

S&W INORGANIC SOIL CONSTITUENT DEFINITIONS

CONSTITUENT[2]	FINE-GRAINED SOILS (50% or more fines)[1]	COARSE-GRAINED SOILS (less than 50% fines)[1]
Major	***Silt, Lean Clay, Elastic Silt,*** or ***Fat Clay***[3]	***Sand*** or ***Gravel***[4]
Modifying (Secondary) Precedes major constituent	30% or more coarse-grained: ***Sandy*** or ***Gravelly***[4]	More than 12% fine-grained: ***Silty*** or ***Clayey***[3]
Minor Follows major constituent	15% to 30% coarse-grained: ***with Sand*** or ***with Gravel***[4]	5% to 12% fine-grained: ***with Silt*** or ***with Clay***[3]
	30% or more total coarse-grained *and* lesser coarse-grained constituent is 15% or more: ***with Sand*** or ***with Gravel***[5]	15% or more of a second coarse-grained constituent: ***with Sand*** or ***with Gravel***[5]

[1]All percentages are by weight of total specimen passing a 3-inch sieve.
[2]The order of terms is: *Modifying Major with Minor*.
[3]Determined based on behavior.
[4]Determined based on which constituent comprises a larger percentage.
[5]Whichever is the lesser constituent.

MOISTURE CONTENT TERMS

Dry	Absence of moisture, dusty, dry to the touch
Moist	Damp but no visible water
Wet	Visible free water, from below water table

STANDARD PENETRATION TEST (SPT) SPECIFICATIONS

Hammer:	140 pounds with a 30-inch free fall. Rope on 6- to 10-inch-diam. cathead 2-1/4 rope turns, > 100 rpm
Sampler:	10 to 30 inches long Shoe I.D. = 1.375 inches Barrel I.D. = 1.5 inches Barrel O.D. = 2 inches
N-Value:	Sum blow counts for second and third 6-inch increments. Refusal: 50 blows for 6 inches or less; 10 blows for 0 inches.

NOTE: Penetration resistances (N-values) shown on boring logs are as recorded in the field and have not been corrected for hammer efficiency, overburden, or other factors.

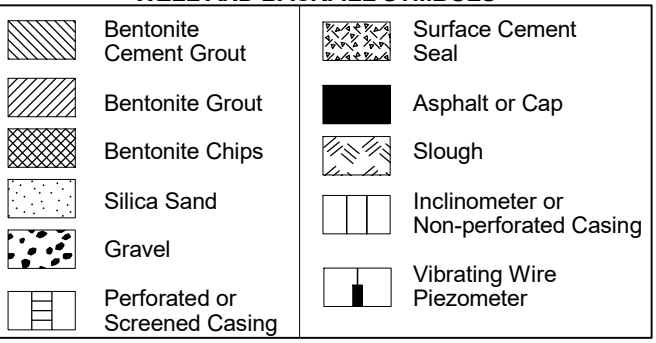
PARTICLE SIZE DEFINITIONS

DESCRIPTION	SIEVE NUMBER AND/OR APPROXIMATE SIZE
FINES	< #200 (0.075 mm = 0.003 in.)
SAND	
Fine	#200 to #40 (0.075 to 0.4 mm; 0.003 to 0.02 in.)
Medium	#40 to #10 (0.4 to 2 mm; 0.02 to 0.08 in.)
Coarse	#10 to #4 (2 to 4.75 mm; 0.08 to 0.187 in.)
GRAVEL	
Fine	#4 to 3/4 in. (4.75 to 19 mm; 0.187 to 0.75 in.)
Coarse	3/4 to 3 in. (19 to 76 mm)
COBBLES	3 to 12 in. (76 to 305 mm)
BOULDERS	> 12 in. (305 mm)

RELATIVE DENSITY / CONSISTENCY

COHESIONLESS SOILS		COHESIVE SOILS	
N, SPT, BLOWS/FT.	RELATIVE DENSITY	N, SPT, BLOWS/FT.	RELATIVE CONSISTENCY
< 4	Very loose	< 2	Very soft
4 - 10	Loose	2 - 4	Soft
10 - 30	Medium dense	4 - 8	Medium stiff
30 - 50	Dense	8 - 15	Stiff
> 50	Very dense	15 - 30	Very stiff
		> 30	Hard

WELL AND BACKFILL SYMBOLS



PERCENTAGES TERMS [1, 2]

Trace	< 5%
Few	5 to 10%
Little	15 to 25%
Some	30 to 45%
Mostly	50 to 100%

[1]Gravel, sand, and fines estimated by mass. Other constituents, such as organics, cobbles, and boulders, estimated by volume.

UNIFIED SOIL CLASSIFICATION SYSTEM (USCS)
(Modified From USACE Tech Memo 3-357, ASTM D2487, and ASTM D2488)

MAJOR DIVISIONS			GROUP/GRAPHIC SYMBOL		TYPICAL IDENTIFICATIONS
COARSE-GRAINED SOILS *(more than 50% retained on No. 200 sieve)*	Gravels *(more than 50% of coarse fraction retained on No. 4 sieve)*	Gravel *(less than 5% fines)*	GW		Well-Graded Gravel; Well-Graded Gravel with Sand
			GP		Poorly Graded Gravel; Poorly Graded Gravel with Sand
		Silty or Clayey Gravel *(more than 12% fines)*	GM		Silty Gravel; Silty Gravel with Sand
			GC		Clayey Gravel; Clayey Gravel with Sand
	Sands *(50% or more of coarse fraction passes the No. 4 sieve)*	Sand *(less than 5% fines)*	SW		Well-Graded Sand; Well-Graded Sand with Gravel
			SP		Poorly Graded Sand; Poorly Graded Sand with Gravel
		Silty or Clayey Sand *(more than 12% fines)*	SM		Silty Sand; Silty Sand with Gravel
			SC		Clayey Sand; Clayey Sand with Gravel
FINE-GRAINED SOILS *(50% or more passes the No. 200 sieve)*	Silts and Clays *(liquid limit less than 50)*	Inorganic	ML		Silt; Silt with Sand or Gravel; Sandy or Gravelly Silt
			CL		Lean Clay; Lean Clay with Sand or Gravel; Sandy or Gravelly Lean Clay
		Organic	OL		Organic Silt or Clay; Organic Silt or Clay with Sand or Gravel; Sandy or Gravelly Organic Silt or Clay
	Silts and Clays *(liquid limit 50 or more)*	Inorganic	MH		Elastic Silt; Elastic Silt with Sand or Gravel; Sandy or Gravelly Elastic Silt
			CH		Fat Clay; Fat Clay with Sand or Gravel; Sandy or Gravelly Fat Clay
		Organic	OH		Organic Silt or Clay; Organic Silt or Clay with Sand or Gravel; Sandy or Gravelly Organic Silt or Clay
HIGHLY-ORGANIC SOILS	Primarily organic matter, dark in color, and organic odor		PT		Peat or other highly organic soils (see ASTM D4427)
FILL	Placed by humans, both engineered and nonengineered. May include various soil materials and debris.				The Fill graphic symbol is combined with the soil graphic that best represents the observed material

NOTE: No. 4 size = 4.75 mm = 0.187 in.; No. 200 size = 0.075 mm = 0.003 in.

NOTES

1. Dual symbols *(symbols separated by a hyphen, i.e., SP-SM, Sand with Silt)* are used for soils with between 5% and 12% fines or when the liquid limit and plasticity index values plot in the *CL-ML* area of the plasticity chart.
2. Borderline symbols *(symbols separated by a slash, i.e., CL/ML, Lean Clay to Silt; SP-SM/SM, Sand with Silt to Silty Sand)* indicate that the soil properties are close to the defining boundary between two groups.
3. The soil graphics above represent the various USCS identifications (i.e., *GP*, *SM*, etc.) and may be augmented with additional symbology to represent differences within USCS designations. *Sandy Silt (ML)*, for example, may be accompanied by the *ML* soil graphic with sand grains added. Non-USCS materials may be represented by other graphic symbols; see log for descriptions.

Sheet 2 of 3

2013 BORING CLASS2 110668.GPJ SW2013LIBRARYPDX.GLB SWNEW.GDT 3/20/23

GRADATION TERMS

Poorly Graded	Narrow range of grain sizes present or, within the range of grain sizes present, one or more sizes are missing (Gap Graded). Meets criteria in ASTM D2487, if tested.
Well-Graded	Full range and even distribution of grain sizes present. Meets criteria in ASTM D2487, if tested.

CEMENTATION TERMS[1]

Weak	Crumbles or breaks with handling or slight finger pressure
Moderate	Crumbles or breaks with considerable finger pressure
Strong	Will not crumble or break with finger pressure

PLASTICITY[2]

DESCRIPTION	VISUAL-MANUAL CRITERIA	APPROX. PLASITICTY INDEX RANGE
Nonplastic	A 1/8-in. thread cannot be rolled at any water content.	< 4%
Low	A thread can barely be rolled and a lump cannot be formed when drier than the plastic limit.	4 to 10%
Medium	A thread is easy to roll and not much time is required to reach the plastic limit. The thread cannot be rerolled after reaching the plastic limit. A lump crumbles when drier than the plastic limit.	10 to 20%
High	It take considerable time rolling and kneading to reach the plastic limit. A thread can be rerolled several times after reaching the plastic limit. A lump can be formed without crumbling when drier than the plastic limit.	> 20%

ADDITIONAL TERMS

Mottled	Irregular patches of different colors.
Bioturbated	Soil disturbance or mixing by plants or animals.
Diamict	Nonsorted sediment; sand and gravel in silt and/or clay matrix.
Cuttings	Material brought to surface by drilling.
Slough	Material that caved from sides of borehole.
Sheared	Disturbed texture, mix of strengths.

PARTICLE ANGULARITY AND SHAPE TERMS[1]

Angular	Sharp edges and unpolished planar surfaces.
Subangular	Similar to angular, but with rounded edges.
Subrounded	Nearly planar sides with well-rounded edges.
Rounded	Smoothly curved sides with no edges.
Flat	Width/thickness ratio > 3.
Elongated	Length/width ratio > 3.

ACRONYMS AND ABBREVIATIONS

ATD	At Time of Drilling
approx.	Approximate/Approximately
Diam.	Diameter
Elev.	Elevation
ft.	Feet
FeO	Iron Oxide
gal.	Gallons

q_u	Unconfined Compressive Strength
VWP	Vibrating Wire Piezometer
Vert.	Vertical
WOH	Weight of Hammer
WOR	Weight of Rods
Wt.	Weight

STRUCTURE TERMS[1]

Interbedded	Alternating layers of varying material or color with layers at least 1/4-inch thick; singular: bed.
Laminated	Alternating layers of varying material or color with layers less than 1/4-inch thick; singular: lamination.
Fissured	Breaks along definite planes or fractures with little resistance.
Slickensided	Fracture planes appear polished or glossy; sometimes striated.
Blocky	Cohesive soil that can be broken down into small angular lumps that resist further breakdown.
Lensed	Inclusion of small pockets of different soils, such as small lenses of sand scattered through a mass of clay.
Homogeneous	Same color and appearance throughout.

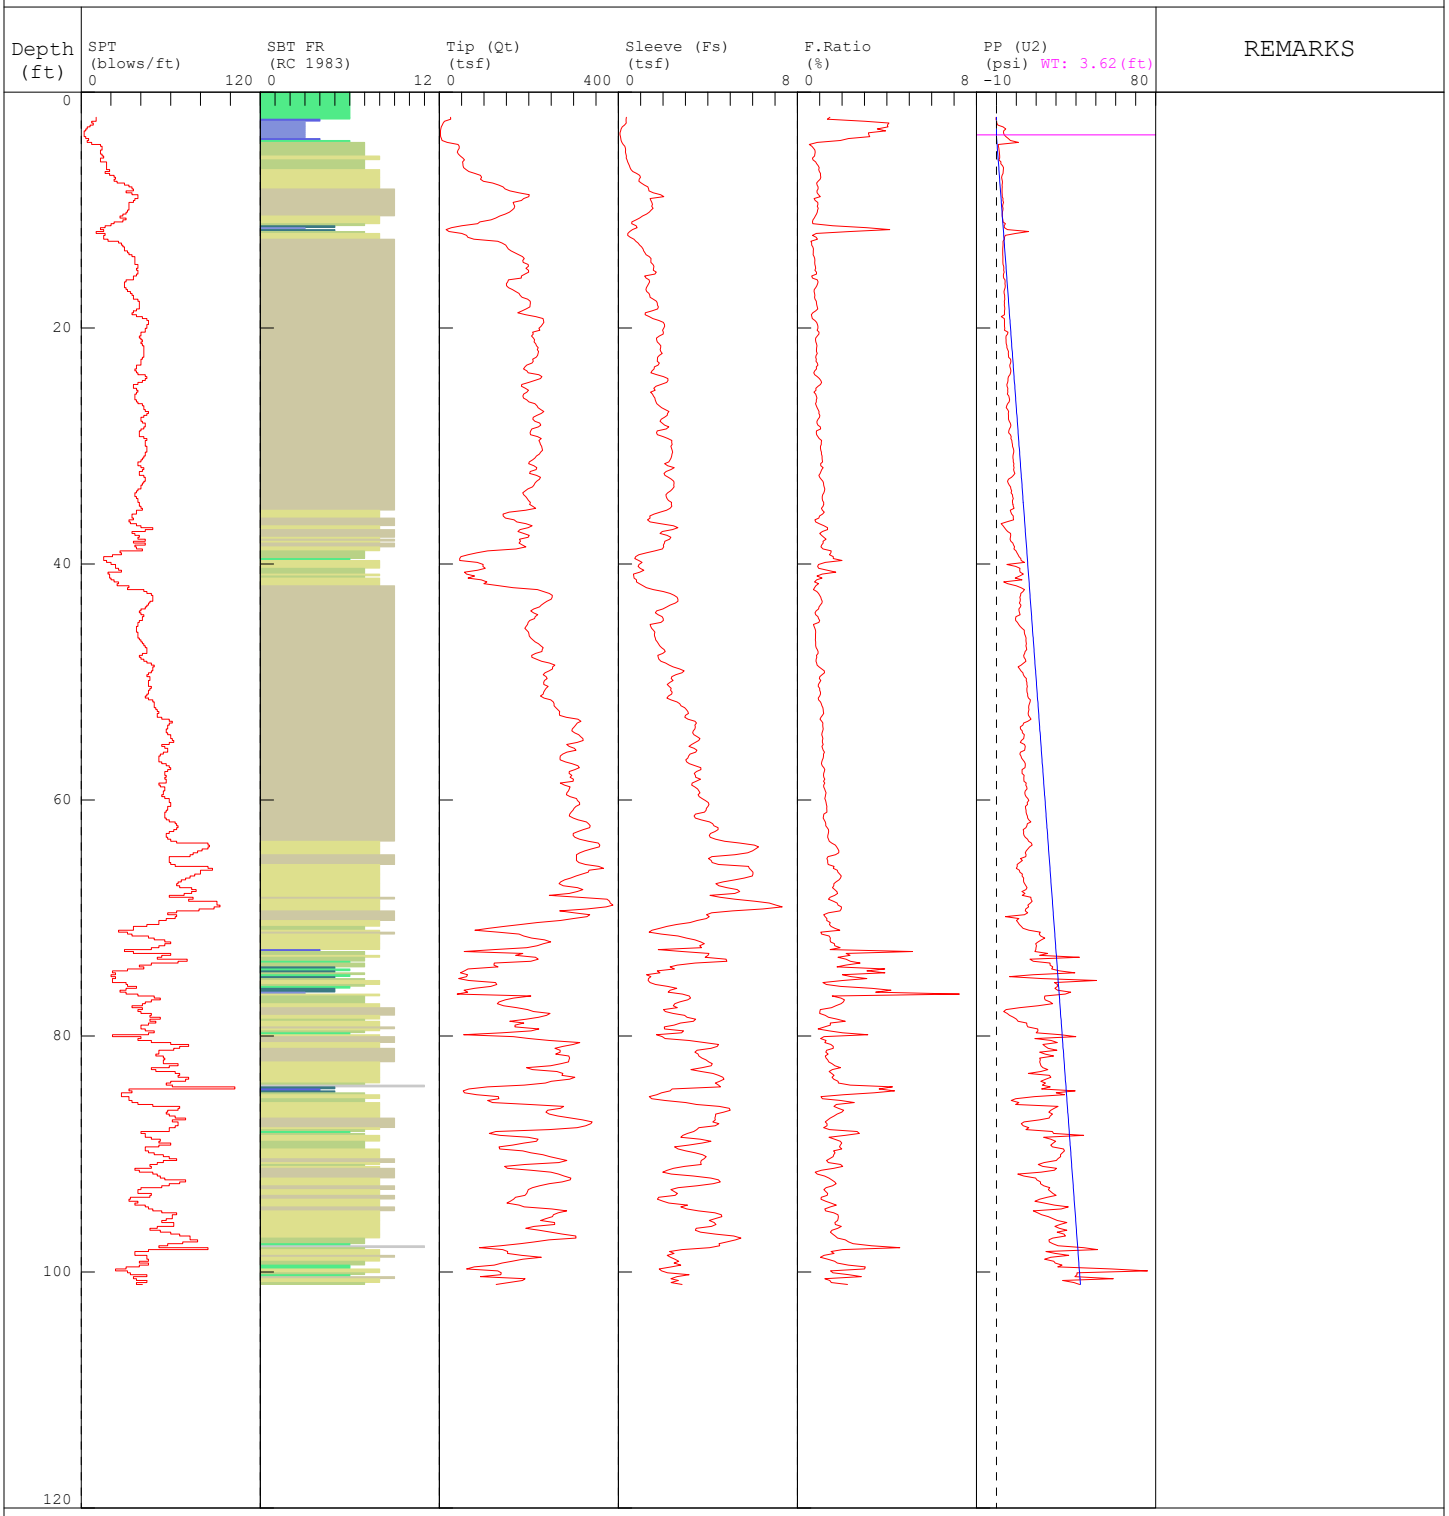
Shannon & Wilson / CPT-2 / Warrenton Hammond Pipeline

OPERATOR: OGE BAK
CONE ID: DDG1661
TEST DATE: 1/24/2024 8:55:17 AM
TOTAL DEPTH: 101.050 ft

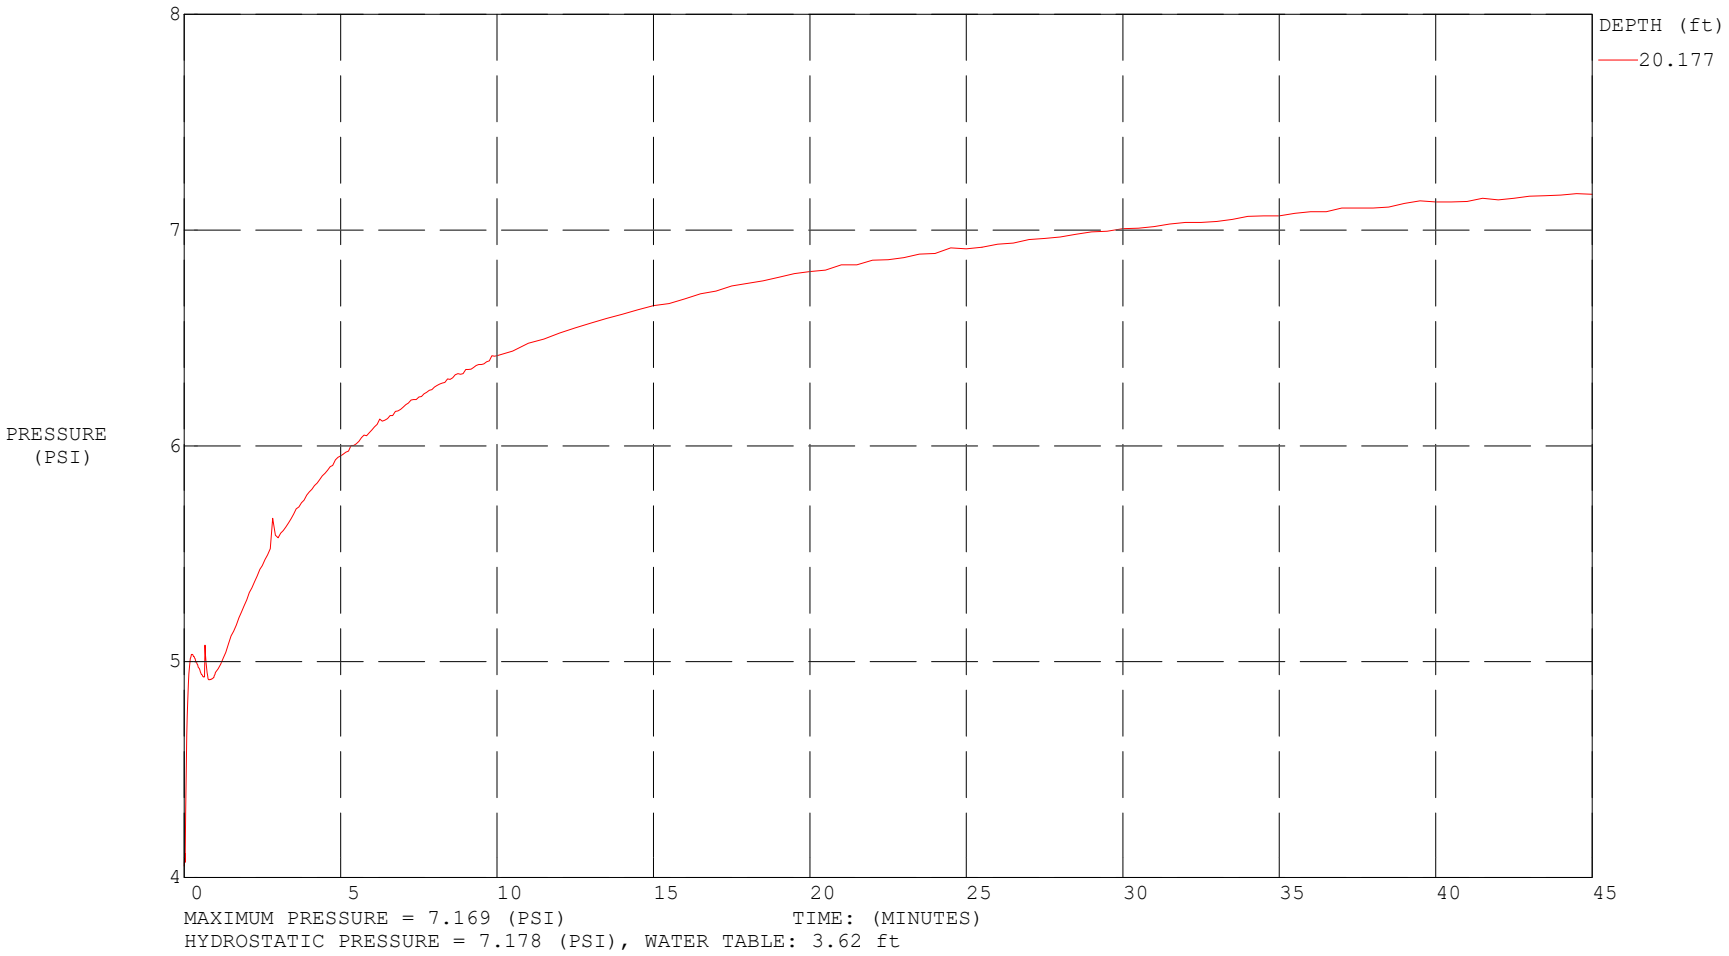


1 sensitive fine grained
2 organic material
3 clay
4 silty clay to clay
5 clayey silt to silty cl
6 sandy silt to clayey si
7 silty sand to sandy si
8 sand to silty sand
9 sand
10 gravelly sand to sand
11 very stiff fine grained (*)
12 sand to clayey sand (*)

*SBT/SPT CORRELATION: UBC-1983

COMMENT: Shannon & Wilson / CPT-2 / Warrenton Hammond Pipeline

CONE ID: DDG1661
TEST DATE: 1/24/2024 8:55:17 AM



MAXIMUM PRESSURE = 7.169 (PSI)
HYDROSTATIC PRESSURE = 7.178 (PSI), WATER TABLE: 3.62 ft

APPENDIX B: LABORATORY TEST RESULTS

B.1 GENERAL

Soil samples obtained during the field explorations were described and identified in the field in general accordance with the Practice for Description and Identification of Soils (Visual-Manual Procedure), ASTM D2488. The Specific terminology used is defined in the Soil Description and Log Key, Figure A1, Appendix A. The physical characteristics of the collected samples were noted, and field descriptions and identifications were modified, as necessary, in accordance with the terminology presented in Appendix A, Figure A1.

During the review, select soil were collected for further testing. The material descriptions and identifications were refined/revised, as necessary, based on the results of the laboratory tests. The soil testing program included moisture content testing and particle size analysis. Results of the soil testing are presented in Figure B1. All laboratory tests were performed in accordance with applicable ASTM International (ASTM) standards.

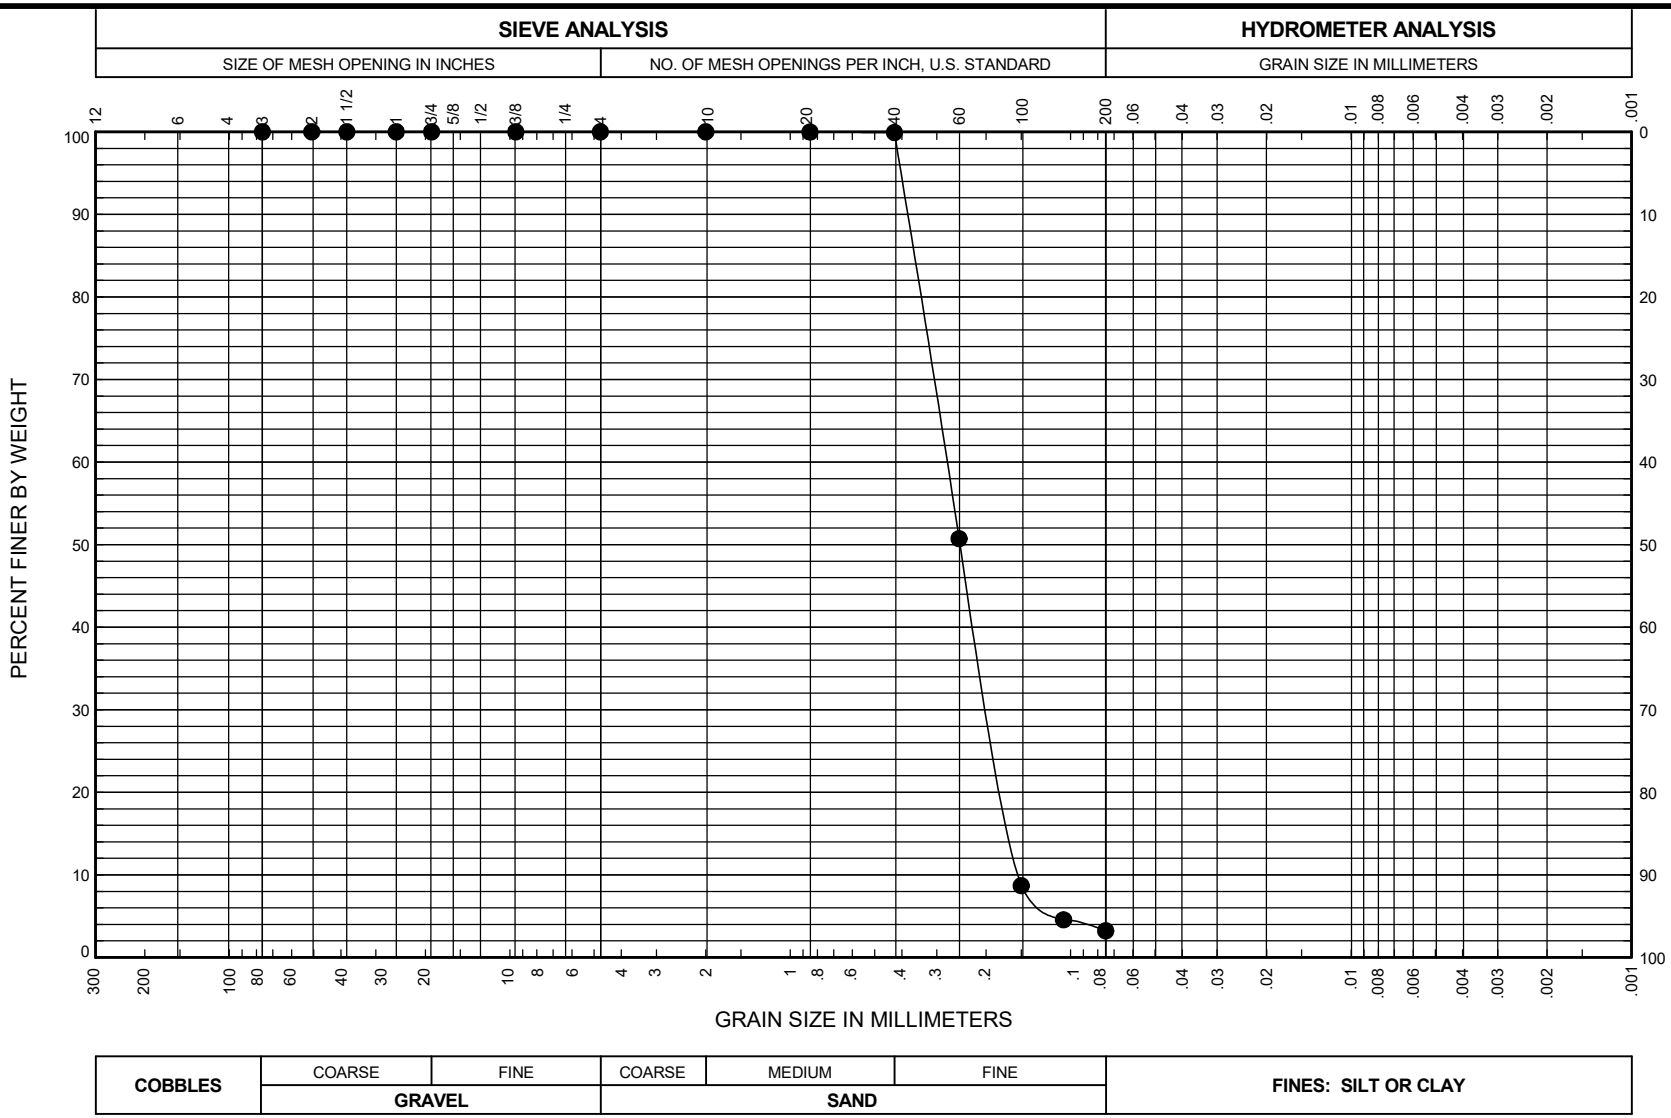
B.2 SOIL TESTING

B.2.1 Moisture (Natural Water) Content

Natural moisture content determinations were performed in accordance with ASTM D2216, on selected soil samples. The natural moisture content is a measure of the amount of moisture in the soil at the time of exploration. It is defined as the ratio of the weight of water to the dry weight of the soil, expressed as a percentage. The results of moisture content determinations are presented on the Logs of Borings in Appendix A.

B.2.2 Particle-size Analyses

Particle-size analyses were conducted on select samples to determine their grain-size distributions. Grain size distributions were determined in accordance with ASTM D6913 D1140, and D422 as applicable. For all samples, a wet sieve analysis was performed to determine the percentage (by weight) of each sample passing the No. 200 (0.075 mm) sieve. Additionally, the material retained on the No. 200 sieve was shaken through a series of sieves to determine the distribution of the plus No. 200 fraction (ASTM 6913). Particle size analyses were performed by Shannon & Wilson. Results of all particle-size analyses are plotted on Figure B1, Grain Size Distribution. The percentage of each sample passing the No. 200 sieve is presented on the Logs of Borings in Appendix A.



NOTES:
1) Sieve analyses were performed in general accordance with ASTM D6913, sieve with hydrometer analyses were performed in general accordance with ASTM D422, and amount finer than #200 sieve analyses were performed in general accordance with ASTM D1140 unless otherwise noted in the report.
2) Group Name and Group Symbol are in accordance with ASTM D2488 and are refined in accordance with ASTM D2487 where appropriate laboratory tests are performed.

Important Information

About Your Geotechnical Engineering Report

IMPORTANT INFORMATION

IMPORTANT INFORMATION ABOUT YOUR GEOTECHNICAL/ENVIRONMENTAL REPORT

CONSULTING SERVICES ARE PERFORMED FOR SPECIFIC PURPOSES AND FOR SPECIFIC CLIENTS.

Consultants prepare reports to meet the specific needs of specific individuals. A report prepared for a civil engineer may not be adequate for a construction contractor or even another civil engineer. Unless indicated otherwise, your consultant prepared your report expressly for you and expressly for the purposes you indicated. No one other than you should apply this report for its intended purpose without first conferring with the consultant. No party should apply this report for any purpose other than that originally contemplated without first conferring with the consultant.

THE CONSULTANT'S REPORT IS BASED ON PROJECT-SPECIFIC FACTORS.

A geotechnical/environmental report is based on a subsurface exploration plan designed to consider a unique set of project-specific factors. Depending on the project, these may include the general nature of the structure and property involved; its size and configuration; its historical use and practice; the location of the structure on the site and its orientation; other improvements such as access roads, parking lots, and underground utilities; and the additional risk created by scope-of-service limitations imposed by the client. To help avoid costly problems, ask the consultant to evaluate how any factors that change subsequent to the date of the report may affect the recommendations. Unless your consultant indicates otherwise, your report should not be used (1) when the nature of the proposed project is changed (for example, if an office building will be erected instead of a parking garage, or if a refrigerated warehouse will be built instead of an unrefrigerated one, or chemicals are discovered on or near the site); (2) when the size, elevation, or configuration of the proposed project is altered; (3) when the location or orientation of the proposed project is modified; (4) when there is a change of ownership; or (5) for application to an adjacent site. Consultants cannot accept responsibility for problems that may occur if they are not consulted after factors that were considered in the development of the report have changed.

SUBSURFACE CONDITIONS CAN CHANGE.

Subsurface conditions may be affected as a result of natural processes or human activity. Because a geotechnical/environmental report is based on conditions that existed at the time of subsurface exploration, construction decisions should not be based on a report whose adequacy may have been affected by time. Ask the consultant to advise if additional tests are desirable before construction starts; for example, groundwater conditions commonly vary seasonally.

Construction operations at or adjacent to the site and natural events such as floods, earthquakes, or groundwater fluctuations may also affect subsurface conditions and, thus, the continuing adequacy of a geotechnical/environmental report. The consultant should be kept apprised of any such events and should be consulted to determine if additional tests are necessary.

MOST RECOMMENDATIONS ARE PROFESSIONAL JUDGMENTS.

Site exploration and testing identifies actual surface and subsurface conditions only at those points where samples are taken. The data were extrapolated by your consultant, who then applied judgment to render an opinion about overall subsurface conditions. The actual interface between materials may be far more gradual or abrupt than your report indicates. Actual conditions in areas not sampled may differ from those predicted in your report. While nothing can be done to prevent such situations, you and your consultant can work together to help reduce their impacts. Retaining your consultant to observe subsurface construction operations can be particularly beneficial in this respect.

A REPORT'S CONCLUSIONS ARE PRELIMINARY.

The conclusions contained in your consultant's report are preliminary, because they must be based on the assumption that conditions revealed through selective exploratory sampling are indicative of actual conditions throughout a site. Actual subsurface conditions can be discerned only during earthwork; therefore, you should retain your consultant to observe actual conditions and to provide conclusions. Only the consultant who prepared the report is fully familiar with the background information needed to determine whether or not the report's recommendations based on those conclusions are valid and whether or not the contractor is abiding by applicable recommendations. The consultant who developed your report cannot assume responsibility or liability for the adequacy of the report's recommendations if another party is retained to observe construction.

THE CONSULTANT'S REPORT IS SUBJECT TO MISINTERPRETATION.

Costly problems can occur when other design professionals develop their plans based on misinterpretation of a geotechnical/environmental report. To help avoid these problems, the consultant should be retained to work with other project design professionals to explain relevant geotechnical, geological, hydrogeological, and environmental findings, and to review the adequacy of their plans and specifications relative to these issues.

BORING LOGS AND/OR MONITORING WELL DATA SHOULD NOT BE SEPARATED FROM THE REPORT.

Final boring logs developed by the consultant are based upon interpretation of field logs (assembled by site personnel), field test results, and laboratory and/or office evaluation of field samples and data. Only final boring logs and data are customarily included in geotechnical/environmental reports. These final logs should not, under any circumstances, be redrawn for inclusion in architectural or other design drawings, because drafters may commit errors or omissions in the transfer process.

To reduce the likelihood of boring log or monitoring well misinterpretation, contractors should be given ready access to the complete geotechnical engineering/environmental report prepared or authorized for their use. If access is provided only to the report prepared for you, you should advise contractors of the report's limitations, assuming that a contractor was not one of the specific persons for whom the report was prepared, and that developing construction cost estimates was not one of the specific purposes for which it was prepared. While a contractor may gain important knowledge from a report prepared for another party, the contractor should discuss the report with your consultant and perform the additional or alternative work believed necessary to obtain the data specifically appropriate for construction cost estimating purposes. Some clients hold the mistaken impression that simply disclaiming responsibility for the accuracy of subsurface information always insulates them from attendant liability. Providing the best available information to contractors helps prevent costly construction problems and the adversarial attitudes that aggravate them to a disproportionate scale.

READ RESPONSIBILITY CLAUSES CLOSELY.

Because geotechnical/environmental engineering is based extensively on judgment and opinion, it is far less exact than other design disciplines. This situation has resulted in wholly unwarranted claims being lodged against consultants. To help prevent this problem, consultants have developed a number of clauses for use in their contracts, reports, and other documents. These responsibility clauses are not exculpatory clauses designed to transfer the consultant's liabilities to other parties; rather, they are definitive clauses that identify where the consultant's responsibilities begin and end. Their use helps all parties involved recognize their individual responsibilities and take appropriate action. Some of these definitive clauses are likely to appear in your report, and you are encouraged to read them closely. Your consultant will be pleased to give full and frank answers to your questions.

The preceding paragraphs are based on information provided by the Geoprofessional Business Association (https://www.geoprofessional.org)

2 – INADVERTENT DISCOVERY PLAN

ARCHAEOLOGICAL AND HUMAN REMAINS INADVERTENT DISCOVERY PLAN (IDP)

PROJECT: Hammond Transmission Waterline Phase 1
PROJECT MANAGER: Twyla Vittetoe, Engineering Technician
LANDOWNER AGENCY: City of Warrenton, Oregon
DATE: 07/31/2024
SHPO CASE NUMBER: 24-0018

This document outlines procedures and protocols to be followed if archaeological objects or features, or human remains are encountered in the course of work. These procedures are intended for circumstances where there is not an expectation or anticipation of encountering cultural resources or human remains. **This is not a replacement for due diligence, robust project design, and consultation with appropriate Native American Tribes**.[1] Prior to undertaking project work, an assessment of the likelihood for disturbance to cultural resources and tribal heritage should be completed. All personnel will be briefed on all procedures and reporting structures before the start of any work.

CONTENTS OF THIS DOCUMENT

A. Procedures for archaeological features and materials
B. Procedures for human remains, burials, funerary objects, sacred objects, and objects of cultural patrimony
C. Roles and responsibilities
D. Contact information
E. Confidentiality statement
F. Procedure flow chart
G. Visual reference guide for archaeology and tribal heritage items

---

A. *PROCEDURES FOR INADVERTENT DISCOVERY OF ARCHAEOLOGICAL FEATURES AND MATERIALS (DOES **NOT** INCLUDE HUMAN REMAINS, BURIALS, FUNERARY OBJECTS, OBJECTS OF CULTURAL PATRIMONY, OR SPIRITUAL OBJECTS)*

It is expected that ALL artifacts, features, structural elements, and other cultural items that are identified will be reported to required project, agency, and Tribal contacts, and accounted for as soon as possible. It is understood that there will be a single project point of contact to coordinate with the project archaeologist, SHPO, LCIS, and appropriate Native American Tribes.

Step 1. Stop work (immediately after discovery)

[1] Appropriate Native American Tribes will be identified by LCIS

If any person believes that they have located an archaeological object[2] or site[3], all work must stop immediately.

Discovery made in field _____(date/time) _____ (initials of discoverer)

Step 2. Secure and protect the area (within first hour after discovery)

Establish a **minimum** 30 meter/100-foot area of protection, or more as necessary, around the find(s). Exclude all vehicle traffic and non-essential foot traffic. Non-ground-disturbing work may continue outside of the area of protection with caution until the situation is assessed by a qualified archaeologist.[4]

Buffer established _____ (time) _____ (initials of person responsible)

Step 3. Notify (within first hour after discovery)

Notify the project manager, agency official (if applicable), and project archaeologist. If there is not an archaeologist on-site, or on retainer for the project, the project manager will contact an Oregon Qualified Archaeologist (which include agency and Tribal archaeologists) to assess the find.

Project Manager contacted _____ (time) _____ (initials of contactor)
Agency Official contacted _____ (time) _____ (initials of contactor)
Project Archaeologist contacted _____ (time) _____ (initials of contactor)

Step 4. Identify and Follow Guidance (timeline variable, as soon as possible)

If the archaeologist determines the find is an archaeological feature or object, or other cultural item or feature, OR if no qualified archaeologist can be contacted within the first hour of discovery, the **State Historic Preservation Office (SHPO) and appropriate Native American Tribes must be contacted,** and their guidance must be followed. SHPO, Native American Tribes, and project and agency personnel will determine in consultation how or if work may continue at the site. If the discovery is determined to *not* be archaeological or a cultural item, you may continue work. This determination should be confirmed in writing to the project manager and agency official.

SHPO contacted _____ (time) _____ (initials of contactor)

---

[2] "Archaeological object" means an object that is at least 75 years old (or 50 years if there is a federal nexus), is part of the physical record of an indigenous or other culture found in the state or waters of the state, and is material remains of past human life or activity that are of archaeological significance including, but not limited to, monuments, symbols, tools, facilities, technological by-products and dietary by-products (ORS 358.905).

[3] "Archaeological site" means a geographic locality in Oregon that contains archaeological objects and the contextual associations of the archaeological objects with each other or biotic or geological remains or deposits (ORS 358.905).

[4] Ground-disturbing work on different landforms distant from the find and outside of the buffer may continue.

Appropriate Native American Tribes[5] _____ (time) _____ (initials of contactor)

B. *PROCEDURES FOR INADVERTENT DISCOVERY OF HUMAN REMAINS*

(INCLUDES HUMAN REMAINS, BURIALS, FUNERARY OBJECTS, OBJECTS OF CULTURAL PATRIMONY, AND SPIRITUAL OBJECTS)

It is expected that ALL potential human remains, burials, funerary objects, or objects of cultural patrimony that are identified will be reported and accounted for within 3 hours of discovery.[6] It is understood that there will be a single project point of contact to coordinate with the project archaeologist, SHPO, LCIS, OSP and appropriate Native American Tribes.

Step 1: Stop work (immediately after discovery)

If any person believes that they have located human remains[7], ALL work will stop immediately. Any human remains, regardless of antiquity or ethnic origin, will always be treated with dignity and respect.

Step 2. Secure and protect the area (as soon as possible, within c. 10 min)

Secure and protect the area of inadvertent discovery with a **minimum** of 100 meter/300 foot buffer, or more as necessary. The location and other information about the find should be treated as confidential and shared on a **need to know basis only**. Prevent all vehicle traffic and unauthorized foot traffic from entry. Block remains from view and protect them from damage or exposure without touching or disturbing the remains, and leave them in place.

Do not take photographs unless approved by the appropriate Native American Tribes and Oregon Legislative Commission on Indian Services (LCIS), and only for the purpose of identification. **Do not speak to the media or public** or post any information about the find on social media. Non-ground-disturbing work may continue outside of the buffer with caution.[8]

Buffer established _____ (time) _____ (initials of person responsible)

Step 3. Notify (within first hour after discovery) – see contact list below (section D)

1. Project Manager _____ (time) _____ (initials)
2. Agency Official _____ (time) _____ (initials)

[5] ALL Tribes designated by LCIS must be notified. Contacting one or some of the Tribes does not fulfill the obligation to notify.

[6] Modifications to reporting timelines can be made in consultation with SHPO and Tribes.

[7] Bone may be fragmented, weathered, or otherwise modified to make it difficult to identify, so when in doubt, stop work and call it in.

[8] Ground-disturbing work on different landforms distant from the find and outside of the buffer may continue.

3. Oregon State Police[9] **DO NOT CALL 911** _____ (time) _____ (initials)
4. State Historic Preservation Office (SHPO) _____ (time) _____ (initials)
5. Commission on Indian Services (LCIS) _____ (time) _____ (initials)
6. Appropriate Native American Tribes[10] _____ (time) _____ (initials)

   Name of Tribe(s) Contacted and Individual(s):

_____
_____
_____
_____

Step 4. Follow guidance (timeline variable, may be up to several days or more)

If the site is determined not to be a crime scene by the Oregon State Police, **do not move anything!** The remains will continue to be *secured in place* along with any associated funerary objects, and protected from weather, water runoff, and shielded from view. Follow all guidance provided by OSP, LCIS, SHPO, and appropriate Native American Tribes.

Continue to maintain the work stoppage within the buffer until a plan is developed and carried out between the Oregon State Police, SHPO, LCIS, and appropriate Native American Tribes and you are directed in writing by the project manager that work may proceed.

C. ROLES AND RESPONSIBILITIES

Person Responsible	**Responsibility**
Contractor/Discoverer will…	Notify the Project Manager Twyla Vittetoe: 503-861-0912
Twyla Vittetoe will…	Notify the Agency Official Greg Shafer: 971-286-2035
Twyla Vittetoe will…	Notify the Contracted Archaeologist Bradley Bowden: 206-898-5781
Twyla Vittetoe will…	Notify the State Agencies (OSP, LCIS, SHPO)
Twyla Vittetoe will…	Notify the Native American Tribes identified by LCIS
Greg Shafer will…	Enforce the work stoppage and buffer

[9] OSP will be responsible for contacting the county or state medical examiner's office as appropriate.
[10] ALL Tribes designated by LCIS must be notified. Contacting one or some of the Tribes does not fulfill the obligation to notify.

D. *CONTACT INFORMATION*[11]

	Confederated Tribes of Warm Springs Reservation of Oregon • Bobby Brunoe, THPO & NAGPRA Coordinator • Mars Galloway, Cultural Resources Manager	541-553-2026 541-553-3583

[11] Contact information should be regularly updated for all individuals. Up to date contacts for LCIS, OSP, SHPO, and Native American Tribes can be found on the LCIS cultural resources page: Commission on Indian Services archaeology (oregonlegislature.gov)

[12] Northern command: Benton, Clackamas, Clatsop, Columbia, Crook, Deschutes, Gilliam, Hood River, Jefferson, Klamath, Lane, Lincoln, Linn, Marion, Multnomah, Polk, Sherman, Tillamook, Wasco, Washington, Wheeler, Yamhill

[13] Southern command: Baker, Coos, Curry, Douglas, Grant, Harney, Jackson, Josephine, parts of Klamath, Lake, Malheur, Morrow, Umatilla, Union, and Wallowa

E. CONFIDENTIALITY

The Hammon Transmission Waterline Phase 1 Project and employees shall make their best efforts, in accordance with federal and state law, to ensure that its personnel and contractors keep the discovery confidential. The media, or any third-party member or members of the public are not to be contacted or have information regarding the discovery, and any public or media inquiry is to be reported to the City of Warrenton. Photos shall not be taken except for when authorized by LCIS, SHPO, and Native American Tribes for identification purposes, and no photos will be circulated publicly or on social media. Prior to any release, the responsible agencies and Tribes shall concur on the amount of information, if any, to be released to the public.

To protect fragile, vulnerable, or threatened sites, the National Historic Preservation Act, as amended (Section 304 [16 U.S.C. 470s-3]), and Oregon State law (ORS 192.345(11)) establishes that the location of archaeological sites, both on land and underwater, shall be confidential.

DESCRIPTION OF DESIRED USE

The Hammond Transmission Waterline Project Phase 1 includes the installation of approximately 4,679 linear feet (LF) of 18-in and smaller diameter water transmission waterline and related system appurtenances (i.e., fittings, valves). Of that amount, about 2,890 LF of pipeline will be installed within ODOT right-of-way along Fort Stevens Hwy (OR-104). The new pipeline will generally parallel existing waterlines within this corridor except for one crossing of OR-104. The new transmission pipeline will have 42-in of cover from top of pipe to the ground surface.

SPECIAL PROVISIONS (FOR ODOT USE ONLY)

TRAFFIC CONTROL REQUIRED

- ☒ YES [OAR 734-055-0025(6)] ☐ NO

OPEN CUTTING OF PAVED OR SURFACED AREAS ALLOWED

- ☒ YES [OAR 734-055-0100(2)] ☐ NO [OAR 734-055-0100(1)]

- **AT LEAST 48 HOURS BEFORE BEGINNING WORK, THE APPLICANT OR HIS CONTRACTOR SHALL NOTIFY THE DISTRICT REPRESENTATIVE** District 1 Office **AT PHONE NO.:** 503-325-7222 **OR EMAIL OR FAX THIS PAGE TO THE DISTRICT OFFICE AT:** ---------- N/A ---------- **. SPECIFY TIME AND DATE WORK IS TO OCCUR.**
- A COPY OF THIS PERMIT AND ALL ATTACHMENTS SHALL BE AVAILABLE AT THE WORK AREA DURING CONSTRUCTION.
- **ATTENTION: Oregon Law requires you to follow rules adopted by the Oregon Utility Notification Center. Those rules are set forth in OAR 952-001-0001 through OAR 952-001-0090. You may obtain copies of the rules by calling the center at (503) 232-1987.**
  CALL BEFORE YOU DIG 1-800-332-2344

COMMENTS (FOR ODOT USE ONLY)

The City shall provide to its contractor the same plans that ODOT approved under this permit.

Applicant to Email TRIP CHECK form in 24 hours prior to any Traffic Control impacting ODOT Highways to: DPCSLMWTOC@odot.state.or.us see attached form.
Notifying the District 1 office 48 hours before work starts and Trip check are two separate actions.
Have your permit in hand as you will need information off of the permit. 503-325-7222

XX

IF THE PROPOSED APPLICATION WILL AFFECT THE LOCAL GOVERNMENT, THE APPLICANT SHALL ACQUIRE THE LOCAL GOVERNMENT OFFICIAL'S SIGNATURE BEFORE ACQUIRING THE DISTRICT MANAGER'S SIGNATURE.

LOCAL GOVERNMENT OFFICIAL SIGNATURE: X [signature] — TITLE: Public Works Director — DATE: 8/7/24

APPLICANT SIGNATURE: X Tanya Miller — APPLICATION DATE: 9/5/2024 — TITLE: City of Warrenton Engineering Technician — TELEPHONE NO.: 503-861-0913

When this application is approved by the Department, the applicant is subject to, accepts and approves the terms and provisions contained and attached, and the terms of Oregon Administrative Rules, Chapter 734, Division 55, which is by this reference made a part of this permit.

DISTRICT MANAGER OR REPRESENTATIVE: Mark Buffington — Mark BUFFINGTON (Dec 23, 2024 12:52 PST) — APPROVAL DATE: 12/23/2024

734-3457 (2/2021)

MILE POINT	TO MILE POINT	ENGINEERS STATION	TO ENGINEERS STATION	SIDE OF HWY OR ANGLE OF CROSSING	DISTANCE FROM CENTER OF PVMT	DISTANCE FROM R/W LINE	BURIED CABLE OR PIPE DEPTH/VERT.	BURIED CABLE OR PIPE SIZE AND KIND	SPAN LENGTH

1.14	1.14	A54+37	A54+37	West/South	80'	20'		Air Release Valve	

Special Provisions:

☒The contractor shall go to the City who is the permit holder with any proposed changes. The City can then bring to ODOT in writing any changes they would like to propose to ODOT. All questions or changes must come to ODOT from the City.

☒The City shall insure that ODOT is supplied with a working cell number of someone who will respond to any issues that may occur after daytime working hours, to address any issue that may arise due to the city's installation. This shall be supplied to ODOT before any work begins.

☒The City and the Contractor shall contact ODOT every Monday to update ODOT with location of work and how the project is progressing.

☒ The applicant shall not work outside the permitted work schedule without prior approval for an exceptional situation. If an unforeseen situation comes up the applicant shall notify the City and ODOT by phone of the situation as soon as possible.

☒No air release valves shall be placed in a ditch section of the Highway Right of Way at any time, specifically, in a shallow ditch / swale line.

☒Only one section of this water line has been pre – approved to be placed under the ditch line between mile point 1.55 by NW 15th ST and 1.68 by NW 13th ST. This line shall not be placed less than 48" below the bottom of the natural ditch line. ODOT shall determine the depth of the natural ditch line. 10" of the top cover shall be ¾" minus.

☒Applicant to email Trip Check 48 hours prior to any work being performed in ODOT's Right of Way. DPCSLMWTOC@odot.state.or.us See the attached form. Applicant to notify the District Office 48 hours before beginning work. These are two separate actions!

☒Please have the permit in hand you will be asked for the application number, who the permit is issued to, who you are, Highway and mile point, Date you would like to start work. What your specified Comp. Date is on

this permit. In the right-hand corner on the face of the permit. specified Comp. Date: That is the last day any work can be done under this permit.

☒Erosion control devices need to be in place and kept in working order at all times during this project.

☒No staging of materials in ODOT's Right of Way.

☒Applicant is responsible for the removal of all contaminated material form ODOT Right of Way, and the proper disposal of the materials and the coast associated with that disposal.

☒ Any damage to ODOT facilities including but not limited to culverts, striping, site posts, signs, asphalt and guardrail shall be repaired by applicant at applicant's expense. Any damage or excavation of asphalt shall require applicant to repair to ODOT's "T-CUT" restoration specifications and the ODOT line to line shall also apply.

☒Applicant to insure no damage occurs to any existing ADA curb ramps or any ADA feathers. If damage occurs the applicant will be required to reconstructs to the current ADA standards at the applicant's expense.

☒In the event of adverse weather or other conditions (ice, snow, excessive rain, or slides resulting from said conditions or traffic or road related incident) ODOT crews reserve the right to stop this permitted activity to perform their necessary maintenance activities or to insure the safety of travelling public.

☒All vaults shall be installed flush to the surface of the ground. No vaults shall be placed in a driveway access in ODOT's Right of Way.

☒Any damage done to a driveway access in ODOT's Right of Way, ODOT will determine the restoration limits.

☒The city shall insure that the contractor they hire to perform this work understands while the plans were created for the complete job this permit is

only written for the phase 1, and a new permit must be applied for by the city for the remainder of this project.

Oregon Department of Transportation

GENERAL PROVISIONS FOR POLELINE, PIPELINE, BURIED CABLE, AND MISCELLANEOUS PERMITS

Revised April 2022

APPLICANT: CITY OF WARRENTON	PERMIT NO.: 01M41513
HIGHWAY: 104 FORT STEVENS	MP: 1.14 - 1.69

These permit provisions are in addition to the requirements described in Oregon Administrative Rule, Chapter 734, Division 55 and may be supplemented by permit special provisions. In the event of a conflict, the Administrative Rule will apply then these provisions followed by any permit special provisions. Unless otherwise specified, all documents referenced are references to the current version, with any revisions or supplements, in place when the work is conducted.

All checked (☒) provisions apply.

WORKSITE

☒ 1. Access control fence must be maintained during permitted work and restored to its original or better condition after permitted work is complete.

☒ 2. The Applicant shall not use state highway right of way to display advertising signs or to display or sell merchandise of any kind.

☒ 3. The stopping and parking of vehicles upon state highway right of way for the maintenance of adjoining property or in furtherance of any business transaction or commercial establishment is prohibited.

☐ 4. All grass and small brush within the work area shall be rotary or flail mowed to ground level prior to the beginning of work to facilitate clean up.

☒ 5. Disturbed areas shall be reseeded with grass native to the area in an appropriate seeding time.

☒ 6. The spreading of mud or debris upon any state highway is prohibited and violation shall be cause for immediate cancellation of the permit. Clean up shall be at the Applicant's expense. The highway shall be cleaned of all dirt and debris at the end of each work day, or more frequently as directed by the District Manager or representative.

☒ 7. Applicant shall replace any landscape vegetation or fences that are damaged or destroyed. Any damage that is not fully restored within 30 days may be replaced by ODOT at the expense of the Applicant. A "plant establishment" shall be understood to be part of the planting work to assure satisfactory growth of planted materials. The plant establishment period will begin when the original planting has been completed and approved. The length of the establishment period will be one calendar year or as defined in the permit Special Provisions.

☐ 8. Applicant shall install and maintain the landscaped area as shown on the attached drawings. Plantings shall be limited to non-invasive, low-growing shrubs, grass or flowers that do not attain sufficient height to obstruct clear vision in any direction. ODOT may remove plantings without liability or loss, injury, or damage of any nature whatsoever if in the future it is determined to be in the public interest to do so.

TRAFFIC

☒ 9. The work area shall be protected in accordance with the Manual on Uniform Traffic Control Devices for Streets and Highways (MUTCD), and the Oregon Temporary Traffic Control Handbook as supplemented or amended by ODOT.

☒ 10. For work requiring traffic control devices to be in place continuously for longer than three days, Applicant shall provide a site specific traffic control plan developed based on the principles of the Manual on Uniform Traffic Control Devices for Streets and Highways (MUTCD) and ODOT Standards. The traffic control plan may be reviewed by ODOT before work begins. The ODOT review does not relieve the Applicant of responsibility for the accuracy of the traffic control plan.

☒ 11. For permitted utility work, the Applicant shall take measures necessary to maintain the accessibility of the state highway including sidewalks and pedestrian areas by individuals with disabilities to the ODOT Americans with Disability Act (ADA) standard during the course of the work by following the Oregon Temporary Traffic Control Handbook, Section 1.6.

☒ 12. When constructing a new utility service line, Applicant shall ensure that advance notice of any temporary pedestrian route is provided in an accessible format to the public, people with disabilities, and disability organizations to the greatest extent possible. The Notice is to be sent to the organizations on the contact list of Centers for Independent Living at https://www.oregon.gov/odot/Engineering/DOCS_ADA/AOCIL-Contacts.pdf

☒ 13. All damaged or removed highway signs shall be replaced by the Applicant. Installation shall be according to MUTCD and ODOT standards, and shall be completed as soon as possible but no later than the end of the work shift.

☐ 14. No lane restrictions are permitted on the roadway during the hours of darkness, on weekends, or between 6:00 AM and 9:00 AM, or 3:00 PM and 6:00 PM (Monday through Friday) without prior approval by ODOT.

☒ 15. Hours of work shall be _____

Monday - Thursady.

No work on Friday Saturday or Sundays

8:00 am to 4:00pm

No work the day before the day after or the day of a holiday.

DRAINAGE

☐ 16. On-site storm drainage shall be controlled within the permitted property. No blind connections to existing state facilities are allowed.

☒ 17. Excavation shall not be done on ditch slopes. Trench excavation shall either be at ditch bottom or outside ditch area. (Minimum depth at bottom of ditch shall be 36 inches; minimum depth outside of ditch shall be 42 inches).

☒ 18. Only earth or rock shall be used as fill material and shall slope so as not to change or adversely affect existing drainage. Fine grade and seed the finished fill with native grasses to prevent erosion.

☐ 19. A storm drainage study stamped by an Oregon Registered Professional Engineer (PE) is required. The study must meet standards of the National Pollution Discharge Elimination Systems (NPDES) when any of the following conditions apply:

- whenever a four inch pipe is inadequate to serve the developed area,
- development site is one acre or larger in size and directly or indirectly affects state facilities, or
- as directed by the District Manager or representative.

☐ 20. Applicant shall provide on-site retention for storm water runoff that exceeds that of the undeveloped site.

☒ 21. All water discharged to an ODOT drainage system must be treated prior to discharge. All requests for connection to an ODOT storm system must meet any requirements of the National Pollutant Discharge Elimination System (NPDES). This may include local jurisdiction approval of on-site water quality treatment facilities and/or development of an operation and maintenance plan for any on-site water quality treatment facility, as determined by local jurisdiction.

EXCAVATION / CONSTRUCTION

☒ 22. "Oregon Standard Specifications for Construction" and ODOT "Standard Drawings" where applicable and not otherwise superseded by the permit, shall be incorporated for use in the permit; https://www.oregon.gov/odot/engineering/pages/index.aspx. These documents apply only to the extent they provide standards and performance requirements for work to be performed under the permit. In the event of a conflict, the permit provisions will take precedent.

☐ 23. Trench backfill shall be according to the attached typical drawing, marked as Exhibit A.

☒ 24. When open cutting of the highway is allowed, all excavation in paved areas shall be backfilled and the roadway surface patched before the end of each shift.

☒ 25. Steel plates shall be pinned and a temporary cold patch applied to the edges. The Applicant shall be responsible for monitoring and maintenance of temporary patching and steel plating.

☒ 26. Compaction tests shall be required for each open cut per Oregon Standard Specifications for Construction. Compaction tests shall be conducted once for every 300 lineal feet per lift of continuous trench according to the Manual of Field Test Procedures (MFTP), published by ODOT. Percent Compaction shall be at least 95%. Results of compaction test shall be provided upon request of the District Manager or representative at Applicants' expense.

☒ 27. Control Density Fill (CDF) shall be used as surface backfill material in place of crushed rock in open trenches that impact the travel portions of the highway. A ¾"-0, or 1"-0 rock will be used for the aggregate. The amount of cement used shall not exceed 3.0% of the total mixture's weight. Maximum compressed strengths must not exceed 250 pounds per square inch (psi).

☒ 28. Surface restoration shall be a minimum of four inches of hot asphalt-concrete (AC), compacted in two inch lifts, or to match existing pavement depth, whichever is greater. Sand-seal all edges and joints.

☒ 29. Any area of cut or damaged asphalt shall be restored in accordance with the attached "T-Cut Typical Section" drawing. For a period of two years following the patching of the paved surface, Applicant shall be responsible for the condition of the pavement patches, and during that two year period shall repair to District Manager or representative's satisfaction any of the patches which become settled, cracked, broken, or otherwise faulty.

☒ 30. An overlay to seal an open-cut area shall be completed prior to the end of the construction season, or when minimum temperature allows per the Oregon Standard Specification for Construction. The overlay shall be 1.5 inches deep and cover the affected area from edge of pavement to edge of pavement, and taper longitudinally at a fifty feet to one inch (50':1") ratio. Taper may be adjusted by the District Manager as required. For a period of two years following this patching of the paved surface, the Applicant shall be responsible for the condition of said pavement patches, and during that time shall repair to the District Manager or representative's satisfaction any of the patches which become settled, cracked, broken or otherwise faulty.

☒ 31. Highway crossings of utility lines shall be bored, or jacked. Bore pits shall be located behind the ditch line unless otherwise specified in the permit. Unattended pits shall either be protected by a six-foot fence, backfilled, or steel plated and pinned.

☒ 32. Any non-conductive, un-locatable, underground facility shall have a tracer wire or other similar conductive marking tape or device placed the full length of the installed underground facility in compliance with the Oregon Utilities Notification Center rules, OAR Chapter 952.

☒ 33. Trench backfill outside of ditch line may be native soil compacted at optimum moisture in twelve inch layers to not less than 95% relative maximum density.

☒ 34. Native material that is unsatisfactory for compaction shall be disposed of off the work site and granular backfill used.

☒ 35. Trench backfill in rock slope or shoulder shall be crushed 1"-0 or ¾"-0 size rock compacted at optimum moisture in eight-inch layers. Compaction tests shall be conducted according to the Manual of Field Test Procedures (MFTP), published by ODOT. Percent compaction shall be at least 95%maximum density. At the request of the District Manager or representative, results of compaction tests shall be provided to District Manager or representative at Applicant's expense.

☒ 36. Where excavation is on fill slope steeper than a two to one (2:1) ratio, slope protection shall be provided using four-inch size rock laid evenly to a minimum depth of twelve inches.

☒ 37. No more than 300 feet of trench longitudinally along the highway shall be left open at any one time and no trench shall be left in an open condition overnight.

☒ 38. Areas of disturbed cut and fill slopes shall be restored to a condition suitable to the District Manager or representative. Areas of erosion to be inlaid with an acceptable riprap material.

☒ 39. All underground utilities shall be installed with three-foot or more of horizontal clearance from existing or contract plans guardrail posts and attachments.

☒ 40. Any area of cut or damaged concrete shall be restored in accordance with the attached Typical Section-Pipe Section under sidewalk.

☒ 41. Utility markers, pedestals, and vaults shall be placed as near the highway right-of-way line as practical. In no case shall pedestals, vaults, and line markers be located within the area where highway maintenance activities regularly occur including mowing operations, or nearer the pavement edge than any official highway sign in the same general location.

☒ 42. No cable plowing is allowed within the lateral support of the highway asphalt (e.g. at six feet lower than the edge of the asphalt, no plowing within nine feet of the edge of the asphalt).

☐ 43. Review by the ODOT Bridge Engineer is required for all proposed bridge and structure attachments and for any facilities to be installed within sixteen feet of bridge foundations, supports, walls or related elements, or within the influence zone of bridge facilities.

MISCELLANEOUS

☒ 44. Applicant shall be responsible and liable for (1) investigating presence/absence of any legally protected or regulated environmental resource(s) in the action area; (2) determining any and all restrictions or requirements that relate to the proposed actions, and complying with such, including but not limited to those relating to hazardous material(s), water quality constraints, wetlands, archeological or historic resources(s) state and federal threatened or endangered species, etc., (3) complying with all federal, state, and local laws, and obtaining all required and necessary permits and approvals.

☒ 45. If the Applicant impacts a legally protected/regulated resource, Applicant shall be responsible for all costs associated with such impact, including, but not limited to all costs of mitigation and rehabilitation, and shall indemnify, and hold ODOT harmless for such impacts and be responsible and liable to ODOT for any associated costs or claims that ODOT may have.

☒ 46. Plans are reviewed by ODOT in general only and do not relieve the Applicant from completing roadway improvements in a manner satisfactory to ODOT. The District Manager or representative may require field changes. When revisions are made in the field, Applicant is responsible to provide "as built" drawings, within 60 days from completion of roadway improvements, and shall submit them to the District Office issuing the permit.

☒ 47. Applicant shall be responsible for locating and preserving all existing survey monumentation within the work area in accordance with ORS 209.150 and/or 209.155. If monumentation or its accessories are inadvertently or otherwise disturbed or destroyed, Applicant shall be responsible for all costs and coordination associated with its reestablishment by a professional licensed surveyor.

☒ 48. Applicant shall be responsible to restore or replace any curbs or curb ramps damaged by the permitted activity according to ODOT's ADA Standards available at https://www.oregon.gov/ODOT/Engineering/Pages/Accessibility.aspx. Any review or inspection of the curbs or curb ramps conducted by ODOT does not relieve the Applicant of the responsibility to comply with any other aspect of federal, state, and local laws, rules and regulations applicable to the work allowed under the permit including but not limited to the Americans with Disabilities Act of 1990.

☒ 49. When constructing a minor roadway improvement, Applicant shall comply with all federal, state, and local laws, regulations, executive orders and ordinances applicable to the work under this permit, including, without limitation, the provisions of ORS 276.071. If Applicant chooses to assign their permitted responsibilities to a consultant or contractor, Applicant shall inform the consultant or contractor of the requirements of ORS 276.071.

☐ 50. Upon completion of the permitted minor roadway improvement, Applicant shall notify ODOT and request final inspection. If all structures and appurtenances constructed under this permit are found to be in compliance with permit provisions and state standards, ODOT will accept ownership of the permitted structures and appurtenances by written notice to the Applicant.

By this signature Applicant acknowledges that the Applicant is subject to and accepts all checked (☒) provisions (4 pages).

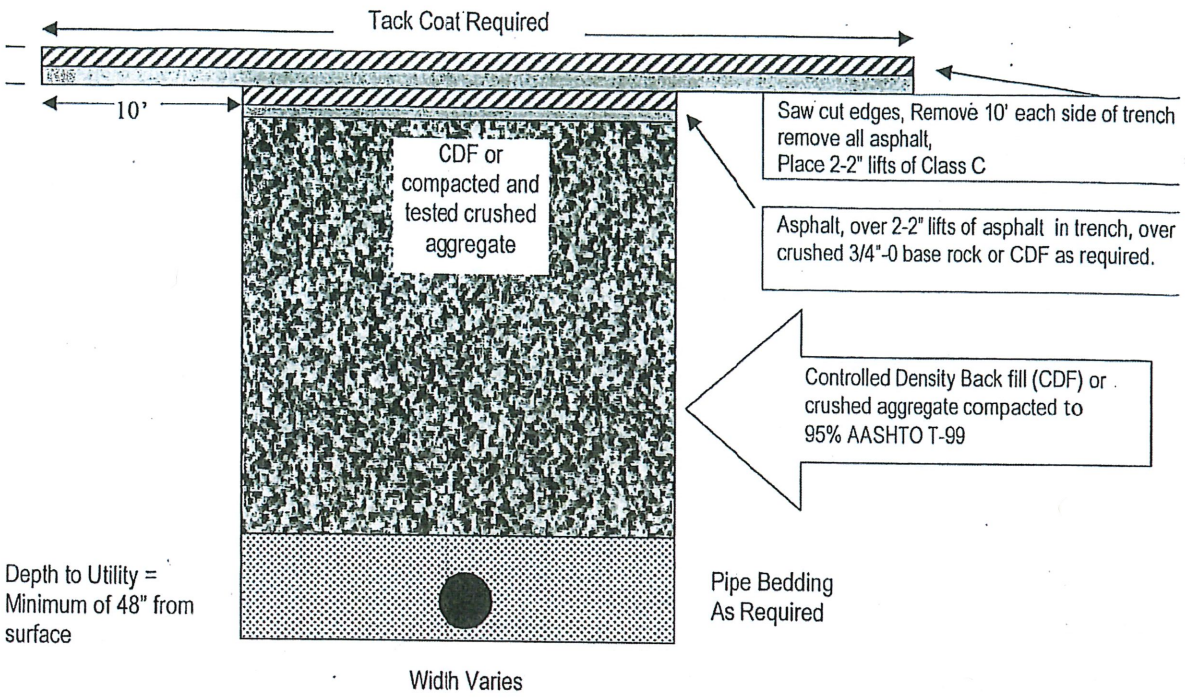
Attachment B
T-Cut Typical Section
CDF or Compacted Aggregate Backfill Option

Permit # 01M_41513



Backfill Material:

If Crushed Rock is used:

Place approved compacted crushed aggregate in trench to within 8" of the top of the sub-grade compacted to a minimum of 95% of the maximum density of the material, placed in 12" maximum lifts. Results of compaction tests to be made available to ODOT.

If CDF is used:

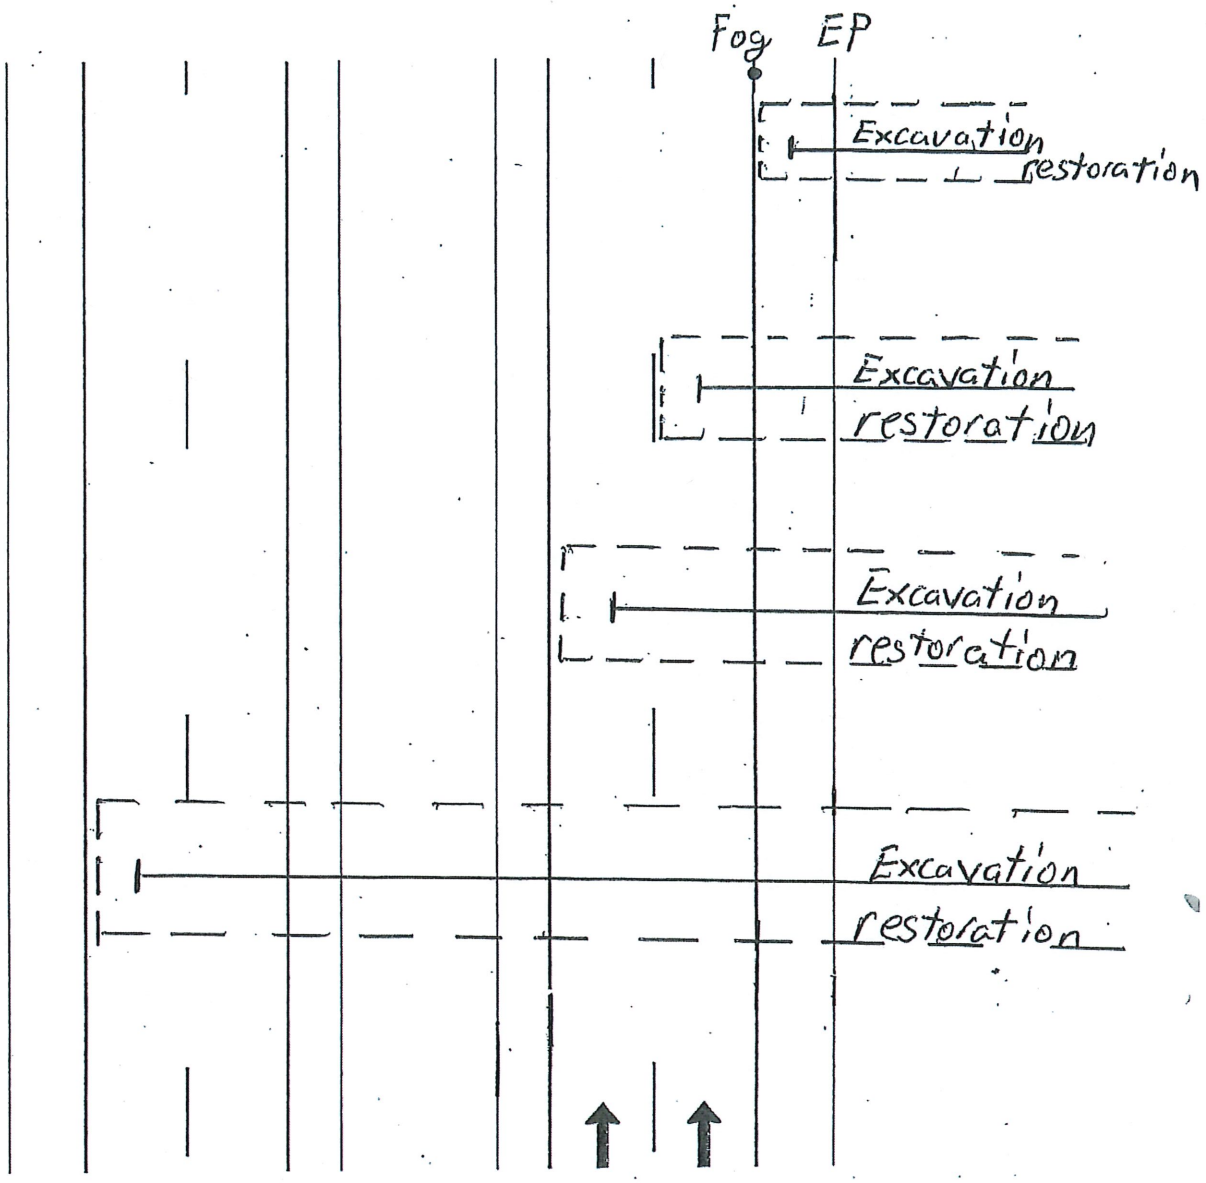
Controlled Density Fill (CDF), consists of ¾" -0 aggregate and an amount of concrete not to exceed 3% of the mixtures total mass. Do not exceed maximum compression strengths of 150 psi. Place approved CDF in trench to 8" below the roadway surface.

Apply an asphalt emulsion tack coat to all asphalt edges and ground surface. Place 2 additional lifts of Asphalt pavement in 2" compacted lifts in the T-Cut surface to grade. Provide a minimum compacted thickness of 4", or the thickness of the removed pavement, whichever is greater.

Cold Patch all cut areas at the end of each workday and maintain the patch. Hot patch damaged area within 7 days.

Restoration of cut asphalt.

A Crossed pavement line must restore to next line.



Any damaged to striping shall be replaced in kind by applicant.

Oregon Department of Transportation

Utility Permit Cultural Resource Certification

This form is to be completed and submitted to the Oregon Department of Transportation with the *Application and Permit to Occupy or Perform Operations Upon a State Highway* when ground disturbance (directional boring, cable plowing, trenching, and digging of any kind) is proposed as part of a permit application for installation of a utility line including moving or repositioning existing lines or poles.

Applicant Information		
Applicant Name City of Warrenton		
Address 45 SW 2nd St		
City Warrenton	State OR	Zip 97146
Contact Person Name Twyla Vittetoe	Phone Number 503.861.0912	Email tvittetoe@warrentonoregon.us

Project Location Information		
Highway Name and Route Number OR-104 / 104 / Fort Stevens		
Begin MP 1.17	End MP 1.69	County Clatsop

I represent that this Certification is in support of the *Application and Permit to Occupy or Perform Operations Upon a State Highway* at the above location dated 08/22/2023, submitted to the Oregon Department of Transportation with this Certification.

I am an authorized representative of the Applicant and certify that the Applicant has reached out to the Tribe(s) identified by the Legislative Commission on Indian Services (LCIS) and verified the presence/absence of cultural resources based on information available from the State Historic Preservation Office (SHPO) for a utility installation proposed on state highway right of way that is expected to include ground disturbance (directional boring, cable plowing, trenching, and digging of any kind).

The Tribe(s) was given at least 14 calendar days to respond to the request for feedback on cultural resources in the proposed work area that may be known to the Tribe(s) but not in the SHPO database.

Based on this information, the necessary cultural resource protection clearances and permits have been, or will be, obtained for the proposed work. In addition, it is understood that this does not relieve the Applicant from its responsibility to protect cultural resources. If cultural resources are discovered during the project, work will be stopped and SHPO contacted according to SHPO regulations.

By signing below, I certify that the above statements are true and correct to the best of my knowledge.

1 INTRODUCTION

We understand that the City of Warrenton (the City) is planning to install an approximately 10,000 foot long, 18-inch diameter ductile iron waterline. Based on preliminary plans provided to us, the pipeline is planned to have a minimum cover that varies from 30- to 42-inches. Therefore, we anticipate that the pipeline will have an average depth of 4- to 5-feet to invert. However, profiles included in the preliminary plans provided by Consor indicate that the pipeline will be deeper in certain locations along the alignment, but still less than 10-feet to invert.

2 GEOLOGIC SETTING

2.1 Regional Geology

The Oregon Coast Range began as a mid-oceanic volcanic island chain, riding atop the ocean basaltic Kula and Juan de Fuca plates that collided with the North American continental plate during the early Eocene, 55 million years ago (Orr and others, 1992). These volcanic rocks of accreted islands form the backbone of the coastal mountains and are the oldest known rocks in the Coast Range. As the islands were accreted to North America, and the Kula and Juan de Fuca plates on which they were riding were forced beneath the continental plate, a trough was created between the ancestral Cascade Mountains and the accreted volcanic islands. During the Eocene and early Miocene, 55 to 16 million years ago, silt, sand, mud, and volcanic debris were deposited in the forearc basin and onto the subsiding accreted island chain from the landmass to the east. During the Oligocene and early Miocene, deposition over the subsiding accreted islands and the forearc basin continued from increased volcanism in the Western Cascades. During the Miocene, the ocean retreated to the west and the western edge of the North American plate wrinkled and buckled upwards by pressure from the subducting Juan de Fuca plate. Subduction of the Juan de Fuca plate under North America has pushed the Coast Range upwards and created the Coast Range physiographic province, a narrow north-south trending belt of moderately high mountains and coastal headlands, 30 to 60 miles wide and about 200 miles long, typically consisting of Tertiary marine sedimentary and volcanic rocks (Orr and others, 1992).

2.2 Local Geology

Published mapping by Walsh (1987), Niem and Niem (1985) and Schlicker and others (1972) indicates the pipeline alignment is underlain by Quaternary (from 1.8 million years ago to the present) beach sand, dune sand and flood plain alluvium silty clay. Neim and Neim (1985) describe the beach sand as consisting of well sorted, fine- to medium grained quartzo-feldspathic sands and the dune sand as well sorted, fine grained, quartzo-feldspathic sands with cross bedding.

2.3 Seismic Setting

The contemporary tectonics and seismicity of the region are the result of oblique, northeastward subduction at a rate of about 37 millimeters per year (mm/yr) (DeMets and others, 2010) of the Juan de Fuca oceanic plate beneath the North American continental plate (Wells and others, 1998; Wells and Simpson, 2001). This complex tectonic setting produces east-west compressive strain along the Cascadia Subduction Zone (CSZ), as well as northward translation and rotation of the mobile, crustal, Cascadia forearc blocks that span the leading edge of the North American plate (Wells and others, 1998; McCaffrey and others, 2007, 2013). Rotation of the Sierra-Nevada block and expansion of the Basin and Range drive the northward migration and clockwise rotation of the Cascadia forearc blocks (Pezzopane and Weldon, 1993; Wells and others, 1998; Wells and Simpson, 2001). As a result, the southern portion of the forearc, the Oregon Coast block, is impinging on western Washington and northwest Oregon at a rate of about 8 to 12 mm/yr causing crustal shortening in northwest Oregon and western Washington (Wells and others, 1998; Wells and Simpson, 2001; Mazzotti and others, 2002).

The combined effect of margin-normal subduction and margin-parallel shortening produces complex and diverse deformation within the northern edge of the Cascadia forearc and triggers large (greater than magnitude [M] 6), damaging earthquakes from three seismogenic source zones:

- The locked zone of the CSZ fault interface, which produces great mega-thrust earthquakes;
- The deep intraslab portion of the CSZ (i.e., the subducted portion of the Juan de Fuca Plate), the source of Wadati-Benioff zone earthquakes; and
- The overriding North American Plate, where shallow crustal faults rupture.

All three sources potentially produce earthquakes that impact the ground motion hazards at the project site. Offshore, elastic release of strain accumulated in the locked plate interface of the CSZ produces great megathrust earthquakes (greater than M 8.0) occurring at

irregular intervals that span from about 100 to more than 1,200 years, with an average recurrence interval of about 300 to 500 years (Atwater and Hemphill-Haley, 1997; Clague, 1997; Goldfinger and others, 2003 and 2012); the most recent rupture occurred in A.D. 1700 (Satake and others, 1996; Atwater and Hemphill-Haley, 1997; Clague, 1997; Yamaguchi and others, 1997; Goldfinger and others, 2003 and 2012).

Onshore, migration and rotation of tectonic blocks produce deformation along shallow faults within the upper part of the crust. At depth, rupture within the subducting slab, referred to as the intraslab, has produced some of the largest recorded earthquakes (M 6.5 to 7) to strike the Pacific Northwest, the northern California Coast, and Western Washington. However, over the past century, intraslab earthquakes have been markedly infrequent in Oregon. The following sections briefly describe the location, characteristics, and seismicity of each of the sources.

2.3.1 Cascadia Subduction Zone: Mega-Thrust Interface Source

CSZ mega-thrust earthquakes originate along the interface between the subducting oceanic plates and the North American plate. Because of the significant uncertainty of the landward extent of a potential rupture surface, estimates of the closest distance between the project and potential rupture surface range from about 5 to 40 horizontal miles. Focal depths for mega-thrust earthquakes are commonly on the order of about 15 to 25 miles. Rupture of the interface could result in earthquakes with moment magnitudes (Mw) on the order of 8.5 to over 9.0, with strong shaking that lasts for several minutes. No large earthquakes have occurred in this zone during historic times (the last 170 years). However, geologic evidence suggests that coastal estuaries have experienced rapid subsidence at various times within the last 2,000 years (Atwater, 1987; Atwater and Hemphill-Haley, 1997) as a result of tectonic movement associated with mega-thrust earthquakes on the CSZ. It appears that ruptures of this zone have occurred at irregular intervals that span from about 100 to more than 1,200 years, with an average recurrence interval of about 300 to 500 years (Atwater and Hemphill-Haley, 1997). Based on historical tsunami records in Japan (Satake and others, 1996) the most recent interplate event on the CSZ was a Mw 9 event on January 26, 1700.

2.3.2 Cascadia Subduction Zone: Intraslab Source

CSZ intraslab earthquakes originate from within the subducting oceanic plates as a result of down-dip tensional forces and bending caused by mineralogical and density changes in the plates at depth. These earthquakes typically occur 28 to 37 miles beneath the surface. The nearest seismogenic intraslab portion of the Juan de Fuca plate is approximately 30 to 60 miles below the Portland area. Ludwin and others (1991) estimate that the maximum Mw from this source zone would be about 7.5. Ground shaking produced by intraplate

earthquakes would be less intense and less prolonged in the Portland area than ground motions generated by large subduction zone interface earthquake events. Historic seismicity from this source zone includes the 1949 Mw 6.7 Olympia earthquake, the 1965 Mw 6.7 earthquake between Tacoma and Seattle, and the 2001 Mw 6.8 Nisqually earthquake. While intraslab events have occurred frequently in the Puget Sound area, they are historically rare in Oregon.

2.3.3 Shallow Crustal Source

Shallow crustal earthquakes within the North American Plate have historically occurred in a diffuse pattern within Pacific Northwest, typically within the upper 4 to 19 miles of the continental crust. The largest known crustal earthquake in the Pacific Northwest is the 1872 North Cascades earthquake at approximate Mw 6.5 to 7.0. Other examples include the 1993 Mw 5.6 Scotts Mill earthquake and the 1993 Mw 6.0 Klamath Falls earthquake.

2.3.4 Quaternary Faults and Folds

Faults and associated folds which demonstrate geological evidence of co-seismic surface deformation during the Quaternary time period in Oregon and Washington have been located and characterized by the United States Geological Survey (USGS). The USGS provides approximate fault locations and a detailed summary of available fault information in the USGS Quaternary Fault and Fold Database. The database defines four categories of faults, Class A through D, based on evidence of tectonic movement known or presumed to be associated with large earthquakes during Quaternary time (within the last 2.6 million years). For Class A faults, geologic evidence demonstrates that a tectonic fault exists and that it has likely been active within the Quaternary period. For Class B faults, there is equivocal geologic evidence of Quaternary tectonic deformation, or the fault may not extend deep enough to be considered a source of significant earthquakes. Class C and D faults lack convincing geologic evidence of Quaternary tectonic deformation or have been studied carefully enough to determine that they are not likely to generate significant earthquakes.

According to the USGS Quaternary Fault and Fold Database (USGS, 2023), there are 5 Class A features, within approximately 20 miles of the project site. Their names, general locations relative to the site, and the time since their most recent deformation are summarized in Exhibit 2-1. The CSZ itself is approximately 6 miles west of the project site, with an average slip rate of approximately 40 millimeters (1.5 inches) per year.

Exhibit 2-1: USGS Class A Faults Within an Approximate 20-Mile Radius of the Project Site

Fault Name	USGS Fault Number	Approximate Length	Approximate Distance and Direction from Project Site[1]	Slip Rate Category[2]	Time Since Last Deformation[3]
Cascadia Fold and Fault Bed	784	301 miles	5.7 miles West	Between 1.0 and 5.0 mm/yr	< 15 ka
Unnamed Offshore Faults	785	174 miles	9.3 miles West	Between 1.0 and 5.0 mm/yr	< 15 ka
Willapa Bay Fault Zone	592	23 miles	14.7 miles North	Between 0.2 and 1.0 mm/yr	<750 ka
Nehalem Bank Fault	789	62.8	16.9 miles West	Between 1.0 and 5.0 mm/yr	< 15 ka
Fault H	790	30.4	17.2 miles SW	Greater than 5.0 mm/yr	< 15 ka

NOTES:

[1] Approximate distance between project site and nearest extent of fault mapped at the ground surface.

[2] mm = millimeters; yr = year.

[3] Ma = "Mega-annum" or million years ago; ka = "Kilo-annum" or one thousand years ago.

3 EXPLORATION PROGRAM

Shannon & Wilson explored subsurface conditions at the project site with six Cone Penetetration Tests (CPTs), designated CPT-1 to CPT-6 and one geotechnical boring designated B-1. The CPT's were completed to depths ranging from 60.4 to 101.5 feet below ground surface (bgs) between January 23 to January 25, 2024. During explorations, a vibrating wire piezometer (VWP) was installed to allow the measurement of groundwater levels in boring B-1.

Approximate locations of the explorations are shown on the Site and Exploration Plan, Figure 2. Details of drilling, sampling procedures, and our log of the materials encountered are presented in Appendix A, Field Explorations.

3.1 Laboratory Testing

Soil samples obtained during our field exploration were transported to our laboratory for further examination. Representative samples were selected for laboratory tests. The laboratory testing program included moisture contents and grain size analyses. Laboratory testing was performed by Shannon & Wilson in accordance with applicable ASTM International (ASTM) standard test procedures. Results of the laboratory testing are presented in Appendix B and are shown on the log of the boring included in Appendix A.

4 SUBSURFACE CONDITIONS

4.1 Geotechnical Units

Shannon & Wilson grouped the materials encountered in our field explorations into two geotechnical units. The soil classifications are presented in the individual boring logs. The geotechnical units are as follows:

- **Fill:** Asphalt and Base Aggregate; and
- **Holocene Beach Sand:** Poorly Graded Sand (SP).

These geotechnical units were grouped based on their engineering properties, geologic origins, and their distribution in the subsurface. Contacts between the units may be more gradational than shown in the boring log in Appendix A.

4.2 Groundwater

Based on pore water dissipation testing in the CPTs, depth to groundwater was inferred in the CPT locations at the time of testing. Additionally, during explorations, a vibrating wire piezometer was installed to measure the groundwater level in boring B-1. The vibrating wire piezometer was installed to allow for ongoing groundwater level measurements. A summary of groundwater measurements is provided in Exhibit 4-1.

Exhibit 4-1: Depth to Groundwater Summary

Exploration (Method)	Date	Depth of Water (ft)	Approximate Ground Surface Elevation (ft)	Approximate Groundwater Elevation (ft)
B-1	1/23/2024	2.8	11.4	8.6
CPT-1 (PWD_1)	1/25/2024	8.93	14.5	5.6
CPT-2 (PWD_1)	1/24/2024	3.62	9.6	6.0
CPT-3 (PWD_1)	1/24/2024	4.90	13.6	8.7
CPT-4 (PWD_1)	1/24/2024	1.02	10.1	9.1
CPT-5 (PWD_1)	1/25/2024	5.40	11.4	6.0
CPT-6 (PWD_1)	1/23/2024	2.39	12.8	10.4

NOTES:

[1] Measurement inferred from Pore Water Dissipation Test in Cone Penetrometer (PWD)

Groundwater levels should be expected to vary with changes in topography and precipitation. Generally, groundwater highs occur at the end of the wet season in late spring or early summer, and groundwater lows occur towards the end of the dry season in the early to mid-fall.

5 GEOLOGIC HAZARDS

5.1 Landslide Hazard

According to the Oregon Department of Geology and Mineral Industries, no landslides have been mapped along the proposed pipeline alignment. Relative earthquake hazard maps prepared for coastal communities by DOGAMI (IMS-10) indicate that the proposed alignment is in an area of low landslide hazard. Based on the site topography and mapped landslide hazard, we consider the risk of earthquake induced landslides impacting the proposed pipeline to be low.

5.2 Liquefaction

Soil liquefaction is a phenomenon in which excess pore water pressure of loose to medium dense, saturated, granular soils increases during ground shaking to a level near the initial effective stress. The increased excess pore pressure results in a reduction of soil shear strength. The effects of liquefaction typically include lateral spreading, slope instability, and ground settlement.

Soil behavior under seismic loading is the primary factor in determining the susceptibility of soil to liquefaction. Important factors in evaluating soil behavior are relative density, the fines content (percent of soil by weight smaller than 0.075 millimeters, passing the No. 200 sieve), and the plasticity characteristics of the fines. Relative density can be estimated from CPT tip resistances and shear wave velocity measurements that were performed for this project. We completed grain size analyses to evaluate the index parameters of the soils at the site.

5.2.1 Liquefaction Analysis and Liquefaction-Induced Settlement

We evaluated liquefaction potential of the soils based on the boring and CPT results completed for this study. The CPT soundings were evaluated using the computer program CLiq Version 2 by GeoLogismiki, which incorporates the Boulanger and Idriss (2014) method. Our analysis was completed using a peak ground acceleration (PGA_M) of 0.8g and a mean Mw 8.89, based on the total seismic source contribution, according to USGS's Unified Hazard Tool with a 2,475-year return period. Exhibit 5-1 presents a summary of liquefaction induced settlement under the proposed pipeline.

Exhibit 5-1: Summary of Liquefaction-Induced Settlement

Exploration ID	Approximate Pipe Invert Elevation (feet)	Approximate Elevations of Liquefaction Susceptible Soils (feet)	Approximate Total Settlement at Pipe Invert[1] (inch)
CPT-1	6	4 to -46	1.5
CPT-2	6	4 to -51	2.5
CPT-3	6	8.5 to -46.5	3.0
CPT-4	6	8 to -50	2.0
CPT-5	6	6 to -48.5	3.5
CPT-6	6	10 to -47.5	3.0

Liquefaction-induced settlement magnitudes based on CPT soundings were estimated using Boulanger and Idriss (2014).

Soil deposits are not homogeneous; and liquefaction-induced settlement seldom occurs uniformly, even in small, localized areas (Ishihara and Yoshimine 1992), making differential settlements difficult to predict. Based on the available data and considering the range of liquefaction-induced settlement for the borings and CPT soundings along the proposed alignment, it is our qualitative assessment that the average liquefaction-induced differential settlement of the pipeline for the design earthquake ground motions will likely be less than or equal to approximately 1 inch in 500 feet.

We anticipate the estimated settlements could impact the buried pipeline that will be within or above the identified potentially liquefiable layers. Consequently, we recommend the designers of these structures consider the liquefaction-induced settlements.

5.2.2 Potential Increased Flotation Effect

The proposed pipelines within the identified potentially liquefiable soil layers will be subjected to increased buoyance forces beyond those during static conditions due to the dramatic increase in the pore water pressure associated with soil liquefaction.

The assessment of potential flotation of the pipeline from liquefaction involves determining if sufficient resistance to buoyancy forces is provided by the weight of the pipelines and resistance of the surrounding soil to uplift. We recommend the risk for flotation be evaluated during final design based on the specific pipeline and structure embedment within the liquefiable soil. Seismic mitigations for potential pipeline flotation are discussed

in Section 5.5 with additional guidance on the unit weight of various backfill materials and buoyant unit weight of soil in Section 6.2.

5.3 Lateral Spreading

Lateral spreading hazards can exist in areas with mild slopes adjacent to a much steeper slope or vertical face. Lateral spreading failure can occur if soil liquefaction develops during a seismic event and the ground acceleration (inertial force) briefly surpasses the yield acceleration (shear strength) of the liquefied soil. This can cause both the liquefied soil and an overlying non-liquefied crust of soil to displace laterally down mild slopes or towards an embankment face. The displacements are cumulative and permanent in nature.

The proposed pipeline alignment is approximately 750 to greater than 1,000 feet from the nearest free face. Based on the distance to the free face and the presence of existing infrastructure between the site and the Columbia River, the potential for lateral spreading to impact the pipeline is low.

5.4 Fault Surface Rupture

As presented in Exhibit 2-1, the closest mapped fault to the site is mapped approximately 5.7 miles west of the proposed alignment. Consequently, it is our opinion that the risk of surface fault rupture along the alignment is low during a design life of 100 years or less.

5.5 Seismic Hazard Mitigation

Where liquefied soil buoyant forces could cause flotation along the pipeline, mitigation strategies largely consist of protecting the pipeline with weighted pipe, such as encasements, or anchoring the pipeline with special foundation systems. For mitigation of differential settlements, lateral forces, and permanent ground displacements, potential measures consist of the selection of appropriate pipe materials and joints capable of withstanding predicted movements, and the use of specialized earthquake-resistant pipe and joints, as necessary.

Seismic mitigation for flotation of pipelines may include the use of backfilling with Controlled Low Strength Material (CLSM) above the pipeline. If CLSM is used, it will result in additional lateral forces on the pipeline during placement of the CLSM; therefore, we recommend consideration be given to the other methods, or very specific restrictions are placed on lift thickness and allowable time for setup of the CLSM before additional lifts are placed during construction.

6 PIPELINE DESIGN RECOMMENDATIONS AND CONSIDERATIONS

6.1 Bedding, Pipe Zone and Trench Backfill

The following are recommendations for pipe bedding, pipe zone, trench backfill, foundation (subgrade) preparation, and soil stiffness properties for pipe design. The recommendations below are consistent with the City of Warrenton Engineering Design Standards, which follow the 2018 Oregon Standard Specifications for Construction requirements for bedding, pipe zone, and trench backfill.

6.1.1 Bedding

The pipe bedding zone in the trench should be constructed with imported, well-graded, clean crushed rock material suitable for compaction and allowing for flexible joints. The on-site excavation spoils will be predominantly graded sands that are not suitable for use as bedding material. The bedding material should consist of imported, ¾-inch-minus crushed aggregate, as specified in the current Oregon Standard Specification for Construction, Item 00405.12, Bedding. Provided that the subgrade soil is competent, and is not disturbed by the excavation equipment, the minimum thickness of granular bedding below the invert of the pipeline should be 6 inches for 18-inch diameter pipelines in accordance with Oregon Standard Drawing RD300.

In areas where wet, weak, or disturbed subgrade conditions are encountered, the required subgrade stabilization (subgrade overexcavation/replacement) will likely result in thicker pipe bedding. During our explorations, soft clay soils were encountered in the pipe zone in CPT-1, CPT-4 and CPT-6. Additionally, high groundwater is expected at various locations along the alignment. For estimating purposes, in high groundwater areas we recommend planning for installation of a crushed rock drainage layer at a minimum. The crushed rock drainage layer should be at least 12 inches thick and installed below the pipe bedding to facilitate dewatering, such as engineered sump pumping from within this drainage layer to maintain groundwater within this layer. To prevent soils fines from migrating into the drainage layer during sump pumping (described below), we recommend a non-woven geotextile such as Mirafi 140N, Amoco Style 4550 (or equivalent), be placed between the subgrade soils and the bottom of the drainage layer and on the sides of the drainage layer. We recommend that the actual amount of over-excavation and additional work related to the acceptance of the subgrade be determined in the field, observed, and approved by a qualified Owner's Representative.

The drainage layer should be constructed with open, free-draining crushed rock materials with a 1½- to 3/4-inch gradation, conforming to Oregon Standard Specifications for Construction (OSSC 2018, 00430.11). The crushed rock for the working mat/drainage system should also have less than 2 percent by weight passing the No. 200 wet sieve; and 90 percent of particles by weight retained on the U.S. No. 4 sieve should have at least two fractured faces. In areas where the drainage rock described above is used, the material can also serve as the pipe bedding.

If native soil migration or softening of the native subgrade soils is observed during construction, or is a result of construction activities, we recommend a non-woven geotextile such as Mirafi 140N, Amoco Style 4550 (or equivalent), be placed between the subgrade soils and the bedding layer.

6.1.2 Pipe Zone

For the pipe zone material, bedding material specified in OSSC 2018, Item 00405.12, should be used for flexible pipes. In accordance with Oregon Standard Drawing RD300 the pipe zone materials should extend at least 12 inches above the top of an 18-inch pipe, or as determined by the manufacturer or civil engineer. Pipe zone compaction should be at least 90 percent of maximum density, as determined by a proctor, conforming to AASHTO T99.

6.1.3 Trench Backfill

Within roadways, shoulders, and settlement sensitive areas we recommend the use of ¾-inch-minus crushed aggregate, with less than 7 percent by dry weight passing a U.S. Standard No. 200 Sieve, and it should meet OSSC 2024 00405.14 (Class B Backfill). We recommend the backfill be compacted to at least 95 percent of the maximum dry density, as determined by AASHTO T 99 or as recommended by the civil engineer.

In non-settlement sensitive areas Class A Backfill may be used. We recommend the backfill be compacted to at least 90 percent of the maximum dry density, as determined by AASHTO T 99. If native topsoil was present prior to excavation in non-paved areas, then it should be replaced within the upper 12-inches of the adjacent ground surface. The topsoil should be mounded over the trench to allow for settlement.

6.2 Uplift Design and Potential Flotation Effects

The assessment of potential pipeline flotation from liquefaction involves determining if enough resistance to buoyancy forces is provided by the weight of the pipeline and contents, and resistance of the surrounding soil to pipeline uplift. We recommend the risk

for flotation be evaluated based on the specific pipeline embedment within the liquefiable soil. For the discussion on seismic mitigation for flotation, please refer to Section 5.54.6.

For preliminary evaluation purposes, the project structural engineer can evaluate flotation hazards by treating the liquefied soil as a heavy viscous fluid with a unit weight of 95 pounds per cubic foot (pcf). The depth of the fluid can be taken as the distance from the design groundwater elevation to the bottom of the pipeline. Exhibit 6-1 summarizes the total and buoyant unit weights for the various native and imported backfill materials.

Exhibit 6-1: Summary of Total and Buoyant Unit Weights

Material	Total Unit Weight, γ (pcf)	Buoyant Unit Weight, γ' (pcf)
Native Backfill	110	47
Crushed Rock Backfill	130	67
Controlled Low Strength Material (CLSM)	145	83
Liquefied Native Soil	--	95

7 CONSTRUCTION CONSIDERATIONS

7.1 Groundwater Control

We understand that the proposed alignment will typically be installed using open-cut construction methods. In general, the majority of the open cut excavations will be made through graded sands with a portion of the excavation below the water table. In areas where graded sands are present and the excavations are 1 to 3 feet below the water table, we anticipate dewatering can generally be handled by internal sump pumps inside the trench excavation, pumping from within the drainage layer described in Section 6.1.1. In excavations 3 to 12 feet below the water level, an active dewatering system outside the trench should be considered necessary, such as wells or well-points. Wells or well-points mitigate the potential for running soils by reducing pore water pressure buildup in the soil and will also help to stabilize the subgrade especially for excavations that may be near the contact between the fine-grained alluvium gravelly terrace deposits. Running soils could soften, disturb, or weaken the subgrade and could result in long term settlements of the pipeline. Additional details regarding typical external dewatering systems is presented in Section 7.1.2.

Our recommended approach for evaluating the subsurface soil and groundwater conditions prior to performing the excavations is to dig test pits (or perform potholes or install additional observation wells near the proposed alignment) approximately 6 to 8 weeks prior

to the start of excavating. Test pits are likely to provide the most benefit as they will provide relevant information of not only the groundwater depth, but also on the overall stability of the excavation and subgrade conditions. Test pits should be performed to a similar depth as the planned open-cut excavations and at spacings of 400 to 500 feet. The test pits would give further indication of the plasticity of the soil, allowing City representatives and the contractor to visually evaluate the depth and potential adverse effects of groundwater for a particular construction period and to evaluate the potential need for external dewatering systems, for excavation and subgrade instability, and subgrade stabilization depths. If active dewatering is found to be necessary based on the test pit excavations, then we would still recommend supplementing the active dewatering system with internal sump pumps operating within the drainage layer.

We recommend the construction contract documents be prepared in such a way as to accommodate the groundwater control decisions, type of external dewatering systems, and unit price methods of payment during construction.

7.1.1 Sump Pumps

We recommend incorporating a drainage layer into the trench excavation. The sump pumps should be installed at sufficient spacing to keep the groundwater level within the drainage rock layer.. Additional details regarding the recommended drainage layer is discussed in Section 6.1.1.

7.1.2 Wells and Well Points

External dewatering systems, such as wells and well points, should be designed by the Contractor to draw groundwater levels down to below the bottom of the excavations where required during construction. External dewatering will help prevent disturbance and instability of the surrounding soil during excavation and construction of permanent facilities, which would likely lead to constructability issues and short- and long-term settlement.

The contractor should retain the services of a specialized dewatering subcontractor to design and oversee the installation, operation, and removal of the dewatering systems. The type of dewatering system (i.e., vacuum wellpoints and/or dewatering wells) and the spacing and depth of dewatering system components will depend on the contractor's dewatering system design. However, we anticipate, based on the variability of the soils to be dewatered, vacuum well-points may need to be installed on 5- to 6-foot centers. If dewatering wells are selected, we anticipate they may need to be spaced between 20 and 30 feet.

Vacuum well-points or dewatering wells should be developed immediately upon completion using methods such as over-pumping until a visibly clear discharge is achieved and the specific capacity of the wells reaches a minimum level.

Observation wells should be installed close to the trench to measure groundwater depths and to confirm that the target groundwater drawdown has occurred before beginning trench excavation below the groundwater levels. The observation wells should be developed as part of the installation procedure to enable reliable groundwater level measurements to be made. Observation wells installed before the dewatering system can be utilized to observe subsurface soils and static groundwater conditions. However, our recommended approach for evaluating the subsurface conditions ahead of the construction is discussed in Section 7.1.

7.1.3 Control of Surface Water

Surface water should be controlled/redirected so as not to allow it to flow into open excavations. Any water collected, as well as any excavated soil, should be treated and disposed of in a manner meeting local, state, and federal environmental regulations and requirements.

7.2 Temporary Pipeline Excavation Stability

The majority of the trench excavation can be accomplished with a suitably designed trench shield (often referred to as trench boxes), designed or selected by the Contractor, provided the dewatering recommendations prepared in our report are implemented and excavations are less than approximately 10 feet in depth.

Note that while trench boxes are typically used for shallow pipeline installations in the type of soil encountered in our explorations above the groundwater table, they do not provide full-time lateral support for the excavation sidewalls and are typically solely for worker safety. Therefore, excavation sidewalls may still experience sloughing or instability, which could cause damage to existing adjacent infrastructure near the excavation, including adjacent pavement, pipelines or culverts.

If caving, sloughing, or raveling is a potential and/or observed for any excavations, we would recommend that the voids between the sidewalls and the shoring should be immediately backfilled with crushed rock to prevent trench side wall instability and undermining of existing utilities or pavement sections. The voids should be filled with 3/4-inch minus imported crushed rock materials (OSSC, 2018 Item 00405.12) immediately after the trench box is placed to maintain tight contact to the sidewall soils.

We are providing the above information and opinions solely as a service to our client. Under no circumstances should the information provided, and opinions expressed above, be interpreted to mean that Shannon & Wilson is assuming responsibility for construction site safety or the contractor's activities; such responsibility is not being implied and should not be inferred.

7.3 Wet Weather Construction

Excavation and construction operations may expose the on-site soils to inclement weather conditions. The stability of exposed soils may rapidly deteriorate due to a change in moisture content (i.e., wetting or drying) or the action of heavy or repeated construction traffic. Accordingly, excavations should be adequately protected from the elements and from the action of repetitive or heavy construction loadings.

8 LIMITATIONS

The analyses, interpretations, conclusions, and recommendations contained in this report are based on site conditions as they presently exist and further assume that the explorations are representative of the subsurface conditions throughout the site; that is, the subsurface conditions everywhere are not significantly different from those disclosed by the current explorations. If future phases of work at the site uncover subsurface conditions different from those encountered in these explorations, we should be advised at once so that we can review these encountered conditions and reconsider our interpretations and conclusions, where necessary. If there is a substantial lapse of time between the submission of this report and the start of future phases of work at the site, or if conditions have changed because of natural forces or construction operations at or adjacent to the site, we recommend that we review our report to determine the applicability of the conclusions and recommendations.

Within the limitations of scope, schedule, and budget, the analyses, interpretations, conclusions, and recommendations presented in this report were prepared in accordance with generally accepted professional geotechnical engineering principles and practice in this area at the time this report was prepared. We make no other warranty, either express or implied. These interpretations and conclusions were based on our understanding of the project as described in this report and the site conditions as observed previously and at the time of our current explorations.

This report was prepared for the exclusive use of Consor, and the City of Warrenton, as covered in this report. During future phases of work involving construction, the data contained in this report should be provided to the contractors for their information, but our

report interpretations, conclusions, and recommendations should not be construed as a warranty of subgrade conditions as included in this report, and should not used as a basis for contractor bidding.

The scope of this report did not include environmental assessments or evaluations regarding the presence or absence of wetlands, or hazardous or toxic substances in the soil, surface water, groundwater, or air, on or below or around this site, or for the evaluation or disposal of contaminated soils or groundwater should any be encountered.

Shannon & Wilson, Inc., has prepared and included, "Important Information About Your Geotechnical/Environmental Report," to assist you and others in understanding the use and limitations of this report.

APPENDIX A: FIELD EXPLORATIONS

A.1 GENERAL

The geotechnical field exploration program included six cone penetration tests (CPTs), designated CPT-1 to CPT-6 and one geotechnical boring, designated B-1. A vibrating wire piezometer (VWP) was installed in boring B-1. Completed boring locations were measured in the field and are shown on the Site and Exploration Plan, Figure 2. Shannon & Wilson geology and engineering staff were present during the drilling of the geotechnical borings and borehole installations to locate the drilling sites, log the materials encountered, and collect soil samples.

This appendix describes the techniques used to advance and sample the borings and presents logs of the materials encountered.

A.2 DRILLING

One geotechnical boring designated B-1 was completed adjacent to CPT-5. The boring was completed to a depth of 15-feet below ground surface (bgs) with a track-mounted Geoprobe 6622CPT drilling rig operated by Oregon Geotechnical Explorations, Inc. (OGE), of Keizer, Oregon. The approximate locations are shown in the attached Figure 2, Site and Exploration Plan.

A.2.1 Direct Push

The boring CPT-5a was complete using a direct push drilling method where vehicle weight and percussive force are used to advance the drilling rod. Continuous disturbed samples were collected in the boring with a 2-inch plastic sheath. All samples were visually identified and described in the field, sealed to retain moisture, and returned to our laboratory for additional examination and testing.

A.3 CONE PENETRATION TEST (CPT) RESULTS

A.3.1 General

The field exploration program as part of this study included a total of four Cone Penetration Tests (CPTs), designated CPT-1 to CPT-6, performed along the path of the proposed pipeline. The approximate locations are shown in the attached Figure 2, Site and Exploration Plan. The CPTs were completed to a depth of between 60.4 to 101.5 feet bgs and were completed by OGE between January 23, and January 25, 2024.

A.3.2 Cone Penetration Testing

OGE pushed the CPTs using a truck-mounted CPT rig. In some instances, a track-mounted Geoprobe 6622CPT was used to predrill through asphalt layers or gravel. During a CPT, a specialized cone assembly at the end of a steel probe is hydraulically pushed down through the subsurface. The cone assembly contains load cells and associated strain gauges which monitor the deformation of the load cells. One set of load cells deforms with increasing resistance to cone tip penetration. Another set of load cells deforms with increasing frictional resistance encountered on a sleeve on the outside of the assembly.

The cone assembly also contains a piezometer, which measures pore pressure. Pore pressure is useful in estimating soil behavior type because penetration has varying effects on pore pressure, depending on the type of material being penetrated. Data from the strain gauges and from the piezometer is transmitted from the cone assembly back through extension rods to the CPT recording device via a cable. Analysis software using industry-standard calculations then convert the raw data signals from the instruments into tip resistance, skin friction, and pore pressure. The same software applies correlations to the processed data to estimate the soil type and equivalent Standard Penetration Test (SPT) N-value.

A.3.3 CPT Logs

All CPT data was reduced and correlated by OGE. Summary graphic and numeric logs of the CPT data, prepared by OGE, are attached to the end of this appendix. Logs include depth in feet, tip resistance (Qt) in tons per square foot, local friction (Fs) in tons per square foot, friction ratio (Fs/Qt) expressed as a percentage, pore pressure (Pw) in pounds per square inch, estimated soil behavior type, and estimated SPT N-value (N60).

A.4 MATERIAL DESCRIPTIONS

Soil samples were described and identified visually in the field in general accordance with ASTM D2488, Standard Practice for Description and Identification of Soils (Visual-Manual Procedure). Consistency, color, relative moisture, degree of plasticity, and other distinguishing characteristics of the samples were noted. Once transported to Shannon & Wilson, the SPT and hand grab samples from the hand auger were re-examined and the field descriptions, and identifications were modified where necessary. The specific terminology used is defined in the Soil Description and Log Key, Figure A1.

A.5 DRILL LOGS

The summary logs of the borings are presented in the Logs of Borings, Figure A2. Material descriptions and interfaces on the logs are interpretive, and actual changes may be gradual. The left-hand portions of the logs show individual sample intervals, percent recovery, SPT data, and natural moisture content measurements. Material descriptions and geotechnical unit designations are shown in the center of the boring logs, and the right-hand portions provides a graphic log, miscellaneous comments, and a graphic depicting hole installation and backfill details.

A.6 BOREHOLE INSTALLATIONS

A vibrating wire pressure transducer was installed to allow for ongoing measurements of groundwater levels. Installation details are discussed below and shown graphically on the Logs of Borings.

A.6.1 Vibrating Wire Piezometers

A vibrating wire pressure transducer (Geokon model 4500S) was installed in boring B-1 to allow for ongoing groundwater level measurements. A vibrating wire pressure transducer (VWP) measures pressure using a pressure-sensitive diaphragm with a vibrating wire element attached to it. A cable runs from the transducer to the ground surface, where a readout device can be attached. Pressure acting on the outside face of the diaphragm causes it to deflect, which changes the tension of the wire element and the frequency of its vibration. The readout device measures the frequency of the induced vibration, which is converted to pressure, or head of groundwater above the transducer. The vibrating wire pressure transducer was permanently grouted into place in the borehole. The instrument was taped to a measured length of polyvinyl chloride (PVC) pipe to control the depth of installation. Prior to insertion, an initial "zero" reading was taken at "zero" head. With the transducer and PVC pipe in place, the hole was tremie grouted with bentonite cement grout. The cable leading up from the transducer is protected at the surface by a flush-mount monument set in concrete. The VWP installation depth is indicated on the boring log.

Shannon & Wilson, Inc. (S&W), uses a soil identification system modified from the Unified Soil Classification System (USCS). Elements of the USCS and other definitions are provided on this and the following pages. Soil descriptions are based on visual-manual procedures (ASTM D2488) and laboratory testing procedures (ASTM D2487), if performed.

S&W INORGANIC SOIL CONSTITUENT DEFINITIONS

CONSTITUENT[2]	FINE-GRAINED SOILS (50% or more fines)[1]	COARSE-GRAINED SOILS (less than 50% fines)[1]
Major	***Silt, Lean Clay, Elastic Silt,*** or ***Fat Clay***[3]	***Sand*** or ***Gravel***[4]
Modifying (Secondary) Precedes major constituent	30% or more coarse-grained: ***Sandy*** or ***Gravelly***[4]	More than 12% fine-grained: ***Silty*** or ***Clayey***[3]
Minor Follows major constituent	15% to 30% coarse-grained: ***with Sand*** or ***with Gravel***[4]	5% to 12% fine-grained: ***with Silt*** or ***with Clay***[3]
	30% or more total coarse-grained *and* lesser coarse-grained constituent is 15% or more: ***with Sand*** or ***with Gravel***[5]	15% or more of a second coarse-grained constituent: ***with Sand*** or ***with Gravel***[5]

[1]All percentages are by weight of total specimen passing a 3-inch sieve.
[2]The order of terms is: *Modifying Major with Minor*.
[3]Determined based on behavior.
[4]Determined based on which constituent comprises a larger percentage.
[5]Whichever is the lesser constituent.

MOISTURE CONTENT TERMS

Dry	Absence of moisture, dusty, dry to the touch
Moist	Damp but no visible water
Wet	Visible free water, from below water table

STANDARD PENETRATION TEST (SPT) SPECIFICATIONS

Hammer:	140 pounds with a 30-inch free fall. Rope on 6- to 10-inch-diam. cathead 2-1/4 rope turns, > 100 rpm
Sampler:	10 to 30 inches long Shoe I.D. = 1.375 inches Barrel I.D. = 1.5 inches Barrel O.D. = 2 inches
N-Value:	Sum blow counts for second and third 6-inch increments. Refusal: 50 blows for 6 inches or less; 10 blows for 0 inches.

NOTE: Penetration resistances (N-values) shown on boring logs are as recorded in the field and have not been corrected for hammer efficiency, overburden, or other factors.

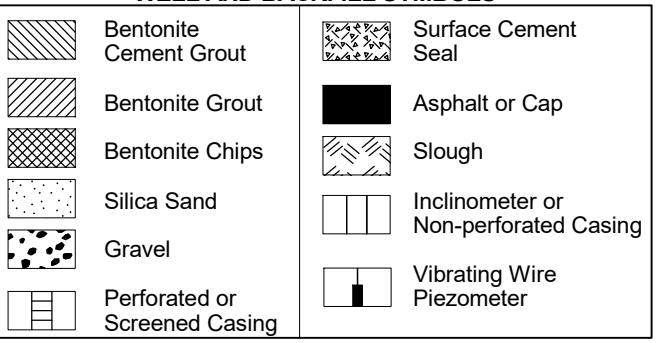
PARTICLE SIZE DEFINITIONS

DESCRIPTION	SIEVE NUMBER AND/OR APPROXIMATE SIZE
FINES	< #200 (0.075 mm = 0.003 in.)
SAND	
Fine	#200 to #40 (0.075 to 0.4 mm; 0.003 to 0.02 in.)
Medium	#40 to #10 (0.4 to 2 mm; 0.02 to 0.08 in.)
Coarse	#10 to #4 (2 to 4.75 mm; 0.08 to 0.187 in.)
GRAVEL	
Fine	#4 to 3/4 in. (4.75 to 19 mm; 0.187 to 0.75 in.)
Coarse	3/4 to 3 in. (19 to 76 mm)
COBBLES	3 to 12 in. (76 to 305 mm)
BOULDERS	> 12 in. (305 mm)

RELATIVE DENSITY / CONSISTENCY

COHESIONLESS SOILS		COHESIVE SOILS	
N, SPT, BLOWS/FT.	RELATIVE DENSITY	N, SPT, BLOWS/FT.	RELATIVE CONSISTENCY
< 4	Very loose	< 2	Very soft
4 - 10	Loose	2 - 4	Soft
10 - 30	Medium dense	4 - 8	Medium stiff
30 - 50	Dense	8 - 15	Stiff
> 50	Very dense	15 - 30	Very stiff
		> 30	Hard

WELL AND BACKFILL SYMBOLS



PERCENTAGES TERMS [1, 2]

Trace	< 5%
Few	5 to 10%
Little	15 to 25%
Some	30 to 45%
Mostly	50 to 100%

[1]Gravel, sand, and fines estimated by mass. Other constituents, such as organics, cobbles, and boulders, estimated by volume.

UNIFIED SOIL CLASSIFICATION SYSTEM (USCS)
(Modified From USACE Tech Memo 3-357, ASTM D2487, and ASTM D2488)

MAJOR DIVISIONS			GROUP/GRAPHIC SYMBOL		TYPICAL IDENTIFICATIONS
COARSE-GRAINED SOILS *(more than 50% retained on No. 200 sieve)*	Gravels *(more than 50% of coarse fraction retained on No. 4 sieve)*	Gravel *(less than 5% fines)*	GW		Well-Graded Gravel; Well-Graded Gravel with Sand
			GP		Poorly Graded Gravel; Poorly Graded Gravel with Sand
		Silty or Clayey Gravel *(more than 12% fines)*	GM		Silty Gravel; Silty Gravel with Sand
			GC		Clayey Gravel; Clayey Gravel with Sand
	Sands *(50% or more of coarse fraction passes the No. 4 sieve)*	Sand *(less than 5% fines)*	SW		Well-Graded Sand; Well-Graded Sand with Gravel
			SP		Poorly Graded Sand; Poorly Graded Sand with Gravel
		Silty or Clayey Sand *(more than 12% fines)*	SM		Silty Sand; Silty Sand with Gravel
			SC		Clayey Sand; Clayey Sand with Gravel
FINE-GRAINED SOILS *(50% or more passes the No. 200 sieve)*	Silts and Clays *(liquid limit less than 50)*	Inorganic	ML		Silt; Silt with Sand or Gravel; Sandy or Gravelly Silt
			CL		Lean Clay; Lean Clay with Sand or Gravel; Sandy or Gravelly Lean Clay
		Organic	OL		Organic Silt or Clay; Organic Silt or Clay with Sand or Gravel; Sandy or Gravelly Organic Silt or Clay
	Silts and Clays *(liquid limit 50 or more)*	Inorganic	MH		Elastic Silt; Elastic Silt with Sand or Gravel; Sandy or Gravelly Elastic Silt
			CH		Fat Clay; Fat Clay with Sand or Gravel; Sandy or Gravelly Fat Clay
		Organic	OH		Organic Silt or Clay; Organic Silt or Clay with Sand or Gravel; Sandy or Gravelly Organic Silt or Clay
HIGHLY-ORGANIC SOILS	Primarily organic matter, dark in color, and organic odor		PT		Peat or other highly organic soils (see ASTM D4427)
FILL	Placed by humans, both engineered and nonengineered. May include various soil materials and debris.				The Fill graphic symbol is combined with the soil graphic that best represents the observed material

NOTE: No. 4 size = 4.75 mm = 0.187 in.; No. 200 size = 0.075 mm = 0.003 in.

NOTES

1. Dual symbols *(symbols separated by a hyphen, i.e., SP-SM, Sand with Silt)* are used for soils with between 5% and 12% fines or when the liquid limit and plasticity index values plot in the *CL-ML* area of the plasticity chart.
2. Borderline symbols *(symbols separated by a slash, i.e., CL/ML, Lean Clay to Silt; SP-SM/SM, Sand with Silt to Silty Sand)* indicate that the soil properties are close to the defining boundary between two groups.
3. The soil graphics above represent the various USCS identifications (i.e., *GP*, *SM*, etc.) and may be augmented with additional symbology to represent differences within USCS designations. *Sandy Silt (ML)*, for example, may be accompanied by the *ML* soil graphic with sand grains added. Non-USCS materials may be represented by other graphic symbols; see log for descriptions.

Sheet 2 of 3

2013 BORING CLASS2 110668.GPJ SW2013LIBRARYPDX.GLB SWNEW.GDT 3/20/23

GRADATION TERMS

Poorly Graded	Narrow range of grain sizes present or, within the range of grain sizes present, one or more sizes are missing (Gap Graded). Meets criteria in ASTM D2487, if tested.
Well-Graded	Full range and even distribution of grain sizes present. Meets criteria in ASTM D2487, if tested.

CEMENTATION TERMS[1]

Weak	Crumbles or breaks with handling or slight finger pressure
Moderate	Crumbles or breaks with considerable finger pressure
Strong	Will not crumble or break with finger pressure

PLASTICITY[2]

DESCRIPTION	VISUAL-MANUAL CRITERIA	APPROX. PLASITICTY INDEX RANGE
Nonplastic	A 1/8-in. thread cannot be rolled at any water content.	< 4%
Low	A thread can barely be rolled and a lump cannot be formed when drier than the plastic limit.	4 to 10%
Medium	A thread is easy to roll and not much time is required to reach the plastic limit. The thread cannot be rerolled after reaching the plastic limit. A lump crumbles when drier than the plastic limit.	10 to 20%
High	It take considerable time rolling and kneading to reach the plastic limit. A thread can be rerolled several times after reaching the plastic limit. A lump can be formed without crumbling when drier than the plastic limit.	> 20%

ADDITIONAL TERMS

Mottled	Irregular patches of different colors.
Bioturbated	Soil disturbance or mixing by plants or animals.
Diamict	Nonsorted sediment; sand and gravel in silt and/or clay matrix.
Cuttings	Material brought to surface by drilling.
Slough	Material that caved from sides of borehole.
Sheared	Disturbed texture, mix of strengths.

PARTICLE ANGULARITY AND SHAPE TERMS[1]

Angular	Sharp edges and unpolished planar surfaces.
Subangular	Similar to angular, but with rounded edges.
Subrounded	Nearly planar sides with well-rounded edges.
Rounded	Smoothly curved sides with no edges.
Flat	Width/thickness ratio > 3.
Elongated	Length/width ratio > 3.

ACRONYMS AND ABBREVIATIONS

ATD	At Time of Drilling
approx.	Approximate/Approximately
Diam.	Diameter
Elev.	Elevation
ft.	Feet
FeO	Iron Oxide
gal.	Gallons
Horiz.	Horizontal
HSA	Hollow Stem Auger
I.D.	Inside Diameter
in.	Inches
lbs.	Pounds
MgO	Magnesium Oxide
mm	Millimeter
MnO	Manganese Oxide
NA	Not Applicable or Not Available
NP	Nonplastic
O.D.	Outside Diameter
OW	Observation Well
pcf	Pounds per Cubic Foot
PID	Photo-Ionization Detector
PMT	Pressuremeter Test
ppm	Parts per Million
psi	Pounds per Square Inch
PVC	Polyvinyl Chloride
rpm	Rotations per Minute
SPT	Standard Penetration Test
USCS	Unified Soil Classification System
q_u	Unconfined Compressive Strength
VWP	Vibrating Wire Piezometer
Vert.	Vertical
WOH	Weight of Hammer
WOR	Weight of Rods
Wt.	Weight

STRUCTURE TERMS[1]

Interbedded	Alternating layers of varying material or color with layers at least 1/4-inch thick; singular: bed.
Laminated	Alternating layers of varying material or color with layers less than 1/4-inch thick; singular: lamination.
Fissured	Breaks along definite planes or fractures with little resistance.
Slickensided	Fracture planes appear polished or glossy; sometimes striated.
Blocky	Cohesive soil that can be broken down into small angular lumps that resist further breakdown.
Lensed	Inclusion of small pockets of different soils, such as small lenses of sand scattered through a mass of clay.
Homogeneous	Same color and appearance throughout.

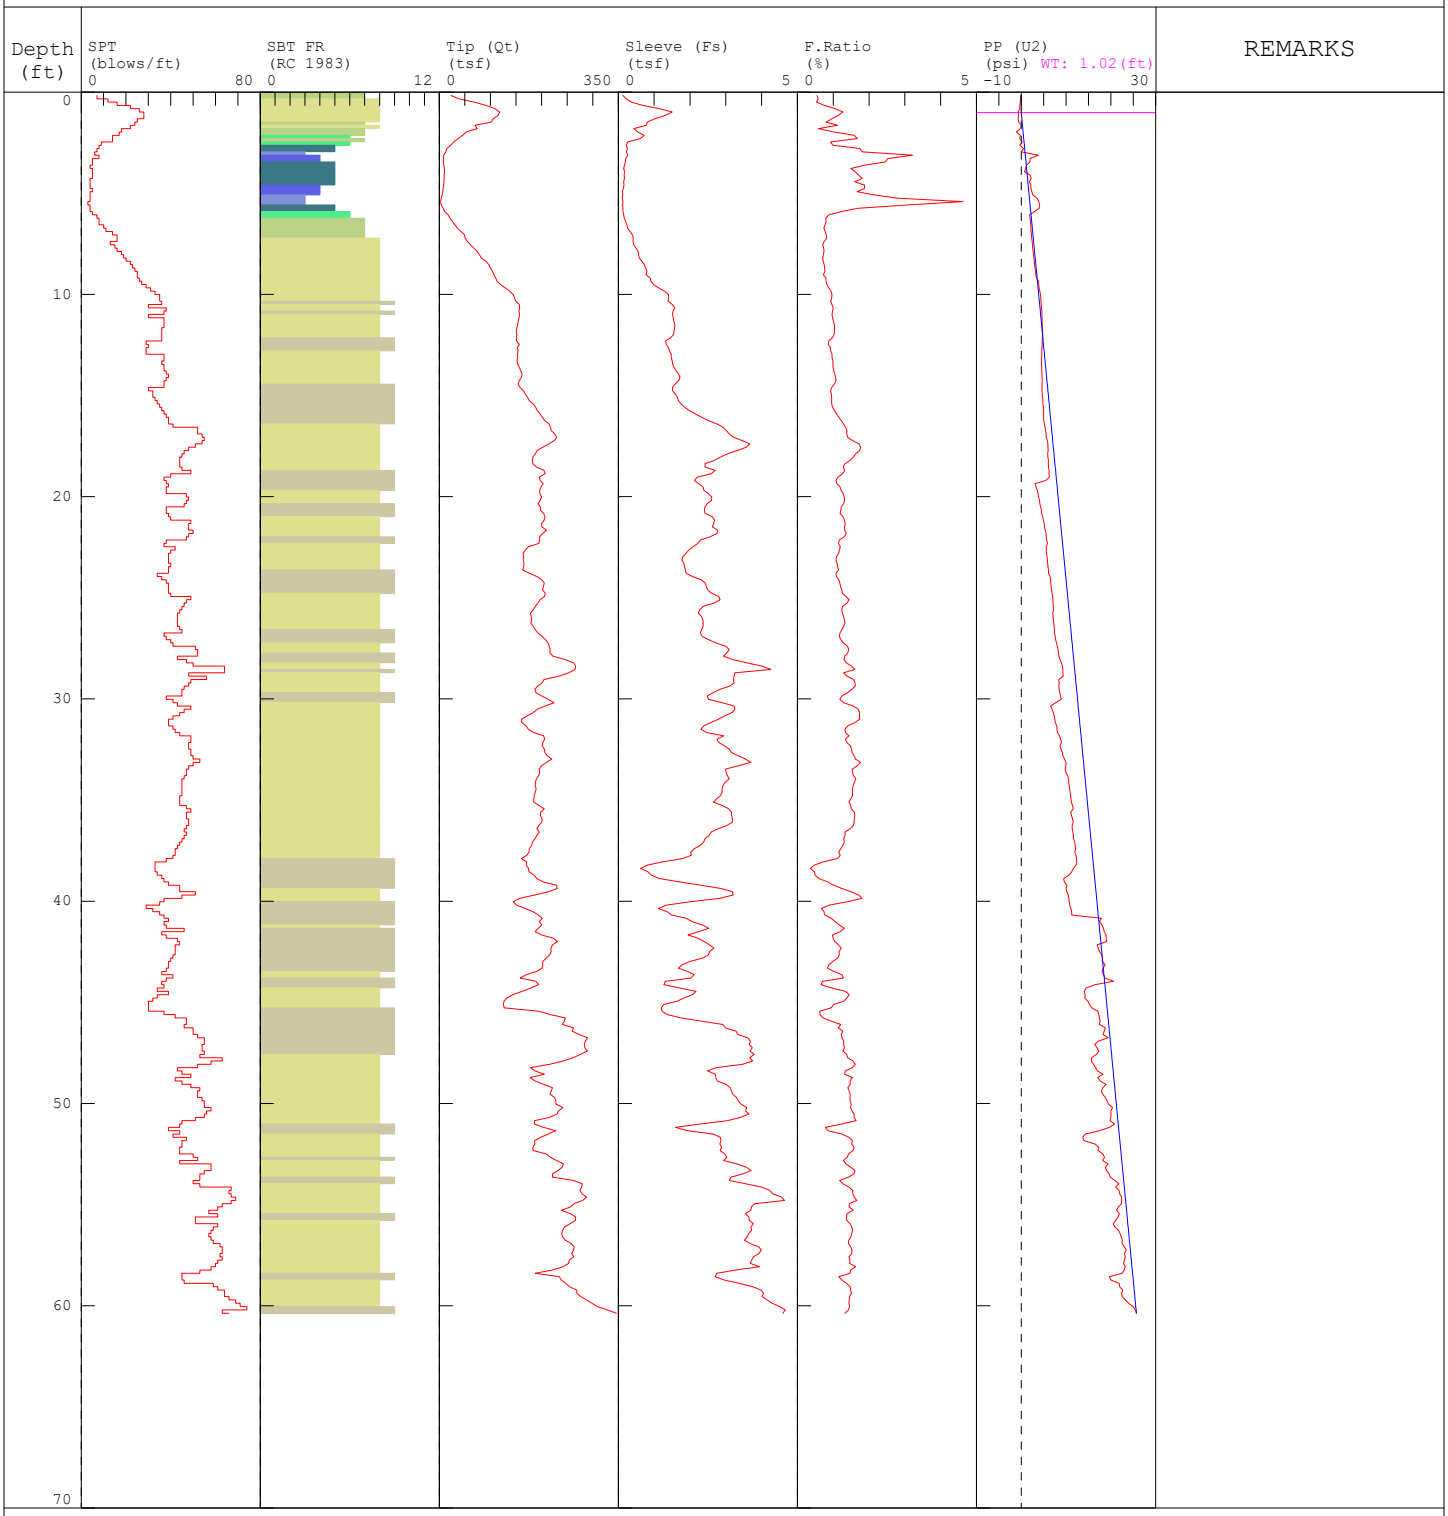
Shannon & Wilson / CPT-4 / Warrenton Hammond Pipeline

OPERATOR: OGE BAK
CONE ID: DDG1661
TEST DATE: 1/24/2024 1:47:38 PM
TOTAL DEPTH: 60.367 ft



1 sensitive fine grained
2 organic material
3 clay
4 silty clay to clay
5 clayey silt to silty cl
6 sandy silt to clayey si
7 silty sand to sandy si
8 sand to silty sand
9 sand
10 gravelly sand to sand
11 very stiff fine grained (*)
12 sand to clayey sand (*)

*SBT/SPT CORRELATION: UBC-1983

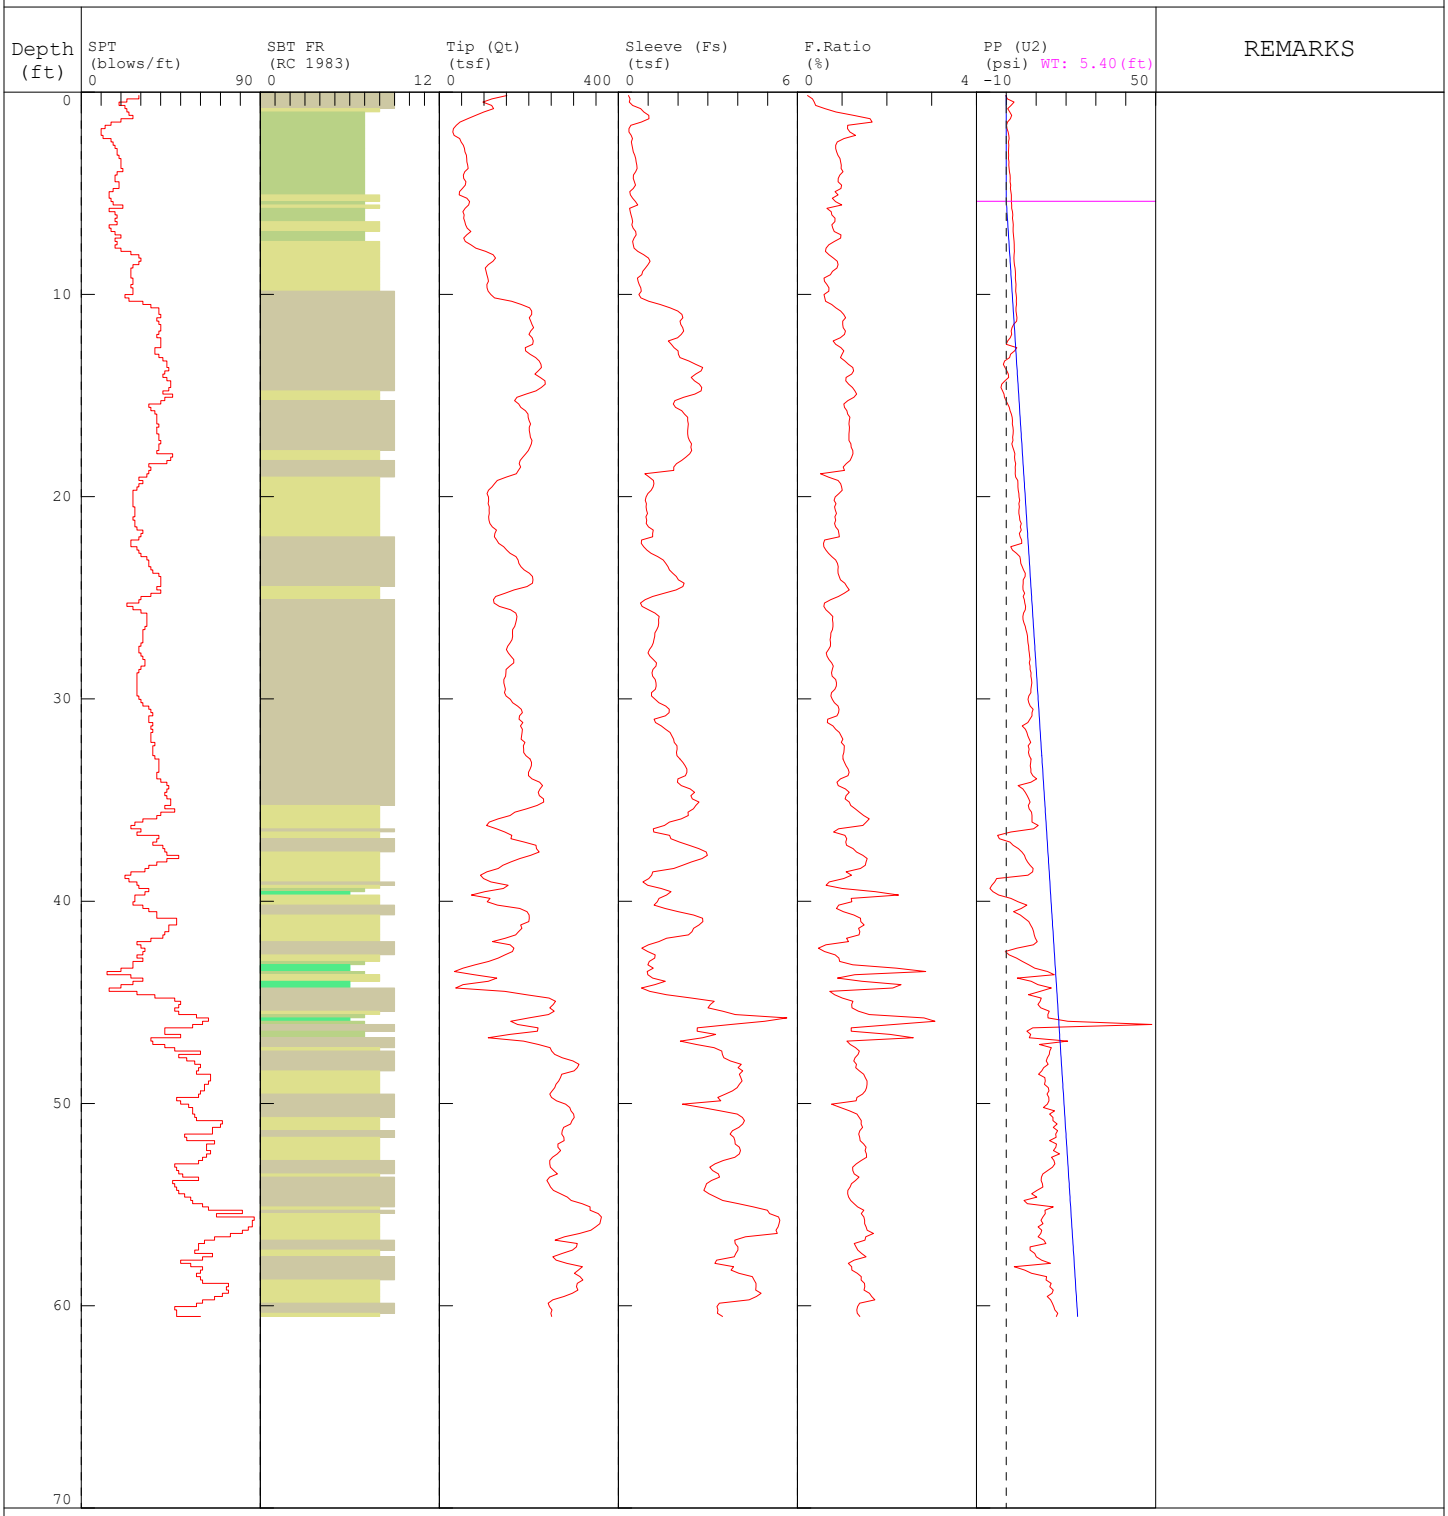
Shannon & Wilson / CPT-5 / Warrenton Hammond Pipeline

OPERATOR: OGE BAK
CONE ID: DDG1661
TEST DATE: 1/25/2024 8:07:00 AM
TOTAL DEPTH: 60.532 ft

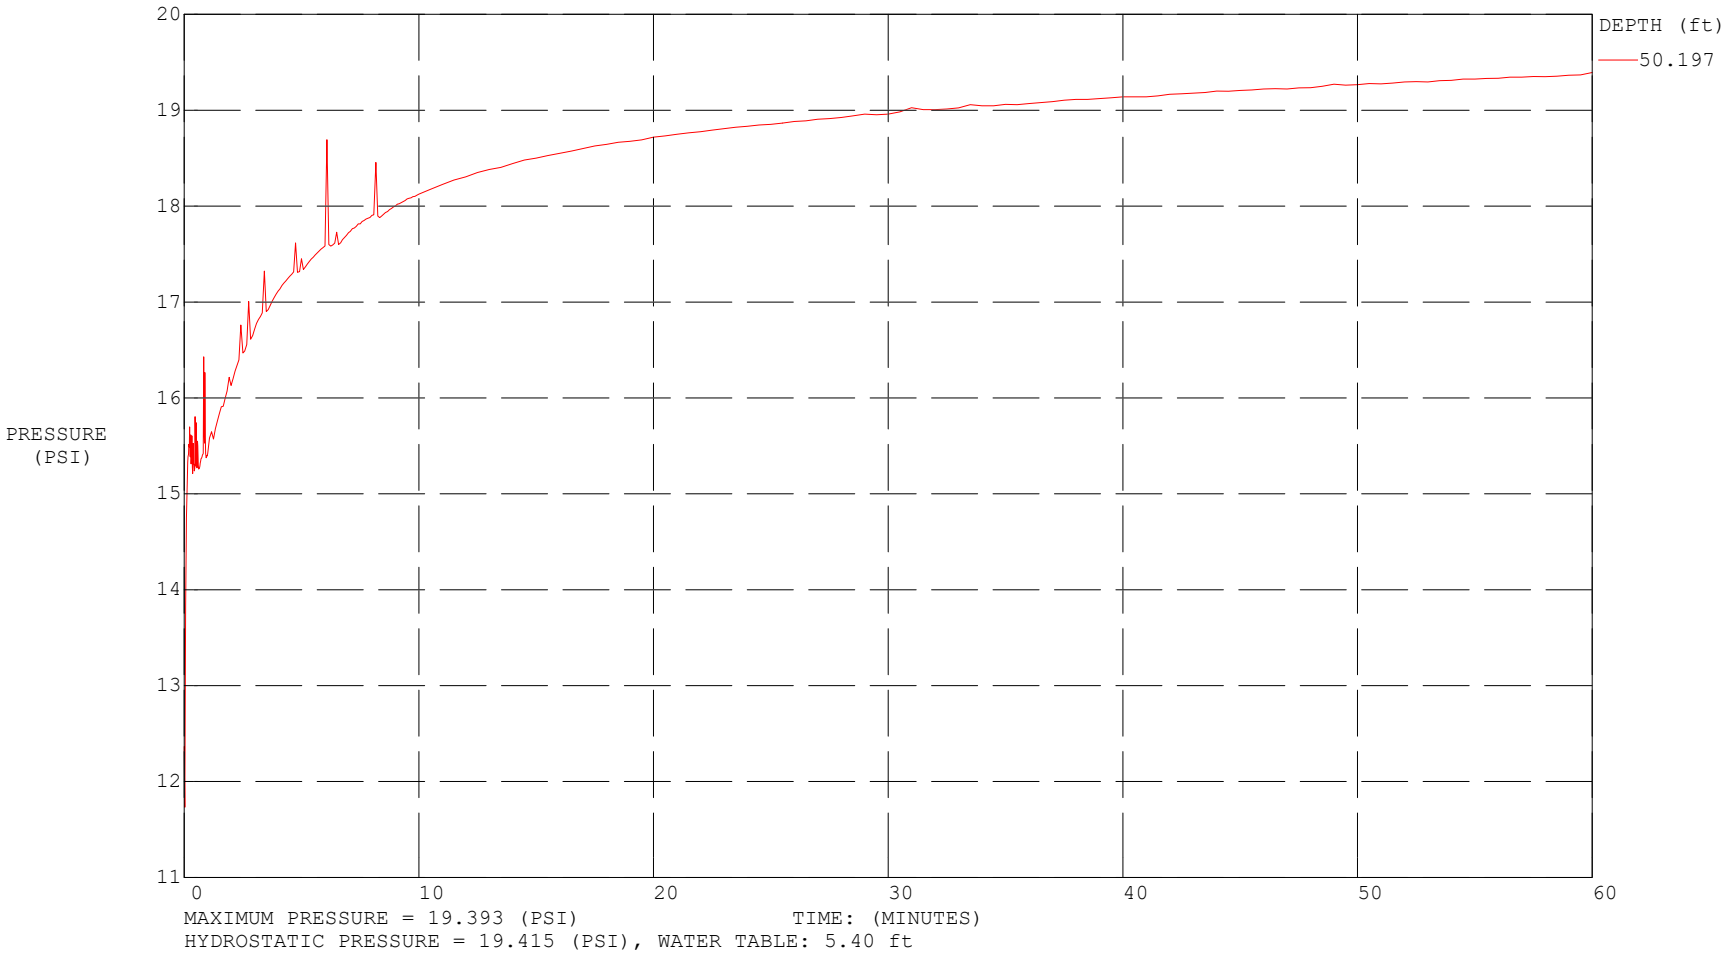


1 sensitive fine grained
2 organic material
3 clay
4 silty clay to clay
5 clayey silt to silty cl
6 sandy silt to clayey si
7 silty sand to sandy si
8 sand to silty sand
9 sand
10 gravelly sand to sand
11 very stiff fine grained (*)
12 sand to clayey sand (*)

*SBT/SPT CORRELATION: UBC-1983

COMMENT: Shannon & Wilson / CPT-5 / Warrenton Hammond Pipeline

CONE ID: DDG1661
TEST DATE: 1/25/2024 8:07:00 AM



MAXIMUM PRESSURE = 19.393 (PSI)
HYDROSTATIC PRESSURE = 19.415 (PSI), WATER TABLE: 5.40 ft

Figure B1 Grain Size Distribution

APPENDIX B: LABORATORY TEST RESULTS

B.1 GENERAL

Soil samples obtained during the field explorations were described and identified in the field in general accordance with the Practice for Description and Identification of Soils (Visual-Manual Procedure), ASTM D2488. The Specific terminology used is defined in the Soil Description and Log Key, Figure A1, Appendix A. The physical characteristics of the collected samples were noted, and field descriptions and identifications were modified, as necessary, in accordance with the terminology presented in Appendix A, Figure A1.

During the review, select soil were collected for further testing. The material descriptions and identifications were refined/revised, as necessary, based on the results of the laboratory tests. The soil testing program included moisture content testing and particle size analysis. Results of the soil testing are presented in Figure B1. All laboratory tests were performed in accordance with applicable ASTM International (ASTM) standards.

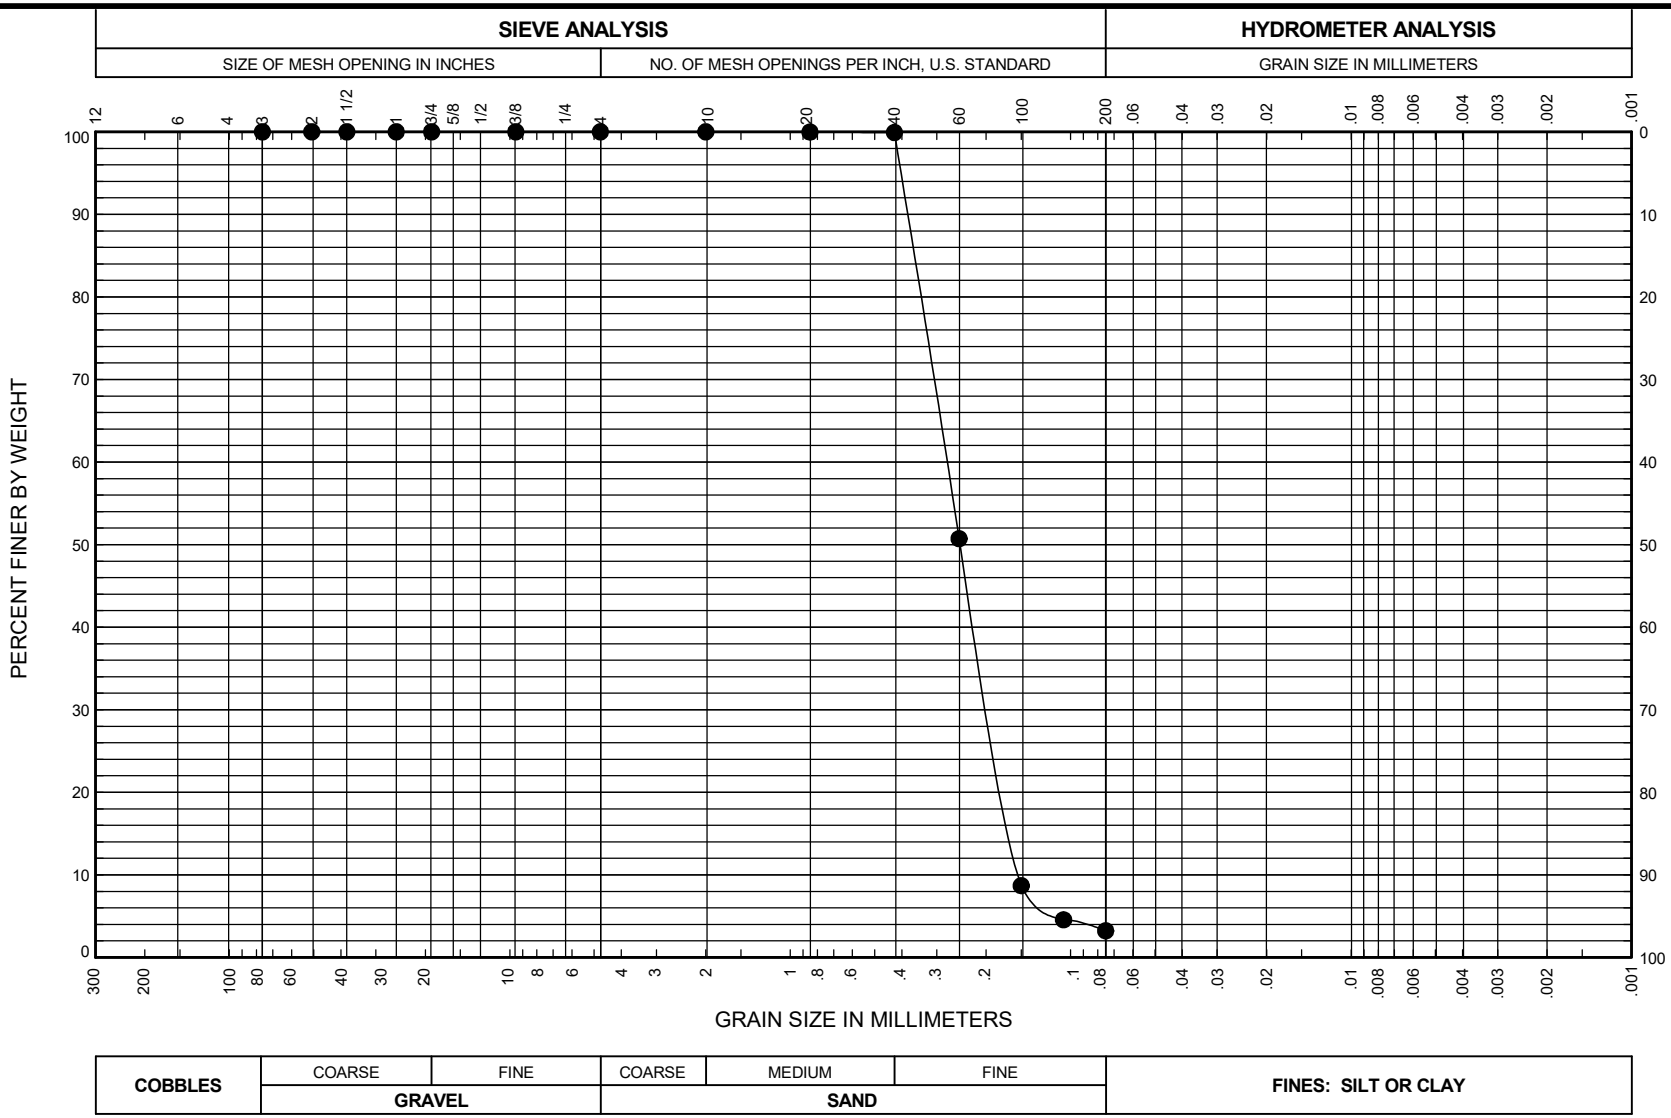
B.2 SOIL TESTING

B.2.1 Moisture (Natural Water) Content

Natural moisture content determinations were performed in accordance with ASTM D2216, on selected soil samples. The natural moisture content is a measure of the amount of moisture in the soil at the time of exploration. It is defined as the ratio of the weight of water to the dry weight of the soil, expressed as a percentage. The results of moisture content determinations are presented on the Logs of Borings in Appendix A.

B.2.2 Particle-size Analyses

Particle-size analyses were conducted on select samples to determine their grain-size distributions. Grain size distributions were determined in accordance with ASTM D6913 D1140, and D422 as applicable. For all samples, a wet sieve analysis was performed to determine the percentage (by weight) of each sample passing the No. 200 (0.075 mm) sieve. Additionally, the material retained on the No. 200 sieve was shaken through a series of sieves to determine the distribution of the plus No. 200 fraction (ASTM 6913). Particle size analyses were performed by Shannon & Wilson. Results of all particle-size analyses are plotted on Figure B1, Grain Size Distribution. The percentage of each sample passing the No. 200 sieve is presented on the Logs of Borings in Appendix A.



NOTES:
1) Sieve analyses were performed in general accordance with ASTM D6913, sieve with hydrometer analyses were performed in general accordance with ASTM D422, and amount finer than #200 sieve analyses were performed in general accordance with ASTM D1140 unless otherwise noted in the report.
2) Group Name and Group Symbol are in accordance with ASTM D2488 and are refined in accordance with ASTM D2487 where appropriate laboratory tests are performed.

Important Information

About Your Geotechnical Engineering Report

IMPORTANT INFORMATION

IMPORTANT INFORMATION ABOUT YOUR GEOTECHNICAL/ENVIRONMENTAL REPORT

CONSULTING SERVICES ARE PERFORMED FOR SPECIFIC PURPOSES AND FOR SPECIFIC CLIENTS.

Consultants prepare reports to meet the specific needs of specific individuals. A report prepared for a civil engineer may not be adequate for a construction contractor or even another civil engineer. Unless indicated otherwise, your consultant prepared your report expressly for you and expressly for the purposes you indicated. No one other than you should apply this report for its intended purpose without first conferring with the consultant. No party should apply this report for any purpose other than that originally contemplated without first conferring with the consultant.

THE CONSULTANT'S REPORT IS BASED ON PROJECT-SPECIFIC FACTORS.

A geotechnical/environmental report is based on a subsurface exploration plan designed to consider a unique set of project-specific factors. Depending on the project, these may include the general nature of the structure and property involved; its size and configuration; its historical use and practice; the location of the structure on the site and its orientation; other improvements such as access roads, parking lots, and underground utilities; and the additional risk created by scope-of-service limitations imposed by the client. To help avoid costly problems, ask the consultant to evaluate how any factors that change subsequent to the date of the report may affect the recommendations. Unless your consultant indicates otherwise, your report should not be used (1) when the nature of the proposed project is changed (for example, if an office building will be erected instead of a parking garage, or if a refrigerated warehouse will be built instead of an unrefrigerated one, or chemicals are discovered on or near the site); (2) when the size, elevation, or configuration of the proposed project is altered; (3) when the location or orientation of the proposed project is modified; (4) when there is a change of ownership; or (5) for application to an adjacent site. Consultants cannot accept responsibility for problems that may occur if they are not consulted after factors that were considered in the development of the report have changed.

SUBSURFACE CONDITIONS CAN CHANGE.

Subsurface conditions may be affected as a result of natural processes or human activity. Because a geotechnical/environmental report is based on conditions that existed at the time of subsurface exploration, construction decisions should not be based on a report whose adequacy may have been affected by time. Ask the consultant to advise if additional tests are desirable before construction starts; for example, groundwater conditions commonly vary seasonally.

Construction operations at or adjacent to the site and natural events such as floods, earthquakes, or groundwater fluctuations may also affect subsurface conditions and, thus, the continuing adequacy of a geotechnical/environmental report. The consultant should be kept apprised of any such events and should be consulted to determine if additional tests are necessary.

MOST RECOMMENDATIONS ARE PROFESSIONAL JUDGMENTS.

Site exploration and testing identifies actual surface and subsurface conditions only at those points where samples are taken. The data were extrapolated by your consultant, who then applied judgment to render an opinion about overall subsurface conditions. The actual interface between materials may be far more gradual or abrupt than your report indicates. Actual conditions in areas not sampled may differ from those predicted in your report. While nothing can be done to prevent such situations, you and your consultant can work together to help reduce their impacts. Retaining your consultant to observe subsurface construction operations can be particularly beneficial in this respect.

A REPORT'S CONCLUSIONS ARE PRELIMINARY.

The conclusions contained in your consultant's report are preliminary, because they must be based on the assumption that conditions revealed through selective exploratory sampling are indicative of actual conditions throughout a site. Actual subsurface conditions can be discerned only during earthwork; therefore, you should retain your consultant to observe actual conditions and to provide conclusions. Only the consultant who prepared the report is fully familiar with the background information needed to determine whether or not the report's recommendations based on those conclusions are valid and whether or not the contractor is abiding by applicable recommendations. The consultant who developed your report cannot assume responsibility or liability for the adequacy of the report's recommendations if another party is retained to observe construction.

THE CONSULTANT'S REPORT IS SUBJECT TO MISINTERPRETATION.

Costly problems can occur when other design professionals develop their plans based on misinterpretation of a geotechnical/environmental report. To help avoid these problems, the consultant should be retained to work with other project design professionals to explain relevant geotechnical, geological, hydrogeological, and environmental findings, and to review the adequacy of their plans and specifications relative to these issues.

BORING LOGS AND/OR MONITORING WELL DATA SHOULD NOT BE SEPARATED FROM THE REPORT.

Final boring logs developed by the consultant are based upon interpretation of field logs (assembled by site personnel), field test results, and laboratory and/or office evaluation of field samples and data. Only final boring logs and data are customarily included in geotechnical/environmental reports. These final logs should not, under any circumstances, be redrawn for inclusion in architectural or other design drawings, because drafters may commit errors or omissions in the transfer process.

To reduce the likelihood of boring log or monitoring well misinterpretation, contractors should be given ready access to the complete geotechnical engineering/environmental report prepared or authorized for their use. If access is provided only to the report prepared for you, you should advise contractors of the report's limitations, assuming that a contractor was not one of the specific persons for whom the report was prepared, and that developing construction cost estimates was not one of the specific purposes for which it was prepared. While a contractor may gain important knowledge from a report prepared for another party, the contractor should discuss the report with your consultant and perform the additional or alternative work believed necessary to obtain the data specifically appropriate for construction cost estimating purposes. Some clients hold the mistaken impression that simply disclaiming responsibility for the accuracy of subsurface information always insulates them from attendant liability. Providing the best available information to contractors helps prevent costly construction problems and the adversarial attitudes that aggravate them to a disproportionate scale.

READ RESPONSIBILITY CLAUSES CLOSELY.

Because geotechnical/environmental engineering is based extensively on judgment and opinion, it is far less exact than other design disciplines. This situation has resulted in wholly unwarranted claims being lodged against consultants. To help prevent this problem, consultants have developed a number of clauses for use in their contracts, reports, and other documents. These responsibility clauses are not exculpatory clauses designed to transfer the consultant's liabilities to other parties; rather, they are definitive clauses that identify where the consultant's responsibilities begin and end. Their use helps all parties involved recognize their individual responsibilities and take appropriate action. Some of these definitive clauses are likely to appear in your report, and you are encouraged to read them closely. Your consultant will be pleased to give full and frank answers to your questions.

The preceding paragraphs are based on information provided by the Geoprofessional Business Association (https://www.geoprofessional.org)

ARCHAEOLOGICAL AND HUMAN REMAINS INADVERTENT DISCOVERY PLAN (IDP)

PROJECT: Hammond Transmission Waterline Phase 1
PROJECT MANAGER: Twyla Vittetoe, Engineering Technician
LANDOWNER AGENCY: City of Warrenton, Oregon
DATE: 07/31/2024
SHPO CASE NUMBER: 24-0018

This document outlines procedures and protocols to be followed if archaeological objects or features, or human remains are encountered in the course of work. These procedures are intended for circumstances where there is not an expectation or anticipation of encountering cultural resources or human remains. **This is not a replacement for due diligence, robust project design, and consultation with appropriate Native American Tribes**.[1] Prior to undertaking project work, an assessment of the likelihood for disturbance to cultural resources and tribal heritage should be completed. All personnel will be briefed on all procedures and reporting structures before the start of any work.

CONTENTS OF THIS DOCUMENT

A. Procedures for archaeological features and materials
B. Procedures for human remains, burials, funerary objects, sacred objects, and objects of cultural patrimony
C. Roles and responsibilities
D. Contact information
E. Confidentiality statement
F. Procedure flow chart
G. Visual reference guide for archaeology and tribal heritage items

---

A. *PROCEDURES FOR INADVERTENT DISCOVERY OF ARCHAEOLOGICAL FEATURES AND MATERIALS (DOES **NOT** INCLUDE HUMAN REMAINS, BURIALS, FUNERARY OBJECTS, OBJECTS OF CULTURAL PATRIMONY, OR SPIRITUAL OBJECTS)*

It is expected that ALL artifacts, features, structural elements, and other cultural items that are identified will be reported to required project, agency, and Tribal contacts, and accounted for as soon as possible. It is understood that there will be a single project point of contact to coordinate with the project archaeologist, SHPO, LCIS, and appropriate Native American Tribes.

Step 1. Stop work (immediately after discovery)

[1] Appropriate Native American Tribes will be identified by LCIS

If any person believes that they have located an archaeological object[2] or site[3], all work must stop immediately.

Discovery made in field _____(date/time) _____ (initials of discoverer)

Step 2. Secure and protect the area (within first hour after discovery)

Establish a **minimum** 30 meter/100-foot area of protection, or more as necessary, around the find(s). Exclude all vehicle traffic and non-essential foot traffic. Non-ground-disturbing work may continue outside of the area of protection with caution until the situation is assessed by a qualified archaeologist.[4]

Buffer established _____ (time) _____ (initials of person responsible)

Step 3. Notify (within first hour after discovery)

Notify the project manager, agency official (if applicable), and project archaeologist. If there is not an archaeologist on-site, or on retainer for the project, the project manager will contact an Oregon Qualified Archaeologist (which include agency and Tribal archaeologists) to assess the find.

Project Manager contacted _____ (time) _____ (initials of contactor)
Agency Official contacted _____ (time) _____ (initials of contactor)
Project Archaeologist contacted _____ (time) _____ (initials of contactor)

Step 4. Identify and Follow Guidance (timeline variable, as soon as possible)

If the archaeologist determines the find is an archaeological feature or object, or other cultural item or feature, OR if no qualified archaeologist can be contacted within the first hour of discovery, the **State Historic Preservation Office (SHPO) and appropriate Native American Tribes must be contacted,** and their guidance must be followed. SHPO, Native American Tribes, and project and agency personnel will determine in consultation how or if work may continue at the site. If the discovery is determined to *not* be archaeological or a cultural item, you may continue work. This determination should be confirmed in writing to the project manager and agency official.

SHPO contacted _____ (time) _____ (initials of contactor)

---

[2] "Archaeological object" means an object that is at least 75 years old (or 50 years if there is a federal nexus), is part of the physical record of an indigenous or other culture found in the state or waters of the state, and is material remains of past human life or activity that are of archaeological significance including, but not limited to, monuments, symbols, tools, facilities, technological by-products and dietary by-products (ORS 358.905).

[3] "Archaeological site" means a geographic locality in Oregon that contains archaeological objects and the contextual associations of the archaeological objects with each other or biotic or geological remains or deposits (ORS 358.905).

[4] Ground-disturbing work on different landforms distant from the find and outside of the buffer may continue.

Appropriate Native American Tribes[5] _____ (time) _____ (initials of contactor)

B. *PROCEDURES FOR INADVERTENT DISCOVERY OF HUMAN REMAINS*

(INCLUDES HUMAN REMAINS, BURIALS, FUNERARY OBJECTS, OBJECTS OF CULTURAL PATRIMONY, AND SPIRITUAL OBJECTS)

It is expected that ALL potential human remains, burials, funerary objects, or objects of cultural patrimony that are identified will be reported and accounted for within 3 hours of discovery.[6] It is understood that there will be a single project point of contact to coordinate with the project archaeologist, SHPO, LCIS, OSP and appropriate Native American Tribes.

Step 1: Stop work (immediately after discovery)

If any person believes that they have located human remains[7], ALL work will stop immediately. Any human remains, regardless of antiquity or ethnic origin, will always be treated with dignity and respect.

Step 2. Secure and protect the area (as soon as possible, within c. 10 min)

Secure and protect the area of inadvertent discovery with a **minimum** of 100 meter/300 foot buffer, or more as necessary. The location and other information about the find should be treated as confidential and shared on a **need to know basis only**. Prevent all vehicle traffic and unauthorized foot traffic from entry. Block remains from view and protect them from damage or exposure without touching or disturbing the remains, and leave them in place.

Do not take photographs unless approved by the appropriate Native American Tribes and Oregon Legislative Commission on Indian Services (LCIS), and only for the purpose of identification. **Do not speak to the media or public** or post any information about the find on social media. Non-ground-disturbing work may continue outside of the buffer with caution.[8]

Buffer established _____ (time) _____ (initials of person responsible)

Step 3. Notify (within first hour after discovery) – see contact list below (section D)

1. Project Manager _____ (time) _____ (initials)
2. Agency Official _____ (time) _____ (initials)

[5] ALL Tribes designated by LCIS must be notified. Contacting one or some of the Tribes does not fulfill the obligation to notify.

[6] Modifications to reporting timelines can be made in consultation with SHPO and Tribes.

[7] Bone may be fragmented, weathered, or otherwise modified to make it difficult to identify, so when in doubt, stop work and call it in.

[8] Ground-disturbing work on different landforms distant from the find and outside of the buffer may continue.

3. Oregon State Police[9] **DO NOT CALL 911** _____ (time) _____ (initials)
4. State Historic Preservation Office (SHPO) _____ (time) _____ (initials)
5. Commission on Indian Services (LCIS) _____ (time) _____ (initials)
6. Appropriate Native American Tribes[10] _____ (time) _____ (initials)

   Name of Tribe(s) Contacted and Individual(s):

_____
_____
_____
_____

Step 4. Follow guidance (timeline variable, may be up to several days or more)

If the site is determined not to be a crime scene by the Oregon State Police, **do not move anything!** The remains will continue to be *secured in place* along with any associated funerary objects, and protected from weather, water runoff, and shielded from view. Follow all guidance provided by OSP, LCIS, SHPO, and appropriate Native American Tribes.

Continue to maintain the work stoppage within the buffer until a plan is developed and carried out between the Oregon State Police, SHPO, LCIS, and appropriate Native American Tribes and you are directed in writing by the project manager that work may proceed.

C. *ROLES AND RESPONSIBILITIES*

Person Responsible	**Responsibility**
Contractor/Discoverer will…	Notify the Project Manager Twyla Vittetoe: 503-861-0912
Twyla Vittetoe will…	Notify the Agency Official Greg Shafer: 971-286-2035
Twyla Vittetoe will…	Notify the Contracted Archaeologist Bradley Bowden: 206-898-5781
Twyla Vittetoe will…	Notify the State Agencies (OSP, LCIS, SHPO)
Twyla Vittetoe will…	Notify the Native American Tribes identified by LCIS
Greg Shafer will…	Enforce the work stoppage and buffer

[9] OSP will be responsible for contacting the county or state medical examiner's office as appropriate.
[10] ALL Tribes designated by LCIS must be notified. Contacting one or some of the Tribes does not fulfill the obligation to notify.

D. *CONTACT INFORMATION*[11]

Agency	Position/Contact	Contact Information

[11] Contact information should be regularly updated for all individuals. Up to date contacts for LCIS, OSP, SHPO, and Native American Tribes can be found on the LCIS cultural resources page: Commission on Indian Services archaeology (oregonlegislature.gov)

[12] Northern command: Benton, Clackamas, Clatsop, Columbia, Crook, Deschutes, Gilliam, Hood River, Jefferson, Klamath, Lane, Lincoln, Linn, Marion, Multnomah, Polk, Sherman, Tillamook, Wasco, Washington, Wheeler, Yamhill

[13] Southern command: Baker, Coos, Curry, Douglas, Grant, Harney, Jackson, Josephine, parts of Klamath, Lake, Malheur, Morrow, Umatilla, Union, and Wallowa

E. CONFIDENTIALITY

The Hammon Transmission Waterline Phase 1 Project and employees shall make their best efforts, in accordance with federal and state law, to ensure that its personnel and contractors keep the discovery confidential. The media, or any third-party member or members of the public are not to be contacted or have information regarding the discovery, and any public or media inquiry is to be reported to the City of Warrenton. Photos shall not be taken except for when authorized by LCIS, SHPO, and Native American Tribes for identification purposes, and no photos will be circulated publicly or on social media. Prior to any release, the responsible agencies and Tribes shall concur on the amount of information, if any, to be released to the public.

To protect fragile, vulnerable, or threatened sites, the National Historic Preservation Act, as amended (Section 304 [16 U.S.C. 470s-3]), and Oregon State law (ORS 192.345(11)) establishes that the location of archaeological sites, both on land and underwater, shall be confidential.

DESCRIPTION OF DESIRED USE

The Hammond Transmission Waterline Project Phase 1 includes the installation of approximately 4,679 linear feet (LF) of 18-in and smaller diameter water transmission waterline and related system appurtenances (i.e., fittings, valves). Of that amount, about 2,890 LF of pipeline will be installed within ODOT right-of-way along Fort Stevens Hwy (OR-104). The new pipeline will generally parallel existing waterlines within this corridor except for one crossing of OR-104. The new transmission pipeline will have 42-in of cover from top of pipe to the ground surface.

SPECIAL PROVISIONS (FOR ODOT USE ONLY)

TRAFFIC CONTROL REQUIRED

- ☒ YES [OAR 734-055-0025(6)] ☐ NO

Special Provisions:

☒The contractor shall go to the City who is the permit holder with any proposed changes. The City can then bring to ODOT in writing any changes they would like to propose to ODOT. All questions or changes must come to ODOT from the City.

☒The City shall insure that ODOT is supplied with a working cell number of someone who will respond to any issues that may occur after daytime working hours, to address any issue that may arise due to the city's installation. This shall be supplied to ODOT before any work begins.

☒The City and the Contractor shall contact ODOT every Monday to update ODOT with location of work and how the project is progressing.

☒ The applicant shall not work outside the permitted work schedule without prior approval for an exceptional situation. If an unforeseen situation comes up the applicant shall notify the City and ODOT by phone of the situation as soon as possible.

☒No air release valves shall be placed in a ditch section of the Highway Right of Way at any time, specifically, in a shallow ditch / swale line.

☒Only one section of this water line has been pre – approved to be placed under the ditch line between mile point 1.55 by NW 15th ST and 1.68 by NW 13th ST. This line shall not be placed less than 48" below the bottom of the natural ditch line. ODOT shall determine the depth of the natural ditch line. 10" of the top cover shall be ¾" minus.

☒Applicant to email Trip Check 48 hours prior to any work being performed in ODOT's Right of Way. DPCSLMWTOC@odot.state.or.us See the attached form. Applicant to notify the District Office 48 hours before beginning work. These are two separate actions!

☒Please have the permit in hand you will be asked for the application number, who the permit is issued to, who you are, Highway and mile point, Date you would like to start work. What your specified Comp. Date is on

this permit. In the right-hand corner on the face of the permit. specified Comp. Date: That is the last day any work can be done under this permit.

☒Erosion control devices need to be in place and kept in working order at all times during this project.

☒No staging of materials in ODOT's Right of Way.

☒Applicant is responsible for the removal of all contaminated material form ODOT Right of Way, and the proper disposal of the materials and the coast associated with that disposal.

☒ Any damage to ODOT facilities including but not limited to culverts, striping, site posts, signs, asphalt and guardrail shall be repaired by applicant at applicant's expense. Any damage or excavation of asphalt shall require applicant to repair to ODOT's "T-CUT" restoration specifications and the ODOT line to line shall also apply.

☒Applicant to insure no damage occurs to any existing ADA curb ramps or any ADA feathers. If damage occurs the applicant will be required to reconstructs to the current ADA standards at the applicant's expense.

☒In the event of adverse weather or other conditions (ice, snow, excessive rain, or slides resulting from said conditions or traffic or road related incident) ODOT crews reserve the right to stop this permitted activity to perform their necessary maintenance activities or to insure the safety of travelling public.

☒All vaults shall be installed flush to the surface of the ground. No vaults shall be placed in a driveway access in ODOT's Right of Way.

☒Any damage done to a driveway access in ODOT's Right of Way, ODOT will determine the restoration limits.

☒The city shall insure that the contractor they hire to perform this work understands while the plans were created for the complete job this permit is

only written for the phase 1, and a new permit must be applied for by the city for the remainder of this project.

Oregon Department of Transportation

GENERAL PROVISIONS FOR POLELINE, PIPELINE, BURIED CABLE, AND MISCELLANEOUS PERMITS

Revised April 2022

APPLICANT: CITY OF WARRENTON	PERMIT NO.: 01M41513
HIGHWAY: 104 FORT STEVENS	MP: 1.14 - 1.69

These permit provisions are in addition to the requirements described in Oregon Administrative Rule, Chapter 734, Division 55 and may be supplemented by permit special provisions. In the event of a conflict, the Administrative Rule will apply then these provisions followed by any permit special provisions. Unless otherwise specified, all documents referenced are references to the current version, with any revisions or supplements, in place when the work is conducted.

All checked (☒) provisions apply.

WORKSITE

☒ 1. Access control fence must be maintained during permitted work and restored to its original or better condition after permitted work is complete.

☒ 2. The Applicant shall not use state highway right of way to display advertising signs or to display or sell merchandise of any kind.

☒ 3. The stopping and parking of vehicles upon state highway right of way for the maintenance of adjoining property or in furtherance of any business transaction or commercial establishment is prohibited.

☐ 4. All grass and small brush within the work area shall be rotary or flail mowed to ground level prior to the beginning of work to facilitate clean up.

☒ 5. Disturbed areas shall be reseeded with grass native to the area in an appropriate seeding time.

☒ 6. The spreading of mud or debris upon any state highway is prohibited and violation shall be cause for immediate cancellation of the permit. Clean up shall be at the Applicant's expense. The highway shall be cleaned of all dirt and debris at the end of each work day, or more frequently as directed by the District Manager or representative.

☒ 7. Applicant shall replace any landscape vegetation or fences that are damaged or destroyed. Any damage that is not fully restored within 30 days may be replaced by ODOT at the expense of the Applicant. A "plant establishment" shall be understood to be part of the planting work to assure satisfactory growth of planted materials. The plant establishment period will begin when the original planting has been completed and approved. The length of the establishment period will be one calendar year or as defined in the permit Special Provisions.

☐ 8. Applicant shall install and maintain the landscaped area as shown on the attached drawings. Plantings shall be limited to non-invasive, low-growing shrubs, grass or flowers that do not attain sufficient height to obstruct clear vision in any direction. ODOT may remove plantings without liability or loss, injury, or damage of any nature whatsoever if in the future it is determined to be in the public interest to do so.

TRAFFIC

☒ 9. The work area shall be protected in accordance with the Manual on Uniform Traffic Control Devices for Streets and Highways (MUTCD), and the Oregon Temporary Traffic Control Handbook as supplemented or amended by ODOT.

☒ 10. For work requiring traffic control devices to be in place continuously for longer than three days, Applicant shall provide a site specific traffic control plan developed based on the principles of the Manual on Uniform Traffic Control Devices for Streets and Highways (MUTCD) and ODOT Standards. The traffic control plan may be reviewed by ODOT before work begins. The ODOT review does not relieve the Applicant of responsibility for the accuracy of the traffic control plan.

☒ 11. For permitted utility work, the Applicant shall take measures necessary to maintain the accessibility of the state highway including sidewalks and pedestrian areas by individuals with disabilities to the ODOT Americans with Disability Act (ADA) standard during the course of the work by following the Oregon Temporary Traffic Control Handbook, Section 1.6.

☒ 12. When constructing a new utility service line, Applicant shall ensure that advance notice of any temporary pedestrian route is provided in an accessible format to the public, people with disabilities, and disability organizations to the greatest extent possible. The Notice is to be sent to the organizations on the contact list of Centers for Independent Living at https://www.oregon.gov/odot/Engineering/DOCS_ADA/AOCIL-Contacts.pdf

☒ 13. All damaged or removed highway signs shall be replaced by the Applicant. Installation shall be according to MUTCD and ODOT standards, and shall be completed as soon as possible but no later than the end of the work shift.

☐ 14. No lane restrictions are permitted on the roadway during the hours of darkness, on weekends, or between 6:00 AM and 9:00 AM, or 3:00 PM and 6:00 PM (Monday through Friday) without prior approval by ODOT.

☒ 15. Hours of work shall be _____

Monday - Thursady.

No work on Friday Saturday or Sundays

8:00 am to 4:00pm

No work the day before the day after or the day of a holiday.

DRAINAGE

☐ 16. On-site storm drainage shall be controlled within the permitted property. No blind connections to existing state facilities are allowed.

☒ 17. Excavation shall not be done on ditch slopes. Trench excavation shall either be at ditch bottom or outside ditch area. (Minimum depth at bottom of ditch shall be 36 inches; minimum depth outside of ditch shall be 42 inches).

☒ 18. Only earth or rock shall be used as fill material and shall slope so as not to change or adversely affect existing drainage. Fine grade and seed the finished fill with native grasses to prevent erosion.

☐ 19. A storm drainage study stamped by an Oregon Registered Professional Engineer (PE) is required. The study must meet standards of the National Pollution Discharge Elimination Systems (NPDES) when any of the following conditions apply:

- whenever a four inch pipe is inadequate to serve the developed area,
- development site is one acre or larger in size and directly or indirectly affects state facilities, or
- as directed by the District Manager or representative.

☐ 20. Applicant shall provide on-site retention for storm water runoff that exceeds that of the undeveloped site.

☒ 21. All water discharged to an ODOT drainage system must be treated prior to discharge. All requests for connection to an ODOT storm system must meet any requirements of the National Pollutant Discharge Elimination System (NPDES). This may include local jurisdiction approval of on-site water quality treatment facilities and/or development of an operation and maintenance plan for any on-site water quality treatment facility, as determined by local jurisdiction.

EXCAVATION / CONSTRUCTION

☒ 22. "Oregon Standard Specifications for Construction" and ODOT "Standard Drawings" where applicable and not otherwise superseded by the permit, shall be incorporated for use in the permit; https://www.oregon.gov/odot/engineering/pages/index.aspx. These documents apply only to the extent they provide standards and performance requirements for work to be performed under the permit. In the event of a conflict, the permit provisions will take precedent.

☐ 23. Trench backfill shall be according to the attached typical drawing, marked as Exhibit A.

☒ 24. When open cutting of the highway is allowed, all excavation in paved areas shall be backfilled and the roadway surface patched before the end of each shift.

☒ 25. Steel plates shall be pinned and a temporary cold patch applied to the edges. The Applicant shall be responsible for monitoring and maintenance of temporary patching and steel plating.

☒ 26. Compaction tests shall be required for each open cut per Oregon Standard Specifications for Construction. Compaction tests shall be conducted once for every 300 lineal feet per lift of continuous trench according to the Manual of Field Test Procedures (MFTP), published by ODOT. Percent Compaction shall be at least 95%. Results of compaction test shall be provided upon request of the District Manager or representative at Applicants' expense.

☒ 27. Control Density Fill (CDF) shall be used as surface backfill material in place of crushed rock in open trenches that impact the travel portions of the highway. A ¾"-0, or 1"-0 rock will be used for the aggregate. The amount of cement used shall not exceed 3.0% of the total mixture's weight. Maximum compressed strengths must not exceed 250 pounds per square inch (psi).

☒ 28. Surface restoration shall be a minimum of four inches of hot asphalt-concrete (AC), compacted in two inch lifts, or to match existing pavement depth, whichever is greater. Sand-seal all edges and joints.

☒ 29. Any area of cut or damaged asphalt shall be restored in accordance with the attached "T-Cut Typical Section" drawing. For a period of two years following the patching of the paved surface, Applicant shall be responsible for the condition of the pavement patches, and during that two year period shall repair to District Manager or representative's satisfaction any of the patches which become settled, cracked, broken, or otherwise faulty.

☒ 30. An overlay to seal an open-cut area shall be completed prior to the end of the construction season, or when minimum temperature allows per the Oregon Standard Specification for Construction. The overlay shall be 1.5 inches deep and cover the affected area from edge of pavement to edge of pavement, and taper longitudinally at a fifty feet to one inch (50':1") ratio. Taper may be adjusted by the District Manager as required. For a period of two years following this patching of the paved surface, the Applicant shall be responsible for the condition of said pavement patches, and during that time shall repair to the District Manager or representative's satisfaction any of the patches which become settled, cracked, broken or otherwise faulty.

☒ 31. Highway crossings of utility lines shall be bored, or jacked. Bore pits shall be located behind the ditch line unless otherwise specified in the permit. Unattended pits shall either be protected by a six-foot fence, backfilled, or steel plated and pinned.

☒ 32. Any non-conductive, un-locatable, underground facility shall have a tracer wire or other similar conductive marking tape or device placed the full length of the installed underground facility in compliance with the Oregon Utilities Notification Center rules, OAR Chapter 952.

☒ 33. Trench backfill outside of ditch line may be native soil compacted at optimum moisture in twelve inch layers to not less than 95% relative maximum density.

☒ 34. Native material that is unsatisfactory for compaction shall be disposed of off the work site and granular backfill used.

☒ 35. Trench backfill in rock slope or shoulder shall be crushed 1"-0 or ¾"-0 size rock compacted at optimum moisture in eight-inch layers. Compaction tests shall be conducted according to the Manual of Field Test Procedures (MFTP), published by ODOT. Percent compaction shall be at least 95%maximum density. At the request of the District Manager or representative, results of compaction tests shall be provided to District Manager or representative at Applicant's expense.

☒ 36. Where excavation is on fill slope steeper than a two to one (2:1) ratio, slope protection shall be provided using four-inch size rock laid evenly to a minimum depth of twelve inches.

☒ 37. No more than 300 feet of trench longitudinally along the highway shall be left open at any one time and no trench shall be left in an open condition overnight.

☒ 38. Areas of disturbed cut and fill slopes shall be restored to a condition suitable to the District Manager or representative. Areas of erosion to be inlaid with an acceptable riprap material.

☒ 39. All underground utilities shall be installed with three-foot or more of horizontal clearance from existing or contract plans guardrail posts and attachments.

☒ 40. Any area of cut or damaged concrete shall be restored in accordance with the attached Typical Section-Pipe Section under sidewalk.

☒ 41. Utility markers, pedestals, and vaults shall be placed as near the highway right-of-way line as practical. In no case shall pedestals, vaults, and line markers be located within the area where highway maintenance activities regularly occur including mowing operations, or nearer the pavement edge than any official highway sign in the same general location.

☒ 42. No cable plowing is allowed within the lateral support of the highway asphalt (e.g. at six feet lower than the edge of the asphalt, no plowing within nine feet of the edge of the asphalt).

☐ 43. Review by the ODOT Bridge Engineer is required for all proposed bridge and structure attachments and for any facilities to be installed within sixteen feet of bridge foundations, supports, walls or related elements, or within the influence zone of bridge facilities.

MISCELLANEOUS

☒ 44. Applicant shall be responsible and liable for (1) investigating presence/absence of any legally protected or regulated environmental resource(s) in the action area; (2) determining any and all restrictions or requirements that relate to the proposed actions, and complying with such, including but not limited to those relating to hazardous material(s), water quality constraints, wetlands, archeological or historic resources(s) state and federal threatened or endangered species, etc., (3) complying with all federal, state, and local laws, and obtaining all required and necessary permits and approvals.

☒ 45. If the Applicant impacts a legally protected/regulated resource, Applicant shall be responsible for all costs associated with such impact, including, but not limited to all costs of mitigation and rehabilitation, and shall indemnify, and hold ODOT harmless for such impacts and be responsible and liable to ODOT for any associated costs or claims that ODOT may have.

☒ 46. Plans are reviewed by ODOT in general only and do not relieve the Applicant from completing roadway improvements in a manner satisfactory to ODOT. The District Manager or representative may require field changes. When revisions are made in the field, Applicant is responsible to provide "as built" drawings, within 60 days from completion of roadway improvements, and shall submit them to the District Office issuing the permit.

☒ 47. Applicant shall be responsible for locating and preserving all existing survey monumentation within the work area in accordance with ORS 209.150 and/or 209.155. If monumentation or its accessories are inadvertently or otherwise disturbed or destroyed, Applicant shall be responsible for all costs and coordination associated with its reestablishment by a professional licensed surveyor.

☒ 48. Applicant shall be responsible to restore or replace any curbs or curb ramps damaged by the permitted activity according to ODOT's ADA Standards available at https://www.oregon.gov/ODOT/Engineering/Pages/Accessibility.aspx. Any review or inspection of the curbs or curb ramps conducted by ODOT does not relieve the Applicant of the responsibility to comply with any other aspect of federal, state, and local laws, rules and regulations applicable to the work allowed under the permit including but not limited to the Americans with Disabilities Act of 1990.

☒ 49. When constructing a minor roadway improvement, Applicant shall comply with all federal, state, and local laws, regulations, executive orders and ordinances applicable to the work under this permit, including, without limitation, the provisions of ORS 276.071. If Applicant chooses to assign their permitted responsibilities to a consultant or contractor, Applicant shall inform the consultant or contractor of the requirements of ORS 276.071.

☐ 50. Upon completion of the permitted minor roadway improvement, Applicant shall notify ODOT and request final inspection. If all structures and appurtenances constructed under this permit are found to be in compliance with permit provisions and state standards, ODOT will accept ownership of the permitted structures and appurtenances by written notice to the Applicant.

By this signature Applicant acknowledges that the Applicant is subject to and accepts all checked (☒) provisions (4 pages).

Trip Check Form*

HIGHWAY MAINTENANCE AND CONSTRUCTION WORK – TO BE DONE

Please fill out this form in its entirety (if applicable) and email to

DPCSLMWTOC@odot.state.or.us

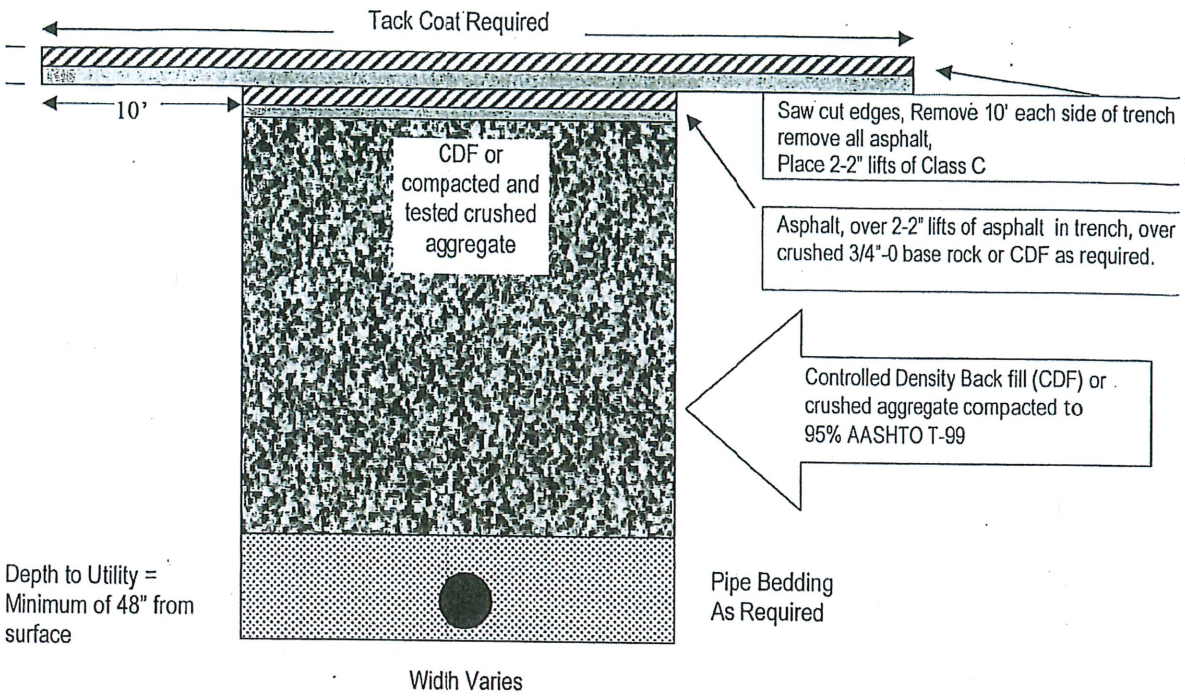
Attachment B
T-Cut Typical Section
CDF or Compacted Aggregate Backfill Option

Permit # 01M_41513



Backfill Material:

If Crushed Rock is used:

Place approved compacted crushed aggregate in trench to within 8" of the top of the sub-grade compacted to a minimum of 95% of the maximum density of the material, placed in 12" maximum lifts. Results of compaction tests to be made available to ODOT.

If CDF is used:

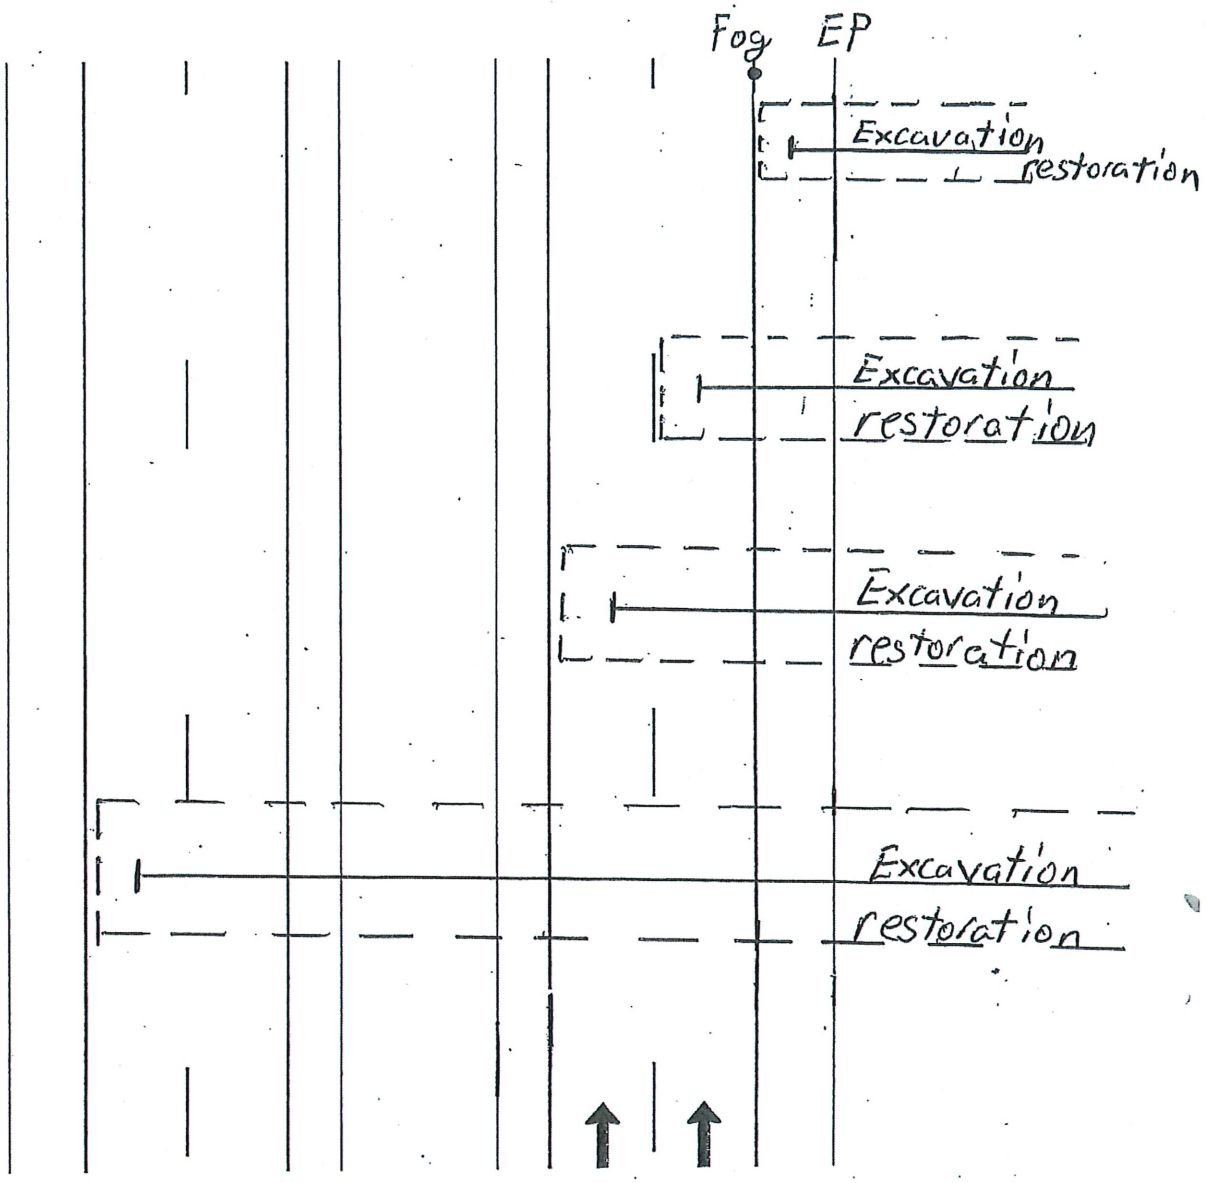
Controlled Density Fill (CDF), consists of ¾" -0 aggregate and an amount of concrete not to exceed 3% of the mixtures total mass. Do not exceed maximum compression strengths of 150 psi. Place approved CDF in trench to 8" below the roadway surface.

Apply an asphalt emulsion tack coat to all asphalt edges and ground surface. Place 2 additional lifts of Asphalt pavement in 2" compacted lifts in the T-Cut surface to grade. Provide a minimum compacted thickness of 4", or the thickness of the removed pavement, whichever is greater.

Cold Patch all cut areas at the end of each workday and maintain the patch. Hot patch damaged area within 7 days.

Restoration of cut asphalt.

A Crossed pavement line must restore to next line.



Any damaged to striping shall be replaced in kind by applicant.

Oregon Department of Transportation

Utility Permit Cultural Resource Certification

This form is to be completed and submitted to the Oregon Department of Transportation with the *Application and Permit to Occupy or Perform Operations Upon a State Highway* when ground disturbance (directional boring, cable plowing, trenching, and digging of any kind) is proposed as part of a permit application for installation of a utility line including moving or repositioning existing lines or poles.

Applicant Information		
Applicant Name City of Warrenton		
Address 45 SW 2nd St		
City Warrenton	State OR	Zip 97146
Contact Person Name Twyla Vittetoe	Phone Number 503.861.0912	Email tvittetoe@warrentonoregon.us
Project Location Information		
Highway Name and Route Number OR-104 / 104 / Fort Stevens		
Begin MP 1.17	End MP 1.69	County Clatsop

I represent that this Certification is in support of the *Application and Permit to Occupy or Perform Operations Upon a State Highway* at the above location dated 08/22/2023, submitted to the Oregon Department of Transportation with this Certification.

I am an authorized representative of the Applicant and certify that the Applicant has reached out to the Tribe(s) identified by the Legislative Commission on Indian Services (LCIS) and verified the presence/absence of cultural resources based on information available from the State Historic Preservation Office (SHPO) for a utility installation proposed on state highway right of way that is expected to include ground disturbance (directional boring, cable plowing, trenching, and digging of any kind).

The Tribe(s) was given at least 14 calendar days to respond to the request for feedback on cultural resources in the proposed work area that may be known to the Tribe(s) but not in the SHPO database.

Based on this information, the necessary cultural resource protection clearances and permits have been, or will be, obtained for the proposed work. In addition, it is understood that this does not relieve the Applicant from its responsibility to protect cultural resources. If cultural resources are discovered during the project, work will be stopped and SHPO contacted according to SHPO regulations.

By signing below, I certify that the above statements are true and correct to the best of my knowledge.

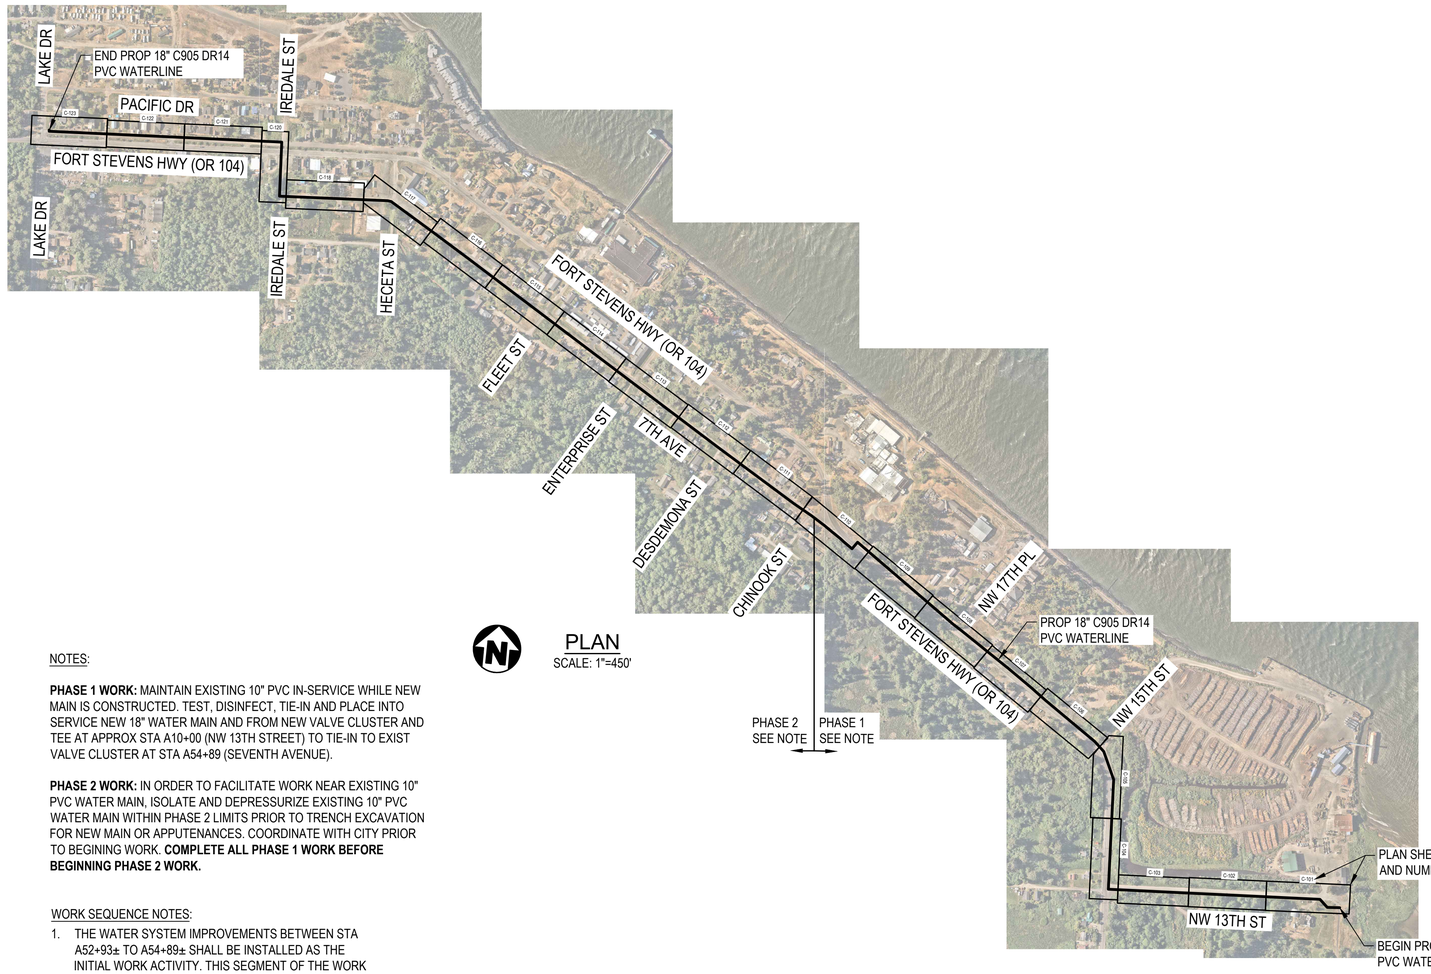
Call before you dig.



PLAN
SCALE: 1"=450'

NOTES:

PHASE 1 WORK: MAINTAIN EXISTING 10" PVC IN-SERVICE WHILE NEW MAIN IS CONSTRUCTED. TEST, DISINFECT, TIE-IN AND PLACE INTO SERVICE NEW 18" WATER MAIN AND FROM NEW VALVE CLUSTER AND TEE AT APPROX STA A10+00 (NW 13TH STREET) TO TIE-IN TO EXIST VALVE CLUSTER AT STA A54+89 (SEVENTH AVENUE).

PHASE 2 WORK: IN ORDER TO FACILITATE WORK NEAR EXISTING 10" PVC WATER MAIN, ISOLATE AND DEPRESSURIZE EXISTING 10" PVC WATER MAIN WITHIN PHASE 2 LIMITS PRIOR TO TRENCH EXCAVATION FOR NEW MAIN OR APPUTENANCES. COORDINATE WITH CITY PRIOR TO BEGINING WORK. **COMPLETE ALL PHASE 1 WORK BEFORE BEGINNING PHASE 2 WORK.**

WORK SEQUENCE NOTES:

1. THE WATER SYSTEM IMPROVEMENTS BETWEEN STA A52+93± TO A54+89± SHALL BE INSTALLED AS THE INITIAL WORK ACTIVITY. THIS SEGMENT OF THE WORK REQUIRES ARCHAEOLOGIST MONITORING OF EXCAVATION AND TRENCHING ACTIVITIES. THIS SEGMENT OF WORK SHALL BE INSTALLED, TESTED AND DISINFECTED. THE CUT-OFF VALVES WILL BE CLOSED TO ISOLATE IT FROM THE EXISTING 10-INCH WATER MAIN, THE WATER SHALL BE DRAINED FROM THE PIPE AND A TEMPORARY CAP INSTALLED.
2. UPON COMPLETION OF THE PREVIOUS WORK SEGMENT, THE WATERLINE INSTALLATION SHALL RESUME BEGINNING AT STA A10+00 AND PROCEEDING WEST/NORTH IN STATION ASCENDING ORDER. THE WATER SYSTEM IMPROVEMENTS SHALL BE INSTALLED, TESTED, DISINFECTED AND ACCEPTED IN LOGICAL SEQUENCE.
3. UPON REACHING THE TEMPORARY CAP INSTALLED IN STEP 1, THE TEMPORARY CAP SHALL BE REMOVED, WATERLINE CONNECTED, AND THE PIPE SEGMENT SHALL BE TESTED, DISINFECTED, AND ACCEPTED.
4. REFER TO SECTIONS 00 73 00, SPECIAL PROVISIONS, AND 01 12 16, WORK SEQUENCE, FOR ADDITIONAL INFORMATION.

GENERAL NOTES

1. CONSTRUCTION SHALL CONFORM TO THE OREGON SPECIFICATIONS AND STANDARD DRAWINGS FOR CONSTRUCTION AND AS REVISED BY THE CITY OF WARRENTON. ANY CONDITION NOT DESCRIBED IN THE PERMIT SHALL BE PER SUBMITTED PLANS AND TO ALL APPLICABLE REQUIREMENTS OF APWA, AWWA, DEQ, EPA, DSL, AND ODOT CONSTRUCTION STANDARDS.

2. IT SHALL BE THE RESPONSIBILITY OF THE CONTRACTOR TO VERIFY ALL UTILITY LOCATIONS PRIOR TO CONSTRUCTION AND ARRANGE FOR THE RELOCATION OF ANY IN CONFLICT WITH THE PROPOSED CONSTRUCTION. THE LOCATIONS, DEPTH, AND DESCRIPTION OF EXISTING UTILITIES SHOWN WERE COMPILED FROM AVAILABLE RECORDS AND-OR FIELD SURVEYS. THE CITY OR UTILITY COMPANIES DO NOT GUARANTEE THE ACCURACY OF THE COMPLETENESS OF SUCH RECORDS. ADDITIONAL UTILITIES MAY EXIST WITHIN THE WORK AREA.

3. OREGON LAW REQUIRES THAT THE RULES ADOPTED BY OREGON UTILITY NOTIFICATION CENTER BE FOLLOWED. THOSE RULES ARE SET FORTH IN OAR 952-001-0090. THE CONTRACTOR IS RESPONSIBLE TO CALL 1-800-332-2344 FOR LOCATES PRIOR TO EXCAVATION. AT LEAST TWO (2) BUSINESS DAYS PRIOR TO CONSTRUCTION, THE CONTRACTOR SHALL NOTIFY THE OREGON UTILITY NOTIFICATION CENTER OF THE DATE AND LOCATION OF THE PROPOSED CONSTRUCTION, AND THE TYPE OF WORK TO BE PERFORMED. ANY DAMAGE TO CITY OR PRIVATE SERVICES SHALL BE REPAIRED BY THE CONTRACTOR WITH OWN REPAIR MATERIALS.

4. THE CONTRACTOR SHALL MAKE PROVISIONS TO KEEP ALL EXISTING UTILITIES (INCLUDING NON-LOCATABLE) IN SERVICE AND PROTECT THEM DURING CONSTRUCTION. CONTRACTOR SHALL BE RESPONSIBLE FOR THE IMMEDIATE NOTIFICATION OF DAMAGE TO UTILITIES AND THE REPAIR OR REPLACEMENT OF DAMAGED UTILITIES USING MATERIALS AND METHODS APPROVED BY THE UTILITY OWNER. NO SERVICE INTERRUPTIONS SHALL BE PERMITTED WITHOUT PRIOR WRITTEN AGREEMENT WITH THE UTILITY OWNER/PROVIDER.

5. THE CONTRACTOR SHALL POTHOLE AND VERIFY LOCATION AND DEPTH OF ALL EXISTING UTILITIES PRIOR TO THE START OF CONSTRUCTION. THE CONTRACTOR SHALL TAKE ALL NECESSARY FIELD MEASUREMENTS AND OTHERWISE VERIFY ALL DIMENSIONS AND EXISTING CONSTRUCTION CONDITIONS INDICATED AND OR SHOWN ON THE PLANS. SHOULD ANY ERROR OR INCONSISTENCY EXIST, THE CONTRACTOR SHALL NOT PROCEED WITH THE WORK AFFECTED UNTIL REPORTED TO THE DESIGN ENGINEER FOR CLARIFICATION OR CORRECTION.

6. ALL PROJECT ELEMENTS SHALL BE CONSTRUCTED PER APPROVED PROJECT DRAWINGS; SPECIFICATIONS; FEDERAL, STATE AND LOCAL PERMITS.

7. THE CONTRACTOR SHALL KEEP AN APPROVED SET OF PLANS ON THE PROJECT SITE AT ALL TIMES.

8. ALL SURVEY MONUMENTS ON THE PROJECT'S SITE OR THAT MAY BE SUBJECT TO DISTURBANCE WITHIN THE CONSTRUCTION AREA, OR THE CONSTRUCTION OF ANY OFF-SITE IMPROVEMENTS SHALL BE ADEQUATELY REFERENCED AND PROTECTED PRIOR TO COMMENCEMENT OF ANY CONSTRUCTION ACTIVITY. IF THE SURVEY MONUMENTS ARE DISTURBED, MOVED, RELOCATED, OR DESTROYED AS A RESULT OF ANY CONSTRUCTION, THE CONTRACTOR SHALL, AT THEIR COST, RETAIN THE SERVICES OF A REGISTERED PROFESSIONAL LAND SURVEYOR IN THE STATE OF OREGON TO RESTORE THE MONUMENT TO ITS ORIGINAL CONDITION AND FILE THE NECESSARY SURVEYS AS REQUIRED BY OREGON STATE LAW.

9. CONTRACTOR SHALL ERECT AND MAINTAIN TEMPORARY TRAFFIC CONTROL PER THE "MANUAL ON UNIFORM TRAFFIC CONTROL DEVICES" (MUTCD), PART 6, AND DEVIATIONS TO THE MUTCD AS ADOPTED AND MODIFIED BY ODOT.

10. SHOULD WORK BE IN AN EXISTING PUBLIC RIGHT OF WAY THAT IS OPEN TO TRAFFIC, THE CONTRACTOR SHALL SUBMIT A TRAFFIC CONTROL PLAN WITH ROW PERMIT TO APPROPRIATE CITY, COUNTY, AND STATE JURISDICTIONAL AUTHORITIES FOR APPROVAL.

11. ANY INSPECTION BY THE CITY, COUNTY, STATE, FEDERAL AGENCY OR DESIGN ENGINEER SHALL NOT, IN ANY WAY, RELIEVE THE CONTRACTOR FROM ANY OBLIGATION TO PERFORM THE WORK IN COMPLIANCE WITH THE APPLICABLE CODES, REGULATIONS, CITY STANDARDS AND PROJECT CONTRACT DOCUMENTS.

12. FINAL LOCATIONS OF ALL NEW FACILITIES SHALL BE FIELD VERIFIED WITH THE CITY'S INSPECTOR AND ENGINEER PRIOR TO CONSTRUCTION.

13. PROVIDE "AS CONSTRUCTED" DRAWINGS TO THE ENGINEER INDICATING ALL CHANGES IN GRADE, ALIGNMENT, FITTINGS AND MATERIALS INSTALLED INSTALLED AND ANY OTHER UTILITIES OR OBSTACLES NOT SO INDICATED ON THESE PLANS.

14. CONTRACTOR SHALL BE RESPONSIBLE FOR PROTECTING CONSTRUCTION SURVEYS. PRIOR TO CONSTRUCTION, FIELD LAYOUT SHALL BE APPROVED BY ENGINEER, SEE CONTRACT DOCUMENTS FOR SURVEY REQUIREMENTS.

15. ALL EXISTING FEATURES INCLUDING BUT NOT LIMITED TO ROADWAYS, STRUCTURES, LOTS, CURBS, SIDEWALKS, FENCES, WALLS, PLANTING, DITCHES, SIGNS, PIPING AND UTILITIES DISTURBED DURING CONSTRUCTION SHALL BE REMOVED AND RESTORED TO AS GOOD OR BETTER THAN EXISTING CONDITION AS DETERMINED BY THE OWNER. CONTRACTOR SHALL REPAIR ALL UTILITY SERVICES DAMAGED DURING CONSTRUCTION AND SUCH REPAIR SHALL BE CONSIDERED INCIDENTAL UNLESS PROVIDED FOR OTHERWISE IN THE SPECIFICATIONS.

WATER SYSTEM NOTES

1. AT THE END OF EACH WORKDAY ALL OPEN TRENCHES SHALL BE BACKFILLED.

2. OPERATION OF WATER VALVES SHALL BE BY CITY OF WARRENTON STAFF ONLY.

3. NO UNDERGROUND WORK SHALL BE "BURIED" UNTIL INSPECTED AND APPROVED BY THE ENGINEER.

4. FINAL LOCATIONS OF ALL VALVE BOXES, FIRE HYDRANTS, AND AIR RELEASE VALVES SHALL BE VERIFIED BY OWNER PRIOR TO CONSTRUCTION.

5. THE USE OF CONCRETE THRUST BLOCKS IS ALLOWED ONLY WHERE SHOWN ON PLANS. REQUIRED THRUST RESTRAINT IN ALL OTHER LOCATIONS WILL BE ACCOMPLISHED WITH APPROVED JOIN RESTRAINT SYSTEM.

6. DEPTH OF INSTALLATION PARALLEL TO ODOT HIGHWAY WILL BE AT A MINIMUM OF 42" TO TOP OF PIPE.

7. CROSSINGS UNDER ODOT HIGHWAY WILL BE A MINIMUM OF 48" TO TOP OF PIPE. CROSSINGS UNDER ODOT HIGHWAY WILL REQUIRE PIPE TO BE PLACED IN CASING.

8. THE CONTRACTOR SHALL CONSTRUCT THE WATER MAIN TO THE MINIMUM DEPTHS OF COVER INDICATED ON THE DRAWINGS FOLLOWING THE EXISTING GROUND CONTOURS. WHERE PIPING INVERTS ARE SHOWN ON THE PIPELINE PROFILES, THE PIPELINE SHALL BE CONSTRUCTED TO THOSE INVERTS, UNLESS OTHERWISE SPECIFIED OR APPROVED BY ENGINEER.

9. COMPLY WITH OAR CHAPTER 333 RULES FOR REQUIRED WATERLINE-SEWERLINE SEPARATION AND CROSSING REQUIREMENTS. IN SPECIFIC LOCATIONS WHERE WATER PIPELINE IS TO BE INSTALLED CROSSING UNDERNEATH EXISTING SANITARY SEWERS, CONTRACTOR SHALL EXPOSE EXISTING SEWERS TO NEAREST JOINTS TO EXAMINE CONDITION AND THEN CONCRETE ENCASE OR REPLACE SECTION OF SEWER PER THE REQUIREMENTS OF OAR 333-061-0050(9)(c)(C) IF IT IS FOUND TO BE LEAKING OR ITS CONDITION IS DETERMINED TO BE UNFAVORABLE BY THE CITY'S INSPECTOR. IF EXISTING SEWER'S CONDITION IS DETERMINED TO BE FAVORABLE, CENTER A FULL STICK OF WATER PIPING AT THE CROSSING ASSURE THAT SEWER IS PROPERLY SUPPORTED DURING AND AFTER BACKFILLING, AND PREPARE A WRITTEN REPORT, ALL PER THE REQUIREMENT'S OF OAR 333. WITH THE CITY APPROVAL, THE CONTRACTOR MAY ALSO ELECT TO CUT AND REPLACE A FULL STICK OF SEWER LATERAL PIPING AT CROSSING REGARDLESS OF PIPING CONDITION TO FACILITATE SHORING PROGRESSION AND WATERLINE INSTALLATION. CONTRACTOR SHALL PROVIDE SEWER BYPASS AS REQUIRED TO FACILITATE THE WORK.

10. NO CONNECTION TO EXISTING MAIN LINES WILL BE ALLOWED WITHOUT FLUSHING, TESTING, DISINFECTION, AND RECEIPT OF SATISFACTORY BACTERIAL TESTS. CONTRACTOR SHALL PROVIDE TEMPORARY BLOW-OFF ASSEMBLIES AT ALL CONNECTIONS TO EXISTING PIPING AS REQUIRED TO FACILITATE TESTING AND DISINFECTION OF NEW PIPELINES.

9. COORDINATE ADJUSTMENT OF GAS UTILITY W/ NW NATURAL

WORK SEQUENCE NOTES:

1. THE WATER SYSTEM IMPROVEMENTS BETWEEN STA A52+93± TO A54+89± SHALL BE INSTALLED AS THE INITIAL WORK ACTIVITY. THIS SEGMENT OF THE WORK REQUIRES ARCHAEOLOGIST MONITORING OF EXCAVATION AND TRENCHING ACTIVITIES. THIS SEGMENT OF WORK SHALL BE INSTALLED, TESTED AND DISINFECTED. THE CUT-OFF VALVES WILL BE CLOSED TO ISOLATE IT FROM THE EXISTING 10-INCH WATER MAIN. THE WATER SHALL BE DRAINED FROM THE PIPE AND A TEMPORARY CAP INSTALLED.
2. UPON COMPLETION OF THE PREVIOUS WORK SEGMENT, THE WATERLINE INSTALLATION SHALL RESUME BEGINNING AT STA A10+00 AND PROCEEDING WEST/NORTH IN STATION ASCENDING ORDER. THE WATER SYSTEM IMPROVEMENTS SHALL BE INSTALLED, TESTED, DISINFECTED AND ACCEPTED IN LOGICAL SEQUENCE.
3. UPON REACHING THE TEMPORARY CAP INSTALLED IN STEP 1, THE TEMPORARY CAP SHALL BE REMOVED, WATERLINE CONNECTED, AND THE PIPE SEGMENT SHALL BE TESTED, DISINFECTED, AND ACCEPTED.
4. REFER TO SECTIONS 00 73 00, SPECIAL PROVISIONS, AND 01 12 16, WORK SEQUENCE, FOR ADDITIONAL INFORMATION.

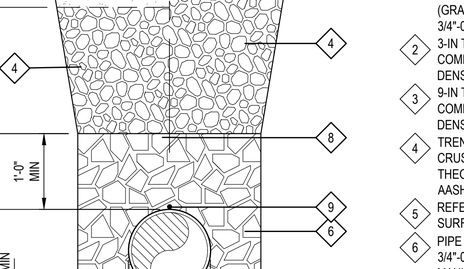
1. LEVEL 3, 1/2" MIX HMAC COMPACTED TO 92% MAXIMUM THEORETICAL DENSITY PER AASHTO T 209. MATCH EXISTING AC THICKNESS OR 8-IN, WHICHEVER IS GREATER. MAXIMUM AC BASE COURSE LIFTS SHALL BE 3-IN. MAXIMUM WEARING COURSE LIFTS SHALL BE 2-IN. FOR NON-AC (GRAVEL) ROADWAYS AND DRIVEWAYS, BRING 3/4"-0" CRUSHED ROCK BACKFILL TO GRADE.
2. 3-IN THICK CRUSHED SURFACING TOP COURSE COMPACTED TO 95% MAXIMUM THEORETICAL DENSITY PER AASHTO T-99.
3. 9-IN THICK CRUSHED SURFACING BASE COURSE COMPACTED TO 95% MAXIMUM THEORETICAL DENSITY PER AASHTO T-99.
4. TRENCH ZONE BACKFILL: USE CLASS B 3/4"-0" CRUSHED ROCK COMPACTED TO 95% MAXIMUM THEORETICAL DENSITY IN ACCORDANCE WITH AASHTO T-99.
5. REFER TO SURFACE RESTORATION PLANS FOR SURFACING REQUIREMENTS.
6. PIPE ZONE BEDDING AND BACKFILL: USE CLASS B 3/4"-0" CRUSHED ROCK COMPACTED TO 95% MAXIMUM THEORETICAL DENSITY IN ACCORDANCE WITH AASHTO T-99.
7. REMOVE UNSUITABLE MATERIAL AND INSTALL FOUNDATION MATERIAL PER SPECIFICATIONS (ENGINEER APPROVAL REQUIRED).
8. DETECTABLE MARKING TAPE
9. TRACER WIRE
10. IN AREAS OF HIGH GROUNDWATER, INSTALL CRUSHED ROCK DRAINAGE LAYER AND NON-WOVEN GEOTEXTILE BETWEEN SUBGRADE AND BOTTOM AND SIDES OF ROCK DRAINAGE LAYER. INSTALL DRAINAGE LAYER IN ACCORDANCE WITH GEOTECHNICAL RECOMMENDATIONS AND SPECIFICATIONS. ENGINEER APPROVAL REQUIRED.

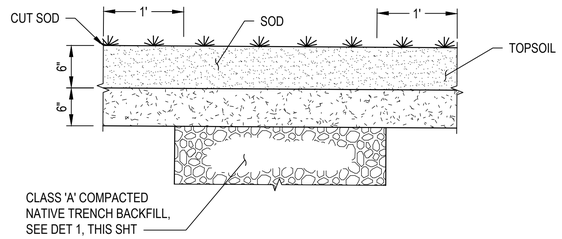
NOTES:

1. TRENCH BACKFILL SHALL BE PLACED IN HORIZONTAL LAYERS NO MORE THAN 6 INCHES THICK AND COMPACTED TO THE DENSITIES SPECIFIED.
2. MAX TRENCH WIDTH SHALL BE 18 INCHES PLUS 1.5 TIMES THE OUTSIDE DIA OF THE PIPE OR 30 INCHES, WHICHEVER IS GREATER, TYPICAL.
3. INSTALL DETECTABLE MARKING TAPE AS REQ'D.
4. INSTALL TRACER WIRE AS REQ'D.
5. BACKSLOPE TRENCH WALLS OR PROVIDE VERTICAL SHORING TO CONFORM WITH OSHA REQUIREMENTS.
6. COORDINATE FINAL RESTORATION LIMITS WITH OWNER.
7. SAND SEAL ALL ASPHALT JOINTS.

1 -- TYPICAL TRENCH SECTION
SCALE: NTS



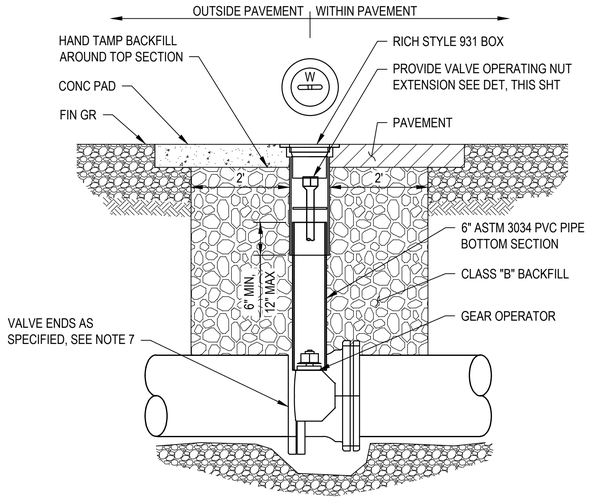
4 -- TYPICAL WATERLINE PLACEMENT
SCALE: NTS



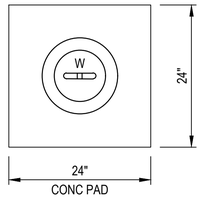
NOTES:

1. NON-PAVED SURFACES SHALL BE RESURFACED TO MATCH EXISTING. FINISH TRENCH SURFACE TO MATCH ORIGINAL CONTOURS. REPLACE EXIST LANDSCAPING.
2. CUT SOD WITH SOD HARVESTING EQUIPMENT AND STOCKPILE BESIDE TRENCH.
3. EXCAVATE TOPSOIL AND STOCKPILE BESIDE TRENCH, SEPARATE FROM SOD.
4. PROTECT EXIST WETLANDS AND GRASS AREAS WITH GEOTEXTILE BENEATH STOCKPILES.
5. FURNISH AND INSTALL CLASS "A" NATIVE TRENCH BACKFILL TO 1' BELOW FINISH GRADE COMPACTED TO 95% MAXIMUM DENSITY PER AASHTO T-99.
6. REPLACE TOPSOIL AND STOCKPILED SOD TO MATCH ORIGINAL LANDSCAPE AND CONTOURS.

2 -- TYPICAL WETLAND AND GRASS AREAS SURFACE RESTORATION
SCALE: NTS



5 -- VALVE BOX DETAIL
SCALE: NTS

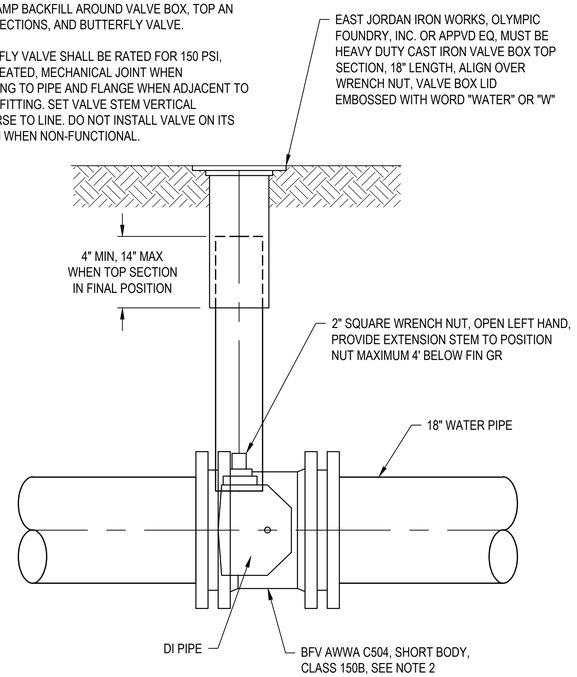


NOTES:

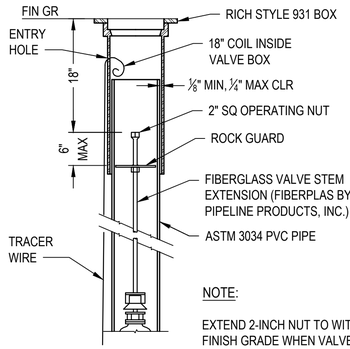
1. VALVE BOX NOT TO REST ON OPERATING ASSEMBLY.
2. OPERATING NUT EXTENSION REQUIRED WHEN VALVE NUT IS DEEPER THAN 3-FEET FROM FINISHED GRADE. SEE DETAIL 2, THIS SHEET.
3. CENTER VALVE BOX ON AXIS OF OPERATING NUT.
4. PROVIDE 24-INCH SQUARE BY 6-INCH THICK CONCRETE PAD AROUND VALVE BOX OUTSIDE OF PAVED AREAS AS SHOWN IN CONCRETE PAD DETAIL.
5. ORIENT GEAR OPERATOR TO CENTERLINE SIDE IN ROADWAYS.
6. USE CLASS B TRENCH BACKFILL A MINIMUM OF 2-FEET EACH SIDE OF VALVE.
7. COAT VALVE ENDS WITH WAX TAPE PER SPECS. WRAP VALVE AND PIPING WITH POLYETHYLENE TUBING.

NOTES:

1. HAND TAMP BACKFILL AROUND VALVE BOX, TOP AN BOTTOM SECTIONS, AND BUTTERFLY VALVE.
2. BUTTERFLY VALVE SHALL BE RATED FOR 150 PSI, RUBBER-SEATED, MECHANICAL JOINT WHEN CONNECTING TO PIPE AND FLANGE WHEN ADJACENT TO ANOTHER FITTING. SET VALVE STEM VERTICAL TRANSVERSE TO LINE. DO NOT INSTALL VALVE ON ITS SIDE EVEN WHEN NON-FUNCTIONAL.



3 -- BURIED BUTTERFLY VALVE DETAIL
SCALE: NTS



NOTE:

EXTEND 2-INCH NUT TO WITHIN 18" OF FINISH GRADE WHEN VALVE NUT IS DEEPER THAN 3-FEET FROM FINISHED GRADE.

6 -- OPERATING NUT EXTENSION DETAIL
SCALE: NTS

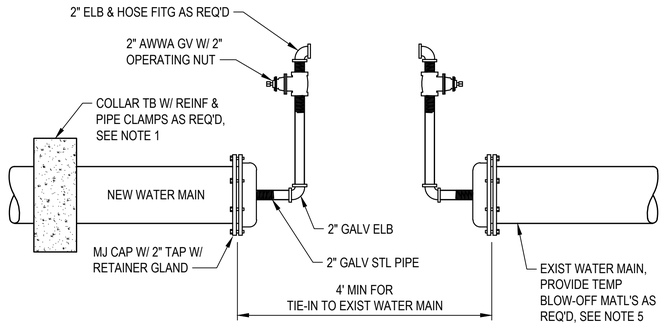
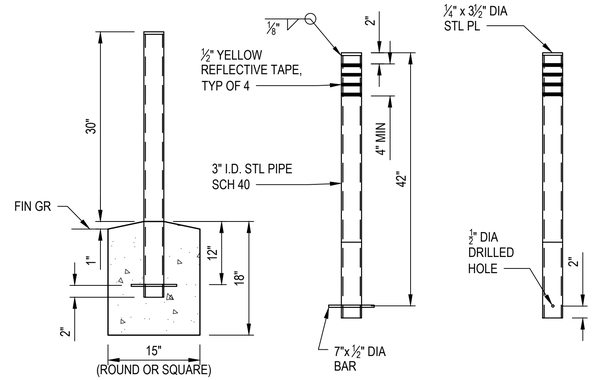
9. ¼" STL PLATE, WELL & GRIND BEVEL

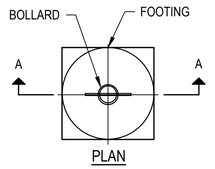
3 -- STANDPIPE DETAIL
SCALE: NTS



NOTES:
1. CONTRACTOR SHALL PROVIDE TEMPORARY THRUST RESTRAINTS AS REQ'D.
2. SEE SPECIFICATIONS REGARDING DISPOSAL/ DECHLORINATION OF SUPERCHLORINATED WATER.
3. PROVIDE LARGER BLOW-OFF PIPING MATERIAL AT CONTRACTOR'S OPTION.
4. WHERE BLOW-OFF IS TO BE REMOVED, CONTRACTOR SHALL CONDUCT OPERATIONS TO PREVENT SUBSEQUENT CONTAMINATION OF APPROVED DISINFECTED WATER MAIN.
5. PROVIDE TEMPORARY BLOW-OFF ON EXISTING WATER MAIN AS REQ'D TO FACILITATE TESTING AND DISINFECTION OF NEW MAINS. CONTRACTOR SHALL PROVIDE BACKFLOW PREVENTION DEVICE FOR TEMPORARY CONNECTION TO EXISTING WATER SYSTEM. CONTRACTOR SHALL DISINFECT EXISTING WATER MAIN PER REQ'S OF AWWA C651 DURING INSTALLATION OF TEMPORARY BLOW-OFF ASSEMBLY.

4 -- TEMPORARY BLOW-OFF ASSEMBLY
SCALE: NTS





BOLLARD NOTES:

1. CONCRETE FOOTINGS SHALL HAVE 15" MIN DIAMETER AND 3000 PSI MINIMUM 28 DAY COMPRESSIVE STRENGTH.

2. THREE (3) BOLLARDS SHALL BE PLACED AT EACH PROPOSED FIRE HYDRANT AND AIR RELEASE VALVE LOCATION. SPECIFIC BOLLARD ARRANGEMENTS SHALL BE AS DIRECTED IN THE FIELD BY ENGINEER.

5 -- NON-REMOVABLE BOLLARD
SCALE: NTS

NOTES:

1. CONCRETE THRUST BLOCKING SHALL BE POURED AGAINST UNDISTURBED EARTH.

2. KEEP CONCRETE CLEAR OF JOINT AND ACCESSORIES. INSTALL ISOLATION MATERIAL BETWEEN PIPE AND/OR FITTINGS BEFORE POURING BLOCKING.

3. THE REQUIRED THRUST BEARING AREAS FOR SPECIAL CONNECTIONS ARE SHOWN ENCIRCLED ON THE PLANS; e.g. 15 INDICATES 15 SQUARE FEET BEARING AREA REQUIRED.

4. IF NOT SHOWN ON PLANS, REQUIRED BEARING AREAS AT FITTING SHALL BE AS INDICATED IN TABLE, ADJUSTED IF NECESSARY, TO CONFORM TO THE TEST PRESSURE(S) AND ALLOWABLE SOIL BEARING STRESS(ES) STATED IN THE SPECIFICATIONS.

5. BEARING AREAS AND SPECIAL BLOCKING DETAILS SHOWN ON PLANS TAKE PRECEDENCE OVER BEARING AREAS AND BLOCKING DETAILS SHOWN ON THIS DETAIL.

6. CONCRETE SHALL BE 3000 PSI MINIMUM 28 DAY COMPRESSIVE STRENGTH.

7. BEARING AREAS WHERE EXISTING PIPE WILL BE ABANDONED IN PLACE, AS SHOWN ON PLAN, SHALL INCLUDE ½" STEEL PLATE AT THE BASE OF THE THRUST BLOCK. THE MINIMUM BEARING AREA OF THE STEEL PLATE SHALL BE BASED ON DATA FROM THE TABLE.

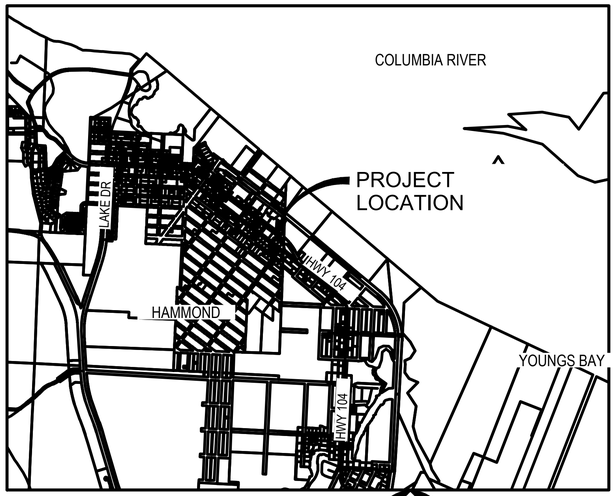
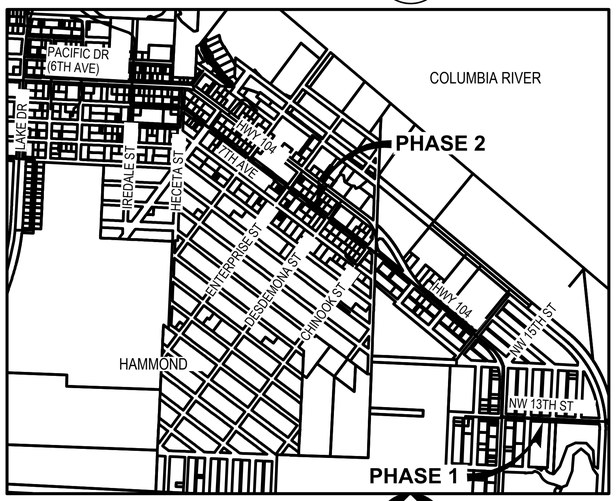
EROSION AND SEDIMENT CONTROL PLAN



VICINITY MAP
SCALE: 1"=5000'



LOCATION MAP
SCALE: 1"=1000'

THIS PROJECT IS SUBJECT TO THE TERMS AND CONDITIONS SET FORTH IN THE DRAINAGE, EROSION AND SEDIMENT CONTROL PERMIT ISSUED BY CITY OF WARRENTON. GIVEN THE LAND DISTURBANCE IS LESS THAN 1 ACRE, A DEQ 1200-C PERMIT IS NOT REQUIRED FOR THIS PROJECT.

THE EROSION AND SEDIMENT CONTROL PLAN DRAWINGS NOTES ON THIS SHEET REFERENCE DEQ 1200-C PERMIT LANGUAGE. THESE NOTES ARE PROVIDED AS GUIDANCE AND BEST MANAGEMENT PRACTICES FOR COMPLYING WITH CITY OF WARRENTON PERMIT. NOT ALL DEQ 1200-C LANGUAGE IS APPLICABLE FOR THIS PROJECT.

SHEET INDEX
EROSION AND SEDIMENT CONTROL PLANS

C-1001	ESC COVER SHEET & NOTES
C-101 TO C-122	ESC PLANS - WATERLINE
C-1501	ESC DETAILS

RAIN GAUGE:
ASTORIA REGIONAL AIRPORT (KAST), NOAA RAIN GAUGE

POLLUTANT-GENERATING ACTIVITIES:
1. PIPELINE TRENCHING

PROJECT LOCATIONS:
NW 13TH ST, FORT STEVENS HWY (OR 104), 7TH AVE, IREDALE ST, PACIFIC DR, HAMMOND, WARRENTON, OR 97121

PROPERTY DESCRIPTIONS:
TAX PARCELS
CLATSOP COUNTY, OREGON

NARRATIVE DESCRIPTIONS:
EXISTING SITE CONDITIONS
STATE OF OREGON AND CITY OF WARRENTON ROADWAYS AND UNIMPROVED RIGHTS-OF-WAY

DEVELOPED CONDITIONS AND DESCRIPTION
APPROX. 4,500 FT OF 18-IN C905 DR14 PVC WATERLINE WILL BE INSTALLED PARALLEL TO EXISTING WATERLINE.

NATURE OF CONSTRUCTION ACTIVITY AND ESTIMATED TIME TABLE
PIPELINE UTILITY INSTALLATION (2025)

TOTAL DISTURBED AREA:
PIPELINE UTILITY: 0.52 ACRES (22,445 SQ.FT.)

EXISTING REPLACED IMPERVIOUS SURFACE AREA:
0.12 ACRES (5,102 SQ.FT.)

PROPOSED IMPERVIOUS SURFACE AREA:
N/A

SOIL CLASSIFICATION:
COQUILLE-CLATSOP COMPLEX, PROTECTED, 0 TO 1% SLOPES (MAP UNIT 12A)
COQUILLE VARIANT SILT LOAM, 0 TO 1% SLOPES (MAP UNIT 13A)
WALDPORT FINE SAND, 3 TO 15% SLOPES (MAP UNIT 70C)

RECEIVING WATER BODIES:
NOTHING DIRECT. COLUMBIA RIVER IS 0.2 MILES NORTH/EAST OF PROJECT SITE.

ATTENTION EXCAVATORS:
OREGON LAW REQUIRES YOU TO FOLLOW RULES ADOPTED BY THE OREGON UTILITY NOTIFICATION CENTER. THOSE RULES ARE SET FORTH IN OAR 952-001-0010 THROUGH OAR 952-001-0090. YOU MAY OBTAIN COPIES OF THESE RULES FROM THE CENTER BY CALLING 503-232-1987. IF YOU HAVE ANY QUESTIONS ABOUT THE RULES, YOU MAY CONTACT THE CENTER. YOU MUST NOTIFY THE CENTER AT LEAST TWO BUSINESS DAYS, BEFORE COMMENCING AN EXCAVATION. CALL 503-246-6699.

* HOLD A PRE-CONSTRUCTION MEETING OF PROJECT CONSTRUCTION PERSONNEL THAT INCLUDES THE INSPECTOR TO DISCUSS EROSION AND SEDIMENT CONTROL MEASURES AND CONSTRUCTION LIMITS. (SCHEDULE A.8.C.I.(3))
* ALL INSPECTIONS MUST BE MADE IN ACCORDANCE WITH DEQ 1200-C PERMIT REQUIREMENTS.
* INSPECTION LOGS MUST BE KEPT IN ACCORDANCE WITH DEQ'S 1200-C PERMIT REQUIREMENTS.
* RETAIN A COPY OF THE ESCP AND ALL REVISIONS ON SITE AND MAKE IT AVAILABLE ON REQUEST TO DEQ, AGENT, OR THE LOCAL MUNICIPALITY. DURING INACTIVE PERIODS OF GREATER THAN SEVEN (7) CONSECUTIVE CALENDAR DAYS, RETAIN THE ESCP AT THE CONSTRUCTION SITE OR AT ANOTHER LOCATION. (SCHEDULE B.2.A)

ASSOCIATED PERMITS
CITY OF WARRENTON, PUBIC WORKS CONSTRUCTION PERMIT <<PENDING>>
OREGON DEPT OF TRANSPORTATION, PERMIT NO. 01M_41513

STANDARD EROSION AND SEDIMENT CONTROL PLAN DRAWING NOTES:

1. ONCE KNOWN, INCLUDE A LIST OF ALL CONTRACTORS THAT WILL ENGAGE IN CONSTRUCTION ACTIVITIES ON SITE, AND THE AREAS OF THE SITE WHERE THE CONTRACTOR(S) WILL ENGAGE IN CONSTRUCTION ACTIVITIES. REVISE THE LIST AS APPROPRIATE UNTIL PERMIT COVERAGE IS TERMINATED (SECTION 4.4.C.I). IN ADDITION, INCLUDE A LIST OF ALL PERSONNEL (BY NAME AND POSITION) THAT ARE RESPONSIBLE FOR THE DESIGN, INSTALLATION AND MAINTENANCE OF STORMWATER CONTROL MEASURES (E.G. ESCP DEVELOPER, BMP INSTALLER (SEE SECTION 4.10), AS WELL AS THEIR INDIVIDUAL RESPONSIBILITIES. (SECTION 4.4.C.II)
2. VISUAL MONITORING INSPECTION REPORTS MUST BE MADE IN ACCORDANCE WITH DEQ 1200-C PERMIT REQUIREMENTS. (SECTION 6.5)
3. INSPECTION LOGS MUST BE KEPT IN ACCORDANCE WITH DEQ'S 1200-C PERMIT REQUIREMENTS. (SECTION 6.5.O)
4. RETAIN A COPY OF THE ESCP AND ALL REVISIONS ON SITE AND MAKE IT AVAILABLE ON REQUEST TO DEQ, AGENT, OR THE LOCAL MUNICIPALITY. (SECTION 4.7)
5. THE PERMIT REGISTRANT MUST IMPLEMENT THE ESCP. FAILURE TO IMPLEMENT ANY OF THE CONTROL MEASURES OR PRACTICES DESCRIBED IN THE ESCP IS A VIOLATION OF THE PERMIT. (SECTIONS 4 AND 4.11)
6. THE ESCP MUST BE ACCURATE AND REFLECT SITE CONDITIONS. (SECTION 4.8)
7. SUBMISSION OF ALL ESCP REVISIONS IS NOT REQUIRED. SUBMITTAL OF THE ESCP REVISIONS IS ONLY UNDER SPECIFIC CONDITIONS. SUBMIT ALL NECESSARY REVISION TO DEQ OR AGENT WITHIN 10 DAYS. (SECTION 4.9)
8. SEQUENCE CLEARING AND GRADING TO THE MAXIMUM EXTENT PRACTICAL TO PREVENT EXPOSED INACTIVE AREAS FROM BECOMING A SOURCE OF EROSION. (SECTION 2.2.2)
9. CREATE SMOOTH SURFACES BETWEEN SOIL SURFACE AND EROSION AND SEDIMENT CONTROLS TO PREVENT STORMWATER FROM BYPASSING CONTROLS AND PONDING. (SECTION 2.2.3)
10. IDENTIFY, MARK, AND PROTECT (BY CONSTRUCTION FENCING OR OTHER MEANS) CRITICAL RIPARIAN AREAS AND VEGETATION INCLUDING IMPORTANT TREES AND ASSOCIATED ROOTING ZONES, AND VEGETATION AREAS TO BE PRESERVED. IDENTIFY VEGETATIVE BUFFER ZONES BETWEEN THE SITE AND SENSITIVE AREAS (E.G., WETLANDS), AND OTHER AREAS TO BE PRESERVED, ESPECIALLY IN PERIMETER AREAS. (SECTION 2.2.1)
11. PRESERVE EXISTING VEGETATION WHEN PRACTICAL AND RE-VEGETATE OPEN AREAS. RE-VEGETATE OPEN AREAS WHEN PRACTICABLE BEFORE AND AFTER GRADING OR CONSTRUCTION. IDENTIFY THE TYPE OF VEGETATIVE SEED MIX USED. (SECTION 2.2.5)
12. MAINTAIN AND DELINEATE ANY EXISTING NATURAL BUFFER WITHIN THE 50-FEET OF WATERS OF THE STATE. (SECTION 2.2.4)
13. INSTALL PERIMETER SEDIMENT CONTROL, INCLUDING STORM DRAIN INLET PROTECTION AS WELL AS ALL SEDIMENT BASINS, TRAPS, AND BARRIERS PRIOR TO LAND DISTURBANCE. (SECTIONS 2.1.3)
14. CONTROL BOTH PEAK FLOW RATES AND TOTAL STORMWATER VOLUME, TO MINIMIZE EROSION AT OUTLETS AND DOWNSTREAM CHANNELS AND STREAM BANKS. (SECTIONS 2.1.1. AND 2.2.16)
15. CONTROL SEDIMENT AS NEEDED ALONG THE SITE PERIMETER AND AT ALL OPERATIONAL INTERNAL STORM DRAIN INLETS AT ALL TIMES DURING CONSTRUCTION, BOTH INTERNALLY AND AT THE SITE BOUNDARY. (SECTIONS 2.2.6 AND 2.2.13)
16. ESTABLISH CONCRETE TRUCK AND OTHER CONCRETE EQUIPMENT WASHOUT AREAS BEFORE BEGINNING CONCRETE WORK. (SECTION 2.2.14)
17. APPLY TEMPORARY AND/OR PERMANENT SOIL STABILIZATION MEASURES IMMEDIATELY ON ALL DISTURBED AREAS AS GRADING PROGRESSES. TEMPORARY OR PERMANENT STABILIZATIONS MEASURES ARE NOT REQUIRED FOR AREAS THAT ARE INTENDED TO BE LEFT UNVEGETATED, SUCH AS DIRT ACCESS ROADS OR UTILITY POLE PADS.(SECTIONS 2.2.20 AND 2.2.21)
18. ESTABLISH MATERIAL AND WASTE STORAGE AREAS, AND OTHER NON-STORMWATER CONTROLS. (SECTION 2.3.7)
19. KEEP WASTE CONTAINER LIDS CLOSED WHEN NOT IN USE AND CLOSE LIDS AT THE END OF THE BUSINESS DAY FOR THOSE CONTAINERS THAT ARE ACTIVELY USED THROUGHOUT THE DAY. FOR WASTE CONTAINERS THAT DO NOT HAVE LIDS, PROVIDE EITHER (1) COVER (E.G., A TARP, PLASTIC SHEETING, TEMPORARY ROOF) TO PREVENT EXPOSURE OF WASTES TO PRECIPITATION, OR (2) A SIMILARLY EFFECTIVE MEANS DESIGNED TO PREVENT THE DISCHARGE OF POLLUTANTS (E.G., SECONDARY CONTAINMENT). (SECTION 2.3.7)
20. PREVENT TRACKING OF SEDIMENT ONTO PUBLIC OR PRIVATE ROADS USING BMPS SUCH AS: CONSTRUCTION ENTRANCE, GRAVELED (OR PAVED) EXITS AND PARKING AREAS, GRAVEL ALL UNPAVED ROADS LOCATED ONSITE, OR USE AN EXIT TIRE WASH. THESE BMPS MUST BE IN PLACE PRIOR TO LAND- DISTURBING ACTIVITIES. (SECTION 2.2.7)
21. WHEN TRUCKING SATURATED SOILS FROM THE SITE, EITHER USE WATER-TIGHT TRUCKS OR DRAIN LOADS ON SITE. (SECTION 2.2.7.F)
22. CONTROL PROHIBITED DISCHARGES FROM LEAVING THE CONSTRUCTION SITE, I.E., CONCRETE WASH-OUT, WASTEWATER FROM CLEANOUT OF STUCCO, PAINT AND CURING COMPOUNDS. (SECTIONS 1.5 AND 2.3.9)
23. ENSURE THAT STEEP SLOPE AREAS WHERE CONSTRUCTION ACTIVITIES ARE NOT OCCURRING ARE NOT DISTURBED. (SECTION 2.2.10)
24. PREVENT SOIL COMPACTION IN AREAS WHERE POST-CONSTRUCTION INFILTRATION FACILITIES ARE TO BE INSTALLED. (SECTION 2.2.12)
25. USE BMPS TO PREVENT OR MINIMIZE STORMWATER EXPOSURE TO POLLUTANTS FROM SPILLS; VEHICLE AND EQUIPMENT FUELING, MAINTENANCE, AND STORAGE; OTHER CLEANING AND MAINTENANCE ACTIVITIES; AND WASTE HANDLING ACTIVITIES. THESE POLLUTANTS INCLUDE FUEL, HYDRAULIC FLUID, AND OTHER OILS FROM VEHICLES AND MACHINERY, AS WELL AS DEBRIS, FERTILIZER, PESTICIDES AND HERBICIDES, PAINTS, SOLVENTS, CURING COMPOUNDS AND ADHESIVES FROM CONSTRUCTION OPERATIONS. (SECTIONS 2.2.15 AND 2.3)
26. PROVIDE PLANS FOR SEDIMENTATION BASINS THAT HAVE BEEN DESIGNED PER SECTION 2.2.17 AND STAMPED BY AN OREGON PROFESSIONAL ENGINEER. (SEE SECTION 2.2.17.A)
27. IF ENGINEERED SOILS ARE USED ON SITE, A SEDIMENTATION BASIN/IMPOUNDMENT MUST BE INSTALLED. (SEE SECTIONS 2.2.17 AND 2.2.18)
28. PROVIDE A DEWATERING PLAN FOR ACCUMULATED WATER FROM PRECIPITATION AND UNCONTAMINATED GROUNDWATER SEEPAGE DUE TO SHALLOW EXCAVATION ACTIVITIES. (SEE SECTION 2.4)
29. IMPLEMENT THE FOLLOWING BMPS WHEN APPLICABLE: WRITTEN SPILL PREVENTION AND RESPONSE PROCEDURES, EMPLOYEE TRAINING ON SPILL PREVENTION AND PROPER DISPOSAL PROCEDURES, SPILL KITS IN ALL VEHICLES, REGULAR MAINTENANCE SCHEDULE FOR VEHICLES AND MACHINERY, MATERIAL DELIVERY AND STORAGE CONTROLS, TRAINING AND SIGNAGE, AND COVERED STORAGE AREAS FOR WASTE AND SUPPLIES. (SECTION 2.3)
30. USE WATER, SOIL-BINDING AGENT OR OTHER DUST CONTROL TECHNIQUE AS NEEDED TO AVOID WIND-BLOWN SOIL. (SECTION 2.2.9)
31. THE APPLICATION RATE OF FERTILIZERS USED TO REESTABLISH VEGETATION MUST FOLLOW MANUFACTURER'S RECOMMENDATIONS TO MINIMIZE NUTRIENT RELEASES TO SURFACE WATERS. EXERCISE CAUTION WHEN USING TIME-RELEASE FERTILIZERS WITHIN ANY WATERWAY RIPARIAN ZONE. (SECTION 2.3.5)
32. IF AN ACTIVE TREATMENT SYSTEM (FOR EXAMPLE, ELECTRO-COAGULATION, FLOCCULATION, FILTRATION, ETC.) FOR SEDIMENT OR OTHER POLLUTANT REMOVAL IS EMPLOYED, SUBMIT AN OPERATION AND MAINTENANCE PLAN (INCLUDING SYSTEM SCHEMATIC, LOCATION OF SYSTEM, LOCATION OF INLET, LOCATION OF DISCHARGE, DISCHARGE DISPERSION DEVICE DESIGN, AND A SAMPLING PLAN AND FREQUENCY) BEFORE OPERATING THE TREATMENT SYSTEM. OBTAIN ENVIRONMENTAL MANAGEMENT PLAN APPROVAL FROM DEQ BEFORE OPERATING THE TREATMENT SYSTEM. OPERATE AND MAINTAIN THE TREATMENT SYSTEM ACCORDING TO MANUFACTURER'S SPECIFICATIONS. (SECTION 1.2.9)
33. TEMPORARILY STABILIZE SOILS AT THE END OF THE SHIFT BEFORE HOLIDAYS AND WEEKENDS, IF NEEDED. THE REGISTRANT IS RESPONSIBLE FOR ENSURING THAT SOILS ARE STABLE DURING RAIN EVENTS AT ALL TIMES OF THE YEAR. (SECTION 2.2)
34. AS NEEDED BASED ON WEATHER CONDITIONS, AT THE END OF EACH WORKDAY SOIL STOCKPILES MUST BE STABILIZED OR COVERED, OR OTHER BMPS MUST BE IMPLEMENTED TO PREVENT DISCHARGES TO SURFACE WATERS OR CONVEYANCE SYSTEMS LEADING TO SURFACE WATERS. (SECTION 2.2.8)
35. SEDIMENT FENCE: REMOVE TRAPPED SEDIMENT BEFORE IT REACHES ONE THIRD OF THE ABOVE GROUND FENCE HEIGHT AND BEFORE FENCE REMOVAL. (SECTION 2.1.5.B)
36. OTHER SEDIMENT BARRIERS (SUCH AS BIOBAGS): REMOVE SEDIMENT BEFORE IT REACHES TWO INCHES DEPTH ABOVE GROUND HEIGHT AND BEFORE BMP REMOVAL. (SECTION 2.1.5.C)
37. CATCH BASINS: CLEAN BEFORE RETENTION CAPACITY HAS BEEN REDUCED BY FIFTY PERCENT. SEDIMENT BASINS AND SEDIMENT TRAPS: REMOVE TRAPPED SEDIMENTS BEFORE DESIGN CAPACITY HAS BEEN REDUCED BY FIFTY PERCENT AND AT COMPLETION OF PROJECT. (SECTION 2.1.5.D)
38. WITHIN 24 HOURS, SIGNIFICANT SEDIMENT THAT HAS LEFT THE CONSTRUCTION SITE, MUST BE REMEDIATED. INVESTIGATE THE CAUSE OF THE SEDIMENT RELEASE AND IMPLEMENT STEPS TO PREVENT A RECURRENCE OF THE DISCHARGE WITHIN THE SAME 24 HOURS. ANY IN-STREAM CLEAN-UP OF SEDIMENT SHALL BE PERFORMED ACCORDING TO THE OREGON DEPARTMENT OF STATE LANDS REQUIRED TIMEFRAME. (SECTION 2.2.19.A)
39. THE INTENTIONAL WASHING OF SEDIMENT INTO STORM SEWERS OR DRAINAGE WAYS MUST NOT OCCUR. VACUUMING OR DRY SWEEPING AND MATERIAL PICKUP MUST BE USED TO CLEANUP RELEASED SEDIMENTS. (SECTION 2.2.19)
40. DOCUMENT ANY PORTION(S) OF THE SITE WHERE LAND DISTURBING ACTIVITIES HAVE PERMANENTLY CEASED OR WILL BE TEMPORARILY INACTIVE FOR 14 OR MORE CALENDAR DAYS. (SECTION 6.5.F.)
41. PROVIDE TEMPORARY STABILIZATION FOR THAT PORTION OF THE SITE WHERE CONSTRUCTION ACTIVITIES CEASE FOR 14 DAYS OR MORE WITH A COVERING OF BLOWN STRAW AND A TACKIFIER, LOOSE STRAW, OR AN ADEQUATE COVERING OF COMPOST MULCH UNTIL WORK RESUMES ON THAT PORTION OF THE SITE. (SECTION 2.2.20)
42. DO NOT REMOVE TEMPORARY SEDIMENT CONTROL PRACTICES UNTIL PERMANENT VEGETATION OR OTHER COVER OF EXPOSED AREAS IS ESTABLISHED. ONCE CONSTRUCTION IS COMPLETE AND THE SITE IS STABILIZED, ALL TEMPORARY EROSION CONTROLS AND RETAINED MOVED AND DISPOSED OF PROPERLY, UNLESS NEEDED FOR LONG TERM USE FOLLOWING TERMINATION OF PERMIT COVERAGE. (SECTION 2.2.21)

BMP MATRIX FOR CONSTRUCTION PHASES:
REFER TO DEQ GUIDANCE MANUAL FOR A COMPREHENSIVE LIST OF AVAILABLE BMP'S.

BMP	UTILITY INSTALLATION	FINAL STABILIZATION	WET WEATHER OCT 1-MAY 31 (IF REQ'D)
EROSION PREVENTION			
GROUND COVER	X	X	X
PLASTIC SHEETING	X		X
DUST CONTROL	X		X
TEMPORARY STABILIZATION	X		X
PERMANENT STABILIZATION	X	X	X
SEDIMENT CONTROL			
SEDIMENT FENCE (PERIMETER)	X	X	X
SEDIMENT FENCE (INTERIOR)	X		X
STRAW WATTLES	X	X	X
DEWATERING (GENERAL)	X		X
RUN-OFF CONTROL			
CONSTRUCTION ENTRANCE	X	X	X
POLLUTION PREVENTION			
HAZ WASTE MGMT	X	X	X
SPILL KIT ON-SITE	X	X	X
CONCRETE WASH OUT AREA	X		X

RATIONALE STATEMENT:
A COMPREHENSIVE LIST OF AVAILABLE BEST MANAGEMENT PRACTICES (BMP) OPTIONS BASED ON DEQ'S GUIDANCE MANUAL HAS BEEN REVIEWED TO COMPLETE THIS EROSION AND SEDIMENT CONTROL PLAN. SOME OF THE ABOVE LISTED BMPS WERE NOT CHOSEN BECAUSE THEY WERE DETERMINED TO NOT EFFECTIVELY MANAGE EROSION PREVENTION AND SEDIMENT CONTROL FOR THIS PROJECT BASED ON SPECIFIC SITE CONDITIONS, INCLUDING SOIL CONDITIONS TOPOGRAPHIC CONSTRAINTS, ACCESSIBILITY TO THE SITE, AND OTHER RELATED CONDITIONS, AS THE PROJECT PROGRESSES AND THERE IS A NEED TO REVISE THE ESC PLAN, AN ACTION PLAN WILL BE SUBMITTED.

INITIAL

PERMITTEE'S SITE INSPECTOR:
TBD

CONTRACTOR:
TBD

INSPECTION FREQUENCY:

SITE CONDITION	MINIMUM FREQUENCY
1. ACTIVE PERIOD	ON INITIAL DATE THAT LAND DISTRURBANCE ACTIVITIES COMMENCE. WITHIN 24 HOURS OF ANY STORM EVENT, INCLUDING RUNOFF FROM SNOW MELT, THAT RESULTS IN DISCHARGE FROM SITE. AT LEAST ONCE EVERY 14 DAYS, REGARDLESS OF WHETHER STORMWATER RUNOFF IS OCCURING.
2. INACTRIVE PERIODS GREATER THAN FOURTEEN (14) DAYS	THE INSPECTOR MAY REDUCE THE FREQUENCY OF INSPECTIONS IN ANY AREA OF THE SITE WHERE THE STABILIZATION STEPS IN SECTION 2.2.20 HAVE BEEN COMPLETED TO TWICE PER MONTH FOR THE FIRST MONTH, NO LESS THAN 14 CALENDAR DAYS APART, THEN ONCE PER MONTH.
3. PERIODS DURING WHICH THE SITE IS INACCESSIBLE DUE TO INCLEMENT WEATHER	IF SAFE, ACCESSIBLE AND PRACTICAL, INSPECTIONS MUST OCCUR DAILY AT A RELEVANT DISCHARGE POINT OR DOWNSTREAM LOCATION OF THE RECEIVING WATERBODY.
4. PERIODS DURING WHICH CONSTRUCTION ACTIVITIES ARE SUSPENDED AND RUNOFF IS UNLIKELY DUE TO FROZEN CONDITIONS.	VISUAL MONITORING INSPECTIONS MAY BE TEMPORARILY SUSPENDED. IMMEDIATELY RESUME MONITORING UPON THAWING, OR WHEN WEATHER CONDITIONS MAKE DISCHARGES LIKELY.
5. PERIODS DURING WHEN CONSTRUCTION ACTIVITIES ARE CONDUCTED AND RUNOFF IS UNLIKELY DURING FROZEN CONDITIONS.	VISUAL MONITORING INSPECTIONS MAY BE REDUCED TO ONCE A MONTH. IMMEDIATELY RESUME MONITORING UPON THAWING, OR WHEN WEATHER CONDITIONS MAKE DISCHARGES LIKELY.

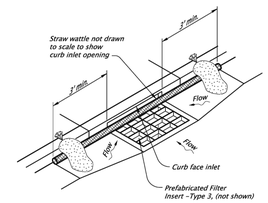
CURB INLET SEDIMENT DAM - TYPE 10
NOT TO SCALE

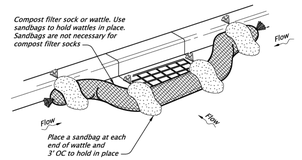
(Type 7 cont.)
Use 12" to 18" dia sock in non-traffic areas or areas where the larger socks can be used safely.
use synthetic mesh socks for temporary installations.

Type 10 – Curb inlet sediment dam
Fit curb inlet sediment dam snugly into inlet mouth. Curb inlet sediment dam is required for use with inlet filter insert where at-grade inlet grate and curb inlet are combined at a catch basin.

Type 11 – Wattle barrier with filter insert
Install prefabricated filter insert per Type 3 detail.
Install wattles over opening and 36" to each side of opening tight against curb. Adjust wattle to force storm water to flow through filter insert or wattle prior to leaving the site.
Adjust, replace or modify the inlet protection as needed to prevent sediment laden water from entering the catch basin.



WATTLE BARRIER WITH FILTER INSERT - TYPE 11
NOT TO SCALE



CURB INLET PERSPECTIVE VIEW

COMPOST FILTER SOCK OR WATTLE - TYPE 7
NOT TO SCALE

NOTES:
Type 2 – Geotextile/wire mesh/aggregate
Place the wire mesh over the grate. Place sediment fence geotextile over the wire mesh and perimeter area around structure.
Install aggregate over the geotextile fabric.

Type 3 – Prefabricated filter inserts
Install prefabricated filter inserts according to the plans, special provisions, and manufacturer recommendations. Prefabricated inserts with provisions for overflow are allowed only when accompanied by additional BMP's to prevent the potential of sediments entering project storm systems. Field fabricated inserts are not allowed.

Type 7 – Compost filter sock
Drive 2"x2" wood stakes a minimum of 6" into ground and flush with the top of the sock.
Overlap ends of sock per manufacturers recommendations (12"min., 36" max.). Use 8" to 12" dia sock on curbside in traffic areas.

All materials shall be in accordance with the current Oregon Standard Specifications.

TRAFFIC CONTROL PLAN

Designed By:	KJM
Drawn By:	KJM
Checked By:	ATM
Approved By:	ATM
CONSOR Project No.:	W231023OR
Issued On:	MARCH 2025
Drawing No.:	C-2101

0 1/2 1 IF BAR DOES NOT MEASURE 1" DRAWING IS NOT TO SCALE

TAPER TYPES & FORMULAS	
TAPER	FORMULA
Merging (Lane Closure)	"L"
Shifting	"L"/2 or ½"L"
Shoulder Closure	"L"/3 or ⅓"L"
Flagging (See Drg. TM850)	50' – 100'
Downstream (Termination)	Varies (See Drawings)

★ Use Pre-Construction Posted Speed to select the Speed from the Tables below:

TEMPORARY BARRIER FLARE RATE TABLE	
★SPEED (mph)	MINIMUM FLARE RATE
≤ 30	8:1
35	9:1
40	10:1
45	12:1
50	14:1
55	16:1
60	18:1
65	19:1
70	20:1

MINIMUM LENGTHS TABLE					
"L" VALUE FOR TAPERS (ft)					BUFFER "B" (ft)
	W = Lane or Shoulder Width being closed or shifted				
★ SPEED (mph)	W ≤ 10	W = 12	W = 14	W = 16	
25	105	125	145	165	75
30	150	180	210	240	100
35	205	245	285	325	125
40	265	320	375	430	150
45	450	540	630	720	180
50	500	600	700	800	210
55	550	660	770	880	250
60	600	720	840	960	285
65	650	780	910	1000	325
70	700	840	980	1000	365
FREEWAYS					
55	1000	1000	1000	1000	250
60	1000	1000	1000	1000	285
65	1000	1000	1000	1000	325
70	1000	1000	1000	1000	365

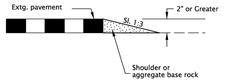
NOTES:
- For Lane closures where W < 10', use "L" value for W = 10'.
- For Shoulder closures where W < 10', use "L" value for W = 10' or calculate "L" using formula, for Speeds ≥ 45: L = WS, Speeds < 45: L = S²W/60, S = Speed, W=Width

TRAFFIC CONTROL DEVICES (TCD) SPACING TABLE				
★ SPEED (mph)	Sign Spacing (ft)			Max. Channelizing Device Spacing (ft)
	A	B	C	
20 – 30	100	100	100	20
35 – 40	350	350	350	20
45 – 55	500	500	500	40
60 – 70	700	700	700	40
Freeway	1000	1500	2640	40

NOTES:
- Place traffic control devices on 10 ft. spacing for intersection and access radii.
- When necessary, sign spacing may be adjusted to fit site conditions. Limit spacing adjustments to 30% of the "A" dimension for all speeds.

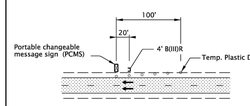
01-JUL-2022 TM800.dgn

NOTES:
- When paved shoulders adjacent to excavations are less than four feet wide protect longitudinal abrupt edge as shown.
- Use aggregate wedge when abrupt edge is 2 inches or greater.



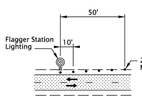
EXCAVATION ABRUPT EDGE

NOTES:
- Install PCMS beyond the outside shoulder, when possible.
- Use the appropriate type of barricade panels for PCMS location. Right shoulder, use Type BI(II)R Left shoulder, use Type BI(II)L
- Use six drums in shoulder taper on 20' spacing. The drums and barricade may be omitted when PCMS is placed behind a roadside barrier.
- Detail as shown is used for trailered and non-crashworthy components of:
  - Portable Traffic Signals
  - Smart Work Zone Systems



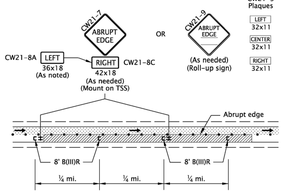
PORTABLE CHANGEABLE MESSAGE SIGN (PCMS) INSTALLATION

NOTES:
- Install Flagger Station Lighting beyond the outside shoulder, where practical.
- Use six tubular markers in shoulder taper on 10' spacing.
- Place cart / generator / power supply off of the shoulder, as far as practical.



FLAGGER STATION LIGHTING DELINEATION

NOTES:
- Abrupt edges may be created by paving, operations, excavations or other roadway work. Use abrupt edge signing for longitudinal abrupt edges of 1 inch or greater.
- If the excavation is located on left side of traffic, replace the 8' BI(II)R barricades with 8' BI(II)L barricades and replace the "RIGHT" (CW21-8C) riders with "LEFT" (CW21-8A) riders.
- Continue signing and other traffic control devices throughout excavation area at spacings shown.
- If roll-up signs are used, attach the correct (CW21-9) plaques to the sign face using hook and loop fasteners. Place roll-up signs in advance of barricades.



TYPICAL ABRUPT EDGE DELINEATION

GENERAL NOTES FOR ALL TCP DRAWINGS:
- Signs and other Traffic Control Devices (TCD) shown are the minimum required.
- Place a barricade approx. 20' ahead of all sequential arrow boards.
- Arrows shown in roadway are directional arrows to indicate traffic movements.
- All signs are 48" x 48" unless otherwise shown. Use fluorescent orange sheeting for the background of all temporary warning signs.
- All diamond shaped warning signs mounted on barrier sign supports shall be 36" by 36". All other signs mounted on barrier sign supports shall not exceed 12 sq. ft. in total sign area.
- Low speed highways have a pre-construction posted speed of 40 mph or less. High speed highways have a pre-construction posted speed of 45 mph or higher.
- Do not locate sign supports in locations designated for bicycle or pedestrian traffic.
- Combine drawing details to complete temporary traffic control for each work activity.
- Coordinate and control pedestrian movements through a Temporary Accessible Route using Flaggers, Traffic Control Measures, or as directed.
- To be accompanied by Dwg. Nos. TM820 & TM821.

Temp. Plastic Drums See TCD Spacing Table for max. spacing.
28" Tubular Markers See TCD Spacing Table for max. spacing.

- Use a minimum of two Type III barricades for a road closure. For roads > 36' wide between curbs or edge of pavement, use a minimum of three Type III barricades for the closure point.
- For full road closures, the C or LR barricade may be used.
- Place additional signing as directed.
- To determine sign spacing A, B, & C, use the "TRAFFIC CONTROL DEVICES (TCD) SPACING TABLE" on Dwg. TM800.
- To be accompanied by Dwg. Nos.TM820 & TM821.

28" Tubular Markers See TCD Spacing Table on TM800 for max. spacing.

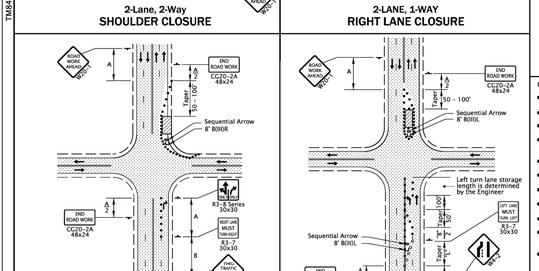
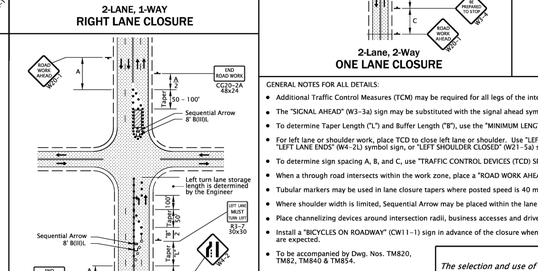
RIGHT LANE CLOSURE, NEAR SIDE



4-Lane, 2-Way
RIGHT LANE CLOSURE, FAR SIDE



4-Lane, 2-Way
LEFT LANE CLOSURE, FAR SIDE

GENERAL NOTES FOR ALL DETAILS:
- Additional Traffic Control Measures (TCM) may be required for all legs of the intersection.
- The "SIGNAL AHEAD" (W3-3a) sign may be substituted with the signal ahead symbol (W3-3) sign.
- To determine Taper Length ("L") and Buffer Length ("B"), use the "MINIMUM LENGTHS TABLE" on Dwg. TM800.
- For left lane or shoulder work, place TCD to close left lane or shoulder. Use "LEFT LANE CLOSED AHEAD" (W20-5) sign, "LEFT LANE ENDS" (W4-2L) symbol sign, or "LEFT SHOULDER CLOSED" (W21-5a) sign, where applicable.
- To determine sign spacing A, B, and C, use "TRAFFIC CONTROL DEVICES (TCD) SPACING TABLE" on Dwg. TM800.
- When a through road intersects within the work zone, place a "ROAD WORK AHEAD" (W20-1) sign in advance of the intersection at sign spacing A.
- Tubular markers may be used in lane closure tapers where posted speed is 40 mph or less.
- Where shoulder width is limited, Sequential Arrow may be placed within the lane closure taper.
- Place channelizing devices around intersection radii, business accesses and driveways at 10' spacing.
- Install a "BICYCLES ON ROADWAY" (CW11-1) sign in advance of the closure when a bike lane is closed, or when the shoulder is closed and bikes are expected.
- To be accompanied by Dwg. Nos. TM820, TM82, TM840 & TM854.

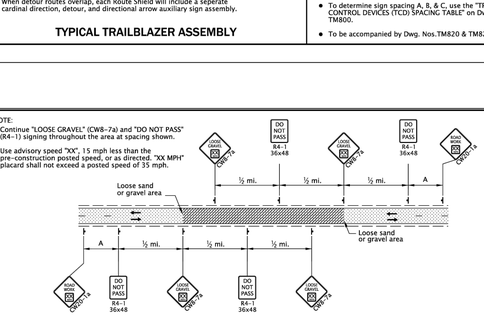
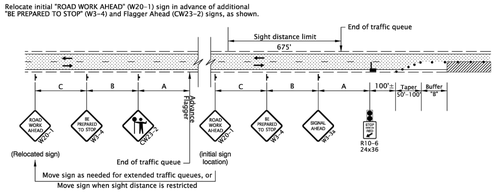
NOTE:
- Continue "LOOSE GRAVEL" (CW8-7a) and "DO NOT PASS" (R4-1) signing throughout the area at spacing shown.
- Use advisory speed "XX", 15 mph less than the pre-construction posted speed, or as directed. "XX MPH" placard shall not exceed a posted speed of 35 mph.



2-Lane, 2-Way Roadway
LOOSE GRAVEL IN ROADWAY SIGNING

NOTES:
- Place Advance Flagger and additional signing when traffic queues extend beyond initial warning signing OR when sight distance is restricted.
- Relocate initial "ROAD WORK AHEAD" (W20-1) sign in advance of additional "BE PREPARED TO STOP" (W3-4) and Flagger Ahead (CW23-2) signs, as shown.
- Place additional Tubular Markers for Flagger and Advance Flagger Stations according to FLAGGER STATION DELINEATION detail.



ADVANCE FLAGGER FOR EXTENDED TRAFFIC QUEUES

GENERAL NOTES FOR ALL DETAILS:
- The "SIGNAL AHEAD" (W3-3a) sign may be substituted with the Signal Ahead (W3-3) symbol sign.
- Cover existing passing zone signing, as directed.
- Install temporary striping as required.
- To determine Taper Length ("L") and Buffer Length ("B"), use the "MINIMUM LENGTHS TABLE" shown on Dwg. No. TM800.
- To determine sign spacing A, B, and C, use "TRAFFIC CONTROL DEVICES (TCD) SPACING TABLE" on Dwg. No. TM800.
- Install a "BICYCLES ON ROADWAY" (CW11-1) sign in advance of the closure when a bike lane is closed, or when the shoulder is closed and bikes are expected.
- At night, flagger stations shall be illuminated according to the FLAGGER STATION LIGHTING DELINEATION detail on Dwg No. TM800.
- To be accompanied by Dwg. Nos. TM820, TM821 & TM854.

City Commission Agenda Memo

Meeting Date: April 8th, 2025
From: Kevin Gorman, Public Works Director
Subject: Raw Waterline RP-2 Easements

Summary:

The Raw Waterline RP-2 Project requires six new easements to accommodate the planned waterline alignment along the roadway. These include three permanent easements and three temporary construction easements. While existing easements are already in place, the new alignment shifts the waterline closer to the road to improve accessibility, reduce land disturbance, and streamline construction. The easements were prepared by the City's legal team and reviewed by the affected property owners. Following review and signature by all parties, Commission approval is required to authorize the City Manager to sign and record the easements.

Recommendation/Suggested Motion:

"I move to approve the City Manager to execute and record the easement agreements for the Raw Waterline RP-2 Project."

Alternative:

Other action as deemed appropriate by the City Commission
OR
None recommended

Fiscal Impact:

There is no fiscal impact, as there are no costs associated with acquiring these easements.

Seaside, OR 97138

GRANTEE/CITY: City of Warrenton, an Oregon municipal corporation

PERMANENT WATER UTILITY EASEMENT – TAXLOT 610000001500

RECITALS:

A. Grantor owns the real property described in Clatsop County Deed Record No. 201505488 ("Property").

B. The City installs, removes, and maintains utilities throughout the city, include waterlines.

C. The City requires a permanent easement on the Property ("Easement") to allow access to and to inspect, maintain, repair, and undertake other activities related to the water pipeline utility that it will construct in the location depicted in **Exhibit A** ("Easement Area").

D. Grantor desires to grant to the City and the City desires to accept from the Grantor a permanent easement over the Easement Area pursuant to the terms of this Agreement.

NOW, THEREFORE, the true consideration for the Easement is the mutual covenants and agreements contained herein, the receipt and sufficiency of which are acknowledged; the parties agree as follows ("Agreement"):

1. Grant of Permanent Utility Easement. Grantor, and Grantor's heirs, successors and assigns, grants and conveys to the City, a permanent, nonexclusive easement for the purpose of designing, accessing, constructing, reconstructing, operating, and maintaining a water utility easement and a water blow-off valve (BOV) assembly in the Easement Area. Grantor also grants to the City the right of reasonable access over other parts of the Property that are adjacent to the Easement Area as allowed under Section 3 below. In the event that the Easement Area overlaps with any preexisting easement areas granted to the City, the creation of this Easement Area shall not be construed to extinguish or otherwise impact or limit the City's rights to any preexisting easement areas. The BOV installed in the Easement Area is designated solely for system maintenance and water release and shall not be used for any non-essential or non-emergency purposes and shall only be operated by the City.

2. City's Rights. Grantor shall allow the City and its officers, employees, agents, assigns, public utility providers, and independent contractors to use the Easement Area for all purposes related to a water pipeline and related facilities. The Easement Area shall be used for ingress and egress of personnel and for the purposes of accessing, constructing, reconstructing, operating, and maintaining a water pipeline and related facilities that are above ground and underground and a water blow-off valve (BOV) assembly. The City has the right to excavate, construct, install, place, lay, operate, inspect, maintain, relocate, add to, and remove underground pipelines, related structures and facilities within the Easement Area. The City has the right to cut, trim, plant, and remove trees or other vegetation within the Easement Area. The City has the right to remove other obstructions that may endanger or interfere with the construction, reconstruction, maintenance, inspection, removal, or efficient service of all or any part of its respective water system on or from the Easement Area without the necessity at any time of procuring the consent or permission of anyone. The City has the right to enter the Easement Area at any and all times for the exercise of any of the easement rights. The BOV in the Easement Area shall be used exclusively for system maintenance purposes to release water as needed.

3. Restrictions on City's Use of Easement Area; Damage. The City shall use the Easement Area as necessary for the purpose described in this Easement. At the City's sole cost and expense, the City agrees to repair any and all damage caused to the Easement Area or Grantor's Property by the City. The City shall stabilize any disturbed soils and reasonably restore the Easement Area following completion of any construction in the Easement Area by the City to the same or better condition as existed in the Easement Area prior to the work. However, if restoration requires the replacement of any trees or vegetation, any trees will be replaced with trees no larger than four-inches in diameter, and any plants will be replaced with plants in two-gallon containers. The size and species of any trees or vegetation replaced will be solely at the City's discretion. After restoration is complete, Grantor is responsible for watering and maintaining the vegetation.

4. Liability for Non-easement Property. The City shall be liable for any damage to the Property that is caused by the City. The City shall have a reasonable time, not to exceed two weeks after notice from Grantor, to restore the Easement Area and other area of the Property that City has damaged. Notice shall be sent to:

   City of Warrenton
   Attn: Public Works
   P.O. Box 250
   Warrenton, OR 97146

5. Grantor's Reservation of Rights; Limitation on Reserved Rights.

   5.1. Grantor reserves the right to continued use of the surface area within the Easement Area for all lawful purposes that do not interfere with, and are not inconsistent with, the City's rights granted in this Easement.

   5.2. This reservation of rights does not include the right to build structures or place objects in the Easement Area that obstruct access to the Easement Area without the City's permission, or to create other impediments to the City's easement rights. Any such obstruction may be summarily removed by the City, and there shall be no claim

allowed for damage to or destruction of the building, structure or object that the City removed. This reservation of rights does not include the right to engage in or allow any action that disturbs the subjacent or lateral support of the Easement Area.

6. Indemnification. Each party shall defend, indemnify, and hold the other party, its officers, employees, and agents harmless from and against any and all claims (including third party claims for damages for property removed from the Easement Area), demands, liabilities, judgments, awards, fines, liens, losses, damages, and expenses of any kind, including attorneys' fees at trial or on appeal, incurred by the indemnifying party to the extent arising either directly or indirectly from and to the extent of any act, error, omission or negligence of indemnifying party, its employees, contractors, licensees, or agents under this Agreement. Nothing in this Agreement, City's approval of plans and specifications, or inspection of work is an acknowledgement of responsibility or liability unless otherwise provided by applicable law.
7. Grantor's Warranty. Grantor agrees that it has the right to convey the Easement to the City and to provide quiet possession to the City. Grantor warrants to the City that the person executing this Agreement on behalf of Grantor is duly authorized to make this conveyance.
8. Breach; Remedies; Equitable Relief. Grantor acknowledges that the rights granted to the City are unique in that money damages alone for breach of the Easement by Grantor are inadequate, and that the City may bring an action at law or a suit in equity to obtain relief, including specific performance, injunctive relief and any other available equitable remedy.
9. Legal Effect; Shall Run with the Land. The Permanent Easement shall become effective and binding on the date signed by the Grantor and inure to the benefit of Grantor and the City, and their respective heirs, personal representatives, successors and assigns. This Easement shall run with the land.
10. Attorneys' Fees. In the event any action is brought to enforce, modify or interpret the provisions of this Agreement, each party shall bear the expense of its own attorney fees and costs incurred in connection with such action.
11. Severability. Nothing contained in this Agreement shall be construed to require the commission of any act contrary to law, and if there is any conflict between any provisions of the Easement and any present or future statute, law, ordinance or regulation to which the parties have no legal right to contract, the latter shall prevail. However, the provision of the Easement, which is affected shall be curtailed and limited only to the extent necessary to bring them within the requirements of the law, and all other provisions of the Easement shall remain in effect.
12. Waiver. Either party's failure to require performance of any provision of the Easement shall not limit the party's right to enforce the provision, nor shall any waiver of any breach of any provision be a waiver of any succeeding breach of the provision or a waiver of the provision itself or any other provision.

THE EASEMENT is granted this 17 day of March, 2025.

GRANTOR:
L&C Tree Farms, LLC

[NAME] Kevin Brown

PERMANENT WATER UTILITY EASEMENT – TAXLOT 610000001600

RECITALS:

A. Grantor owns the real property described in Clatsop County Deed Record No. 201505488 ("Property").
B. The City installs, removes, and maintains utilities throughout the city, including waterlines.
C. The City requires a permanent easement on the Property ("Easement") to allow access to and to inspect, maintain, repair, and undertake other activities related to the water pipeline utility that it will construct in the location depicted in **Exhibit A** ("Easement Area").
D. Grantor desires to grant to the City and the City desires to accept from the Grantor a permanent easement over the Easement Area pursuant to the terms of this Agreement.

NOW, THEREFORE, the true consideration for the Easement is the mutual covenants and agreements contained herein, the receipt and sufficiency of which are acknowledged; the parties agree as follows ("Agreement"):

1. Grant of Permanent Utility Easement. Grantor, and Grantor's heirs, successors and assigns, grants and conveys to the City, a permanent, nonexclusive easement for the purpose of designing, accessing, constructing, reconstructing, operating, and maintaining a water utility easement and a water blow-off valve (BOV), and combination air release valves (CARV) in the Easement Area. Grantor also grants to the City the right of reasonable access over other parts of the Property that are adjacent to the Easement Area as allowed under Section 3 below. In the event that the Easement Area overlaps with any preexisting easement areas granted to the City, the creation of this Easement Area shall not be construed to extinguish or otherwise impact or limit the City's rights to any preexisting easement areas. The BOV and CARV installed in the Easement Area are designated solely for system maintenance, water

release, and air release and shall not be used for any non-essential or non-emergency purposes, and shall only be operated by the City.

2. City's Rights. Grantor shall allow the City and its officers, employees, agents, assigns, public utility providers, and independent contractors to use the Easement Area for all purposes related to a water pipeline and related facilities including a water blow-off valve (BOV) and a combination air release valve (CARV). The Easement Area shall be used for ingress and egress of personnel and for the purposes of accessing, constructing, reconstructing, operating, and maintaining a water pipeline and related facilities that are above ground and underground. The City has the right to excavate, construct, install, place, lay, operate, inspect, maintain, relocate, add to, and remove underground pipelines, related structures and facilities, including the BOV and CARV, within the Easement Area. The City has the right to cut, trim, plant, and remove trees or other vegetation within the Easement Area. The City has the right to remove other obstructions that may endanger or interfere with the construction, reconstruction, maintenance, inspection, removal, or efficient service of all or any part of its respective water system on or from the Easement Area without the necessity at any time of procuring the consent or permission of anyone. The City has the right to enter the Easement Area at any and all times for the exercise of any of the easement rights. The BOV shall be used exclusively for system maintenance and water release by the City, while the CARV is installed for air release/vacuum as needed to maintain operational efficiency.

3. Restrictions on City's Use of Easement Area; Damage. The City shall use the Easement Area as necessary for the purpose described in this Easement. At the City's sole cost and expense, the City agrees to repair any and all damage caused to the Easement Area or Grantor's Property by the City. The City shall stabilize any disturbed soils and reasonably restore the Easement Area following completion of any construction in the Easement Area by the City to the same or better condition as existed in the Easement Area prior to the work. However, if restoration requires the replacement of any trees or vegetation, any trees will be replaced with trees no larger than four-inches in diameter, and any plants will be replaced with plants in two-gallon containers. The size and species of any trees or vegetation replaced will be solely at the City's discretion. After restoration is complete, Grantor is responsible for watering and maintaining the vegetation.

4. Liability for Non-easement Property. The City shall be liable for any damage to the Property that is caused by the City. The City shall have a reasonable time, not to exceed two weeks after notice from Grantor, to restore the Easement Area and other area of the Property that City has damaged. Notice shall be sent to:

   City of Warrenton
   Attn: Public Works
   P.O. Box 250
   Warrenton, OR 97146

5. Grantor's Reservation of Rights; Limitation on Reserved Rights.

   5.1. Grantor reserves the right to continued use of the surface area within the Easement Area for all lawful purposes that do not interfere with, and are not inconsistent with, the City's rights granted in this Easement.

5.2. This reservation of rights does not include the right to build structures or place objects in the Easement Area that obstruct access to the Easement Area without the City's permission, or to create other impediments to the City's easement rights. Any such obstruction may be summarily removed by the City, and there shall be no claim allowed for damage to or destruction of the building, structure or object that the City removed. This reservation of rights does not include the right to engage in or allow any action that disturbs the subjacent or lateral support of the Easement Area.

6. Indemnification. Each party shall defend, indemnify, and hold the other party, its officers, employees, and agents harmless from and against any and all claims (including third party claims for damages for property removed from the Easement Area), demands, liabilities, judgments, awards, fines, liens, losses, damages, and expenses of any kind, including attorneys' fees at trial or on appeal, incurred by the indemnifying party to the extent arising either directly or indirectly from and to the extent of any act, error, omission or negligence of indemnifying party, its employees, contractors, licensees, or agents under this Agreement. Nothing in this Agreement, City's approval of plans and specifications, or inspection of work is an acknowledgement of responsibility or liability unless otherwise provided by applicable law.

7. Grantor's Warranty. Grantor agrees that it has the right to convey the Easement to the City and to provide quiet possession to the City. Grantor warrants to the City that the person executing this Agreement on behalf of Grantor is duly authorized to make this conveyance.

8. Breach; Remedies; Equitable Relief. Grantor acknowledges that the rights granted to the City are unique in that money damages alone for breach of the Easement by Grantor are inadequate, and that the City may bring an action at law or a suit in equity to obtain relief, including specific performance, injunctive relief and any other available equitable remedy.

9. Legal Effect; Shall Run with the Land. The Permanent Easement shall become effective and binding on the date signed by the Grantor and inure to the benefit of Grantor and the City, and their respective heirs, personal representatives, successors and assigns. This Easement shall run with the land.

10. Attorneys' Fees. In the event any action is brought to enforce, modify or interpret the provisions of this Agreement, each party shall bear the expense of its own attorney fees and costs incurred in connection with such action.

11. Severability. Nothing contained in this Agreement shall be construed to require the commission of any act contrary to law, and if there is any conflict between any provisions of the Easement and any present or future statute, law, ordinance or regulation to which the parties have no legal right to contract, the latter shall prevail. However, the provision of the Easement, which is affected shall be curtailed and limited only to the extent necessary to bring them within the requirements of the law, and all other provisions of the Easement shall remain in effect.

12. Waiver. Either party's failure to require performance of any provision of the Easement shall not limit the party's right to enforce the provision, nor shall any waiver of any breach of any provision be a waiver of any succeeding breach of the provision or a waiver of the provision itself or any other provision.

THE EASEMENT is granted this 17 day of March, 2025.

TEMPORARY CONSTRUCTION EASEMENT – TAX LOT 610000001500

RECITALS:

A. Grantor owns the real property described in Clatsop County Deed Record No. 201505488 ("Property").

B. The City requires a temporary construction easement ("Easement") on the Property to allow the City to access and construct a water line in the locations described in **Exhibit A** ("Temporary Construction Easement Area").

C. Grantor desires to grant to the City and the City desires to accept from the Grantor a temporary construction easement pursuant to the terms of this Agreement.

NOW, THEREFORE, the parties agree as follows ("Agreement"):

1. Grant of Permanent Utility Easement. In consideration of the mutual benefits, covenants, and terms contained herein, the receipt and sufficiency of which is hereby acknowledged, Grantor, and Grantor's heirs, successors and assigns, grants and conveys to the City, a permanent, nonexclusive easement for the purpose of designing, accessing, constructing, reconstructing, operating, and maintaining a water utility easement in the Temporary Construction Easement Area. Grantor also grants to the City the right of reasonable access over other parts of the Property that are adjacent to the Temporary Construction Easement.
2. City's Rights. Grantor shall allow the City and its officers, employees, agents, assigns, public utility providers, and independent contractors to use the Temporary Construction Easement Area for all purposes related to a water pipeline and related facilities. The Temporary Construction Easement Area shall be used for ingress and egress of personnel and for the purposes of accessing, constructing, reconstructing, and operating a water pipeline and related facilities that are above ground and underground, this can include items such as fire hydrants, blow-off valve assemblies, combination air release valves, and bollards. The City has the right to excavate, construct, install, place, lay, operate, inspect, relocate, add to, and remove underground pipelines, related structures and facilities within the Temporary

Construction Easement Area. The City has the right to cut, trim, plant, and remove trees or other vegetation within the Temporary Construction Easement Area. The City has the right to remove other obstructions that may endanger or interfere with the construction, reconstruction, inspection, efficient service, or removal of all or any part of its respective water system on or from the Temporary Construction Easement Area without the necessity at any time of procuring the consent or permission of anyone. The City has the right to enter the Temporary Construction Easement Area at any and all times for the exercise of any of the easement rights.

3. Noninterference. Grantor and its heirs, successors, and assigns will not interfere with the City's use of the Temporary Construction Easement Area or the rights granted herein and agrees not to build, construct, improve and/or plant (or permit or allow others to do so) any structures, edifices, plants or other objects within the areas of the Temporary Construction Easement Area during the term of this Easement.

4. Temporary Construction Easement Area Condition. The City shall return the Temporary Construction Easement Area to a good condition (i.e. repair/replace soil disturbance and/or vegetation; removal of construction debris, rocks/gravel and other materials; etc.) with all damage resulting from or arising out of said use to be repaired by the City. In addition, the City shall repair (or pay for the repair of) any damage to the Property caused by the City's activities in the Temporary Construction Easement Area. The City shall have a reasonable time, not to exceed two weeks after notice from Grantor, to restore the Temporary Construction Easement Area and adjacent property. Notice shall be sent to:

   City of Warrenton
   Attn: Public Works
   P.O. Box 250
   Warrenton, OR 97146

5. Indemnification. Each party shall defend, indemnify, and hold the other party, its officers, employees, and agents harmless from and against any and all claims (including third party claims for damages for property removed from the Temporary Construction Easement Area), demands, liabilities, judgments, awards, fines, liens, losses, damages, and expenses of any kind, including attorneys' fees at trial or on appeal, incurred by the indemnifying party to the extent arising either directly or indirectly from and to the extent of any act, error, omission or negligence of indemnifying party, its employees, contractors, licensees, or agents under this Agreement. Nothing in this Agreement, City's approval of plans and specifications, or inspection of work is an acknowledgement of responsibility or liability unless otherwise provided by applicable law.

6. Grantor's Warranty. Grantor agrees that Grantor has the right to convey the Easement to the City and to provide quiet possession to the City. Grantor warrants to the City that the person executing this Agreement on behalf of Grantor is duly authorized to make this conveyance.

7. Breach; Remedies; Equitable Relief. Grantor acknowledges that the rights granted to the City are unique in that money damages alone for breach of the Easement by Grantor are inadequate, and that the City may bring an action at law or a suit in equity to obtain relief, including specific performance, injunctive relief and any other available equitable remedy.

8. Expiration of Easement. The Easement will terminate upon the Owner's issuance of a Certificate of Final Completion to the Contractor for the construction project and shall have no further force or effect thereafter.

9. Attorneys' Fees. In the event any action is brought to enforce, modify or interpret the provisions of this Agreement, each party shall bear the expense of its own attorney fees and costs incurred in connection with such action.

10. Severability. Nothing contained in this Agreement shall be construed to require the commission of any act contrary to law, and if there is any conflict between any provisions of the Easement and any present or future statute, law, ordinance or regulation to which the parties have no legal right to contract, the latter shall prevail. However, the provision of the Easement, which is affected shall be curtailed and limited only to the extent necessary to bring them within the requirements of the law, and all other provisions of the Easement shall remain in effect.

11. Waiver. Either party's failure to require performance of any provision of the Easement shall not limit the party's right to enforce the provision, nor shall any waiver of any breach of any provision be a waiver of any succeeding breach of the provision or a waiver of the provision itself or any other provision.

THE EASEMENT is granted this 17 day of March, 2025.

TEMPORARY CONSTRUCTION EASEMENT – TAX LOT 610000001600

RECITALS:

A. Grantor owns the real property described in Clatsop County Deed Record No. 201505488 ("Property").

B. The City requires a temporary construction easement ("Easement") on the Property to allow the City to access and construct a water line in the locations described in **Exhibit A** ("Temporary Construction Easement Area").

C. Grantor desires to grant to the City and the City desires to accept from the Grantor a temporary construction easement pursuant to the terms of this Agreement.

NOW, THEREFORE, the parties agree as follows ("Agreement"):

1. Grant of Permanent Utility Easement. In consideration of the mutual benefits, covenants, and terms contained herein, the receipt and sufficiency of which is hereby acknowledged, Grantor, and Grantor's heirs, successors and assigns, grants and conveys to the City, a permanent, nonexclusive easement for the purpose of designing, accessing, constructing, reconstructing, operating, and maintaining a water utility easement in the Temporary Construction Easement Area. Grantor also grants to the City the right of reasonable access over other parts of the Property that are adjacent to the Temporary Construction Easement.
2. City's Rights. Grantor shall allow the City and its officers, employees, agents, assigns, public utility providers, and independent contractors to use the Temporary Construction Easement Area for all purposes related to a water pipeline and related facilities. The Temporary Construction Easement Area shall be used for ingress and egress of personnel and for the purposes of accessing, constructing, reconstructing, and operating a water pipeline and related facilities that are above ground and underground, this can include items such as fire hydrants, blow-off valve assemblies, combination air release valves, and bollards. The City has the right to excavate, construct, install, place, lay, operate, inspect, relocate, add to, and remove underground pipelines, related structures and facilities within the Temporary

Construction Easement Area. The City has the right to cut, trim, plant, and remove trees or other vegetation within the Temporary Construction Easement Area. The City has the right to remove other obstructions that may endanger or interfere with the construction, reconstruction, inspection, efficient service, or removal of all or any part of its respective water system on or from the Temporary Construction Easement Area without the necessity at any time of procuring the consent or permission of anyone. The City has the right to enter the Temporary Construction Easement Area at any and all times for the exercise of any of the easement rights.

3. Noninterference. Grantor and its heirs, successors, and assigns will not interfere with the City's use of the Temporary Construction Easement Area or the rights granted herein and agrees not to build, construct, improve and/or plant (or permit or allow others to do so) any structures, edifices, plants or other objects within the areas of the Temporary Construction Easement Area during the term of this Easement.

4. Temporary Construction Easement Area Condition. The City shall return the Temporary Construction Easement Area to a good condition (i.e. repair/replace soil disturbance and/or vegetation; removal of construction debris, rocks/gravel and other materials; etc.) with all damage resulting from or arising out of said use to be repaired by the City. In addition, the City shall repair (or pay for the repair of) any damage to the Property caused by the City's activities in the Temporary Construction Easement Area. The City shall have a reasonable time, not to exceed two weeks after notice from Grantor, to restore the Temporary Construction Easement Area and adjacent property. Notice shall be sent to:

   City of Warrenton
   Attn: Public Works
   P.O. Box 250
   Warrenton, OR 97146

5. Indemnification. Each party shall defend, indemnify, and hold the other party, its officers, employees, and agents harmless from and against any and all claims (including third party claims for damages for property removed from the Temporary Construction Easement Area), demands, liabilities, judgments, awards, fines, liens, losses, damages, and expenses of any kind, including attorneys' fees at trial or on appeal, incurred by the indemnifying party to the extent arising either directly or indirectly from and to the extent of any act, error, omission or negligence of indemnifying party, its employees, contractors, licensees, or agents under this Agreement. Nothing in this Agreement, City's approval of plans and specifications, or inspection of work is an acknowledgement of responsibility or liability unless otherwise provided by applicable law.

6. Grantor's Warranty. Grantor agrees that Grantor has the right to convey the Easement to the City and to provide quiet possession to the City. Grantor warrants to the City that the person executing this Agreement on behalf of Grantor is duly authorized to make this conveyance.

7. Breach; Remedies; Equitable Relief. Grantor acknowledges that the rights granted to the City are unique in that money damages alone for breach of the Easement by Grantor are inadequate, and that the City may bring an action at law or a suit in equity to obtain relief, including specific performance, injunctive relief and any other available equitable remedy.

8. Expiration of Easement. The Easement will terminate upon the Owner's issuance of a Certificate of Final Completion to the Contractor for the construction project and shall have no further force or effect thereafter.

9. Attorneys' Fees. In the event any action is brought to enforce, modify or interpret the provisions of this Agreement, each party shall bear the expense of its own attorney fees and costs incurred in connection with such action.

10. Severability. Nothing contained in this Agreement shall be construed to require the commission of any act contrary to law, and if there is any conflict between any provisions of the Easement and any present or future statute, law, ordinance or regulation to which the parties have no legal right to contract, the latter shall prevail. However, the provision of the Easement, which is affected shall be curtailed and limited only to the extent necessary to bring them within the requirements of the law, and all other provisions of the Easement shall remain in effect.

11. Waiver. Either party's failure to require performance of any provision of the Easement shall not limit the party's right to enforce the provision, nor shall any waiver of any breach of any provision be a waiver of any succeeding breach of the provision or a waiver of the provision itself or any other provision.

THE EASEMENT is granted this 17 day of March, 2025.

PERMANENT WATER UTILITY EASEMENT

RECITALS:

A. Grantor owns real property described by **Exhibit A** ("Property"), which is attached and incorporated by this reference.

B. Sirpa Duoos is the duly appointed Personal Representative of the will and estate of the Grantor. The Letters Testamentary appointing Sirpa Duoos as such are attached as **Exhibit B** and incorporated herein by this reference.

C. The City installs, removes, and maintains utilities throughout the city, including waterlines.

D. The City requires a permanent easement on the Property ("Easement") to allow access to and to inspect, maintain, repair, and undertake other activities related to the water pipeline utility that it will construct in the location depicted in **Exhibit C** ("Easement Area").

E. Grantor desires to grant to the City and the City desires to accept from the Grantor a permanent easement over the Easement Area pursuant to the terms of this Agreement.

NOW, THEREFORE, the true consideration for the Easement is the mutual covenants and agreements contained herein, the receipt and sufficiency of which are acknowledged; the parties agree as follows ("Agreement"):

1. Grant of Permanent Utility Easement. Grantor, and Grantor's heirs, successors and assigns, grants and conveys to the City, a permanent, nonexclusive easement for the purpose of designing, accessing, constructing, reconstructing, operating, and maintaining a water utility easement and a fire hydrant in the Easement Area. Grantor also grants to the City the right of reasonable access over other parts of the Property that are adjacent to the Easement Area as allowed under Section 3 below. The hydrant installed in the Easement Area is designated solely for emergency fire protection and shall not be used for any non-emergency purposes. The water supplied by this hydrant is non-potable and unsuitable for drinking or other

potable uses. The City reserves the right to restrict access to ensure that its use is limited to emergencies, thereby preventing any impact on the City's primary drinking water operations

2. City's Rights. Grantor shall allow the City and its officers, employees, agents, assigns, public utility providers, and independent contractors to use the Easement Area for all purposes related to a water pipeline and related facilities. The Easement Area shall be used for ingress and egress of personnel and for the purposes of accessing, constructing, reconstructing, operating, and maintaining a water pipeline and related facilities that are above ground and underground and a fire hydrant that will be above ground. The City has the right to excavate, construct, install, place, lay, operate, inspect, maintain, relocate, add to, and remove underground pipelines, related structures and facilities within the Easement Area. The City has the right to cut, trim, plant, and remove trees or other vegetation within the Easement Area. The City has the right to remove other obstructions that may endanger or interfere with the construction, reconstruction, maintenance, inspection, efficient service, or removal of all or any part of its respective water system on or from the Easement Area without the necessity at any time of procuring the consent or permission of anyone. The City has the right to enter the Easement Area at any and all times for the exercise of any of the easement rights. The hydrant in the Easement Area shall be used exclusively for emergency fire protection purposes. Flow and pressure from the hydrant are dependent on water levels and WTP pump operations, with low gravity-driven static pressures, which vary. Non-emergency use of the hydrant is strictly prohibited to maintain adequate pressure and flow for the City's drinking water supply

3. Restrictions on City's Use of Easement Area; Damage. The City shall use the Easement Area as necessary for the purpose described in this Easement. At the City's sole cost and expense, the City agrees to repair any and all damage caused to the Easement Area or Grantor's Property by the City. The City shall stabilize any disturbed soils and reasonably restore the Easement Area following completion of any construction in the Easement Area by the City to the same or better condition as existed in the Easement Area prior to the work. However, if restoration requires the replacement of any trees or vegetation, any trees will be replaced with trees no larger than four-inches in diameter, and any plants will be replaced with plants in two-gallon containers. The size and species of any trees or vegetation replaced will be solely at the City's discretion. After restoration is complete, Grantor is responsible for watering and maintaining the vegetation.

4. Liability for Non-easement Property. The City shall be liable for any damage to the Property that is caused by the City and its officers, employees, agents, assigns, public utility providers, and independent contractors. The City shall have a reasonable time, not to exceed two weeks after notice from Grantor, to restore the Easement Area and other area of the Property that City has damaged. Notice shall be sent to:

   City of Warrenton
   Attn: Public Works
   P.O. Box 250
   Warrenton, OR 97146

5. Grantor's Reservation of Rights; Limitation on Reserved Rights.

5.1. Grantor reserves the right to continued use of the surface area within the Easement Area for all lawful purposes that do not interfere with, and are not inconsistent with, the City's rights granted in this Easement.

5.2. This reservation of rights does not include the right to build structures or place objects in the Easement Area that obstruct access to the Easement Area without the City's permission, or to create other impediments to the City's easement rights. Any such obstruction may be summarily removed by the City, and there shall be no claim allowed for damage to or destruction of the building, structure or object that the City removed. This reservation of rights does not include the right to engage in or allow any action that disturbs the subjacent or lateral support of the Easement Area.

6. Indemnification. Each party shall defend, indemnify, and hold the other party, its officers, employees, and agents harmless from and against any and all claims (including third party claims for damages for property removed from the Easement Area), demands, liabilities, judgments, awards, fines, liens, losses, damages, and expenses of any kind, including attorneys' fees at trial or on appeal, incurred by the indemnifying party to the extent arising either directly or indirectly from and to the extent of any act, error, omission or negligence of indemnifying party, its employees, contractors, licensees, or agents under this Agreement. Nothing in this Agreement, City's approval of plans and specifications, or inspection of work is an acknowledgement of responsibility or liability unless otherwise provided by applicable law.

7. Grantor's Warranty. Grantor agrees that it has the right to convey the Easement to the City and to provide quiet possession to the City. Grantor warrants to the City that the person executing this Agreement on behalf of Grantor is duly authorized to make this conveyance.

8. Breach; Remedies; Equitable Relief. Grantor acknowledges that the rights granted to the City are unique in that money damages alone for breach of the Easement by Grantor are inadequate, and that the City may bring an action at law or a suit in equity to obtain relief, including specific performance, injunctive relief and any other available equitable remedy.

9. Legal Effect; Shall Run with the Land. The Permanent Easement shall become effective and binding on the date signed by the Grantor and inure to the benefit of Grantor and the City, and their respective heirs, personal representatives, successors and assigns. This Easement shall run with the land.

10. Attorneys' Fees. In the event any action is brought to enforce, modify or interpret the provisions of this Agreement, each party shall bear the expense of its own attorney fees and costs incurred in connection with such action.

11. Severability. Nothing contained in this Agreement shall be construed to require the commission of any act contrary to law, and if there is any conflict between any provisions of the Easement and any present or future statute, law, ordinance or regulation to which the parties have no legal right to contract, the latter shall prevail. However, the provision of the Easement, which is affected shall be curtailed and limited only to the extent necessary to bring them within the requirements of the law, and all other provisions of the Easement shall remain in effect.

12. Waiver. Either party's failure to require performance of any provision of the Easement shall not limit the party's right to enforce the provision, nor shall any waiver of any breach of any

provision be a waiver of any succeeding breach of the provision or a waiver of the provision itself or any other provision.

THE EASEMENT is granted this _____ day of _____, 2025.

SPECIAL WARRANTY DEED

WEYERHAEUSER NR COMPANY, a Washington corporation, P. O. Box 9777, Federal Way, Washington 98063-9777 ("**Grantor**"), for valuable consideration, receipt of which is hereby acknowledged, conveys and specially warrants to **JAMES J. NEIKES**, 34755 Hwy 101 Business, Astoria, Oregon 97103 ("**Grantee**"), the real property situated in **Clatsop County, Oregon**, described on **Exhibit A** attached hereto and by this reference made a part hereof, free of encumbrances created or suffered by the Grantor, except for the encumbrances of title and reservations as set forth on said Exhibit A.

The true and actual consideration for this transfer is: $280,000.00.

Grantee or anyone claiming by, through or under Grantee, hereby fully and irrevocably releases Grantor, Grantor's parent company, and any of the parent company subsidiaries, including their agents and representatives (collectively, the "**Indemnified Parties**"), from any and all claims that it may now have or hereafter acquire against the Indemnified Parties for any cost, loss, liability, damage, expense, action or cause of action, whether foreseen or unforeseen, arising from or related to any defects, errors or omissions on or in the property, the presence of environmentally hazardous, toxic or dangerous substances, or any other conditions (whether patent, latent or otherwise) affecting the property. Grantee further acknowledges and agrees that this release shall be given full force and effect according to each of its expressed terms and provisions, including, but not limited to, those relating to unknown and suspected claims, damages and causes of action. As a material covenant and condition of this Deed, Grantee agrees that in the event of any such defects, errors or omissions, the presence of environmentally hazardous, toxic or dangerous substances, or any other conditions affecting the property, Grantee shall look solely to the Indemnified Parties predecessors in interest for any redress or relief, except for claims against Grantor based upon any obligations and liabilities of Grantor expressly provided in this Deed.

WNR/Neikes
Temp File No. T2013-205ph

The above provisions are specifically bargained for and represent a material part of Grantor's consideration for this conveyance.

BEFORE SIGNING OR ACCEPTING THIS INSTRUMENT, THE PERSON TRANSFERRING FEE TITLE SHOULD INQUIRE ABOUT THE PERSON'S RIGHTS, IF ANY, UNDER ORS 195.300, 195.301 AND 195.305 TO 195.336 AND SECTIONS 5 TO 11, CHAPTER 424, OREGON LAWS 2007, SECTIONS 2 TO 9 AND 17, CHAPTER 855, OREGON LAWS 2009, AND SECTIONS 2 TO 7, CHAPTER 8, OREGON LAWS 2010. THIS INSTRUMENT DOES NOT ALLOW USE OF THE PROPERTY DESCRIBED IN THIS INSTRUMENT IN VIOLATION OF APPLICABLE LAND USE LAWS AND REGULATIONS. BEFORE SIGNING OR ACCEPTING THIS INSTRUMENT, THE PERSON ACQUIRING FEE TITLE TO THE PROPERTY SHOULD CHECK WITH THE APPROPRIATE CITY OR COUNTY PLANNING DEPARTMENT TO VERIFY THAT THE UNIT OF LAND BEING TRANSFERRED IS A LAWFULLY ESTABLISHED LOT OR PARCEL, AS DEFINED IN ORS 92.010 OR 215.010, TO VERIFY THE APPROVED USES OF THE LOT OR PARCEL, TO DETERMINE ANY LIMITS ON LAWSUITS AGAINST FARMING OR FOREST PRACTICES, AS DEFINED IN ORS 30.930, AND TO INQUIRE ABOUT THE RIGHTS OF NEIGHBORING PROPERTY OWNERS, IF ANY, UNDER ORS 195.300, 195.301 AND 195.305 TO 195.336 AND SECTIONS 5 TO 11, CHAPTER 424, OREGON LAWS 2007, SECTIONS 2 TO 9 AND 17, CHAPTER 855, OREGON LAWS 2009, AND SECTIONS 2 TO 7, CHAPTER 8, OREGON LAWS 2010

EXHIBIT A

IN CLATSOP COUNTY, OREGON

TOWNSHIP 6 NORTH, RANGE 10 WEST, WILLAMETTE MERIDIAN

Section 13: S½N½SW¼NE¼ and S½SW¼NE¼

TOGETHER WITH a non-exclusive appurtenant easement, as reserved by Grantor in the deed dated August 18, 2009, recording instrument #200908127 and re-recorded #200909388, to reconstruct, maintain and use the existing road, hereinafter referred to as "**Access Road**", along a right of way 100 feet in width, being 50 feet on either side of the road centerline as now constructed, upon, over and across the **W½NE¼; SW¼NW¼; NE¼SW¼ and W½SW¼ of Section 13, Township 6 North, Range 10 West, W.M.**; said Access Road is located approximately as shown on the attached Exhibit A-1. Said access being subject to the terms and conditions as stated in said Deed.

TOGETHER WITH a perpetual easement as reserved by Grantor in the deed dated August 18, 2009, recording instrument #200908127 and re-recorded #200909388, to maintain, operate, repair, improve reconstruct and use the water reservoir, water pipeline and related facilities (the "**Water System**") located in the E½ of Section 13, Township 6 North, Range 10 West, W.M., Clatsop County, Oregon, approximately as shown on attached Exhibit A-2 to serve property herein being described and conveyed to Grantee. The Water System consists of the water reservoir located in the SW¼NW¼NW¼SE¼ of said Section 13; and water pipelines located in the NW¼NE¼, the N½N½SW¼NE¼ and the NW¼SE¼ of said Section 13 and such other related facilities as may be necessary to maintain, operate, repair, improve, reconstruct and use the Water System. The right conveyed herein shall be subject to the covenant and agreement identified as "9" in the Bargain and Sale Deed to the city of Warrenton recorded April 12, 2001, Clatsop County Recording instrument #200103387. TOGETHER with the rights to use the existing roads and right of way over and across the Lewis and Clark Mainline road and the BR 5 road in the SE¼ of said Section 13, to provide access to the Water System. The approximate location of such existing roads being shown on the attached Exhibit A-1.

RESERVATION:
Grantor hereby expressly saves, excepts, and reserves out of the grant hereby made, unto itself and its successors and assigns forever, all oil, gas, and other liquid or gaseous hydrocarbons including, without limitation, coal seam gas; geothermal resources including, without limitation, geothermal steam and heat; base and precious metals; ores; coal; lignite; peat; clays; and minerals of any and every nature, kind, or description whatsoever now or hereafter susceptible of commercial exploitation (collectively "**Mineral Resources**") in or upon said land, together with the right to enter upon said land, at any and all times, for the purpose of exploring the same for such Mineral Resources by geological, geophysical, geochemical, or other means, and for

WNR/Neikes
Temp File No. T2013-205ph

drilling, opening, developing, and working mines and wells thereon and taking out, extracting, or removing therefrom by any means whether now in use or hereafter developed, including by surface and sub-surface mining methods, all such Mineral Resources, and to occupy and make use of so much of the surface of said land as may be reasonably necessary or convenient for said purposes, together with the right to store, save, transport, treat, process, market, or otherwise utilize such Mineral Resources so produced, together with all rights and powers in, to, and over said land, whether herein expressed or not, reasonably necessary or convenient to render beneficial and efficient the complete enjoyment of the property and rights hereby reserved; *provided*, however, that Grantee and Grantee's heirs, representatives, successors, and assigns, shall be paid just and reasonable compensation for any injury or damage to the surface of said land or to the crops or improvements thereon caused by the exercise of any rights herein reserved; and *provided further*, that the exercise of such rights by Grantor and its successors and assigns shall not be postponed or delayed so long as Grantor or its successors or assigns is making reasonable efforts to agree upon or have determined such just and reasonable compensation.

Subject to:

1. Rights reserved in federal patents or state deeds, mineral or fossil rights reservations, exceptions or conveyances made by prior owners.

2. As disclosed by the assessment and tax roll, the land herein described has been classified/assessed as forestland. If the land becomes disqualified for this special classification/assessment under ORS Chapter 321 or any subsequent statute, any additional tax or penalties plus interest that may be levied shall be the responsibility of Grantee.

3. Taxes or special assessments which are not yet payable or which are not shown as existing liens by the public records.

4. All planning, zoning, health and other governmental regulations, if any, affecting the subject Property; all building, use, zoning, environmental and protected species restrictions general to the area.

5. Discrepancies, conflicts in boundary lines, shortage in area, encroachments or other facts which a correct survey would disclose.

6. Indian tribal codes or regulations, Indian treaty or aboriginal rights, including easements or equitable servitudes.

7. Rights of the State of Oregon in and to that portion of the Property, if any, lying in the bed or former bed of all rivers and creeks, if it is navigable.

8. Any question that may arise due to shifting or change in the course of any river or creek located on the Property.

9. Any prohibition or limitation on the use, occupancy or improvements of the Property resulting from the rights of the public or riparian owners to use any waters which may cover the Property or to use any portion of the Property which is now or may formerly have been covered by water.

10. All matters of public record, and all covenants, conditions, reservations, restrictions, easements and rights of way for public and/or private roads and roadways, railroads and utilities heretofore established and existing on said Property and all matters evident on the ground.

11. Easement for right of way contained in:

GRANTEE/CITY: City of Warrenton, an Oregon municipal corporation

TEMPORARY CONSTRUCTION EASEMENT

RECITALS:

A. Grantor owns real property described in **Exhibit A** ("Property"), which is attached and incorporated by this reference.

B. Sirpa Duoos is the duly appointed Personal Representative for the will and estate of the Grantor. The Letters Testamentary appointing Sirpa Duoos as such are attached as **Exhibit B** and incorporated herein by this reference.

C. The City requires a temporary construction easement ("Easement") on the Property to allow the City to access and construct a water line in the locations described in **Exhibit C** ("Temporary Construction Easement Area").

D. Grantor desires to grant to the City and the City desires to accept from the Grantor a temporary construction easement pursuant to the terms of this Agreement.

NOW, THEREFORE, the parties agree as follows ("Agreement"):

1. Grant of Temporary Construction Easement. In consideration of the mutual benefits, covenants, and terms contained herein, the receipt and sufficiency of which is hereby acknowledged, Grantor, and Grantor's heirs, successors, and assigns, grants and conveys to the City a temporary, nonexclusive construction easement for the purpose of accessing and constructing a water line within the Temporary Construction Easement Area. Grantor also grants to the City the right of reasonable access over other parts of the Property that are adjacent to the Temporary Construction Easement for construction-related activities.
2. City's Rights. Grantor shall allow the City and its officers, employees, agents, assigns, public utility providers, and independent contractors to use the Temporary Construction Easement Area for all purposes related to a water pipeline and related facilities. The Temporary Construction Easement Area shall be used for ingress and egress of personnel and for the purposes of accessing, constructing, reconstructing, and operating a water pipeline and related facilities that are above ground and underground, this can include items such as

fire hydrants, blow-off valve assemblies, combination air release valves, and bollards. The City has the right to excavate, construct, install, place, lay, operate, inspect, relocate, add to, and remove underground pipelines, related structures and facilities within the Temporary Construction Easement Area. The City has the right to cut, trim, plant, and remove trees or other vegetation within the Temporary Construction Easement Area. The City has the right to remove other obstructions that may endanger or interfere with the construction, reconstruction, inspection, efficient service, or removal of all or any part of its respective water system on or from the Temporary Construction Easement Area without the necessity at any time of procuring the consent or permission of anyone. The City has the right to enter the Temporary Construction Easement Area at any and all times for the exercise of any of the easement rights.

3. Noninterference. Grantor and its heirs, successors, and assigns will not interfere with the City's use of the Temporary Construction Easement Area or the rights granted herein and agrees not to build, construct, improve and/or plant (or permit or allow others to do so) any structures, edifices, plants or other objects within the areas of the Temporary Construction Easement Area during the term of this Easement.

4. Temporary Construction Easement Area Condition. The City shall return the Temporary Construction Easement Area to good condition (i.e., repair/replace soil disturbance and/or vegetation; removal of construction debris, rocks/gravel, and other materials). All damage resulting from or arising out of said use shall be repaired by the City, including any damage caused by the City, its officers, employees, agents, assigns, public utility providers, and independent contractors. The City shall have a reasonable time, not to exceed two weeks after notice from Grantor, to restore the Temporary Construction Easement Area and adjacent property. Notice shall be sent to:

   City of Warrenton

   Attn: Public Works

   P.O. Box 250

   Warrenton, OR 97146

5. Indemnification. Each party shall defend, indemnify, and hold the other party, its officers, employees, and agents harmless from and against any and all claims (including third party claims for damages for property removed from the Temporary Construction Easement Area), demands, liabilities, judgments, awards, fines, liens, losses, damages, and expenses of any kind, including attorneys' fees at trial or on appeal, incurred by the indemnifying party to the extent arising either directly or indirectly from and to the extent of any act, error, omission or negligence of indemnifying party, its employees, contractors, licensees, or agents under this Agreement. Nothing in this Agreement, City's approval of plans and specifications, or inspection of work is an acknowledgement of responsibility or liability unless otherwise provided by applicable law.

6. Grantor's Warranty. Grantor agrees that Grantor has the right to convey the Easement to the City and to provide quiet possession to the City. Grantor warrants to the City that the person executing this Agreement on behalf of Grantor is duly authorized to make this conveyance.

7. Breach; Remedies; Equitable Relief. Grantor acknowledges that the rights granted to the City are unique in that money damages alone for breach of the Easement by Grantor are

inadequate, and that the City may bring an action at law or a suit in equity to obtain relief, including specific performance, injunctive relief and any other available equitable remedy.

8. Expiration of Easement. The Easement will terminate upon the City's issuance of a Certificate of Final Completion to the contractor responsible for the construction project ("Contractor") and shall have no further force or effect thereafter.

9. Attorneys' Fees. In the event any action is brought to enforce, modify or interpret the provisions of this Agreement, each party shall bear the expense of its own attorney fees and costs incurred in connection with such action.

10. Severability. Nothing contained in this Agreement shall be construed to require the commission of any act contrary to law, and if there is any conflict between any provisions of the Easement and any present or future statute, law, ordinance or regulation to which the parties have no legal right to contract, the latter shall prevail. However, the provision of the Easement, which is affected shall be curtailed and limited only to the extent necessary to bring them within the requirements of the law, and all other provisions of the Easement shall remain in effect.

11. Waiver. Either party's failure to require performance of any provision of the Easement shall not limit the party's right to enforce the provision, nor shall any waiver of any breach of any provision be a waiver of any succeeding breach of the provision or a waiver of the provision itself or any other provision.

THE EASEMENT is granted this ____ day of _____, 2025.

SPECIAL WARRANTY DEED

WEYERHAEUSER NR COMPANY, a Washington corporation, P. O. Box 9777, Federal Way, Washington 98063-9777 ("**Grantor**"), for valuable consideration, receipt of which is hereby acknowledged, conveys and specially warrants to **JAMES J. NEIKES**, 34755 Hwy 101 Business, Astoria, Oregon 97103 ("**Grantee**"), the real property situated in **Clatsop County, Oregon**, described on **Exhibit A** attached hereto and by this reference made a part hereof, free of encumbrances created or suffered by the Grantor, except for the encumbrances of title and reservations as set forth on said Exhibit A.

The true and actual consideration for this transfer is: $280,000.00.

Grantee or anyone claiming by, through or under Grantee, hereby fully and irrevocably releases Grantor, Grantor's parent company, and any of the parent company subsidiaries, including their agents and representatives (collectively, the "**Indemnified Parties**"), from any and all claims that it may now have or hereafter acquire against the Indemnified Parties for any cost, loss, liability, damage, expense, action or cause of action, whether foreseen or unforeseen, arising from or related to any defects, errors or omissions on or in the property, the presence of environmentally hazardous, toxic or dangerous substances, or any other conditions (whether patent, latent or otherwise) affecting the property. Grantee further acknowledges and agrees that this release shall be given full force and effect according to each of its expressed terms and provisions, including, but not limited to, those relating to unknown and suspected claims, damages and causes of action. As a material covenant and condition of this Deed, Grantee agrees that in the event of any such defects, errors or omissions, the presence of environmentally hazardous, toxic or dangerous substances, or any other conditions affecting the property, Grantee shall look solely to the Indemnified Parties predecessors in interest for any redress or relief, except for claims against Grantor based upon any obligations and liabilities of Grantor expressly provided in this Deed.

WNR/Neikes
Temp File No. T2013-205ph

The above provisions are specifically bargained for and represent a material part of Grantor's consideration for this conveyance.

BEFORE SIGNING OR ACCEPTING THIS INSTRUMENT, THE PERSON TRANSFERRING FEE TITLE SHOULD INQUIRE ABOUT THE PERSON'S RIGHTS, IF ANY, UNDER ORS 195.300, 195.301 AND 195.305 TO 195.336 AND SECTIONS 5 TO 11, CHAPTER 424, OREGON LAWS 2007, SECTIONS 2 TO 9 AND 17, CHAPTER 855, OREGON LAWS 2009, AND SECTIONS 2 TO 7, CHAPTER 8, OREGON LAWS 2010. THIS INSTRUMENT DOES NOT ALLOW USE OF THE PROPERTY DESCRIBED IN THIS INSTRUMENT IN VIOLATION OF APPLICABLE LAND USE LAWS AND REGULATIONS. BEFORE SIGNING OR ACCEPTING THIS INSTRUMENT, THE PERSON ACQUIRING FEE TITLE TO THE PROPERTY SHOULD CHECK WITH THE APPROPRIATE CITY OR COUNTY PLANNING DEPARTMENT TO VERIFY THAT THE UNIT OF LAND BEING TRANSFERRED IS A LAWFULLY ESTABLISHED LOT OR PARCEL, AS DEFINED IN ORS 92.010 OR 215.010, TO VERIFY THE APPROVED USES OF THE LOT OR PARCEL, TO DETERMINE ANY LIMITS ON LAWSUITS AGAINST FARMING OR FOREST PRACTICES, AS DEFINED IN ORS 30.930, AND TO INQUIRE ABOUT THE RIGHTS OF NEIGHBORING PROPERTY OWNERS, IF ANY, UNDER ORS 195.300, 195.301 AND 195.305 TO 195.336 AND SECTIONS 5 TO 11, CHAPTER 424, OREGON LAWS 2007, SECTIONS 2 TO 9 AND 17, CHAPTER 855, OREGON LAWS 2009, AND SECTIONS 2 TO 7, CHAPTER 8, OREGON LAWS 2010

City Commission Agenda Memo

Meeting Date: April 8, 2025
From: Kevin Gorman, Public Works Director
Subject: Ft. Stevens Guardhouse Street Closure

Summary:

The Ft. Stevens Guardhouse has been undergoing renovations since last year. In the previous year, phase 1, exterior work was completed to address foundation issues. This year, phase 2 Right of Way (ROW) permit has been submitted to continue the renovation efforts at the Guardhouse.

As part of this application, a road closure of Russell Drive is required for the duration of the renovations to facilitate upgrades to the electrical systems and the installation of water proofing at the Guardhouse.

We are requesting approval to close Russell Drive from now until May 19, 2025, to complete the necessary water proofing and electrical upgrades at the Ft. Stevens Guardhouse.

Recommendation/Suggested Motion:

"I move to approve the proposed road closure for the Ft. Stevens Guardhouse renovations."

Alternative:

Other actions as deemed appropriate by the City Commission
OR
None recommended

Fiscal Impact:

No fiscal impact is anticipated.

Subject: Request for Meeting and City Support for Frolic and Lark

Dear Mayor Balensifer,

I hope you're doing well. I am reaching out to request a meeting with you to discuss Frolic and Lark, an indoor playground and child care facility designed to address the critical shortage of early childhood care and family-friendly spaces in Warrenton.

As you may know, Clatsop County is facing a significant lack of child care options, leaving many families without reliable, affordable care. Frolic and Lark aims to help fill this gap by providing a safe, engaging space for young children, along with much-needed after-school care. In addition to supporting local families, our facility will contribute to the local economy by offering a welcoming indoor space for visitors, particularly during the rainy months.

We are in the process of applying for funding through the Child Care Infrastructure Fund (CCIF), a grant program administered by the Oregon Department of Early Learning and Care (DELC) and Business Oregon. As part of our application, we are seeking a letter of support from the City of Warrenton to highlight the importance of expanding child care and play-based opportunities in our community. Your support would be invaluable in demonstrating the need for this project and its benefits to Warrenton families.

I would love the opportunity to meet with you at your convenience to share more about our vision and explore ways to collaborate.

Thank you for your time and consideration. I look forward to connecting soon.

Best,
Nicole Bian

City Commission Agenda Memo

Meeting Date: April 8th, 2025
From: Kevin Gorman, Public Works Director
Subject: Discussion item - Repealing Municipal Code Chapter 8.20 – Fluoride Supplementation

Summary:

The Public Works Department wanted to bring forward a discussion item regarding repealing Municipal Code Chapter 8.20 – Fluoride Supplementation, which mandates the addition of fluoride to the City's public water supply. This recommendation follows a recent internal supply chain analysis, which identified that the fluoride currently used is sourced exclusively from China and subject to existing and potentially increasing import tariffs. Staff estimates a 24% cost increase due to these tariffs, with the potential for further escalation.

In addition to the financial impact, there is increasing community concern regarding the health implications of fluoridating the public water system, particularly given that fluoride supplementation is not a state required practice for cities with populations under 10,000. Staff have also raised serious safety concerns over the years related to the handling and storage of the concentrated fluoride chemical.

There are no known domestic suppliers of fluoride additives. Furthermore, because the chemical is classified as hazardous, the City incurs added costs associated with hazardous materials storage fees and increased shipping costs due to efforts to remain under regulated weight thresholds. Ceasing fluoride supplementation would eliminate these costs and reduce operational risks.

When fluoride supplementation was first recommended decades ago, there was a push to assist dental care for lower income families through fluoride in public water supplies, this is not something that we can concretely show is currently significantly helping families in Warrenton. In the past two decades, public opinion has turned toward preserving a more natural approach to water supplies, with only the minimum treatment additives required to make water safe for drinking per Oregon Health Authority standards.

Should the commission express interest in bringing this code amendment back, staff will follow up with the public hearing process for a code repeal.

Fiscal Impact:

Removing fluoride supplementation is expected to save approximately $23,000 annually, depending on the volume of water produced and tariff increases. This figure includes avoided costs from material purchases, hazardous materials fees, increased shipping charges, and maintenance impacts.
